Another issue raised in this comment is the comparison of costs between Alternative 2 and Alternative 5. When comparing costs between alternatives, it is important to compare equivalent estimates to make an accurate evaluation of any differences. The commentor states that the cost of Alternative 2 is approximately 3 percent of Alternative 5. It is unclear what numbers the commentor used to derive this percentage, but the commentor's estimate of approximately 3 percent is incorrect by a significant amount. If one were to compare the costs of the Alternative 2 airfield improvements to the costs of the Alternative 5 airfield improvements, one can use either estimated costs in 2010 dollars or escalated costs, as both will yield the same ratio. If using estimated costs in 2010 dollars, the comparison would be Alternative 2 airfield improvement costs of $205,200,000 to Airfield 5 airfield improvement costs of $806,660,000 and the result would show that the cost of airfield improvements associated with Alternative 2 are approximately 25 percent of the cost of airfield improvements associated with Alternative 5. The same percentage would hold if escalated costs for airfield improvements were used (i.e., $279,768,000 compared to $1,099,792,000). If one were to compare the total costs of the Alternative 2 improvements to the total costs of the Alternative 5 improvements, again, one can use either estimated costs in 2010 dollars or escalated costs, as both will yield the same ratio. If using estimated costs in 2010 dollars, the comparison would be Alternative 2 total improvement costs of $1,974,840,000 to Airfield 5 total improvement costs of $2,474,180,000 and the result would show that the total costs of improvements associated with Alternative 2 are approximately 80 percent of the total costs of improvements associated with Alternative 5. The same percentage would hold if escalated costs for total improvements were used (i.e., $2,601,629,000 compared to $3,282,424,000).

Comment:

ARSAC comments Preliminary SPAS Report Operational Analysis Attachment Section F-1 This section lays the ground work for much of the environmental assessments by establishing the flight mix of aircraft used. LAWA must identify the impact on these assessments for any necessary changes or inaccuracies.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-639 through SPAS-PC00130-686 below.

SPAS-PC00130-639

Comment:

General comments and some questions

1. SPAS Report Section F-1 states that the design data should be 2010, but uses the busiest day in the second highest traffic month- Tuesday, August 18, 2009. July 2009 was apparently the busiest month in 2009. Ground traffic data was gathered on a different date- a Friday in August 2011. Westchester/Playa del Rey residents have repeated called on LAWA to choose a traffic data gathering date in mid-September to account for traffic from Loyola Marymount University, Otis Institute for Art and the public and private K-12 schools in the area. Shouldn't the base design year data be the same for all elements of the EIR? Should the air traffic and ground traffic data be on the same date or at least the same month in the same year?

Response:

Please see Response to Comment SPAS-PC00130-52 for a discussion of the environmental baseline used in the SPAS Draft EIR. The 2009 Design Day Flight Schedule (DDFS) was developed for the purposes of operational analyses supporting the SPAS Draft EIR, such as airfield simulation, aircraft noise analysis, air quality, and safety. These operational analyses warranted the use of a peak month average day (PMAD) selected based on the month with the highest monthly number of operations in calendar year 2009, as opposed to one with the highest number of passengers. As described in Section 3.2 of the Preliminary LAX SPAS Report, in terms of the number of operations, August 2009 was the peak month with 48,448 operations, representing 8.9 percent of all operations in calendar year 2009, and yielded a PMAD number of operations at 1,563. In comparison, July 2009 was the second busiest month in calendar year 2009 at LAX in terms of operations, with 47,893 operations, representing 8.8 percent of all 2009 operations. In terms of passenger volumes, July 2009 was the busiest month in calendar year 2009, followed by August 2009.1

Sections 4.12.1.2, 4.12.1.3.11 and 4.12.1.3.12 of the SPAS Draft EIR summarize the methodology and trip generation estimates for off-airport vehicular traffic associated with the SPAS analysis. As described in the aforementioned sections, the roadway trip generation analysis is based on traffic activity occurring during a typical Friday in August 2009. August was selected as the basis for the airport-related trip generation because, as noted above, it represents the peak month for airport-related traffic activity. Friday is generally the busiest day of the week for CTA roadway traffic. Given the airport is the single largest traffic generator within the study area, it was determined that analysis of the off-airport roadway system should be based on peak August 2009 conditions. The use of traffic volumes collected during the peak summer months provides a more conservative assessment of traffic conditions (i.e., worst case level of service) within the vicinity of the airport than would traffic collected during a period when the airport is not operating at peak activity levels.

As discussed on page 4-1194 in Section 4.12.2 of the SPAS Draft EIR, intersection turning movement counts were collected during the weekday morning (a.m.), midday (m.d.), and afternoon (p.m.) time periods at the 164 analyzed locations in July and August 2010. July and August are considered to be the peak months for airport-related traffic around LAX; therefore, additional seasonal adjustments were not required to convert the counts to peak month conditions. Collecting counts during the peak months for airport-related traffic provides for a more conservative analysis as discussed on pages 4-1057 and 4-1194 of the SPAS Draft EIR. The study area intersections are located in close proximity to the airport and influenced by airport-related traffic activity; therefore, obtaining traffic count information when the airport is operating at peak conditions is important in obtaining a conservative estimate of traffic activity in the study area.

The commentor indicated that collecting traffic at the intersection of LMU Drive and Lincoln Boulevard during the August peak month may result in an undercount at that location for the nine months when LMU is in regular session. Loyola Marymount University (LMU) is located north of the airport, approximately 2.5 miles driving distance from the entrance to the CTA. As described previously, the traffic data collection and resulting analysis for the off-airport roadway system was conducted during July and August, which represents the peak months for airport-related traffic around LAX. It is recognized that individual businesses, schools, and other traffic generators may produce localized peak traffic conditions that may differ from the airport. For example, each individual traffic generator would likely experience peak seasons and produce peak hour conditions at their primary access locations that would differ from that of the airport and the overall study area. However, given the large scale of the SPAS traffic study analysis area, it is important to analyze the roadway network for the overall ambient peak condition which is influenced by the airport as the largest trip generator within the study area and to assess conditions when the project is producing the highest number of trips and would produce the most potential impacts within the study area. There are numerous large buildings, shopping centers, business campuses, educational facilities, sport and entertainment centers, and other facilities within the study area for the SPAS off-airport transportation analysis (please see Figure 4.12.2-1 of the SPAS Draft EIR). Many of these facilities generate localized traffic that can affect the roadway network in the immediate vicinity of their site, and with seasonal and hourly peaking characteristics that may differ from the overall study area roadway network. It would not be feasible or necessary for the SPAS Draft EIR impact analyses to study the traffic peaking characteristics of every individual trip generator within the geographic scope of the SPAS off-airport transportation analysis shown in Figure 4.12.2-1. Nor is this level of detail required by CEQA. As discussed in Section 15204(a) of the State CEQA Guidelines,

"reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters." (See also State CEQA Guidelines Section 15151.)

As shown in Tables 4.12.2-21 through 4.12.2-25 of the SPAS Draft EIR, the magnitude and severity of the traffic impacts at and surrounding LMU would be minimal. The commentor references the intersection of LMU Drive and Lincoln Boulevard (Intersection #104 shown in Figure 4.12.2-1). Intersection #104 would operate at LOS C or better with and without the proposed project in 2025 in the a.m., m.d., and p.m. peak hours. (See Tables 4.12.2-21 through 4.12.2-25 of the SPAS Draft EIR.) The intersection to the north of Intersection #104 (Intersection #22) and the intersection to the south (Intersection #111) would operate at LOS A and LOS C or better, respectively, with and without the project in the a.m., m.d., and p.m. peak hours. (See Tables 4.12.2-21 through 4.12.2-25 of the SPAS Draft EIR). It would not be feasible or necessary for the SPAS Draft EIR impact analyses to analyze individual traffic peaking characteristics within the geographic scope of the off-airport transportation analysis.

Finally, there is no requirement under CEQA that the "existing conditions" representing the environmental baseline be identical for each impact topic. Rather, lead agencies have flexibility in determining exactly how existing environmental conditions should most realistically be measured, as long as this determination is supported by substantial evidence. (Communities for a Better Environment v. South Coast Air Quality Management District (2010) 48 Cal.4th 310, 326-328.) Substantial evidence supporting the SPAS Draft EIR's choice of existing conditions to use as the baseline for air traffic and ground traffic impact analyses is summarized above.

1. City of Los Angeles, Los Angeles World Airport, LAX - Passenger Traffic Comparison by Terminal, Available: lawa.org/LAXStatistics.aspx; accessed November 10, 2012.

SPAS-PC00130-640

Comment:

2. The year 2025 was chosen as the future design date. Isn't the LAX Master Plan supposed to run through 2015? Where is the authority in CEQA or NEPA to push out the design date to 2025? (The FAA projects air traffic will double worldwide by 2031. Historically, since the start of the Jet Age in October 1958, worldwide air traffic generally has doubled every 20 years with about 50% of the world's air traffic in the USA.)

Response:

Consistent with the requirements of Section V.C. of the LAX Master Plan Stipulated Settlement, LAWA was to focus the SPAS on "Potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers." Based on the 2009 FAA Terminal Area Forecast (TAF) and the more recent 2011 TAF, the passenger activity level at LAX in 2015 was projected to be approximately 66-67 MAP. Had LAWA maintained 2015 as the planning horizon year for SPAS, the analysis of the SPAS alternatives would not be consistent with the requirements of the Stipulated Settlement and, moreover, would have not accurately reflect the impacts likely to occur as a result of buildout of the SPAS alternatives. Based on FAA data available at the time and a review of the historic, current, and anticipated annual growth rates in passenger activity levels at LAX, it was estimated that passenger activity levels at LAX would reach 78.9 MAP around 2025. Furthermore, as provided in footnote 13 on page 1-47 of the SPAS Draft EIR, 78.9 MAP is consistent with the regional growth projections adopted in the 2012 SCAG Regional Transportation Plan. An EIR may rely on projections contained in a previously approved land use document. (See Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899, 930-931; City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 425.) The LAX 2009-2025 growth forecast approach and data used for the SPAS analysis are documented in Appendix F1-1 of the Preliminary LAX SPAS Report.

SPAS-PC00130-641

Comment:

3. SPAS Report Section F-1 lists 1,563 daily flights (passenger, cargo, general aviation, military) for 2009 and predicts 2,053 daily operations for 2025. LAX had about 2,000 daily operations in the year 2000 and LAX was bursting at the seams. Go-arounds for aircraft coming into land on the north complex were a daily occurrence, as the airfield could not handle the congestion. At 2,053 daily ops, capacity appears to exceed 85 MAP, well above the 78.9 MAP cap.

Response:

As discussed in Sections 3.2 and 4.2, respectively, of Appendix F-1 of the Preliminary LAX SPAS Report, the 2009 Design Day Flight Schedule (DDFS) includes 1,563 daily operations, while the 2025 DDFS is projected to include 2,053 operations. The projected number of future operations commensurate to 78.9 million annual passengers (MAP) was derived primarily based on assumed aircraft fleet mix, seat configurations, and passenger load factors, as described in Section 4.2 of Appendix F-1 of the Preliminary LAX SPAS Report.

While activity levels at LAX in 2000 were higher than those of 2009 (i.e., 67.3 MAP in 2000 compared to 56.5 MAP in 2009), the commentor's statements that LAX "was bursting at the seams" and that "Go-arounds for aircraft coming into (sic) land on the north complex were a daily occurrence" appear to be subjective opinions with no supporting evidence, as is also the case with the conjecture that "At 2,053 daily ops, capacity appears to exceed 85 MAP." As indicated above, the basis for LAWA's projection of 2,053 daily operations and associated 78.9 MAP in 2025 is documented in Section 4.2 of Appendix F-1 of the Preliminary LAX SPAS Report.

SPAS-PC00130-642

Comment:

4. There are many problems with the fleet mix.
a. There is no differentiation between all-passenger and all-cargo aircraft. This is important for determining which aircraft will park where on the airfield: passenger gates or cargo ramps.

Response:

As discussed in Sections 3 and 4 of Appendix F-1 of the Preliminary LAX SPAS Report, both passenger and all-cargo operations were analyzed and projected for the purposes of the SPAS Draft EIR. Both air carrier and air taxi cargo operations were analyzed. Accordingly, passenger and all-cargo operations were also assigned to appropriate passenger gates or cargo ramp parking positions around the airfield throughout the gating and simulation efforts.

The following table contains the numbers of daily all-cargo air carrier and air taxi operations included in the 2009 and 2025 DDFSs by aircraft type.

	2009	2025
Aircraft Type	DDFS	DDFS
A300	2	2
A300-600	4	4
A310	2	2
B190 (Air Taxi)	1	2
B747-200	2	4
B747-400	18	15

B747-800	0	8
B767-200	4	4
B767-300	5	6
B777-200	0	6
DC10	11	5
DC87	2	2
MD11	7	10
Total Daily Operations	58	70

SPAS-PC00130-643

Comment:

b. For ADG I and ADG II aircraft, the report breaks them down in Regional Jets and Propellers, however, it does not specify manufacturers and models of these aircraft. This is important to know because US airlines are sending the Bombardier Canadair 50-seat CRJ100 and CRJ200 into retirement. The costs to operate these aircraft have become too high and with upcoming major engine overhauls coming, no airline wants to pick up those costs. For the same hourly block hour cost, a US airline can have a 2-class 75 seat CRJ700 or a 90 seat CRJ-900. US airlines may also push out the Embrarer regional jets such as the 37 seat ERJ-135 and larger ERJ-140 and ERJ-145 jets. As of November 2012, American Airlines is replacing its American Eagle 44-seat ERJ-140 jet operation at LAX with contracted Skywest 50-seat Canadair CRJ-200's. Larger sized aircraft on a one-to-one flight replacement can result in a capacity increase.

Response:

Please see Responses to Comments SPAS-PC00130-770 and SPAS-PC00130-771 regarding the 2009 and 2025 Design Day Flight Schedules (DDFS) assumed fleet mixes and flight schedule information.

The commentor provided comments listed under "general comments and some questions" related to information presented in Appendix F-1 of the Preliminary LAX SPAS Report (i.e., Comments SPAS-PC00130-643 through SPAS-PC00130-654). In addition, "specific comments" were then provided on specific pages and tables in Appendix F-1 (i.e., Comments SPAS-PC00130-655 through SPAS-PC00130-679).

All these comments considered, Comments SPAS-PC00130-643 through SPAS-PC00130-654, and SPAS-PC00130-669 through SPAS-PC00130-679 all relate to the details of the fleet mixes assumed in the 2009 and 2025 DDFSs and suggest alternative mixes or discuss the inclusion or exclusion of various aircraft in or from the mixes.

As described in Section 3.2 in Appendix F-1 of the Preliminary LAX SPAS Report, the 2009 DDFS fleet mix was derived from published schedule data for scheduled-passenger activity and radar flight data for non-scheduled activity data. The projected 2025 DDFS fleet mix and other activity data required were based on a top-down development beginning with a passenger activity forecast, followed by determination of daily aircraft seats required, from which a projected set of aircraft was identified to represent activity in 2025. The assumptions used to develop the projected 2025 DDFS in Section 3.2 in Appendix F-1 were reasonable and supported by substantial evidence. In contrast, the commentor's speculations about potential changes to the 2025 DDFS are subjective, based on anecdotal observations and personal opinion, and not supported by substantial evidence.

Practically, the 2025 DDFS aircraft fleet mix was derived from forecast passenger increases, trends in aircraft seat capacity (including a number of trends that the commentor also cites) and flight load factors needed to serve 78.9 MAP. As described in Section 4.2 in Appendix F-1 of the Preliminary LAX SPAS Report, to meet the daily flight capacity for the 2025 plan year passenger level, the size and number of flights in the 2009 DDFS were increased to provide the needed number of additional daily aircraft seats

to maintain a reasonable passenger load factor for the daily equivalent of 78.9 MAP. This included taking into account trends in aircraft size, seating by aircraft type, new aircraft on order, and expected retirement of older and outdated aircraft. For example, the daily activity reflected in the gating and flight simulations took into account diminished numbers of 50-seat regional jets and the evolution of the Airbus 319/320 and Boeing 737 series of jets to newer models. The number of 767 aircraft in the 2025 mix reflects an assumed growth based on forecast percentages of flight demand out of 757s into larger aircraft such as the 767-300 and 787-800. While there are many Airbus 350 aircraft on order, they are similar in size and seating capacity to the Boeing 777 models for which there are 83 passenger operations assumed in the 2025 DDFS fleet mix. Similarly, the Boeing 747 represents a class of aircraft. All the Boeing 747s in the passenger fleet mix are 747-400s.

There are many different combinations of aircraft that could meet the future seat requirement commensurate to 78.9 million annual passengers (MAP). Table 12, which lists the assumed 2025 DDFS fleet mix, presents an allocation of aircraft meant to provide a reasonable representation of what aircraft types could make up future activity at LAX. They are not meant or expected to provide an exact picture of what will occur in 2025. In many cases, new aircraft that are not yet available and operational will provide replacements for aircraft that will become obsolete in the 2025 horizon. In these cases, the aircraft shown in Table 12 represent similar sized aircraft to those not yet developed or on order.

The commentor suggests many other possible aircraft combinations for the future 2025 activity. Most of these are similar to aircraft already included in the 2025 DDFS fleet mix. Experience has shown that these characteristics change in often unpredictable ways within time periods shorter than the 15-year horizon analyzed in the SPAS Draft EIR. The important factor is that the Preliminary LAX SPAS Report and Draft EIR analyses of facility development alternatives use reasonable assumptions about activity level and aircraft fleet mix supported by substantial evidence to evaluate differences. An EIR is not required to guarantee that its project description or implementation assumptions will be 100 percent accurate in the future. (Village Laguna of Laguna Beach Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022,1030; Environmental Council of Sacramento v. City of Sacramento (2008) 142 Cal.App.4th 1018, 1036.)

Finally, some of the comments on the aircraft fleet mix request a level of detail far beyond that needed for the EIR to meaningfully evaluate the alternatives' environmental impacts. An EIR's project description is supposed to include a "general description" of the project's technical characteristics, and should not provide extensive detail beyond that needed for evaluation of environmental impacts. (State CEQA Guidelines Sections 15124, 15124(c)).

SPAS-PC00130-644

Comment:

c. Airbus A320 series (A318, A319, A320, A321) shows a modest increase from 259 to 273 daily flights. That number appears to be a little low. There have been a huge number of orders for the existing A320 series and the new A320 NEO (new engine option).

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-645

Comment:

d. Boeing 737 series. Although one of the stated assumptions in Section F-1 is the older aircraft would be retired there again is no breakdown between the 737 Classics Series (-100 and -200, now retired, 300/400/500 series still in operation and being retired), the current NextGen 737 series (-600, -700, -800, and -900 and -900ER) and the new 737 MAX series.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-646

Comment:

e. Numbers for A300 and A310 remain at 8. These must be cargo aircraft, but are not specified as such. Number should be lower as FedEx retires these aircraft from their fleet in favor of converted passenger Boeing 757's and new Boeing 767's.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-647

Comment:

f. Boeing 767 series shows an INCREASE from 77 to 190 daily operations. This number appears unbelievable as airlines are retiring their 767's in favor of Boeing 787's or smaller aircraft such as Airbus 320 series or Boeing 737 Next Generation (-600, -700, -800, -900) or 737 MAX series.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-648

Comment:

g. DC-10 series declines from 11 to 5 daily operations. It is doubtful any DC-10's will be in service in 2025.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-649

Comment:

h. MD-11 series increases from 7 to 10 daily operations. Again, this number should decline. Airlines that have MD-11's as freighters are retiring these aircraft due to the cost of operation (e.g. fuel).

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-650

Comment:

i. Two Lockheed C-130's a day into LAX. Does LAX really have that much military traffic into LAX every day?

Response:

As described in Section 3.2 in Appendix F-1 of the Preliminary LAX SPAS Report, based on the Federal Aviation Administration (FAA) aircraft categories, military operations were included in the 2009 Design Day Flight Schedule. Please see Responses to Comments SPAS-PC00130-770 and SPAS-PC00130-771 regarding why assumptions on military operations at LAX for the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-651

Comment:

j. The Airbus A350, the competitor to the Boeing 777 and 787 Dreamliner, is not even listed in the report. Airlines at LAX (or previously at LAX and may return- Aer Lingus, Finnair, TAP Portugal) that have ordered the A350 include Hawaiian Airlines, China Airlines, Aeroflot, Alitalia, Asiana, Avianca, Cathay Pacific, Thai, and United. Other A350 buyers include Qatar Airways, TAM (Brazil) and Vietnam Airlines.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-652

Comment:

k. The ADG V Boeing 747 is way too high, declining from 74 to 65. Many passenger airlines are replacing their 747's with Airbus A380's or Boeing 777-300ER's. Again, there is no breakdown of 747 types here, so one has to assume that there are no more 747-100's, -200's and 300's, but how many are Boeing 747-400 passenger and cargo airplanes? Please list 747's projected in use at LAX by airlines and routes.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-653

Comment:

l. The A380 prediction is also very off with 27 predicted. The real number is a low of 12, a high of 16 and most likely 14. This is based upon which airlines have ordered the A380 and how they have announced to deploy them to LAX. For example, LAX may never see an Airbus A380 from Thai Airways (6 orders) or Malaysia Airways (2 orders) because those airlines are using those aircraft on the Kangaroo Route from London through their respective hubs of Bangkok and Kuala Lumpur to Australia.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-654

Comment:

m. The 747-8 prediction of 12 is also too high. Again, there is no breakdown between passenger and cargo flights. Most of the 747-8 order book is for the freighter version. Lufthansa (20 orders) has announced 747-8 passenger service between LAX and its 747 base in Frankfurt, Germany. Other likely 747-8 passenger operators include Korean Air (5 passenger and 5 cargo orders), Air China (5 passenger orders) and TransAero (Russia-4 unconfirmed orders). Cargo operators are Cathay Pacific (747-8F already seen at LAX), Cargolux, Atlas Air, Air Bridge (Volga-Dnepr), Nippon Cargo Airlines and Korean Airlines Cargo. A projection of 3 passenger flights and 7 cargo flights for a total of 10 747-8 flights a day is more likely.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-655

Comment:

Specific Questions

Page 16- Table 6
The report notes that August 18, 2009 was used as the design date. Table 6 shows a total of 1,563 average daily operations. In looking at the FAA Aircraft Movements for LAX in 2009, there were 544,833 operations that would average to 1,492 operations per day. According to the LAWA Volume of Air Traffic (VOAT) report for LAX posted on the LAWA website, the August 2009 monthly total for flight operations (scheduled, commuter, charter, but excluding cargo operations) is 50,047; this averages to 1,614 operations per day.

1. How did Ricondo arrive at the 1,438 daily flights for Scheduled Passenger Operations? Were the 2009 Air Carrier total from the Ten Year Summary of FAA Aircraft Movements simply divided by 365 for a daily average of 1,200 operations and the Air Taxi total from the same chart daily average of 238 simply added together to get 1,438 average daily operations? What accounts for the variances between the Ricondo figure, FAA and the LAX VOAT?

Response:

As discussed in Section 3.2 in Appendix F-1 of the Preliminary LAX SPAS Report, the 2009 DDFS operations were classified among four FAA aircraft categories: air carrier; air taxi; general aviation; and military. To ensure accuracy and consistency, the number of operations reported in the FAA Air Traffic Activity Data System (ATADS) for August 2009 was compared to the number of operations included in the LAX radar flight data provided by LAWA's Environmental Services Division.

It is important to note that the FAA "air carrier" category includes both scheduled and non-scheduled air carrier passenger operations (with aircraft with seat counts greater than 60 seats), as well as large all-cargo operations (e.g., FedEx, UPS). Similarly, the FAA "air taxi" category includes both scheduled and non-scheduled air taxi passenger operations (with aircraft with seats counts less than 60 seats), as well as air-taxi cargo operations (such as smaller cargo turbo propeller aircraft serving regional airports).

After a thorough analysis of the proportion of each operation type among the four FAA aircraft categories based on the LAX radar flight dataset, all operations were reconciled among the FAA aircraft

categories. The table below provides a breakdown of the information summarized in Table 6 on page 16 in Appendix F-1 of the Preliminary LAX SPAS Report, and provides an explanation of the 1,438 scheduled-passenger operations inquired by the commentor.

Type of Operations/ FAA Aircraft Category	Air Carrier	Air Taxi	General Aviation	Grand Military	Total
Scheduled					
Passenger	1,220	218	0	0	1,438
Non-Scheduled					
Cargo	57	1	0	0	58
General Aviation	0	0	46	0	46
Passenger	1	12	0	0	13
Military	0	0	0	8	8
Grand Total	1,278	231	46	8	1,563

SPAS-PC00130-656

Comment:

2. Why didn't Ricondo break out the Air Taxi numbers as a separate figure since there is established data for Air Taxi?

Response:

Please refer to Response to Comment SPAS-PC00130-655 regarding information on air taxi operations included in the 2009 Design Day Flight Schedule (DDFS).

SPAS-PC00130-657

Comment:

3. Where did Ricondo obtain data for the average number of Cargo flights? Was this number based on a 2009 annual average or an August 2009 monthly average or actual flight data?

Response:

The number of cargo operations included in the 2009 Design Day Flight Schedule (DDFS) was based on an analysis of the LAX radar flight data provided by LAWA's Environmental Services Division. Please refer to Response to Comment SPAS-PC00130-655 regarding the assumed number of cargo operations.

SPAS-PC00130-658

Comment:

4. How was the General Aviation daily average determined? Was this average derived from dividing the annual 16,797 operations by 365 to get a daily average of 58?

Response:

As discussed in the second paragraph of Section 3.2 and depicted in Table 5 in Appendix F-1 of the Preliminary LAX SPAS Report, the assumed daily number of general aviation (GA) operations in the 2009 Design Day Flight Schedule (DDFS) was derived by dividing the monthly number of GA

operations (i.e., 1,416 operations, by 31 days in the month August). The rounded result is therefore 46 daily GA operations.

SPAS-PC00130-659

Comment:

5. Where did Ricondo obtain data for the average number of Non-Scheduled Passenger flights? Was this number based on a 2009 annual average or an August 2009 monthly average or actual flight data?

Response:

The number of non-scheduled operations included in the 2009 Design Day Flight Schedule (DDFS) was based on an analysis of the LAX radar flight data provided by LAWA's Environmental Services Division. Please refer to Response to Comment SPAS-PC00130-655 regarding the assumed number of non-scheduled operations.

SPAS-PC00130-660

Comment:

6. For the Military daily average, was this average derived from dividing the annual 3,058 operations by 365 to get a daily average of 8?

Response:

As discussed in the second paragraph of Section 3.2 and depicted in Table 5 in Appendix F-1 of the Preliminary LAX SPAS Report, the assumed daily number of military operations in the 2009 Design Day Flight Schedule (DDFS) was derived by dividing the monthly number of military operations (i.e., 245 operations, by 31 days in the month August). The rounded result is therefore 8 daily military operations.

SPAS-PC00130-661

Comment:

Page 17- Table 7

1. It appears that the data in Table 6 is inconsistent with the data in Table 7 for Scheduled Passenger Operations. In Table 6, the number of operations is 1,438 and in Table 7 the total number of operations is 1,563. In Table 6, the figure 1,563 is a total for all operations (scheduled, cargo, military, etc.). What accounts for this difference?

Response:

Contrary to the suggestion in the comment, there is no inconsistency between Tables 6 and 7 in Appendix F-1 of the Preliminary LAX SPAS Report.

Table 6 on page 16 of Appendix F-1 summarizes the total number of daily operations included in the 2009 Design Day Flight Schedule (DDFS), between scheduled and non-scheduled operations. As presented in Table 6, the total number of daily operations in the 2009 DDFS is 1,563 operations.

Table 7 on page 17 of Appendix F-1 provides consistent information. The 1,563 daily operations are broken down among domestic and international arrivals and departures.

SPAS-PC00130-662

Comment:

2. In Seats/Operation, the Domestic and International totals do not add up. Was there a factor applied to the total? Why was this not clearly explained?

Response:

The commentor is incorrect. It would not be arithmetically accurate to derive the average number of total seats per operation by adding the average numbers of domestic and international seats per operation. Doing so would result in an average of 320 seats per operation, compared to the correct number of 134 seats per operations.

The results in terms of average numbers of seats per operation provided in Table 7 in Appendix F-1 of the Preliminary LAX SPAS Report were computed as follows:

- Domestic seats/operations = number of domestic seats divided by the number of domestic operations
- International seats/operations = number of international seats divided by the number of international operations
- Total seats/operations = number of total seats divided by the number of total operations

Table 7 on page 17 of Appendix F-1 provided all data necessary to compute these averages.

SPAS-PC00130-663

Comment:

Page 18- Table 8
1. In the ADG I, ADG II and ADG III, propellers and regional jets are not broken out by manufacturer and model (e.g. Canadair CRJ-200, Embraer 140). Why were these not specified? Please list this information.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-664

Comment:

2. The Airbus A330 has been operated at LAX by Aer Lingus, Air Berlin (formerly LTU), Korean Air and Qantas. Why is the A330 is not listed in Table 8?

Response:

As discussed in Section 3.2 of Appendix F-1 of the Preliminary LAX SPAS Report, a published flight schedule for Tuesday, August 18, 2009 was acquired from the Official Airline Guide (OAG) and was used as a base schedule for scheduled-passenger activity in the 2009 Design Day Flight Schedule (DDFS).

Based on the OAG flight schedule, no scheduled-passenger Airbus 330 was scheduled on Tuesday, August 18, 2009.

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-665

Comment:

3. Are the aircraft listed in Table 8 solely passenger aircraft, or a combination of passenger, cargo combi aircraft (e.g. Boeing 747-400 Combi)? If cargo aircraft is included, then why are the Douglas DC-8 and Lockheed L-1011 not listed?

Response:

Aircraft listed in Table 8 in Appendix F-1 of the Preliminary LAX SPAS Report include both passenger and all-cargo aircraft in the 2009 Design Day Flight Schedule (DDFS).

As discussed in Section 3.2 of Appendix F-1 of the Preliminary LAX SPAS Report, flight radar data for Tuesday, August 18, 2009 was obtained and was used as a base schedule for non-scheduled activity. The DC-8 and Lockheed L-1011 were not included in the flight radar data for that day.

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-666

Comment:

Page 21- Table 9
1. Air Berlin operated LAX-Dusseldorf in 2009 with an Airbus A330-200. Air Berlin had acquired LTU in 2007. Why is it not listed under TBIT?

Response:

As discussed in Section 3.2 of Appendix F-1 of the Preliminary LAX SPAS Report, a published flight schedule for Tuesday, August 18, 2009 was acquired from the Official Airline Guide (OAG) and was used as a base schedule for scheduled-passenger activity in the 2009 Design Day Flight Schedule (DDFS).

Based on the OAG flight schedule, on Tuesday, August 18, 2009, no flight operated by Air Berlin to or from Dusseldorf (DUS) was recorded. Therefore, Air Berlin was not listed in Table 9 of Appendix F-1 of the Preliminary LAX SPAS Report, which meant to list the terminal assignments of airlines included in the 2009 DDFS, as opposed to all airlines that may operate out of Tom Bradley International Terminal at any time.

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-667

Comment:

Page 23- Departure and Arrival Times of Scheduled Activity
1. How does one know in the 2025 schedules presented what are an existing flight and a "new operation created"? Please provide a list of the 2009 flight routes including aircraft and the 2025 projection that shows aircraft changed for a route and also new routes added.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-668

Comment:

Page 24- Cargo Operations
1. Why were the 12 "orphan flights" not added to the 58 daily cargo flights for 2009? Could the 12 have been counted as half an operation and added into the daily total for a new total of 64 average daily cargo flights?

Response:

The comment relates to "orphan flights" in the cargo operations of the 2025 Design Day Flight Schedule (DDFS).

For the purposes of the SPAS Draft EIR analyses, an orphan flight refers to an aircraft that operates only once on the representative day. This might be the case under the following conditions:
- An aircraft arrives at LAX on the representative day and does not depart until the next day.
- An aircraft departs from LAX on the representative day but arrived on a previous day.

Please refer to Section 4.2 of the Preliminary LAX SPAS Report, under the "Cargo Operations" section, third paragraph, fourth sentence: "Out of 58, 12 flights were "orphan flights," with no departure or arrival flights on the same day." The 12 orphan flights are in fact 2009 flights and therefore counted toward the total of 58 cargo operations in the 2009 DDFS. For cargo flights, many flights are not daily flights (i.e., if they do not arrive and depart on the same day, there is not a corresponding flight from the day before or after with which to be paired).

Each orphan flight was counted as one operation. Because an operation is defined as either an arrival or a departure, the commentor's suggestion that the 12 orphan flights could be counted as halves of operations (resulting in 6 operations) would not be accurate. The 12 orphan flights are properly counted as 12 operations.

Also, please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-670

Comment:

2. Why does the Airbus A320 series (A318, A319, A320, A321 and A320neo [New Engine Option]) show only a modest increase in aircraft while the Boeing 737 series shows a greater increase? Please break out the Airbus A320 series by number of models by airline and route.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-671

Comment:

3. The Boeing 717 has been operated at LAX by AirTran and Midwest Airlines. Although AirTran has been acquired by Southwest and Midwest has been aquired by Frontier Airlines, the 717 remains in commercial service with Hawaiian and soon, Delta Airlines under a sub-lease with Southwest. Delta may operate the 717 into LAX. The Boeing 717 was built between 1999 and 2006 so it will still be a serviceable aircraft in 2025. Why is the 717 not listed in Table 12?

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-672

Comment:

4. Does this table account for retirement of older Boeing 737's such as first-generation -100 and -200 series as well as the second-generation -300, -400 and -500 series? How much of the total is 737 Next Generation aircraft, -600, -700, -800, -900 and -900ER series? How much is the new 737 MAX series? Please break out the Boeing 737 series by number of models by airline and route.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-673

Comment:

5. The Boeing 767 total dramatically increases from 77 in 2009 to 190 in 2025. What accounts for this increase in 767's when airlines are ordering 787's or smaller aircraft such as the 737 Next Generation or Airbus A321 as replacement aircraft for 767's? Please break out the Boeing 767 series by number of models by airline and route. Please differentiate between passenger and cargo aircraft.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-674

Comment:

6. On page 24, under cargo operations, an assumption is stated that the DC-10's will be replaced by 777F's. Why is the DC-10 still listed for 2025? Are these passenger or cargo aircraft or both? Please specify how many passenger and cargo and by airline.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-675

Comment:

7. The figure of 22 for the Airbus A340 series (A340-300, A340-500 and A340-600) appears to be too high. Production of the A340 has ceased and the A340-500 has been discarded by some airlines due to the high cost of operations. Only Singapore Airlines is operating an A340-500 into LAX once a day. What data is there is support the figure of 22?

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-676

Comment:

8. The figure of 65 appears too high for the Boeing 747 (assumed to be -400 series). How many of these are passenger aircraft and how many are cargo aircraft? Many passenger airlines (Japan Airlines and All Nippon Airways are good examples) have retired their 747's in favor of the Boeing 777-300ER. Please break out the Boeing 747 series by number of models by airline and route.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-677

Comment:

9. The figure of 27 for the Airbus A380 series appears to be too high. What data is there is support the figure of 27? A total of 12 to 16 daily A380 flights appear to be a more reasonable number. What data is there is support the figure of 27?

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-678

Comment:

10. The figure of 12 for the Boeing 747-8 appears to be too high. What data is there is support the figure of 12? How many are passenger aircraft and how many are cargo aircraft? A total of 10 daily 747-8 flights appear to be a more reasonable number. What data is there is support the figure of 12?

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-679

Comment:

11. Why is the Airbus A350 XWB not listed on Table 12? Several airlines operating at LAX have ordered this aircraft and likely will operate it into LAX. Airline which have ordered the A350 include Hawaiian Airlines, China Airlines, Aeroflot, Alitalia, Asiana, Avianca, Cathay Pacific, Thai Airways and United Airlines. Former LAX tenants such as Aer Lingus, Finnair and TAP Portugal have also ordered the A350. Other A350 customer airlines not presently serving LAX include Qatar Airways, TAM (Brazil) and Vietnam Airlines.

Response:

Please see Response to Comment SPAS-PC00130-643 regarding information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PC00130-680

Comment:

Page 28- Gating
1. In Section 4.3, it states, "Non-scheduled aircraft were not gated." If LAWA or Ricondo has data concerning non-scheduled flights, then where were these aircraft parked on the LAX airfield?

Response:

The commentor is referring to a statement contained in the introductory paragraph of Section 4.3 in Appendix F-1 of the Preliminary LAX SPAS Report. The focus of Section 4.3 was to describe the gating analysis of scheduled passenger operations assigned to LAX passenger gates (at the various terminals and commuter parking positions).

Non-scheduled passenger aircraft were not assigned to any passenger gates, but rather, through the SIMMOD simulation exercise, to parking positions on the south airfield near the fixed-base operator facilities.

SPAS-PC00130-681

Comment:

2. Under Section 4.3.1, it states that "the gating exercise focused on only Alternatives 1 through 4" and that estimating "performance assumptions and projections for Alternatives 5 through 7, as utilized in the aircraft noise and air quality analyses." How can the public and decision makers make an "apples-to-apples" comparison of gate when Alternatives 1 through 4 used one standard of gate assumptions and the other Alternatives 5 through 7 used a different set of gate assumptions? This appears to be a deficiency in the Draft EIR to fail to properly evaluate the alternatives. Who made the decision "taking into account contract scope and budget considerations" to apply different standards to evaluate gating between the different gate configurations? What did the LAWA/Ricondo contract state about how the gates in all of the Alternatives were to be evaluated? Were different alternatives to be given different treatments in the contract?

Response:

Section 4.3.1 on page 28 of the Preliminary LAX SPAS Report discusses gating of the 2025 Design Day Flight Schedule (DDFS). Gating refers to the exercise of assigning each scheduled passenger aircraft to passenger gates, either at the passenger terminals or at commuter parking positions.

The 2025 DDFS was thoroughly analyzed and gated to the terminal conditions under Alternatives 1 through 4, with Alternatives 1 and 2 sharing the same terminal layout and number of available gates.

However, as discussed in Section 4.3.1 of the Preliminary LAX SPAS Report, Alternatives 5, 6, and 7 were not gated.

The decision not to gate Alternatives 5, 6, and 7 was made in light of the overall similarities of terminal layout and number of available gates in Alternatives 5, 6, and 7, compared with Alternatives 1 through 4. Had the technical team gated Alternatives 5, 6, and 7, the results would have yielded similar results to those of Alternatives 1 and 2 because of the fact that: 1) the gate layout for each alternative would include 153 passenger gates; 2) the distribution of gates within the terminal area in each of the seven alternatives is similar; 3) the same gating assumptions and methodology would have been used (e.g., if an aircraft could not be gated at one concourse, the gating model would assign an alternate gate at an adjacent or nearby terminal concourse); and, 4) the methodology based on average number of turns per gate (described in Section 4.3.3 of the Preliminary LAX Draft SPAS Report) indicated opportunities for additional aircraft to be accommodated with reasonable turns per gate results. Given these similarities, it was possible to draw reasonable conclusions about Alternatives 5, 6, and 7 based on the results of gating Alternatives 1 through 4.

SPAS-PC00130-682

Comment:

3. In Section 4.3.3, Methodology and Results, "For programmatic planning purposes and because airline assignments throughout the LAX terminals in 2025 would be uncertain at the time this analysis was undertaken, the focus of this analysis was placed on maximizing the level of service and gate utilization." While many long-term airline leases will have expired by 2025, the focus of gating exercise makes no sense in relation to the reality of airline operations. No airline would want to have their operations spread across 9 different terminals at LAX. With a few exceptions (e.g. United at Terminals 6, 7 and 8), airlines at LAX historically have kept their operations in one terminal to maximize the use of their personnel and for customer convenience, including access to the airlines' respective VIP lounges for their premium passengers. Reference the "LAX Terminal Leases as of 2012" below. Since the airlines in Terminals 4 through 8 have made substantial investments in their facilities and due to consolidation in the airline industry (less airlines), why was the gating simulation not performed on the basis of the existing terminal assignments? For example, in Figure 46, it appears that a Southwest Airlines flight is operating out of Gate 70B to Houston Hobby Airport (HOU). United Airlines, Terminal 7 tenant, operates only to Houston Intercontinental Airport (IAH) from LAX. Southwest has operated out of Terminal 1.

LAX Terminal Leases as of 2012

Terminal	Airline	Lease expires	Comment
4	American	December 4, 2024	American Airlines can reject the lease while in reorganizing under Chapter 11 of the US Bankruptcy code
5	Delta	November 1,	
6	United	August 17, 2017	Assumption of Continental Airlines lease
6	Alaska	March 20, 2022	New 10 year lease
7 & 8	United	August 17, 2017	

Response:

This comment contains a long list of subject matters and statements related to the assumptions made in gating the 2025 DDFS, as described in Section 4.3 of Appendix F-1 of the Preliminary LAX SPAS Report.

As a summary of the comment, the following is a list of subject matters discussed by the commentor: expiration of long-term airline leases by 2025; reality of airline operations; potential spread of operations across nine terminals; historical airline operations in one terminal with the exception of United Airlines;

substantial investments in Terminals 4 through 8; consolidation of the airline industry; and LAX terminal leases as of 2012.

In fact, the commentor referred to three important subject matters: the expiration of long-term airline leases by 2025; the consolidation of the airline industry; and the fact that American Airlines could reject their Terminal 4 lease while reorganizing under Chapter 11 of the U.S. Bankruptcy Code. These three subject matters support and reinforce the idea that, over a 16-year period, uncertainties in the airline industry and at LAX are real, specifically in terms of terminal assignments, alliance partnerships, existence of legacy and low carrier operations is existent. Please see Section 2.2.2 of Appendix F-1 of the Preliminary LAX SPAS Report for a discussion of historical operations at LAX, as well as how aircraft operations have fluctuated over the past decade due, in part, to factors affecting the entire aviation industry.

Therefore, the 2025 DDFS was developed to be a representative schedule of future activity at LAX with representative aircraft in the fleet; industry average turn-around times; average seat configurations; average load factors; and average distribution of operations through the day. In other words, the fleet mix, aircraft operating characteristics, and passenger flows were developed for the airport as a whole, with specific airline characteristics averaged across operators currently serving LAX.

As it relates to gating, the allocation of this activity among the terminal and airfield facilities (existing and proposed) was also generalized in recognition of the uncertain nature of future terminal assignments and tenants in activity, as discussed above. As described in Section 4.3 of Appendix F-1 of the Preliminary LAX SPAS Report, the gating exercise focused on spreading aircraft throughout the terminals and commuter parking positions based on an assumed level of service (average number of turns per gate) that LAWA is planning to be able to provide in the future.

That is not, however, to suggest that airline operations would be spread among multiple terminals in 2025. The SPAS Draft EIR is not a document meant to dictate the future state of negotiated terminal leases and terminal assignments at LAX. One would still expect to see terminals at LAX being solely operated by a single airline or alliance partners in the future.

Contrary to the commentor's statement, the flight shown operating at Gate 70B in Figure 46 of the Preliminary LAX SPAS Report is not a Southwest Airlines flight. In fact, the operator of this flight is unknown. For programmatic planning purposes, this Boeing 737-700 with winglets (73W) assigned to Terminal 7 Gate 70B was gated the same way regardless of the airline operating the aircraft. It is a flight representative of a departure to a domestic destination, located in the Southwest region, departing LAX at morning peak time around 7 a.m. on an average day in the peak month at LAX.

Finally, the Preliminary LAX SPAS Report and SPAS Draft EIR analyses of facility development alternatives use reasonable assumptions about gating supported by substantial evidence to evaluate differences. An EIR is not required to guarantee that its project description or implementation assumptions will be 100 percent accurate in the future. (Village Laguna of Laguna Beach Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022,1030; Environmental Council of Sacramento v. City of Sacramento (2008) 142 Cal.App.4th 1018, 1036.)

SPAS-PC00130-683

Comment:

PDF pages 47 to 150- Appendix B- Ramp Charts

1. In the 2025 ramp charts (only Alternatives 1 through 4 were studied; Alternatives 5 through 7 were not studied), there are domestic flights listed at the Tom Bradley International Terminal (TBIT). From 1984 to 1987, World Airways had been the only domestic operator at TBIT. In the beginning of TBIT operations, some domestic World Airways passengers were sent to the US Customs Hall to claim their baggage. Will the new TBIT be set-up for domestic flights to avoid sending domestic passengers into the Customs Hall? Since the focus of TBIT is to be international flights, why were domestic flights included in the TBIT ramp simulations? Will domestic passengers get a good impression of LAX if they are sent to US Customs in error?

Response:

The comment is related to the ramp charts presented in Attachment B of Appendix F-1 of the Preliminary LAX SPAS Report. These ramp charts were attached for illustration purposes only to provide a sense of how busy each terminal is, and how aircraft have been spread among gates, based on the methodology presented in Section 4.3 of Appendix F-1 of the Preliminary LAX SPAS Report. They are however not meant to reflect specific assignments of flights in 2025, as described in Response to Comment SPAS-PC00130-682.

The commentor is incorrect in stating that "only Alternatives 1 through 4 were studied; Alternatives 5 through 7 were not studied." All seven of the airfield improvement alternatives were evaluated throughout the SPAS Draft EIR analysis. The four sets of ramp charts presented in Attachment B of Appendix F-1 of the Preliminary LAX SPAS Report depict the most notable differences in potential gating configurations within the range of airfield alternatives, with Figure A depicting 2009 baseline conditions. Figure B depicts the general gating configuration in 2025 with completion of the Bradley West Project, the Midfield Satellite Concourse, and improvements between Terminals 1 and 2 and between Terminals 2 and 3 (all of which would occur independent of SPAS), development of a new concourse at Terminal 3, demolition of the northern tip of Terminal 1, and addition of the new Concourse 0. Figure C depicts the general gating configuration in 2025 with completion of the Bradley West Project and the Midfield Satellite Concourse (both of which would occur independent of SPAS) and replacement of Terminals 1, 2, and 3 with a linear concourse. Figure D depicts the general gating configuration in 2025 with completion of the Bradley West Project, the Midfield Satellite Concourse, and improvements between Terminals 1 and 2 and between Terminals 2 and 3 (all of which would occur independent of SPAS), but no other improvements (i.e., no Yellow Light alternative improvements). Although Alternatives 5, 6, and 7 are not specifically called-out within the subject ramp charts, the gating configuration for those three alternatives would be generally comparable to that shown in Figure B for Alternatives 1 and 2. The basic similarities between the terminal configurations for Terminals 5, 6, and 7 and the terminal configurations for Terminals 1 and 2, can be seen in reviewing the alternatives development concepts presented in Chapter 1, Introduction and Executive Summary, of the SPAS Draft EIR (see Figures 1-5, 1-6, 1-9, 1-10, and 1-11).

The commentor is correct regarding a few domestic flights being gated at TBIT. These flights were assigned to TBIT because they were either matched with international flights (e.g., SAL-LAX-DFW at Gate 155 depicted in Figure 21 in Attachment B of Appendix F-1 of the Preliminary LAX SPAS Report) or because no domestic gate was available to accommodate them. However, these assignments do not reflect a LAWA policy decision to operate domestic flights at TBIT in 2025.

SPAS-PC00130-684

Comment:

2. In the 2025 ramp charts (see Figure 47 specifically), there are two Airbus A380 flights listed as Paris-Charles de Gaulle to Los Angeles and then and onward to London-Heathrow and vice versa (CDG-LAX-LHR and LHR-LAX-CDG) at Gates 156 and 154. There are other examples of these as well that seem extremely unrealistic- AKL-LAX-TPE, CDG-LAX-MUC, ZRH-LAX-CDG, BNE-LAX-LHR to list a few. There are no airlines presently operating those routes as described above. Airlines have operated certain flights on the same route and time for more than 50 years. The gating simulation does not appear to be realistic. Were these flight schedules used in the gating simulation derived from actual flight schedules? Were some of the flights invented? Were some of the aircraft choices for the routes arbitrarily chosen?
3. In the 2025 ramp charts (see Figure 50 specifically), there is a 747-400 flight listed at Gate MSC-4 at the Tom Bradley International Terminal (TBIT) with a routing of Dallas/Fort Worth-Los Angeles-Anchorage (DFW-LAX-ANC). This looks a like a cargo flight routing. No US passenger airline is operating a 747 on those routes. Were cargo flights listed at passenger gates as passenger flights on the gating charts? What are those flights?

Response:

Please refer to Response to Comment SPAS-PC00130-682 regarding why the assumptions and approach on 2025 Design Day Flight Schedule (DDFS) gating were reasonable and supported by substantial evidence.

In addition, the commentor is inquiring about city pairs (i.e., the arrival and departure cities served by a particular aircraft) depicted on the ramp charts in Attachment B of Appendix F-1 of the Preliminary LAX SPAS Report.

Matching of flights (i.e., assigning a departing flight to an arriving flight) was undertaken for the purposes of the airspace SIMMOD simulation. The methodology used to match the 2025 DDFS is similar to that described in Section 3.2 of Appendix F-1 of the Preliminary LAX SPAS Report for the 2009 DDFS. As explained in Response to Comment SPAS-PC00130-682, the 2025 DDFS was developed to be a generic flight schedule, independent from specific airlines. Because no airline information was available, unexpected city pairs resulted from the aircraft matching process. All arrivals and departures were sorted by aircraft type and time of day, and matched based on minimum gate turn times assumed for each aircraft.

The commentor also inquired if the 2025 DDFS was developed based on actual flight schedule, whether flights were invented and aircraft assigned arbitrarily to routes. As discussed in Section 4.2 of Appendix F-1 of the Preliminary LAX SPAS Report, the 2025 DDFS was based on an actual flight schedule, the 2009 DDFS. No flight was "invented," but rather new flights were created. The methodology to create new flights to contribute to the growth between 2009 and 2025 is also described in details in Section 4.2 of Appendix F-1 of the Preliminary LAX SPAS Report. All aircraft assigned to a newly created flight were selected based on industry standards of aircraft ranges and the ability for the origin or destination airport to accommodate such aircraft.

The commentor questioned a city pair DFW-LAX-ANC. Please refer to the third paragraph above which explains the matching of 2025 DDFS flights. This flight is not a cargo flight, and no cargo flight was accommodated at terminal passenger gates.

SPAS-PC00130-685

Comment:

Note that on Page 28- "....taking into account contract scope and budget considerations...the gating exercise focused on only Alternatives 1 through 4." "From a gating standing, the terminal and gate layouts assumed under SPAS Alternatives 1 and 2 are identical." Alternatives 5 through 7 were not analyzed in this section. WHERE IS THIS ANALYSIS COMPLETED? IF NOT, WHY NOT?

Response:

Please refer to Responses to Comments SPAS-PC00130-681 and SPAS-PC00130-683 regarding why gating assumptions made for Alternatives 5, 6, and 7 were reasonable and supported by substantial evidence.

Comment:

Appendix E -2 LAX SPECIFIC PLAN AMENDMENT STUDY REPORT Ground Transportation Questions

Question: General question covering ground transportation planning. If LAWA was working with SPAS to address this type of issues, why have we not seen any inputs from STV (the writer of this evaluation in the DEIR) prior to the release of the DEIR? Alternatively, why doesn't STV mention any of the suggestions made at SPAS meetings?

Response:

Many comments were received containing questions regarding the LAX Ground Transportation Study (GTS) Report prepared by STV, provided in Appendix E2-1 of the Preliminary LAX SPAS Report. This response to comment provides a detailed discussion of the purpose of the LAX GTS Report, its relation to the SPAS Draft EIR, and the differences between the analyses presented in each document. Where appropriate, information presented in both documents is referenced in Responses to Comments SPAS-PC00130-688 through SPAS-PC00130-724 below. Detailed information about the SPAS Concept Development Process is included in Chapter 5 of the Preliminary LAX SPAS Report.

The purpose of SPAS is to identify "Potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers (MAP) (the "Alternative Projects")," as stated in Section V.D.1 of the Stipulated Settlement.

During the early SPAS planning process, LAWA studied various options that would provide solutions to the problems that the Yellow Light Projects were designed to address based on input from the SPAS Advisory Committee and community meetings. The concept development process is detailed in Chapter 5 of the Preliminary LAX SPAS Report, which identifies all of the concepts considered throughout the SPAS process, including concepts suggested by Advisory Committee members. LAWA circulated an NOP for the preparation of a SPAS Draft EIR in 2008, which included these options. Subsequent to circulation of the 2008 SPAS NOP, LAWA reconsidered and refined the options for potential alternative designs, technologies, and configurations to be evaluated in the SPAS Report and SPAS EIR. Input received during the SPAS EIR scoping meetings in 2008 contributed to the refinement of the alternatives, as did completion of a number of studies, identified in Section 5.3.1 of the Preliminary LAX SPAS Report. LAWA issued a revised NOP in 2010 which identified refined airfield, terminal, and ground access options. (See Section 5.4 of the Preliminary LAX SPAS Report.) Based on these iterative refinements to the SPAS concepts, LAWA identified the alternatives that were carried forward into the SPAS Draft EIR for detailed environmental review. As provided in the LAX GTS Report, while the study considered several operational and physical improvements to the ground transportation system at LAX, not all the improvements were included in the SPAS alternatives. (See page 2 of Appendix E2-1 of the Preliminary LAX SPAS Report.) The designs and improvements that were incorporated into an alternative were subject to environmental and public review in the SPAS Draft EIR. The LAX GTS Report was conducted during the concept development phase and was intended to evaluate and screen potential alternative designs, technologies, and configurations specific to the ground access component of the LAX Master Plan (i.e., the "alternative ground access projects") which could most effectively provide solutions to the issues that the Yellow Light Projects were designed to address at the 78.9 MAP activity level, expected to occur by 2025. The LAX GTS considered planning options both within and outside of the CTA, consistent with SPAS Project Objective 2 (Improve the Ground Access System at LAX to Better Accommodate Airport-Related Traffic, Especially as Related to the Central Terminal Area), presented on page 2-2 in Section 2.2 of the SPAS Draft EIR.

There are not only differences in the intent of the LAX GTS Report and the SPAS Draft EIR, but also differences in technical assumptions and methodologies used. Additionally, the results presented in the LAX GTS Report were used only to assess potential operational and physical improvements to the ground access system, and as guidance in assessing if such improvements should be considered for inclusion in the SPAS alternatives. The results presented in the LAX GTS Report were not used in the SPAS analyses or comparisons; rather, separate independent analyses were conducted to evaluate the SPAS alternatives in the SPAS Draft EIR. The GTS report was used only to identify and evaluate potential improvements that could be incorporated in the SPAS alternatives, which were analyzed separately for environmental impacts in the SPAS Draft EIR. Particularly, information developed from the LAX GTS analyses were used to screen improvements for the initial ground access concepts, which were further narrowed and refined to become the ground access components of Alternatives 1, 2, 4, 8,

and 9. Alternatives 1, 2, 4, 8, and 9, like all the SPAS alternatives, were analyzed in detail throughout the SPAS Draft EIR.

Some key differences in technical assumptions and methodologies used in the two studies include the following: (1) Analyses presented in the LAX GTS Report used micro-simulation modeling to evaluate the CTA traffic conditions for a variety of operational and physical improvements, some of which were included in the SPAS Draft EIR because evaluations showed they could have a positive impact on traffic conditions within the CTA whereas others which were less effective or determined to be unfeasible were not included. In contrast, the SPAS Draft EIR used a spreadsheet modeling approach. (2) The future 78.9 MAP gated aircraft schedules differed between the two analyses because LAX GTS analyses were nearing completion when the SPAS 2025 gated schedules were released. (3) For the simulation modeling portion of the LAX GTS Report, the planned MSC Passenger Processor in the CTA was not included. The MSC Passenger Processor was not modeled as part of the LAX GTS Report because conceptual planning for this improvement had not yet been completed. This is a key distinction since the LAX GTS Report assumed all MSC passengers would be processed through the Tom Bradley International Terminal (TBIT), whereas the SPAS analysis assumed the MSC Passenger Processor would be operational at 78.9 MAP, and used to process the majority of the MSC passengers. MSC passengers not processed at the new MSC Passenger Processor were distributed throughout the existing terminals. (4) While the planned North Terminals Improvements (also referred to as Terminals 1.5 and 2.5) were included as part of the assumed 78.9 MAP condition in the SPAS alternatives, they were not included in the simulation modeling portion of the LAX GTS Report. However some portion of the unallocated curbside located between the existing Terminal 1 and Terminal 2 processor buildings was allocated to specific commercial vehicle modes under certain conditions. Similar to the MSC Central Processor, the proposed Terminal 1.5 and Terminal 2.5 were not modeled as part of the LAX GTS Report because conceptual planning for these improvements had not yet been completed. Further, with start of the SPAS analyses, the study team was not asked to undertake additional modeling as part of the LAX GTS to include the proposed Terminal 1.5, Terminal 2.5, and MSC Passenger Processor in the CTA because (a) they were not proposed SPAS improvements, (b) it was assumed these improvements, along with the redistribution of MSC passengers for processing from TBIT and the additional departures and arrivals level curbsides, would improve traffic conditions within the CTA, and (c) such analysis was to be conducted as part of the SPAS Draft EIR analysis.

While the discussion above details key factors which differentiate these two efforts, the work completed in the LAX GTS represents assumed future conditions which in many ways present a more conservative or worst case scenario of traffic conditions within the CTA at 78.9 MAP and are valid for the purpose of conducting screening level analyses of ground transportation options. Additionally, the detailed simulation of traffic operations within the CTA provided a valuable understanding of how many of the operational and physical improvements evaluated as part of the LAX GTS could be expected to impact traffic flow in the future.

The results of the STV study were shared with the Advisory Committee and were incorporated into the concepts included in the 2010 SPAS NOP and the SPAS Draft EIR. Specifically, the Advisory Committee was made aware of the STV study at a meeting held on July 1, 2010. The preliminary concepts developed by STV were shared with the Advisory Committee on August 16, 2010. (Presentation materials from these meetings are provided in Appendix D-2 of the Preliminary LAX SPAS Report.) These concepts were incorporated into the 2010 SPAS NOP as Ground Transportation Concepts A and B. Components of these concepts were later refined for inclusion in Alternatives 1, 2, 8, and 9, which were analyzed in the SPAS Draft EIR.

The method of analysis, in which the studies and information obtained in the GTS was used to refine the SPAS alternatives, complies with CEQA. An EIR need not consider every conceivable alternative to the project. (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1163.) An EIR must describe a "range of reasonable alternatives" to the project which would attain most of the basic objectives of the project and evaluate the merits of the alternatives. (CEQA Guidelines Section 15126.6(a).) The SPAS alternatives, which include the options proposed and evaluated in the GTS, represent a reasonable range of alternatives. Moreover, as seen throughout the SPAS Draft EIR, the SPAS alternatives were presented and evaluated in a manner that fosters informed decision-making and public participation.

SPAS-PC00130-688

Comment:

Page 11 The study team also examined the disposition of existing CTA real estate, including best-use scenarios for underutilized parcels (e.g., long-term parking areas), current and future use of parking facilities, increase in passenger activity at the TBIT curbside, and the long-term planning of an expansion of Terminal 1 (T1) to the east, referred to as Terminal 0, as part of the LAX specific plan Amendment study (SPAS), and the construction of terminal buildings between T1 and Terminal 2 (T2) and between T2 and Terminal 3 (T3), referred to as Terminal 1.5 and Terminal 2.5, respectively. Terminals 1.5 and 2.5 are LAX Master plan projects independent of SPAS.

Question: Appendix E-2 Page 2 identifies Terminals 1.5 and 2.5 as part of the LAX Master Plan projects "independent of SPAS." Where are these identified in the LAX Master Plan, Alt ID?

Response:

Please see Response to Comment SPAS-PC00130-378 regarding the reconfiguration of the North Terminal Complex, including Terminal 1.5 and Terminal 2.5, as part of the LAX Master Plan, a project that is independent of SPAS.

SPAS-PC00130-689

Comment:

Page 11 SPAS Support - Various options were developed to support the SPAS process, including location of the following: dedicated busway or APM and its associated stations; ConRAC; employee and public parking; redesigned entry roadways; and support facilities.

Question: Appendix E-2 This full design effort and review was never discussed with SPAS. In scanning this section the suggestions and discussions with SPAS Committee for traffic improvements doesn't seem to be identified or discussed. Where are they located and how were they used?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS, including consultation with the Advisory Committee regarding the analysis and its findings. As indicated in Response to Comment SPAS-PC00130-687, the Advisory Committee was specifically apprised of the fact that LAWA had contracted the firm STV to study ground transportation options for SPAS at a meeting held on July 1, 2010. See page 16 of the SPAS Advisory Committee Meeting presentation for July 1, 2010 provided in Appendix D-2 of the Preliminary LAX SPAS Report. The key elements of the ground transportation system improvement options that were formulated with input from STV were then presented to the SPAS Advisory Committee in a subsequent meeting on August 16, 2010, in advance of the publication of the 2010 SPAS NOP. See pages 6 through 12 of the SPAS Advisory Committee Meeting presentation for August 16, 2010 provided in Appendix D-2 of the Preliminary LAX SPAS Report. Two concepts were presented on August 16, 2010, Concept A and Concept B. Although these concepts were further refined through the SPAS process, they include the basic components of the ground access improvements incorporated in the SPAS alternatives, including a redesigned entry way; relocated commercial vehicle holding lot; parking/shuttle facility located between 96th and 98th Streets, and between Vicksburg Avenue and Airport Boulevard (later named the Intermodal Transportation Facility); surface parking and, under one of the options, a CONRAC in Manchester Square; connectivity to the planned Metro Light Rail Station at Century and Aviation Boulevards; and dedicated access (bus or APM) between Manchester Square and the CTA, with a stop at the ITF. These concepts are introduced on pages 5-78 and 5-79 and illustrated in Figures 5-43 and 5-44 of the Preliminary LAX SPAS Report. They were also included in the 2010 SPAS NOP, which was circulated for public review and comment between October 8, 2010 and November 29, 2010, and presented at public scoping meetings held on November 3 and November 6, 2010. Refinement of these concepts for inclusion in the alternatives evaluated in the SPAS Draft EIR is discussed on pages 5-106 and 5-107 of the Preliminary LAX SPAS Report. The final configurations included in the SPAS

Draft EIR alternatives are discussed on pages 5-110 and 5-111 of the Preliminary LAX SPAS Report, with details and illustrations provided in Chapter 6.

The LAX GTS Report by STV includes detailed information and analysis related to formulation and screening of the SPAS ground transportation system alternatives and also provides information and analysis related to other aspects of the circulation system within the CTA, including information related to future non-SPAS improvements such as the future Midfield Satellite Concourse Passenger Processor. As indicated in the Introduction of the GTS Report, the subject study provided a comprehensive look at the ground transportation system and conditions within the CTA and was initiated in parallel with, and in support of, SPAS. As noted above, the key elements of the ground transportation system alternatives related to SPAS as reflected in the GTS Report were, in fact, presented to the SPAS Advisory Committee.

As explained in the Response to Comment SPAS-PC00130-687, the technical analysis presented in the LAX GTS Report were not used in the SPAS analyses or comparisons; separate independent impact analyses were used to evaluate the SPAS alternatives. Information developed from the STV analysis was used to screen improvements for the initial ground access concepts, which were further narrowed to SPAS Alternatives 1, 2, 4, 8, and 9. Please also see Chapter 5 of the Preliminary LAX SPAS Report, and Appendices D-1 and D-2, for a discussion and documentation of the SPAS Concept Development process, including suggestions made by Advisory Committee members and members of the public throughout the process.

SPAS-PC00130-690

Comment:

Page 13-15 Traffic bottlenecks occur along the Arrivals roadway at peak travel times, particularly at T1 and on the approach to TBIT. Without improvements to the existing operation, these choke points will further deteriorate as traffic volumes increase. The VISSIM model was calibrated at 59.8 MAp, the LAX passenger activity level in 2008, which was the last full year of data available when STV began its study in 2009. passenger activity in the SPAS EIR baseline (i.e., 2010) was 59.1 MAP. The activity level in 2008 (i.e., 59.8 MAP) is sufficiently close (within one percent) to be considered representative of 2010 conditions. The model showed some queuing along West Way and minor to moderate congestion at various locations along the CTA roadways. Based on output from the model, recommendations independent of SPAS were made to address existing roadway capacity issues and improve traffic flow along the affected areas, including adding a traffic signal at West Way and World Way south and widening World Way across from TBIT between the driveway to p3 and Center Way to accommodate an additional lane of traffic. The latter recommendation was subsequently included as a component of the Cup project currently under construction.

Question: Appendix E-2 Page 15 Even though the MAP between 2009 and 2010 were comparable, weren't there some major changes (ie alliance consolidations and airline movements out of terminal 2 that could impact the model results? What changes were made to account for these changes in arrival times to ensure proper estimates of the peak hours?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. As noted therein, the LAX GTS Report was prepared prior to the SPAS Draft EIR to screen ground transportation concepts, and analyses prepared for the LAX GTS Report were not used in the SPAS Draft EIR.

The trip generation models developed for both LAX GTS Report and the SPAS Draft EIR were based on the existing conditions for the baseline of each study, and the models were calibrated to these conditions. Therefore, the baseline used in the respective studies represents the conditions existing at the time the study was conducted. A detailed discussion of baseline traffic conditions used in the SPAS Draft EIR is provided in Section 4.12.1.2.1 of the SPAS Draft EIR. As described therein, a number of factors were used to determine baseline traffic conditions, including arrivals and departures airport peak hours, on-airport traffic data, and roadway traffic volumes. (See Section 4.12.1.2.1 of the SPAS Draft EIR.) Please see Section 4.12.1.2.2 of the SPAS Draft EIR for a discussion of future (2025) traffic

conditions. As noted in Response to Comment SPAS-PC00130-687 (see discussion of key differences in assumptions and methodologies used in the LAX GTS compared to those used in the SPAS Draft EIR traffic analysis), each analysis used different future 78.9 million annual passengers (MAP) gated aircraft schedules because the GTS analysis was nearing completion when the SPAS 2025 gated schedule was released. Numerous factors are considered when developing a future gated aircraft schedule, including airline alliance information. To the extent possible, all information used to develop future gated aircraft schedules is the most up to date available when an analysis begins. When using future gated aircraft schedules to estimated future conditions, it should be noted that the estimate of future conditions is the best prediction available based on existing and historical information available at the time. While it is important to ensure that the most accurate and up to date information is included in the schedule development process, it is equally important to recognize that existing airline alliances may change in the future. It would be speculative to try and predict how these alliances might change by 2025.

SPAS-PC00130-691

Comment:

Page 15 The primary reason for this significant increase was the study's assumption that, at the 78.9 MAP activity level, passengers on flights gated at the MSC and TBIT would be processed through the TBIT Arrivals Hall, and that 41% of all arriving passengers would be processed through the TBIT compared to 19% with the 58.9 MAp level. This growth in passengers arriving on the TBIT curbside during the peak hour resulted in a 175% increase in vehicles trying to access the TBIT inner roadway curbsides. Commercial vehicle traffic, on the other hand, grew at a more moderate pace due to underlying efficiencies derived from high-occupancy vehicles (HoVs). note that an increase of 15 privately owned vehicle (poV) passengers would add 10 additional poVs into the network (assuming an occupancy of 1.5 passengers per poV), whereas, 15 rental car customers would warrant only one additional commercial vehicle (at 15 passengers per rental car shuttle). Based on the 175% (746-vehicle) increase in vehicles attempting to access the TBIT curbside with no accompanying facility improvements, the VISSIM simulation showed that vehicles block both the inner and outer roadway lanes from the TBIT curbsides back to the airport entry ramps from both Century and Sepulveda Boulevards. (UNDERLINE FOR EMPHASIS)

Question: Appendix E-2 Page 6 if the assumption is that TBIT and MSC are primarily the NLA sized gates which would be for international traffic, what is the justification for such an increase in international passengers? If they are international, is there a difference in percentage that are staying at LAX vs those who are on domestic flights? How is this accounted for in the model?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

As part of the on-airport traffic analyses for the LAX GTS Report, the STV analyses assumed that all future MSC passengers would be processed through TBIT gates. At the time the GTS was started, definitive concept plans had not been developed for how or where MSC passenger processing would take place. (See page 70 of Appendix E2-1 of the Preliminary LAX SPAS Report.) The STV analyses assumed all future MSC passengers would be processed through TBIT gates to produce a conservative or worst case assessment of the impacts from the airport's growth and development of the MSC on the CTA ground transportation facilities. Thus, the GTS analysis is based upon the assumption that implementation of the MSC would create an increase in vehicles trying to access TBIT. The study does not say that there will be an increase in international passengers, only that the number of vehicles attempting to access TBIT will increase, due to the fact that passengers arriving at the MSC would be processed at TBIT. (See page 6-7 of Appendix E2-1 of the Preliminary LAX SPAS Report.)

There is a difference in the percentage of international passengers whose trip terminates at LAX compared to passengers arriving on domestic flights. Passengers traveling through LAX who use the curbside are either Origin or Destination (O&D) passengers. These are the passengers of interest in the ground transportation analyses as these passengers generate vehicle trips on both levels of the CTA roadways, whereas most connecting passengers have little or no impact on roadway conditions.

This difference is included in the trip generation models for both analyses by applying separate O&D percentages to international and domestic flights as estimated in the gated flight schedule.

SPAS-PC00130-692

Comment:

Page 16 The modeling revealed that if the curbsides are reversed, the overall congestion levels dropped significantly. The outer curbsides operated with some congestion but with significant improvement over the existing operation. on the inner curbsides, the commercial vehicles operated with a reasonable Los, although the change in congestion levels before and after the reversal of the curbside operations have not been quantified.

Question: Appendix E-2 Page 7 Talks about changes in LOC without quantification. Since SPAS was supposed to address the issues resolved by the yellow light projects, was there a quantification of the amount of curb space required or a specific estimate of the number of cars that must be handled identified so that options could be directly compared? If not, why not? If yes, where is this identified?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. As noted in Response to Comment SPAS-PC00130-687, the modeling efforts undertaken as part of the LAX GTS were intended to screen possible ground transportation concepts prior to evaluating them as part of SPAS. The LAX GTS and SPAS Draft EIR did not directly compare analyses of various ground transportation concepts for the reasons noted in the Response to Comment SPAS-PC00130-687. Also as noted in the LAX GTS, modeling activities were suspended before the post processing of model outputs were completed for quantitative analyses. (See page 70 of Appendix E2-1 of the Preliminary LAX SPAS Report.) Visual comparisons of the model's simulation of traffic operations within the CTA under a wide variety of ground transportation concepts, including reversing the Arrivals level curbsides, showed promising results which were not fully complete before the suspension of modeling activities.

Additionally, as stated in the Response to Comment SPAS-PC00130-687, the work completed in the LAX GTS represents assumed future conditions which in many ways should present a more conservative or worst case scenario of traffic conditions within the CTA at 78.9 MAP and are valid for the purpose of conducting screening level analyses of ground transportation options. Additionally, the detailed simulation of traffic operations within the CTA provided a valuable understanding of how many of the operational and physical improvements evaluated as part of the LAX GTS could be expected to impact traffic flow in the future.

SPAS-PC00130-693

Comment:

Page 16 Reprogramming Arrivals Curbside Operations
This section describes one of the planning initiatives, the reconfiguration of the Arrivals curbsides, that would dramatically change vehicular and passenger circulation and improve Los. The study team developed three options (options 1, 2, and 3) for reprogramming the inner and outer curbsides of the Arrivals level; bus traffic is relocated to the inner curbsides along with taxis, and private vehicles are relocated to the outer curbside. A fourth option...

Question: Appendix e-2 page 7 Discusses the arrivals reprogramming options from inner to outer locations for commercial vehicles. This was actually done during 2011 for at least a short time with the Lot C buses. What were the results and how did it correlate to the model results?

Response:

The commenter states the Lot C buses were moved from the arrivals level outer curbside to the inner curbside for a short period of time during 2011. LAWA is not aware of such an operational change

having ever been implemented, even on a temporary basis, at LAX, and the commentor presents no evidence in support of this statement.

SPAS-PC00130-694

Comment:

Page 18 under option 1, pedestrian crosswalks are consolidated at a limited number of signalized crossing locations to optimize bus and taxi frontage along the terminal curbs and to facilitate safe pedestrian circulation between the terminals and the relocated private vehicle pick-up areas within the parking structures. Architectural barriers would be added to the curbsides for directing passengers through reconfigured, signalized crosswalks. A new wayfinding program would be introduced to guide passengers to relocated pick-up areas. A future ApM right-of-way along the frontages of the parking structures is also incorporated to work in tandem with the proposed private vehicle pick-up areas (Figure 8).

Question: Appendix E-2 page 9 talks about option 1 which has drop offs in the parking lots and a reduction of the number of pedestrian cross walks. Although this is, in principle, a good idea to enhance traffic flow how much further must people walk to get across? Is there an ADA requirement for max walking distance? Does this meet that? How will it be accommodated?

Other options discussed early on was to substantially reduce the number of walkway options and to provide for passenger bridges to avoid stoppage of traffic. How was this included in the study? How does it compare to the option discussed?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

Currently there is no specific Americans with Disabilities (ADA) requirement for maximum walking distances from terminal buildings to passenger pick up curbsides or parking spaces.

However, the ADA 2010 standards, Section 208.3 Location, Subsection 208.3.1 require the following: "Parking spaces complying with 502 that serve a particular building or facility shall be located on the shortest accessible route from parking to an entrance complying with 206.4. Where parking serves more than one accessible entrance, parking spaces complying with 502 shall be dispersed and located on the shortest accessible route to the accessible entrances. In parking facilities that do not serve a particular building or facility, parking spaces complying with 502 shall be located on the shortest accessible route to an accessible pedestrian entrance of the parking facility."

As noted in Response to Comment SPAS-PC00130-687, the intent of the LAX GTS was to screen potential ground transportation concepts to determine if they would have a positive impact on CTA traffic conditions and would provide solutions to the problems the Yellow Light Projects were designed to address. However, as also discussed in Response to Comment SPAS-PC00130-687, not all simulations of all concepts were completed as part of the GTS. The option to grade-separate pedestrian movements between the terminal buildings and the public parking structures, plus the removal of some traffic signals were considered and evaluated at a conceptual level but were not simulated. These conceptual level analyses showed that, under certain conditions, the elimination of traffic signals could improve traffic conditions. Grade separation of pedestrian movements between the terminal buildings and the public parking structures in all cases would improve pedestrian safety.

SPAS-PC00130-695

Comment:

Page 18 Traffic Simulation Analysis & Findings simulation modeling was performed to determine the advantages and disadvantages of option 1. in summary, relocation of the commercial shuttles to the inner roadway can create an additional lane on World Way; however, the need for additional right-of-way to integrate a future ApM alignment along the parking structures may eliminate that advantage.

Question: Appendix E-2 Page 9 addresses the elimination of parking spaces on the ground level. Are the structures assumed to be full at most times so that revenue is lost? With all of the rework necessary on the upper roadway, passenger bridges, and parking structures how difficult would a reconfiguration be? Was this considered? Why not?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The LAX GTS Report did not consider impacts of potential revenue lost due to the various concepts tested. Constructability of the concepts tested in the LAX GTS were considered at a program level of planning to assess whether the improvements being tested could be built without significant impact to normal ground transportation operations within the CTA. Such program level analysis is appropriate at this stage of the planning process.

SPAS-PC00130-696

Comment:

Page 19 - parking structures may require modifications to accept the APM station and support structure requires new passenger wayfinding and passenger education through pamphlets and other outreach materials

Question: Appendix E-2 general- several of the options call for rebuilding Terminal three and moving it west. How does this change the traffic curb usage?

Was a third level roadway for commercial and emergency vehicles considered? Why not? What were the results of such a change?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The LAX GTS Report did not analyze rebuilding Terminal 3 west of its current location. However, relocation of Terminal 3 as part of the SPAS alternatives was considered in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-150 regarding the potential addition of a third level roadway.

SPAS-PC00130-697

Comment:

Page 20 Figure 14 provides a section of the proposed inner and outer roadway lanes with the outer curbside island widened from 10 feet to 20 feet to accommodate increased pedestrian activity. Widening the outer curbside towards the parking structures would result in the loss of a travel lane on the outer roadway of World Way. However, the reversed curbside operation also eliminates the need for many of the vehicle slip ramps which currently allow private vehicles and taxis to move between the inner and outer roadways. The closure of these...

Question: Appendix E-2 page 11. Has any option for curb space increase been considered? If vehicles are handled at an angle two deep, for instance, and then able to pull out? When congestion increases drop off gets to be very difficult. What provision for drop off protection of pedestrians is provided for those getting out of cars facing the circulating traffic?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

The LAX GTS Report did consider alternatives for increasing curbside length, such as providing additional curbside within the garages, using under-utilized surface space with the CTA, and reversing

the arrivals level curbsides. Reversing the arrivals level inner and outer curbside operation by moving commercial vehicle activity to the inner roadway and all private vehicle loading to outer curbside would increase the length of available curbside on the outer curbside by eliminating most existing slip ramps connecting the inner and outer roadways. Angled loading or unloading spaces where vehicles would pull-in to a space, perform their loading or unloading operation, and then either pull-through or back-out of the space were not simulated, as this type of operation would reduce capacity and increase congestion along the curbside roadways on either level. No new provisions were considered for passengers exiting vehicles on the left side on the departures level curbsides. The designated lane for unloading passengers along the departures level curbside is approximately 20-feet wide, which is intended to provide sufficient space for passenger unloading bypassing vehicles. Passengers should refrain from exiting vehicles on the left side; however, in those cases where it is necessary, caution should be taken.

SPAS-PC00130-698

Comment:

Page 23 the p3 and p4 structures and the TBIT was modeled to assess the impact on traffic flow, specific grade-separation concepts have not been developed as part of this study. should a grade-separated pedestrian crossing be constructed at the TBIT, pedestrians currently required to cross the departures level roadway at grade would likely also use the grade-separated crossing, thereby allowing the departure level signals to be removed.

Question: When will these grade separations issues be addressed? Doesn't this have a major impact on traffic flow? The document states that grade-separated concepts were not developed as part of this study. Why not? Isn't passenger convenience a priority?

Response:

As discussed previously, the GTS was used to evaluate possible modifications for inclusion, and further analysis, into the SPAS alternatives. Please see Response to Comment SPAS-PC00130-687 for a discussion of the GTS and how it relates to the SPAS Draft EIR. The content of this comment is similar to comment SPAS-PC00130-694. Please see Response to Comment SPAS-PC00130-694 regarding advantages of grade-separating pedestrian and vehicle movements.

Please see the SPAS Draft EIR for an analysis of the modifications and improvements designed to facilitate transportation and circulation at LAX. All grade-separation modifications designed to improve traffic flow are discussed in Section 4.12.2 of the SPAS Draft EIR.

SPAS-PC00130-699

Comment:

Page 27 The 30-foot-wide inner roadway is currently striped with two travel lanes and one passenger loading lane. While it may be possible to operate large commercial vehicles such as a 40-foot bus in three lanes of the inner roadway along World Way north from T1 to T3, and along World Way south from T4 to T7, the 40-foot design vehicle would not be able to operate safely in three lanes as the inner roadway turns 90 degrees between T3 and the TBIT and between the TBIT and T4. Therefore, the study team proposed a roadway striping alternative for the curved sections of the Arrivals level inner roadway, shown in Figure 23.

Question: Appendix E-2 The analysis indicates the difficulties in handling multiple 40' buses. How long are the articulated buses and who many can be handled? Was this part of the assessment that assumes no APM but a busway instead? Where is this addressed?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The LAX GTS Report does not make reference to, or propose the use of, articulated buses in the CTA, nor does the SPAS Draft EIR. As noted in Response to Comment SPAS-

PC00130-687, the intent of the LAX GTS was to screen ground transportation concepts to evaluate their potential to improve landside capacity within the CTA.

As described previously, the LAX GTS Report conducted analyses that were separate from those in the SPAS Draft EIR. For an analysis of the alternatives that include a busway, please see Section 4.12.1 of the SPAS Draft EIR.

SPAS-PC00130-700

Comment:

Page 28 Figure 22 - Plan for installation of 2-phase signal and jug handle at intersection of Sky Way and World Way North

Question: Appendix E-2 page 19. Figure 22 shows the current intersection and a 2 phase signal, but virtually all of the options contain a Terminal zero which changes this intersection completely. Where are the results of this changed CTA access analyzed?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The LAX GTS Report was intended to screen ground transportation concepts to evaluate their potential to improve landside capacity within the CTA. The intent of the 2-phase signal and jig handle design at the intersection of Sky Way and World Way North was to evaluate an option for improving the northbound left-turn movement for buses in the event Terminal 0 was not built (see page 20 of the LAX GTS Report).

SPAS-PC00130-701

Comment:

Page 29 Figure 24 - Proposed location of Concourse 0 with realigned Taxilane D7 and ADG VI separation standards

Question: Appendix E-2 page 20 shows terminal 0 with four ADG IV gates. When all other ADG IV are planned to TBIT and MSC why have four of these gates instead of more mid-sized ones? Has LAWA fixed upon a design for T0? if so, what is it? How many gates? From the diagram it shows very little for passenger processing. Is this assumed to occur in T1?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

The planning level concept layout for Terminal 0 is depicted in Figure 24 of the LAX GTS Report, which shows four Aircraft Design Group (ADG) IV aircraft gated with ADG IV taxilane separation standards.

This gate layout was subsequently refined. Please see Figures B through D in Attachment A of Appendix F-1 of the Preliminary LAX SPAS Report for an illustration of the gate layouts assumed in the SPAS Draft EIR. As shown in Figure B, TBIT gates are primarily intended for ADG V and VI aircraft. As depicted, the MSC would accommodate a range of aircraft sizes, between ADG IV and VI. Figure B in Appendix F-1 provides a conceptual gate layout at Terminal 0 with ADG III and IV gates.

At this time, LAWA is only in the preliminary stages of planning for a potential Terminal 0. The SPAS Draft EIR is a programmatic document, appropriate for this level of planning. No detailing planning or programing for Terminal 0 have been undertaken and will not occur unless a SPAS alternative is approved that includes this terminal and the project is proposed for implementation, at which time detailed, project-level planning, engineering design, and environmental review will be undertaken. As noted on page 4-1099 in Section 4.12.1.6.2 of the SPAS Draft EIR, "while it is presently assumed that all Terminal 0 passengers would be processed at Terminal 1 or Terminal 1.5, changes in security

processing or other processing requirements may necessitate those functions be incorporated into Terminal 0."

SPAS-PC00130-702

Comment:

Page 30 Option3-Tunnel under CTA Loop Roadway
This option looks to provide grade separation, i.e,. a tunnel, for the exiting sky Way traffc movement under World Way north. This allows the sky Way approach to shift to the eastern part of park one which provides a separate and enlarged T1 Arrivals curbside, common to the other options (Figure 27).

Question: Appendix E-2 has an option to tunnel under CTA Loop Roadway. How in the world is this even considered when the whole area around the CTA was so cluttered that the Central Utilities Plant utilidors were removed because it was impractical to bury them?

Response:

No response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

CTA access improvements, Option 3 -- Tunnel under CTA Loop Roadway described on page 21 of the LAX GTS Report, was determined to be infeasible due to the need to construct the roadway beneath Terminal 0, a reduction in the area available for future airside operations near Terminal 0, and the potential impacts to underground utilities. Therefore, this CTA access option was documented in the LAX GTS Report as one of the options that was preliminarily considered, but rejected for further detailed study.

SPAS-PC00130-703

Comment:

Page 33 - Summary of Options for realignment of Sky Way

Question: Appendix E-2 Table 3 talks about options for realignment of Sky Way bridge on 96th street.

Why has no option for exiting out of CTA from modified skyway been considered? Drop off in an area of Park One could be built and allow for moving sidewalk or other conveyance to terminals 0 and 1 without going through the CTA traffic and instead exiting to Sepulveda. Was this rejected? It was brought up in SPAS.

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

The LAX GTS Report did consider alternatives to exit traffic out of the CTA northbound via the proposed Sky Way realignment as presented in Figure 28 on page 23 of the LAX GTS Report, but it was determined this alignment was not feasible because it would have required a new, signalized intersection to be constructed to allow traffic exiting via the airport return roadway (east of the LAWA Administration Building) to cross inbound traffic from Sepulveda and Century Boulevards. Physical constraints caused by the alignment of the airport return roadway and the existing departures level roadway support columns limited available queuing area for vehicles (mainly shuttle buses) which would exit the airport via Sky Way to only a few vehicles per signal cycle. This would result in unacceptable backups on the return roadway and likely the primary airport exit, the intersection of Center Way and World Way South.

As indicated in Table 2-3 and discussed on page 2-55 of the SPAS Draft EIR, under Alternatives 1, 2, and 5 through 9, the existing commercial vehicle holding lot would be relocated to the eastern portion of the Park One facility. Due to the importance of this site for the efficient operation of future commercial vehicle operations within the CTA, neither the LAX GTS nor the SPAS Draft EIR considered the development of a new passenger drop off curb in the portion of the existing Park One lot located east of a realigned Sky Way.

An EIR need not consider every conceivable alternative to the project. (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1163; State CEQA Guidelines Section 15126.6(a).) CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.) The EIR was prepared with a degree of analysis sufficient to provide the decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines 15151.)

SPAS-PC00130-704

Comment:

Page 24 ...were developed: (1) a processor that handled departures only, and (2) a full-service processor. This facility would be implemented independent SPAS; however, it was assumed to be in place in the future background (i.e., 2025) condition in the SPAS EIR.

Question: Appendix E-2 page 24 states that a full service processor is assumed to be in place but independent of SPAS. Is this required to support SPAS MSC? How much cost will this be? How will LAWA pay for it along with everything else they plan?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

As noted in that response, the LAX GTS did not include the MSC Passenger Processor in the simulation evaluations of the CTA roadways, while the SPAS Draft EIR included it as a non-SPAS improvement project (see Section 5.3.2 of the SPAS Draft EIR and Section 4.3.1 of Appendix F-1 of the Preliminary LAX SPAS Report). As indicated on page 5-18 of the SPAS Draft EIR, the MSC Passenger Processor is an integral component of the MSC program. Please also see Section 4.12.1.6.2 of the SPAS Draft EIR for a discussion of the Midfield Satellite Concourse Passenger Processor. As provided in that section, the MSC Passenger Processor is designed to support the processing requirements of passengers using the future MSC. Please also see Responses to Comments SPAS-AL00007-44 and SPAS-PC00130-218 regarding the evaluation of the MSC in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, which include project costs. Please also see Response to Comment SPAS-PC00096-2 regarding funding for the SPAS improvements.

SPAS-PC00130-705

Comment:

Page 37 Alternative 2 - MSC Dual-Level Processor
Alternative 2 expands the MsC processor to incorporate an Arrivals function in addition to departures. Adding an Arrivals level component in the processor would increase the size of the facility and potentially preclude the reversal of the Arrivals roadway curbs, described in reprogrammed Curbsides Alternatives 3 and 4, by limiting or removing curbside locations which are proposed to be in the same footprint as the processor. The expanded processor may also require removing p2B and p5, in addition to impacting both levels of West Way as well as Center Way between World Way and West Way.

Question: Appendix E-2 page 28. Alternative 2 of MSC Dual level processor points out that reversal of the curbs is precluded. If the previous section already stated that without doing the reversal the traffic

could back up to Century why is this even shown as a consideration? If this is still possible, is there another mitigation that could fix some of this traffic? What is it? Alternative 3 follows as a "solution" but one has to ask if this is included in the total costs of the Master Plan and where is any of this included in the approved Alt D?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The commentor is incorrect in maintaining that the GTS Report states that the MSC dual-level processor would preclude the reversal of the curb. Rather, the text actually states that "[a]dding an Arrivals level component in the Processor would increases the size of the facility and potentially preclude the reversal of the Arrivals level roadway curbs…" Moreover, the text that follows this statement provides an option to mitigate this concern, concluding that "[p]reliminary analysis indicates that this arrangement may enable the proposal to reverse the Arrivals curbsides."

The conceptual layout of the MSC Passenger Processor roads and curbsides assumed in the SPAS Draft EIR is described on page 4-1094 in Section 4.12.1.6.2 of that document. Please also see Response to Comment SPAS-AL00007-44 regarding the evaluation of the MSC in the SPAS Draft EIR. The construction of passenger processing facilities in the CTA, in the area currently occupied by parking garages, is an approved component of the LAX Master Plan and is not a Yellow Light Project. The road and curbside changes associated with MSC Passenger Processor are reasonably foreseeable improvements that LAWA would implement as part of the MSC Passenger Processor, prior to full implementation of the LAX Master Plan, which, if implemented as approved, would close the CTA to private vehicle access.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including project costs.

SPAS-PC00130-706

Comment:

Page 40 Intermodal Connectivity
Shuttle/Bus Service Strategies shuttle and bus service strategies to reduce vehicular volumes in the CTA were studied. under these strategies, certain shuttles would no longer be allowed to operate in the CTA as they do currently; rather, these vehicles would drop off and pick up passengers at a facility constructed outside of the CTA. Consolidated buses would transport passengers between this facility and the CTA. For LAWA to accommodate any consolidated bus operation, a convenient facility beyond the CTA would need to be provided to allow for passengers to transfer between individual commercial vehicle modes/services and a consolidated busing operation. The facility should be located in proximity to the CTA to provide convenient shuttle access

Question: Appendix E-2 page 31 talks about an Intermodal connectivity center in which commercial vehicles will stop so that passengers can transfer to a consolidated bus. How does LAWA feel that this will improve service by making people change conveyances to get into the CTA? The section noted states that this will include ticketing. Will it include baggage drop off? What percentage of the travelers are expected to use this facility? Does LAWA expect all from the ConRAC to use this?

Response:

The construction of an ITF with a grade-separated access for either a LAWA-operated consolidated busing operation or an Automated People Mover (APM) would provide improved time-certain travel between the ITF and the CTA. An ITF would also provide a location for specific commercial vehicle modes to consolidate passengers from individual shuttles of different modes, which are often under-occupied, onto a common LAX-branded shuttle connecting the ITF with the CTA, thereby reducing the number of shuttles accessing the CTA. Also, including a kiss-and-ride curbside at the ITF for drivers/passengers accessing or departing LAX in a private vehicle who wish to avoid roadway congestion entering and exiting the CTA would reduce the number of private vehicles within the CTA.

Please also see Response to Comment SPAS-PC00130-139 regarding the impacts of consolidated specific commercial vehicle operations and offering a kiss-and-ride curb at the ITF.

The LAX GTS Report does suggest that passenger ticketing could be included within the ITF. The assumption is that this ticketing would be for passengers with carry-on bags only; passengers needing to check baggage would be expected to proceed to their appropriate terminal within the CTA. At the current level of planning, the specific design and functions of the ITF have not been finalized.

Section 4.12.1.6 of the SPAS Draft EIR defines what transportation modes were assumed to be assigned to the ITF for SPAS Alternatives 1, 2, 4, 8 and 9 (beginning on page 4-1091 under the subheading "Ground Transportation"). Table 4.12.1-15 on page 4-1103 provides a detailed breakdown of the peak hour percentage of passengers expected to use each transportation mode and specifically defines the percentage of passengers expect to use an elevated busway in Alternatives 1, 2, and 8, and an APM in Alternative 9.

Neither the LAX GTS Report nor the SPAS Draft EIR assumed that rental car companies would consolidate their passengers onto LAWA-operated buses at the ITF. SPAS Alternative 8, which includes a CONRAC at Manchester Square, assumes that rental car customers would ride a consolidated LAWA-operated bus between the CONRAC and the CTA. Under SPAS Alternatives 3 and 9, rental car customers would be consolidated on an APM to transfer between the CONRAC and the CTA.

SPAS-PC00130-707

Comment:

Page 45 Figure 50 - Bird's-eye view of Manchester Square Transit Hub illustrating multimodal integration with airport program

Question: Appendix E-2 page 36 illustration figures 49,50,51 of the transit stations would be much more easily recognized if an orientation and approximate scale were provided. What is the relative position to the CTA and 405 freeway?

Response:

As noted on page 35 of the LAX GTS Report, the Metro Crenshaw/LAX Transit Corridor Project will extend Metro's existing Exposition Line from the intersection of Crenshaw Boulevard and Exposition Boulevard to a new light rail station at Aviation and Century Boulevards, across the street from Manchester Square. Figures 49, 50, and 51 of the LAX GTS Report, show the proposed Transit Hub at Manchester Square located in the northwestern quadrant of the Aviation Boulevard and Century Boulevard intersection. The relationship of the Manchester Square improvements to the planned transit line and station are illustrated in later figures of the LAX GTS Report, including Figures 62 through 77.

The proposed transit hub at Manchester Square is located approximately 0.6 mile west of Interstate 405 and approximately 1.2 miles east of the CTA.

SPAS-PC00130-708

Comment:

Page 46: The following summarize the advantages and disadvantages of a Transit Hub at Manchester square. Pros:
- direct connectivity with the Metro Crenshaw/LAX and Green Line light rail transit corridors
- enhanced levels of service for passengers coming to the airport in private vehicles seeking remote weather protected parking with seamless transfer to airport consolidated service
- potential for economic development, if Manchester square is developed as an airport hub

Cons:
- potentially requires significant capital investment in terms of property acquisition and infrastructure.

Question: Appendix E-2 page 37 The only Con listed for a Manchester Square transit hub is property acquisition. Doesn't LAWA already own this property?

Response:

As discussed on pages 4-667 and 4-668 in Section 4.9.3.3 of the SPAS Draft EIR, while LAWA does own many of the individual properties in Manchester Square, they do not currently own all of the properties.

SPAS-PC00130-709

Comment:

Page 48 Figure 52 Inbound Departures roadway to accommodate busway, Option 1

Question: Appendix E-2 Busway figures show an elevated structure over Sepulveda. When 24L is extended east where does the RPZ land? Is this structure in it or must a waiver be provided?

Response:

With the proposed extension of Runway 6R/24L to the east, as depicted in Figure 2-1 of Chapter 2 of the SPAS Draft EIR, the Runway Protection Zone (RPZ) would also shift east as illustrated in Figure 4.7.2-7 of the SPAS Draft EIR.

The elevated bridge structure spanning Sepulveda Boulevard depicted in Figure 52 on page 39 of the LAX GTS Report is located outside of the proposed Runway 6R/24L RPZs.

SPAS-PC00130-710

Comment:

Page 54 Specific Plan Amendment Study (SPAS) Support
The SPAS process is being undertaken to identify and develop potential alternative designs, technologies, and configurations for the LAX Master plan program that would provide solutions to the problems that the yellow Light projects were designed to address consistent with a practical capacity of 78.9 MAP. The main ground transportation features of the approved LAX Master plan Alternative d include the following:

Question: Appendix E-2 page 54 states that for SPAS alternative designs are being identified which provide solutions to the problems... What are the target metrics for items being solved? What are the problems being solved?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

As discussed on page 4-1043 in Section 4.12.1.1 of the SPAS Draft EIR, the purpose of the on-airport transportation analyses presented in the SPAS Draft EIR was to estimate the SPAS-related impacts on the operation of the CTA ground transportation facilities, pursuant to the requirements of CEQA.

The problems the Yellow Light Projects were designed to address, and to which the SPAS alternatives would provide solutions, are identified in Section 2.3.1 of the SPAS Draft EIR and in Chapter 3 of the Preliminary LAX SPAS Report.

SPAS-PC00130-711

Comment:

Page 65 Alternative 8, illustrated in Figure76, is characterized by the following features.
Ground Transportation

- ConRAC, located in a portion of Manchester square, would include a customer service area and approximately 8,271 spaces for ready/return vehicles.
- All other ground transportation improvements identified in Alternatives 1 and 2 apply to this alternative

Question: The report goes on to say, "Alternative 9, illustrated in Figure 77, is comparable to Alternative 8, except that an APM system is proposed between Manchester square and the CTA, with an intermediate stop at the ITF." This is inconsistent with the descriptions in the DEIR summary and other locations. What IS correct? What was used to reach conclusions of impact?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

The commentor does not identify any specific inconsistencies in the descriptions of Alternatives 8 and 9 between the LAX GTS Report and the SPAS Draft EIR summary and other locations. The descriptions of Alternatives 8 and 9 provided in Section 2.3.1.8 and 2.3.1.9 in Chapter 2 and on pages 4-1092 and 4-1093 in Section 4.12.1.6.1 of the SPAS Draft EIR are correct and consistent with the descriptions of Alternatives 8 and 9 presented on page 56 and depicted in Figures 76 and 77 of the LAX GTS Report. After careful review of the SPAS Draft EIR, no inconsistencies between these descriptions of the Alternatives 8 and 9 ground transportation components were found. In the event an error was overlooked, the Alternative 8 and 9 descriptions provided in the SPAS Draft EIR supersede those presented in the LAX GTS Report.

The thresholds of significance used to determine whether on-airport transportation impacts were significant are described in detail in Section 4.12.1.4 of the SPAS Draft EIR.

SPAS-PC00130-712

Comment:

Page 69 The roadway modeling efforts were suspended on or about June 2010 while a new future 78.9 MAP gated (non-airline specific) flight schedule was reviewed and approved by LAWA. due to delays experienced by the team responsible for completing this non-airline specific flight schedule, and the subsequent kickoff of the SPAS process which has redefined many of the key assumptions related to how the CTA terminals and roadways will function in the future, the refinement of landside modeling was discontinued, with the exception of some specific analyses provided in this study report.

Question: Ground transportation Appendix A page 69 App E2 states: "The roadway modeling efforts were suspended on or about June 2010 while a new future 78.9 MAP gated (non-airline specific) flight schedule was reviewed and approved by LAWA. due to delays experienced by the team responsible for completing this non-airline specific flight schedule, and the subsequent kickoff of the SPAS process which has redefined many of the key assumptions related to how the CTA terminals and roadways will function in the future, the refinement of landside modeling was discontinued, with the exception of some specific analyses provided in this study report."
Does this mean that LAWA is acknowledging that their model is inaccurate and not representative? What does it mean?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The statement to which the commentor refers does not state or imply that the modeling that was done as part of the LAX GTS Report was inaccurate or not representative. As explained in Response to Comment SPAS-PC00130-687, the purpose of the analyses conducted as part of the LAX GTS Report was to evaluate potential ground access concepts as part of the SPAS concept development process. The modeling and analysis that was done as part of the LAX GTS Report was valid for this purpose. As further explained in Response to Comment SPAS-PC00130-687, separate and independent modeling of on-airport transportation impacts was conducted for the SPAS Draft EIR.

SPAS-PC00130-713

Comment:

Page 69 The following field surveys were conducted to support the further development and refinement of the traffic models:
- Turning movement counts for intersections along Center Way
- Vehicle classification survey on the lower level at the entrance to the airport
- Vehicle dwell time survey at T1, T4, and T7
- Vehicle license plate survey at T1 and T7 Arrivals curbside

Question: Ground Eval Appendix E-2, Appendix A page 60 How were vehicle dwell times at T1. T4, and T7 conducted? Was a time recorded or were possible delay causes looked at and extrapolated? What times of day were used? What time of year? If, for instance, people are going to the east coast in winter there is likely more luggage.

Response:

Please see Response to Comment SPAS-PC00130-314 regarding the collection of vehicle dwell times conducted as part of SPAS.

The methodology used for the field surveys, including for vehicle dwell time at T1, T4, and T7, is provided on page 63 of Appendix E2-1 of the Preliminary LAX SPAS Report. As described in that section, the dates on which data were collected represented a typical busy day at the CTA.

SPAS-PC00130-714

Comment:

Page 70 Figure A-1 59.8 MAP and 78.9 MAP peak hour traffic volumes on the eastern end of the CTA

Question: Figure A-1 of Appendix E-2, page 70 Entry into the CTA is shown from two points (the bridge along T1 and Century) for a total of 3255 vehicles baseline and 3839 future. Why did vehicle entries increase by 18% while MAP increased by 32%?

Response:

As illustrated in Figure A-1 on page 61 of the LAX GTS Report, the inbound traffic volumes show the total baseline peak hour volume of 3,670 vehicles, with a future peak hour volume of 4,194 vehicles. This represents a 14.3 percent increase in peak hour vehicle entering the CTA, while the annual passenger activity level increases from 59.8 million annual passengers (MAP) to 78.9 MAP, which represents a 31.9 percent increase in passenger activity over a 16-year period. The percent increase in passenger activity is greater than the percent increase in vehicle volumes over the same time period because the growth in all vehicle volume is not a one-to-one relationship with the growth in passenger activity. Table A-2 of Appendix E2-1 of the Preliminary LAX SPAS Report provides the occupancy numbers for different modes of transit, as well as each mode's percentage share of transportation trips into the CTA. Single-party vehicles, such as private vehicles, taxicabs, and limousines, each grow in closer proportion to passenger growth than do multi-party vehicles because for each additional party using one of these modes, one additional private vehicle, taxicab or limousine will be needed. (A party, in this context, can be more than one person. In the case of the SPAS Draft EIR analysis, an average party size of 1.5 passengers/vehicle was used in the modeling.) However, for multi-party vehicles such as shuttles (buses and vans), an additional vehicle is not required to serve each additional party riding on the shuttle. As described in Table 4.12.1-5 on page 4-1073 of the SPAS Draft EIR, the assumed occupancy level for a charter bus, for baseline conditions, was 22.5, while the occupancy rate for a private vehicle was 1.5. Thus, when one charter bus enters the airport, that one entry adds 22.5 passengers. The operator of the shuttle may wait until they near their vehicle occupancy limit to add another shuttle to their route. As a result, the growth in the number of shuttle trips at LAX is a function of passenger volumes and vehicle occupancy which is not a one-to-one relationship.

SPAS-PC00130-715

Comment:

Page 73 Future Conditions Gated Passenger Schedule Figure A-7 provides a graphic representation of the assumed aircraft gating for the future (78.9 MAP) condition which includes a MSC (see below) but no yellow Light projects. The gated passenger schedule representing the aircraft gating scenario illustrated in the Figure A-7 used as the future condition for this study was created from the passenger schedule for the 78.9 MAP activity level, developed with the assistance of the national Aeronautics and Space Administration (NASA) to support various north airfield simulation efforts.

Question: Appendix E-2 Ground Transportation, p 64, "Future Conditions Gated Passenger Schedule" identifies Figure A-7 to represent the future condition, but doesn't show a terminal 0. Why and how is this accounted for in the models? It also says that NASA simulations were used in the development. Were these for the northside safety study or other studies since the design day aircraft was changed by the professors and the Recondo one wasn't used. What is correct? What will be the different estimated values if conditions were changed?

Response:

Figure A-7 of the LAX GTS Report represents the assumed aircraft gated scenario at 78.9 MAP with no Yellow Light Projects, meaning existing conditions with the projects identified in the LAX Master Plan as non-Yellow Light projects. Terminal 0 is not accounted for in the figure because it is an aspect of the potential alternatives to the Yellow Light Projects and was not identified in the LAX Master Plan. As described on page 64 of the LAX GTS Report, the No Yellow Light Projects scenario assumes, among other things, that the terminals remain in their current configurations and the ground transportation access to the CTA remains unchanged. Please see Appendix F-2 of the Preliminary LAX SPAS Report for figures that depict the gated assumptions of the SPAS alternatives.

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. Terminal 0 is not accounted for in the models developed for the LAX GTS Report, which was a preliminary conceptual report, as planning for the facility was not developed with sufficient detail at the time of the study to understand the potential impacts it would have on the airfield, terminal, and landside components of the airport. As noted in Response to Comment SPAS-PC00130-687, the 78.9 MAP activity level gated aircraft schedule used in the LAX GTS Report differed from the schedule used in the SPAS Draft EIR because the new schedule was not available until the LAX GTS analyses were nearing completion. As part of planning efforts undertaken later in the LAX GTS, the study team evaluated potential Terminal 0 configurations and impacts on the Park One surface parking lot, as discussed beginning on page 20 of the LAX GTS Report.

Please refer to Response to Comment SPAS-PC00130-90 for a discussion of the Design Day Flight Schedule (DDFS) used for the North Airfield Safety Study (NASS). Figure A-7 on page 65 of the LAX GTS Report depicts the gate positions that were assumed to gate the DDFS that was provided to the NASS team. Again, however, the No Yellow Light Projects scenario, as represented by Figure A-7, assumed that terminal configurations and ground access would remain unchanged. The DDFS used for the NASS was also used by STV for the LAX GTS Report. The Academic Panel used the DDFS provided by LAWA and, as part of developing their analysis assumptions, made some minor modifications to the DDFS (e.g., aircraft upgrades), as discussed in the NASS preliminary report.1 These minor modifications did not invalidate the original DDFS provided by LAWA to the Academic Panel, which was used in the STV analysis. Moreover, as noted below, the DDFS used for the GTS, NASS, and SPAS Report, was not used in the SPAS Draft EIR analysis. A detailed discussion of the DDFSs that were used in the SPAS Draft EIR is provided in Section 4.12.1.7.1.

To clarify the origin of the DDFS that was used by STV for the SPAS analysis, pages 64 and 72 of Appendix E2-1 of the Preliminary LAX SPAS Report have been revised. Please see Chapter 4 of the Final LAX SPAS Report. As explained in Response to Comment SPAS-PC00130-687, use of two different schedules in the STV analysis and the SPAS Draft EIR does not undermine either analysis, as each analysis was conducted for a different purpose. The SPAS Draft EIR used the most current DDFS and represents forecasted activity for the SPAS horizon year of 2025.

SPAS-PC00130-716

Comment:

Page 73 Bradley West Project Mitigations
As a part of the Bradley West EIR, mitigation measures were developed to offset potential CTA traffic impacts generated by the project. The mitigation measures in the CTA included the modification of a left-turn only lane on World Way at Center Way (across from TBIT) to a through/left lane. This will be accomplished by widening World Way beginning at Center Way and continuing along the frontage of p4 to the first pedestrian signal on World Way south. in addition, the Bradley West EIR included a second mitigation which will construct a second dedicated right turn lane from World Way south to the southbound on-ramp to Sepulveda Boulevard. The locations of these projects are illustrated in Figure A-5.

Question: Appendix E-2 Ground Transportation, p73 Bradley West Project Mitigations are alluded to as a left turn only lane and widening of Center Way along P4. What impacts to traffic do these cause? Must people know which lane to be in or be squeezed into a location that they do not desire? How will drivers be alerted?

Response:

Programmed CTA roadway improvements are discussed beginning on page 63 and depicted in Figures A-5 and A-6 of the of the LAX GTS Report. Both of these mitigation measures are discussed in detail in Section 4.12.1.5 of the SPAS Draft EIR. Modifying the existing left-turn only lane on World Way at Center Way across from TBIT to a shared through/left-turn lane will provide another through travel lane for vehicle circulating around the west end of the CTA past TBIT. This additional vehicle capacity should provide needed relief for traffic congestion near TBIT. By extending this existing left-turn only or "trap" lane on World Way at Center Way (adjacent to TBIT) to a shared through/left-turn lane, drivers unfamiliar with the airport or who were distracted and found themselves in the existing left-turn only lane will now not need to merge right prior to Center Way to continue past TBIT onto World Way South as a result of this improvement. For a complete discussion of the impacts of the mitigation measures, please see Sections 4.1.9 and 4.1.10 of the LAX Bradley West Project Draft EIR (available at http://www.ourlax.org/NOP.aspx). As for wayfinding within the airport, drivers will continue to be alerted to their routing choices within the CTA with the use of guide signs mounted above or adjacent to their travel path. A traffic control plan with advance warning signs, flashing arrow boards, and temporary lane delineation will be approved by LAWA prior to construction of this roadway improvement.

SPAS-PC00130-717

Comment:

Page 75 ... through the TBIT based on consultations with LAWA staff. Details on a possible passenger processor facility in the CTA for all or some portion of the MSC's passengers were not available when the project began. As the study progressed, LAWA began developing a preliminary concept for a MSC passenger processor building. This preliminary concept assumed the passenger processor would be a departures only facility with all arriving MSC passengers continuing to be processed through the TBIT.

Question: Appendix E-2 ground access page 75 states, details on a possible passenger processor facility in the CTA for all or some portion of the MSC's passengers were not available when the project began. As the study progressed, LAWA began developing a preliminary concept for a MSC passenger processor building. This preliminary concept assumed the passenger processor would be a departures only facility with all arriving MSC passengers continuing to be processed through the TBIT" Since the other sections state that the passenger processing will be arriving as well as departures how is this accounted for in the model and results?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS, including the analysis of the MSC Passenger Processor in the LAX GTS Report.

The Passenger Processor Facility Alternatives are discussed in detail on pages 24 through 31 of Appendix E2-1 of the Preliminary LAX SPAS Report. As discussed in Response to Comment SPAS-PC00130-687, the LAX GTS Report was intended to evaluate and assess surface transportation improvements that could be incorporated into SPAS alternatives. Improvements that were incorporated into the SPAS alternatives were analyzed in the SPAS Draft EIR. Please see Section 4.12.1 of the SPAS Draft EIR for a discussion of on-airport traffic improvements and impacts.

SPAS-PC00130-718

Comment:

Page 75 Passenger Activity TableA-1 provides the peak hour passenger activity for the Baseline (2008) and for 78.9 MAP future year conditions. The August 2008 gated airline schedule and the future conditions gated schedule with no yellow Light projects were used to estimate a rolling hour of originating (i.e., outbound flight) and terminating (i.e., inbound flight with LAX as the final destination) passenger volumes for each terminal. originating passenger volumes throughout each hour of the day were adjusted to account for the time passengers arrived at the curbside prior to...

Question: There have been many terminal location changes for varied airlines which changes the times of day that are peak for that airline which has moved as well as the location (which can impact the amount of luggage from a dwell time standpoint) since 2008. How is this accounted for in the model and results?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS, including the analysis of the MSC Passenger Processor in the LAX GTS Report. For the LAX GTS Report, the VISSIM Model was calibrated at 59.8 MAP, the LAX passenger activity level in 2008, which was the last full year of data available when STV began its study in 2009. (See page 60 of Appendix E2-1 of the Preliminary LAX SPAS Report.) The activity level in 2008 was sufficiently close (within one percent) to be considered representative of 2010 conditions.

The SPAS Draft EIR used as a baseline the conditions existing at the time of the Notice of Preparation. (See Section 4.12.1.3 of the SPAS Draft EIR.) This complies with the requirements for baseline under CEQA. (See State CEQA Guidelines Section 15125.) Moreover, while terminal location changes and changes to flight arrival and departure times may occur, predicting such future changes would be highly speculative.

Dwell times represent the total time a vehicle is waiting at the curbside to either pick up or drop off a passenger. These commercial vehicles will be accommodating passengers carrying different amounts of baggage and with different trip purposes (business and personal travel). Dwell time data cannot be directly correlated with baggage and trip purpose and, therefore, cannot be reported. However, the dwell time data collected during the peak period does provide a composite of the dwell time for vehicles loading and unloading passengers with baggage and with different trip purposes. The composition of passengers with baggage and by trip purpose is not assumed to vary in the future to the extent that the dwell time required to actively load and unload a vehicle during the peak hour would change.

SPAS-PC00130-719

Comment:

Page 75 Passenger Mode Splits & Occupancy passenger mode splits were developed from the 2006 LAX Air passenger survey. The survey data included mode share choices of passengers by the time of the day. The passenger mode splits were determined by processing the raw survey data for the peak hours into a passenger mode split which included reviewing the survey questions to determine the exact nature of a passenger's choices. For example, some rental car customers answered that some of the passengers were dropped off at the curbside before returning their rental car. In this scenario, these passengers were factored in the poV mode choice as well as rental Car shuttle choice. These mode splits as well as other factors were adjusted slightly during the calibration process for the trip generation and distribution model to yield the number of vehicles (by mode) closely matching the existing

conditions. In addition, group sizes were also determined from the same survey data and served as starting point in determining a vehicle mode's occupancy. Table A-2 shows the mode share and occupancy assumptions utilized in the trip generation model.

Question: Appendix E-2 ground access page 75 If the baseline traffic is 2009 and it's based on Aug 2008 gated airline schedule data, how is this reconciled and what impacts on the estimated results? For future predictions the mode of arrival and departure (ie private vehicle vs mass transit) could be different by several percentage points. How is this accounted for and what are the assumed change assumptions (and where is it documented)?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. As noted in the Data Collection section beginning on page 60 of the LAX GTS Report, the traffic data from 2009 was used as supplemental information for purposes of refining the primary data set from 2008. Videos from the CCTV camera system collected in 2008 were used to determine the percentage of various vehicle modes using the CTA roadways. The percentage of vehicle modes observed in 2009 was then applied to 2008 total traffic volumes to estimate the volume of vehicles by mode accessing the CTA in 2008. There were no major transportation improvements or operational modifications that would create a significant change in vehicle allocation between 2008 and 2009; therefore, it can be reasonably assumed that the 2009 observations remain valid for 2008.

Table A-2 on page 69 of the LAX GTS Report presents the passenger mode share information used in this analysis. The future 78.9 MAP mode shares were assumed to be unchanged from the existing conditions (59.8 MAP) to generate a more conservative or worst case scenario of future traffic conditions within the CTA. Keeping passenger transportation mode shares unchanged in the future, particularly the privately-owned vehicle (POV), taxicab, and limousine mode shares which, as single-party vehicles, generate the most trips per passenger compared to multi-party vehicles (i.e., shuttles and vans), ensures that a more conservative or worst case scenario was analyzed.

The traffic model assumptions used to estimate future conditions are described on pages 63 through 66 of Appendix E2-1 of the Preliminary LAX SPAS Report. The future 78.9 MAP hourly passenger volumes were used to generate the future conditions vehicle volumes by mode. These vehicle volumes were then entered into the future conditions baseline VISSIM model to derive a simulated representation of the baseline 78.9 MAP CTA roadway conditions. (See page 70 of Appendix E2-1 of the Preliminary LAX SPAS Report.)

SPAS-PC00130-720

Comment:

Page 76 Table A-1 Passenger Activity During Arrivals and Departures Levels Peak Hours, Departures section of table...

Question: Appendix E-2 ground access page 67 Table A-1

Terminals 1 and 7 each have 12 gates shown in figure A-7 yet there is a substantial difference in the percentages of peak travel passengers shown for these two terminals. Why? What can be done to change this imbalance?

Response:

Table A1 on page 67 of the LAX GTS Report provides the number of passengers on each terminal's curbside during the peak hour for both the arrivals and departures level curbsides. LAX is made up of a series of individual unit terminals (T1 through T8 and TBIT) which each have their own limiting capacities. The number of passengers on each terminal's curbside during the peak hours is directly related to the gated airline schedule, the size of the aircraft, and how many gates are processing arriving and departing flights at that time. For example, during the arrivals peak hour, Terminal 7, which Table A-1 shows having a higher number of passengers on the curbside compared to Terminal 1, may have had more flights arrive, or larger aircraft during the time leading up to and during the peak hour.

Also, Terminal 1 may have had more of their gates processing flights for departures compared to Terminal 7, which would result in fewer passengers on the Terminal 1 arrivals level curbside.

The August 2008 gated airline schedule and the future conditions gated schedule with no Yellow Light Projects were used to estimate a rolling hour of originating (i.e., outbound flights) and terminating (i.e., inbound flight with LAX as the final destination) passenger volumes for each terminal. This information was obtained from gated passenger schedules previously developed for LAWA. (See page 63 of Appendix E2-1 of the Preliminary LAX SPAS Report.)

SPAS-PC00130-721

Comment:

Page 77 Figure a-8 Rolling Hour Originating Passenger Volumes at the Departures Curbside (78.9 MAP)

Question: Appendix E-2 Figure A-8 and -9 have curbside traffic for each terminal. Why does the summary from DEIR figure 4.12.1-9 differ in the total number of passengers? Figure 4.12.1-9 at noon total passengers is about 13.6K vs. Fig A-8 is about 8K+Fig A-9 is about 7.7K (15.7K).

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. The LAX GTS Report and the SPAS Draft EIR analyses were different, including different sets of assumptions, data sets, terminal configurations, and passenger schedules. As explained in Response to Comment SPAS-PC00130-687, the future 78.9 MAP gated aircraft schedules differ between the two analyses. This difference results in different peaking characteristics throughout the design day for both gated schedules. By comparing the total passengers for only a single hour of the day, differences in when flights arrive at or depart a gate would be expected to result in different hourly totals of passengers on the curbsides. Figure 4.12.1-9 depicts the rolling hourly arriving and departing passenger flows for the 2025 SPAS alternatives. Therefore, the future terminal facilities that were assumed to be in place for each analyses, such as the MSC Passenger Processor, also contributes to the differences in the total number of passengers on the curbsides during any given hours.

SPAS-PC00130-722

Comment:

Page 79 Vehicle Dwell Time
Vehicle dwell times provide an estimate of the amount of time a vehicle will spend at the curbside loading and unloading passengers. Table A-3 provides the average vehicle dwell times and associated standard deviations by mode used in the VISSIM model for T1 through T7. The standard deviation represents the variation in dwell time from the average dwell time that a vehicle type will spend at a curbside. The standard deviation in vehicle dwell times were applied in the VISSIM simulation using a normal distribution. The data used to develop this table was collected at T1, T4, and T7.

Question: How was the dwell time data collected? What assumptions were made during the collection? What trend changes in dwell time is anticipated in the future? Where is this documented?

Response:

Please see Response to Comment SPAS-PC00130-314 regarding the collection of vehicle dwell times conducted as part of SPAS. The information cited in Response to Comment SPAS-PC00130-314 is valid for dwell times collected as part of the LAX GTS Report. Dwell time data used in the LAX GTS Report are provided in Table A-3 on page 69. Also, please see page 63 of Appendix E2-1 of the Preliminary LAX SPAS Report for a discussion of how field data, including vehicle dwell times, was collected.

SPAS-PC00130-723

Comment:

Page 79 Results
As discussed previously, the study's simulation modeling efforts were suspended pending the development and approval of a future non-airline specific gated schedule. Due to delays in receiving the new non-airline specific flight schedule, and the subsequent kickoff of the SPAS process which has redefined many of the key assumptions related to how the CTA terminals and roadways will function in the future, the continued refinement of landside modeling has not resumed. As a result, a number of the facility and operational improvements discussed above either have only been modeled and evaluated from a qualitative perspective or have not been modeled.

Question: Since the actual conditions were not modeled how is any of this information correlated to the real world or used to predict what will occur in the future? What conclusions can be drawn from the evaluations that were not based on actuals but based on assumptions? Where are these assumptions listed?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. Specific traffic modeling assumptions for the LAX GTS Report are discussed in the Traffic Model Assumptions section of the report beginning on page 63. As noted in Response to Comment SPAS-PC00130-687, separate and independent modeling of on-airport transportation impacts was conducted for the SPAS Draft EIR, and included all facility and operational changes associated with the SPAS alternatives.

SPAS-PC00130-724

Comment:

Page 81 Table A-4 Results of Analysis LOS (Single Level Busing)

Question: Each scenario shown for 78.9 MAP shows Level of Service F for most if not all of the time around TBIT. Where is the analysis to show an analysis of segregating the buses and commercial vehicles on a separate level? Yes, this would require significant vertical movement support, but is LAWA willing to accept a failing grade even before starting the course?

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS. Please see Response to Comment SPAS-PC00130-150 regarding the consideration of a third level roadway for busing operations within the CTA.

The on-airport transportation system would not fail with implementation of the SPAS alternatives. On the contrary, as indicated in Section 4.12.1 of the SPAS Draft EIR, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles.

SPAS-PC00130-725

LAX SPAS DEIR COMMENTS -- ECONOMIC BENEFITS OF THE PROJECTS

THE DEIR AND SPAS REPORT STATES THE IMPORTANCE OF LAX AS AN ECONOMIC GENERATOR FOR THE REGION. THE ATTACHED CHARTS PRESENT AN ARSAC ASSESSMENT

OF HOW THE VARIOUS ALTERNATIVES RELATE TO JOB CREATION AND ECONOMIC BENEFITS.

Where in the DEIR has LAWA prepared an assessment of economic benefits and job creation to back up the statements made in the document? What are the benefits and job creation factors determined by LAWA?

TERMINAL CONSTRUCTION VS.
RUNWAY CONSTRUCTION
- 5 TIMES NUMBER OF JOBS
  - 40,908 NOT 7,752
- TWICE POSITIVE CONSTRUCTION-RELATED ECONOMIC IMPACT ON REGION
  - $5.1 BILLION NOT $2.6 BILLION
- TWICE DOLLARS BACK FOR DOLLARS INVESTED
  - $2.67 NOT $1.35
- 8 TIMES ONGOING TOURIST DOLLARS
  - $112.8 MILLION NOT $14.1 MILLION PER YEAR

Tables in original Comment Letter in Attachment 5.

Response:

The importance of LAX to the economic growth and vitality of the Los Angeles Region is addressed on page 1-12 of the SPAS Draft EIR and based on a study performed by the Los Angeles Economic Development Corporation (LAEDC). As stated in the SPAS Draft EIR, in 2006, an average transoceanic flight traveling round-trip from LAX every day added $623 million in economic output and sustained 3,120 direct and indirect jobs in Southern California with $156 million in wages. A more recent study of the economic impact of LAX was released by LAEDC subsequent to publication of the SPAS Draft EIR. That study found that, in 2011, capital spending and related visitor spending associated with LAX generated 294,400 jobs in Los Angeles County alone, with labor income of $13.6 billion and economic output of more than $39.7 billion, and added $2.5 billion to local and state revenues. The report estimated that future capital projects, which LAWA's projects will total $8.5 billion over a 10- to 15-year period, will generate 90,500 job-years in Los Angeles County, with labor income of $5.6 billion, and will add $520 million in state and local tax revenues over the project period.1

The commentor states that terminal construction generates more jobs than runway construction. The commentor does not provide any backup information or evidence, such as assumptions or model parameters, to substantiate the attached analysis or its conclusions as to job growth, labor dollars generated, economic impact, or customer satisfaction. Moreover, advancing the economic growth and vitality of the Los Angeles Region is only one of seven objectives of SPAS. Therefore, even if these claims were accurate, improvements to the north airfield address other SPAS objectives besides economic growth. See, in particular, Table 1-2 of the SPAS Draft EIR, which identifies how the various SPAS alternatives respond to the project objectives. These project objectives can only be met by a program that addresses all of the SPAS components, including airfield, terminal, and ground access features.

Finally, please note that purely economic impacts are not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e).)

LAX SPAS DEIR Comments on topic of center-line taxiways...

Question: Why is operation with a center-line taxiway as conceived for the north complex safer since it results in operation of aircraft closer together and it introduces a new failure mode of errant landings on the taxiway?

Response:

Please see Responses to Comments SPAS-PC00130-63 and SPAS-PC00135-2 regarding the safety and operational benefits of a centerfield taxiway. In regards to errant landings on taxiways parallel to the intended runway, please see Response to Comment SPAS-PC00130-366.

SPAS-PC00130-727

Comment:

Below are data sources showing problems with these taxiways: Taxiway Takeoffs and Landings

By Robert Acherman, Vice President, Alliance for a Regional Solution to Airport Congestion October 3, 2012

Commercial airplanes landing and taking off on taxiways is a major worldwide problem. Causes include lack of situational awareness by pilots, complex airport geometry and poorly marked taxiways. In 2004, the issue became so pronounced that the US National Transportation Safety Board (NTSB) issued a Safety Recommendation on how to contain the taxiway landing and takeoff problem. The taxiway incidents in Seattle were the tipping point for a call to action. The NTSB Safety Recommendation also recaps other taxiway landings and takeoffs at Palm Springs, CA; Las Vegas McCarran, NV; and Tuscon, AZ.

http://seattletimes.nwsource.com/news/business/links/ntsb06-24-04.pdf
FAA response to NTSB

http://seattletimes.nwsource.com/news/business/links/faa03-09-05.pdf
NTSB response to FAA

http://seattletimes.nwsource.com/news/business/links/ntsb08-08-05.pdf

The FAA performed research and produced the following report. Several other US airports had taxiway operation problems including Palm Beach, FL; Lincoln, NE and Memphis, TN.

http://www.airporttech.tc.faa.gov/safety/downloads/TN07-54.pdf

In 2010, the FAA issued guidelines in 2010 on how airports can mark taxiways for increased pilot visibility.

http://www.faa.gov/airports/resources/advisory_circulars/index.cfm/go/document.current/documentNumber/150_5340-1

Aviation safety requires eternal vigilance. It requires the active participation of pilots, controllers, airport operators and the general public. Good taxiway design and technology can help resolve part of the taxiway landing and takeoff problem. Ultimately, though, the burden falls upon the pilot with the oversight of controllers to not land or takeoff on taxiways.

Response:

Please see Response to Comment SPAS-PC00130-366 regarding errant landings on taxiways parallel to the intended runway.

It is acknowledged that the commentor provided a series of website links to articles and materials related to errant landing and takeoff operations on taxiways. The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-728

Comment:

Question: Why is the NASS study response to FAA questions not included in the DEIR or SPAS report?

From the Academic Panel's responses to the FAA which was neglected to be included in the DEIR... This is on PDF page 17 (print out page 15) (the hard copy pages of 8, 9, and 14-18):

"Note that only the 3 Runway (3R) configuration (one runway on the north complex) would meet FAA Group VI standards! This one would also eliminate runway incursions caused by runway crossing. There would be no runway crossing here as the same runway would be used for takeoffs and landings. ARSAC recommended the 3R configuration to be studied in the NASS."

Page 15 (hard copy)

"The Panel was asked to estimate the safety of operating the North Airfield under certain configurations and levels of demand, and not to assess the consistency of these operations with FAA design standards. The AP Panel recognizes that all the North Airfield configurations studied except 3R (a three-runway airport) would fall short of at least one FAA design standard. For example, the recommended lateral separation between parallel runways (for VFR Operations) for ADG V and VI is 1,200 feet (FAA AC 150/5300-13 Paragraph 208). This implies configurations Baseline, Baseline-S, 100-N, 340-N and 340-S all fail to meet the recommended standard. A second recommended standard for simultaneous approaches and departures recommends 1,200 feet of runway separation for ADG V and ADG VI. Again, only 3R would meet such a standard (as there is no parallel runway under this alternative). The South Airfield, as modified with the new centerline taxiway, does not meet that standard either.

In short, if deviations from recommended FAA design standards were enough to invalidate a configuration, there would have been no point in conducting the study.

Babbitt did say that runway incursions decreased 50% between 2009 and 2010 (25 to 12). He highlighted the Runway Status Lights technology. He did not say explicitly that RWSL contributed to the decline in runway incursions. RWSL are a tool in reducing incursions- see Fact Sheet below.

2010 Press release from Randy Babbitt at Boston Logan where RWSL was installed. http://www.faa.gov/news/press_releases/news_story.cfm?newsId=11959

FACT SHEET on Runway Incursions

2010 to 2011, 50% drop of incursions from 12 to 6.

http://www.faa.gov/news/fact_sheets/news_story.cfm?newsId=12783

Response:

The NASS academic panel's responses to FAA's comments and questions on the NASS Preliminary Report are included in the NASS Final Report of May 11, 2010, which is referenced in Footnote 398 on page 4-505 of the SPAS Draft EIR. Technical reports may be cited but not included in the EIR pursuant to State CEQA Guidelines Section 15148. Additionally, the NASS Final Report is included as Appendix H-6 in the Preliminary LAX SPAS Report.

The remainder of the comment, beginning with "Babbitt did say…" is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-729

Comment:

Re: Revised Notice of Preparation of a Draft EIR Report (SCH No. 1997061047), dated October 8, 2010 "LAX Specific Plan Amendment Study"

INTRODUCTION

In accordance with the February 2006 Stipulated Settlement with the City of Los Angeles calling for significant revisions to the 2005 LAX Master Plan Alternative D, ARSAC has been a member of the Specific Plan Amendment Study Committee.

We continue to be dedicated to a safe, secure, and convenient LAX of which the residents of this City can be proud. However, ARSAC is adamantly opposed to expanding LAX into the surrounding communities, especially any proposals that move Runway 24 Right to the north. ARSAC provides these comments in hopes that LAWA will revise its conduct so that the Amendment Study and EIR will be consistent with the Settlement Agreement, and will be sensitive to the impacts on the surrounding communities. ARSAC incorporates, by reference, the attached reference documents as noted throughout this document.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-730 through SPAS-PC00130-969 below, which address each separate comment provided in ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR, including comments provided in the attached reference documents that were incorporated by reference. The comments in both NOP comment letters were considered and addressed in the SPAS Draft EIR. Further, the SPAS process and preparation of the SPAS Draft EIR have been conducted in accordance with the Stipulated Settlement, as described in Section 1.1.2 of the SPAS Draft EIR and reflected throughout the main text and appendices of the Preliminary LAX SPAS Report.

SPAS-PC00130-730

Comment:

On the whole, the project options presented in the Revised NOP lack the specificity that is needed to fully assess the environmental impacts or operational efficiency of aircraft ground traffic. We expect LAWA to refine the options and to provide a level of detail in the EIR so that the social impacts as well as financial costs and other impacts of the project can be assessed by decision makers. The ultimate purpose of this EIR is to help the decision makers decide upon a preferred alternative of a Master Plan to be built. All costs-financial, health, environmental, and social-need to be addressed in order to make an informed decision.

Response:

A Notice of Preparation is required to include sufficient information to describe the project and the potential environmental effects in order to enable responsible agencies to provide a meaningful response (State CEQA Guidelines, Section 15082(a)(1)). The Revised NOP for SPAS provided sufficient specificity for these purposes. Following publication of the Revised NOP and the receipt of comments from public agencies and members of the public, LAWA subsequently refined the alternatives identified in the NOP to provide a greater level of detail, enabling the analysis of project impacts in the SPAS Draft EIR.

It should be noted that, per Section 15131(a) of the State CEQA Guidelines, "[e]conomic or social effects of a project shall not be treated as significant effects on the environment." This section of the guidelines further states that "intermediate economic or social changes need not be analyzed in any greater detail than necessary" to identify a physical change caused by the economic or social changes. As outlined in Section 15002(a) of the State CEQA Guidelines, the basic purposes of CEQA are to inform decision-makers and the public about the potential significant environmental effect of proposed activities; to identify means to reduce, avoid, or mitigate environmental damage; and to disclose reasons why the decision-makers approved a project if significant environmental effects are involved. Although considerations other than environmental impacts have a role in the action taken by the decision-makers, the purpose of an EIR is to focus on environmental effects.

SPAS-PC00130-731

Comment:

The Specific Plan Amendment Study (SPAS) was initially envisioned as an opportunity for LAWA to work cooperatively with stakeholders to rapidly update the LAX Master Plan and to facilitate renovation of LAX facilities. Contemplated schedules are overdue.

We encourage LAWA to work closely with stakeholders to get this EIR completed in a timely manner and to ensure that it addresses all of the issues so that delays and litigation are avoided. As a part of the Specific Plan City Ordinance and the Stipulated Settlement Agreement, LAWA was supposed to conduct outreach to affected stakeholders. It is unclear what outreach LAWA has been conducted and would like an enumeration of meetings showing what types of stakeholders participated, what suggestions were considered by LAWA and which, if any, were incorporated into their proposed options.

Response:

LAWA undertook an extensive public participation program in 2006, the outset of the SPAS process, to solicit public input from interested stakeholders. Section 4.1 of the Preliminary LAX SPAS Report discusses the thorough public outreach and community involvement process utilized during the planning process. As provided on page 4-1 in Section 4.2.2 of the Preliminary LAX SPAS Report, between March 2006 and December 2006, a series of six public meetings was held concerning various aspects of the SPAS planning process. These meetings were open to all members of the public, and included break-out sessions for participants to make suggestions regarding improvements. A table of the meetings subjects, dates and time, and locations is provided on page 4-2 in Section 4.2.2 of the Preliminary LAX SPAS Report. Copies of the meeting materials for each meeting, including the meeting notice, welcome sheet, handouts, attendee sign-in sheets, presentation, and public comments,

are included in Appendix D-1, Community Meeting Materials, of the Preliminary LAX SPAS Report. As documented in these meeting materials, LAWA studied many of the suggestions to determine their feasibility. A detailed accounting of the concept development process is provided in Chapter 5 of the Preliminary LAX SPAS Report. As provided in Section 5.1.2 of the LAX SPAS Report, the concepts for different components were presented in various public meetings and all public comments were considered by LAWA. Modifications and updates were made to the concepts, based upon input from community meetings.

In addition, in compliance with Section V.J of the Stipulated Settlement, LAWA established the LAX SPAS Advisory Committee. The Advisory Committee members included representatives from the County of Los Angeles, City of Los Angeles, City of El Segundo, City of Culver City, City of Inglewood, and Alliance for a Regional Solution to Airport Congestion (ARSAC). (See generally Section 5 of the Preliminary LAX SPAS Report.) LAWA held 24 meetings with the Advisory Committee between March 2006 and June 2012. A list of these dates is provided in Appendix D-2 of the Preliminary LAX SPAS Report. Meetings were scheduled prior to and following the public meetings that LAWA convened to seek community input on SPAS. The Advisory Committee members provided input and feedback on various aspects of the airport planning process, and suggested alternatives to be studied as part of SPAS. Inclusion of an alternative that would move Runway 6R/24L 100 feet south (i.e., SPAS Alternative 7) in the SPAS Draft EIR was a result of input from Advisory Committee members. Documentation of the Advisory Committee meetings is provided in Appendix D-2 of the Preliminary LAX SPAS Report.

Please see Response to Comment PC00130-990 regarding the release date of the SPAS Draft EIR relative to contemplated schedules.

SPAS-PC00130-732

Comment:

Since the NOP has divided the option elements into sections to be mixed/matched to be assembled into full Master Plan options, the comments of this letter are organized to accommodate LAWA response.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-733 through SPAS-PC00130-818 below.

SPAS-PC00130-733

Comment:

NORTH RUNWAY MOVEMENT OPTIONS

No runway movement is our preferred alternative for the north complex.

LAWA and the FAA spent most of the past five years using incursion reduction and runway safety improvement as justification for expanding the separation distances between the north runways. ARSAC has repeatedly stated that we want the safest runways practical and that there are other, more cost effective options to improve runway safety.

The FAA stated our case most eloquently in their FAA Runway Safety Report, Executive Summary June 2008 when it put runway incursion experience into context by stating, "Of the 24 serious incursions [nationally] in FY2007, eight involved commercial flights. At this rate (eight in over 25 million operations) a person could fly on one commercial flight every day for as many as 4,280 years without encountering a serious runway incursion." An appendix to this report provides numerous potential additions to airport safety that can be added without runway movement. One of the many examples provided was the one at Long Beach-Daugherty Field, Final Approach Occupancy Signal (FAROS). Another, Runway Status Lights, has only been partially installed at LAX with promises that a full installation will be made. Note that the most serious incursion at LAX occurred on the South runway complex at an intersection where it is believed that RSL could have avoided the incident. Like the FAA report, ARSAC has provided

LAWA with numerous suggestions to improve airfield safety through enhanced marking, lighting and signage; installation of Runway Status Lights and systems such as Enhanced Final Approach Runway Occupancy Signals (eFAROS). We went one step further by advocating for a full staffed control tower of highly experienced controllers. LAWA should conduct an unbiased evaluation of the options before the alternatives are finally selected for inclusion in the Draft EIR.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not present specific alternatives that the commentor believes the SPAS Draft EIR should have considered. The SPAS Draft EIR includes a broad range of airfield improvement options, embodied in seven airfield improvement alternatives, including variations on runway moves, taxiway/taxilane configurations, and gating plans. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

SPAS-PC00130-734

Comment:

The Revised NOP uses descriptors for runway safety conditions which are word crafted and biased toward justifying expansion north. NOP Section 2, item i, under Project Descriptions, for example, states "could create even greater safety..." implying significant possible improvements when the Academic Panel/NASA North Airfield Safety Study (NASS) stated "limited practical importance."

How has LAWA planned to incorporate each of the system improvements in the 2008 FAA Runway Safety Report into its safety and efficiency studies for each option?

The North Airfield Safety Study conducted by the Academic Panel came to a similar conclusion when it deemed the existing north runway complex as extremely safe. Their report states, "All of the proposals to create new configurations of the North Airfield would reduce by a substantial percentage the risk of a runway collision." Followed by "However, because the baseline level of collision is so low, reducing that risk by a substantial percentage is of limited practical importance." The NASS report concluded increasing runway separation would result in 72 deaths vs 80 deaths in 200 years with the current north airfield configuration.

Response:

The subject wording in the Revised NOP accurately describes the conclusions of the North Airfield Safety Study, which indicate that new configurations of the north runway that include runway separation and the addition of a centerfield taxiway would reduce by a substantial percentage (40-55 percent) the risk of a fatal runway collision. Please see Response to Comment SPAS-PC00130-168 regarding the academic panel's conclusion that reducing the risk of a fatal runway collision by a substantial level is of "limited practical importance," which is a value judgment not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation. The ultimate determination of whether to select one of the SPAS alternatives and the rationale for such a determination is left to the decision-makers. This comment will be provided to them for their review prior to making a decision.

Regarding the commentor's question pertaining to how has LAWA planned to incorporate the system improvements in the "2008 FAA Runway Safety Report," it is unclear exactly what report is being referred to, and the comment does not provide any specific citation. If the commentor is referring to the FAA Runway Safety Area Evaluation and Analysis for Los Angeles International Airport of June 2006, Section 4.7.2 of the SPAS Draft EIR describes that study and how it relates to LAX.

SPAS-PC00130-735

Comment:

Runway options devised by LAWA expanding north to accomplish wider north runway complex separation are unacceptable because they increase the impacts on the communities along the north boundary, eastern areas, and on the south by facilitating increased air and ground traffic.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. It should be noted that the increase in passenger activity over time would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR. Regarding impacts of moving Runway 6L/24R north, please see Response to Comment SPAS-PC00130-4. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-736

Comment:

During the September 2010 Specific Plan Amendment Committee meeting, LAWA presented the options that they intended to include in the NOP. In addition to the "no action" and "approved Alternative D of 340' south" configurations, each of the options called for moving runways north toward Westchester-Playa Del Rey.

If further runway separation is deemed mandatory, ARSAC stated that LAWA should move Runway 24 L south instead. After further discussion LAWA agreed to include an option moving runway 24L 100' south along with upgrading the taxiways to accommodate the newer, larger aircraft. ARSAC observed that the current taxiways were built for smaller aircraft in the 1960's and that substantial efficiencies could be achieved if special handling were avoided for larger aircraft around the terminals. LAWA agreed to prepare drawings of an alternative after consulting with ARSAC, but instead prepared two south alternatives moving runway 24L 100' south without input. Their plans failed to respond to our pre-NOP release requests and disappointingly, the LAWA runway south alternatives are the only ones included in the revised NOP.

LAWA stated that their two "100' S alternatives" would receive "at least cursory study" but the criteria for acceptance for formal, complete study have not been revealed in the NOP or other documents. ARSAC informed LAWA that both of "their" options are unacceptable because they fail to include what we requested for taxiway layouts. We request a modification of the existing LAWA plan to extend taxiway D without creating a potential bottleneck along the northern edges of Terminals 1 and 3.

LAWA should adjust its alternative to meet the criteria ARSAC described to modify the taxiways as requested. ARSAC requested that the second LAWA alternative also be modified. This is the one which has a Group VI Taxiway E all along Runway 24R and a Group V Taxiway D that is interrupted near the terminals. We requested that Taxiway D be extended straight instead of diverting away from the terminals. It will impact a small number of gates, but these impacted gates on the ends of the terminals can be replaced on the north complex in the area known as Park One by a new two-sided terminal.

The only runway option in the NOP that addresses the limited spacing taxiways to accommodate the larger aircraft adequately would be that requested by ARSAC. None of the options moving north addresses this issue.

Response:

The relocation of Runway 6R/24L 100 feet southward and the Taxilane D and Taxiway E configuration suggested in the comment (i.e., ADG VI Taxiway E and ADG V for Taxilane D as a continuous taxilane along the northern edge of Terminals 1, 2, and 3) are reflected in Alternative 7 of the Draft EIR. Alternative 7 also proposes the development of new aircraft gates in the area known as Park One,

through the addition of Terminal 0; however, the current Terminal 0 concept provides for gates only along the west side of the concourse. If this, or another alternative that includes a Terminal 0 concept in the area currently occupied by Park One, were adopted, the specific configuration of the concourse and its gates would be determined during project level planning and design, in conjunction with further refinement of the redesign of Sky Way and other transportation improvements that might occur in the same vicinity. Nevertheless, the gating configuration associated with Alternative 7 would still provide 153 passenger gates that can accommodate a variety of aircraft sizes, including large aircraft.

SPAS-PC00130-737

Comment:

At the present time LAWA-owned property located between Runway 24 R and Westchester Parkway is zoned for airfield-serving commercial purposes. This area includes property both inside and outside of the perimeter fence of LAX. Construction of buildings to accommodate such uses would provide a significant environmental buffer between airfield operations and the community to the north with respect to community safety, noise, vibration, light, air pollution, and aesthetics, in addition to the economic benefit of such uses for LAWA and/or the City of Los Angeles. Movement of Runway 24 R to the north will preclude construction of such buildings and hence the environmental and economic benefits of such uses. The environmental cost and financial loss if such land uses are precluded must be identified and studied.

Response:

The LAWA-owned property located between Runway 6L/24R and Westchester Parkway is a portion of LAX Northside, as shown in Figures 4.9-3, 4.9-4, and 4.9-5 of the SPAS Draft EIR. The zoning of the LAX Northside areas within this location is shown in Figure 4.9-5 and is defined in Appendix A of the LAX Specific Plan. These areas include Area 4A (light industrial uses and airline and airport support services); Area 4B (light industrial uses and airline and airport support services); Area 5 (offices, business park, and research and development); Area 6 (offices, business park, and research and development); Area 7 (offices, business park, and research and development); Area 8 (commercial uses); Area 9 (commercial uses); and Area 10 (public automobile parking). A portion of LAX Northside is also located north of Westchester Parkway, including Area 1 (offices, business park, and research and development); Area 2 (offices, business park, and research and development); Area 3 (commercial uses); Area 13 (recreational facilities and public benefit uses); Area 12B (commercial golf course); Area 12A (commercial uses); and Area 11 (commercial uses). (See Appendix A of the Preliminary LAX SPAS Report.) Together, areas of LAX Northside located both south and north of Westchester Parkway serve as an airport buffer zone (comprised of compatible development and landscape) between airfield operations and the Westchester community and is subject to use restrictions, height restrictions, setback requirements, and landscape requirements to avoid or reduce land use conflicts.

The potential impacts on the development of LAX Northside associated with the proposed movement of Runway 6L/24R northward under SPAS Alternatives 1, 5, and 6 are evaluated in Sections 4.9.6 and 5.5.9.1 of the SPAS Draft EIR. As indicated on pages 4-692 and 4-693 in Section 4.9.6.1, under Alternative 1 (and also applicable to Alternatives 5 and 6), within LAX Northside, no changes are proposed with the exception of the Lincoln Boulevard realignment. The movement of Runway 6L/24R north and the related realignment of Lincoln Boulevard would occur mostly within Area 8 and a portion of Area 9, both designated for commercial uses. As described on pages 5-96 and 5-97 in Section 5.5.9.1, and specifically within footnote 536, the potential for commercial uses within these areas without relocation of Runway 6L/24R is limited due to restrictions associated with the existing Airport Surveillance Radar (ASR) in Area 9 and the close proximity to the LAX north airfield and associated noise impacts, safety requirements, and height restrictions. In addition, even without the ability to develop limited commercial uses within Areas 8 and 9, LAX Northside would continue to provide a broad buffer zone between airport uses and residential communities to the north, because Areas 11, 12A, and 12B lie between Areas 8 and 9 and residential land uses to the north. Area 12B is the site of the Westchester Golf Course, which provides a substantial buffer between Areas 8 and 9 and residential land uses. Other buffers in this area include noise walls, which are located along West 88th Street and along portions of La Tijera and West 88th Place, and range in height from 8 to 20 feet. Compatible development would be permitted within Areas 11 and 12A, both of which also lie north of Westchester Parkway, between Areas 8 and 9 and residential uses to the north. The width of the buffer

area between Areas 8 and 9 and residential land uses would range from approximately 700 feet between Westchester Parkway and West 88th Street to as much as approximately 2,000 feet between Westchester Parkway and Manchester Avenue (across Westchester Golf Course). As stated in Appendix A of the LAX Specific Plan, Areas 12A and 11 are permitted to be developed with commercial uses. Furthermore, at the interface between LAX Northside and residential uses to the north, a landscaped buffer setback ranging between 15 to 30 feet is required. As stated on page 4-657 in Section 4.9 of the SPAS Draft EIR, LAX Plan Land Use - LAX Northside Policy P-1, requires that LAWA "Provide and maintain landscaped buffer areas along the northern boundary of LAX Northside that include setbacks, landscaping, screening, or other appropriate view-sensitive uses with the goal of avoiding land use conflicts, shielding lighting, enhancing privacy, and better screening views of airport facilities from adjacent residential uses." Therefore, in consideration of the above, there would continue to be sufficient buffers between airfield operations and the community to the north to address safety, noise, vibration, light, air pollution, and aesthetics concerns, with the exception of construction-related air quality and noise impacts (as analyzed in Sections 4.2 and 4.10.3 of the SPAS Draft EIR, respectively).

Regarding financial loss associated with the slight reduction in land available for development of commercial uses within Areas 8 and 9, economic impacts are not considered impacts on the environment under CEQA. (Please see Response to Comment SPAS-PC00130-730 concerning the treatment of social and economic changes in an EIR.) However, the area that would be affected by the realignment of Lincoln Boulevard has limited potential for commercial development, and since the reduction in land designated for commercial uses could be accommodated within other areas of LAX Northside, no significant economic effects are expected to occur.

SPAS-PC00130-738

Comment:

LAWA's knowledge of what lies below its runways is inadequate as proven by the discovery of a previously unknown runway below the south runway complex during construction of Runway 25 L and the adjacent taxiway. It is known that one and perhaps more than one tunnel exists below Runway 24 R. To understand the environmental, construction and economic cost and impact of moving the runway north, an extensive program of borings along the entire length of the north airfield must be undertaken and the environmental impact and financial cost thereof studied.

Response:

Please see Response to Comment SPAS-PC00130-904 regarding the abandoned runway that was excavated during construction of the South Airfield Improvement Project. Please see Responses to Comments SPAS-PC00130-1012 and SPAS-PC00130-808 regarding the abandoned tunnel segment that lies beneath Runway 6L/24R. The SPAS Draft EIR is a programmatic document. Project-level impacts associated with implementation of individual components, such as the north airfield improvements, will be assessed in future CEQA documents, which will be based on an appropriate level of engineering analysis and design.

SPAS-PC00130-739

Comment:

The intersection of Lincoln Blvd. and Sepulveda Blvd. adjacent to the LAX North Airfield is one of the most important roadways in all of Los Angeles County. It links all of the residential communities, businesses and land uses of the Westside (Marina del Rey, Venice, Mar Vista, Santa Monica, Pacific Palisades, Brentwood, Westwood, Beverly Hills, etc.) with the communities, businesses and land uses of the South Bay (El Segundo, Hawthorne, Manhattan Beach, Hermosa Beach, Redondo Beach, Torrance, Palos Verdes, etc.). If the perimeter fence of LAX is extended outward to accommodate the north movement of the runways, it will have an immense impact on these people, businesses and land uses both during construction and after completion of construction. In fact, the entire region will be impacted if the perimeter fence is moved outward. For each option that is to be evaluated identify the extent of roadway movement and the environmental cost and financial cost of doing so. Each option

should be studied including, without limitation, the impacts both during construction and after project completion on the region as a whole and on local traffic, air quality, noise, etc.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. Please note that this comment states the commentor's personal opinions, not supported by facts or evidence, regarding the importance of the Lincoln Boulevard and Sepulveda Boulevard intersection, and the impacts of Lincoln Boulevard realignment.

SPAS-PC00130-740

Comment:

Similarly, any impacts from sewer lines and oil pipelines rerouting must be assessed with adequate cost projections. The Hyperion treatment plant located adjacent to the southwest corner of LAX is the City of Los Angeles' most important waste water treatment plant. Huge sewer lines bring storm and sewer water to Hyperion near LAX. If the runways of the north airfield are moved and/or if the perimeter fence of LAX is extended outward to accommodate the north movement of the runways, it will likely impact the Hyperion pipeline feeder system. The environmental and financial cost of relocating sewer and storm water pipelines must be thoroughly studied including, without limitation, the impact both during construction and after project completion on regional and local traffic, land use, etc.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the sewer lines and other utility lines, including oil pipelines, in the vicinity of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6 and Response to Comment SPAS-PC00130-348 for a discussion of sewer lines beneath the north airfield.

SPAS-PC00130-741

Comment:

Westchester Central Business District impacts must be fully disclosed, including impacts on traffic, the costs of traffic improvements, and the economic losses that would occur if the 6L/26R runway is moved north.). The Westchester Central Business District is the life blood of the communities on the north of LAX. Depending on the runway option chosen, the impact could be to decimate as much as half of the business district due to FAA required removals to enforce the runway protection zone and runway safety area.

Response:

Potential traffic impacts and traffic improvements, including those within the Westchester Central Business District, were analyzed in Section 4.12.2 of the SPAS Draft EIR. Intersections within the Westchester Central Business District (i.e., Intersections 100, 101, 108, 114, 135, and 146) are shown on Figure 4.12.2-1 and mitigation measures proposed for the intersections that would impacted under the SPAS alternatives are evaluated in Section 4.12.2.7 of the SPAS Draft EIR. These include intersections within the Westchester Central Business District.

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester community, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

As indicated in Section 4.7.2.6.1 of the SPAS Draft EIR, there are several options that can be considered relative to addressing potential safety hazards associated with incompatible structures and uses being located within an RPZ; however, a determination as to the most suitable and practical option cannot be made until more detailed levels of planning and engineering on the selected alternative, if any, when a more complete evaluation of potential safety hazards can be conducted in consultation with

the FAA. It would be premature and speculative to say at this time whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526 includes an analysis of impacts associated with modification or removal of structures and uses within the RPZ, should that occur in the future. In the event that it is determined in the future that relocation of an existing business is necessary, impacts associated with acquisition of the property and relocation of the business would be addressed in future project-specific CEQA documents, and by LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measure MM-RBR-1.

SPAS-PC00130-742

Comment:

What would the effect be on the various schools and churches that are along the Westchester Parkway corridor - St. Bernard's, WHS, St. Anastasia, Paseo del Rey, Loyola Village, Visitation, etc.? This could include air and noise pollution or a safety risk if there was an air disaster.

Response:

The potential air quality, noise, and safety impacts of the proposed SPAS alternatives were analyzed in Sections 4.2, 4.7.1, 4.7.2, 4.9, 4.10.1, 4.10.2, and 4.10.3 of the SPAS Draft EIR.

The analysis of air quality impacts was conducted in accordance with the SCAQMD CEQA Air Quality Handbook (Handbook) and AQMD Modeling Guidance for AERMOD (Modeling Guidance). The Handbook identifies SCAQMD's CEQA thresholds of significance for air pollutant emissions and concentrations in the South Coast Air Basin. These thresholds of significance are identified in Tables 4.2-5 and 4.2-6 of the SPAS Draft EIR. As required by the Handbook, impacts associated with air quality emissions are determined based on the total emissions that would be generated by the project. Air quality pollutant concentration impacts were determined based on pollutant concentrations from construction and operational sources, as calculated to occur at the edge of the airport (i.e., at "fence-line receptors" that provide a conservative estimate of the pollutant concentration levels at the edge of airport property, which would decrease from that point outward into non-airport areas). Therefore, to determine if impacts associated with the SPAS alternatives would be significant, pollutant concentrations at the fence-line were modeled. If concentrations at any fence-line receptor exceeded the thresholds identified in Table 4.2-6, the impact was determined to be significant. CEQA does not require that air quality impacts at specific offsite receptors be determined. For the SPAS Draft EIR air quality impacts analysis, each fence-line receptor was identified by the type of land use closest to the receptor location, thereby providing a conservative estimate of the air pollutant concentration impacts to that land use type, understanding that the concentrations would become lower as one moved away from the fence-line and into each land use area type. Land use types considered included residential, recreation, school, offsite worker, and onsite occupational. Although air quality impacts at individual offsite locations were not determined, four schools were identified as the closest land uses to fence-line receptor locations. These schools are shown in Figure 4.10.1-7 of the SPAS Draft EIR, and include St. Bernard High School (PVS007), Westchester High School (PBS121), Westchester-Emerson Community Adult School (PBS062), and the Imperial Avenue Special Education Facility (which is now closed). Pollutant concentrations at each of these school locations are provided in Attachment 3 of Appendix C of the SPAS Draft EIR. Significant impacts were not determined on a receptor-by-receptor basis, including at each of these schools. Rather, in order to provide a conservative impacts analysis, if there was any exceedance of an ambient air quality standards at any fence-line location, the impact was determined to be significant. As presented in Table 4.2-17 and summarized on pages 4-156 through 4-160 in Section 4.2 of the SPAS Draft EIR, even with implementation of feasible construction-related mitigation measures, such as covering or treating ground surfaces to minimize fugitive dust emissions, minimizing off-site worker vehicle trips, and prohibiting parking adjacent to sensitive receptors, construction-related emissions and concentrations would be significant for all SPAS alternatives. Operational emissions and concentrations would also be significant for all SPAS alternatives, even with implementation of feasible operations-related mitigation measures, such as the

conversion of LAX ground support equipment to low and ultra-low emissions technologies and the electrification of passenger gates.

Regarding impacts to human health associated with exposure to toxic air contaminants, sensitive receptors nearest the LAX fence-line, including schools, residential, recreational, and workers were evaluated, as described above and on page 4-428 and shown in Figure 4.7.1-1 in Section 4.7.1 of the SPAS Draft EIR. For the exposure assessment, the receptors used for the health risk assessment included, among other things, off-airport school children, and covered a range of exposure scenarios for people who may be affected by emissions. As described on page 21 in Section 4.1.2.2 of Appendix G1 of the SPAS Draft EIR, "[s]chool children were evaluated at all school grid nodes and at grid nodes identified as residential locations because future schools could be located in any residentially zoned area." As noted in the air quality impacts discussion above, the grid nodes were all located along the LAX fence-line. Therefore, the impacts to off-airport school children assumed that the school children were located on the fence-line. As there are no schools that are situated on the fence-line, this assumption results in a conservative analysis of health risk impacts (i.e., the analysis overstates risks to school children. Cancer risks for the different receptors under each of the SPAS alternatives are summarized in Table 4.7.1.5 on page 4-445 and illustrated in Figures 4.7.1-2, and 4.7.1-3. As indicated in the figures, cancer risks at all receptor locations, including receptors identified as schools, would be less than significant. Non-cancer hazards for the different receptors under each of the SPAS alternatives are summarized in Table 4.7.1.6 on page 4-456 and illustrated in Figures 4.7.1-4, and 4.7.1-5. As indicated in the figures, the non-cancer hazards at all receptor locations, including the school locations (non-cancer hazards for school children are summarized in Table 4.7.1.6), would be less than significant. Acute non-cancer hazards from acrolein at the different receptor locations under each of the SPAS alternatives are illustrated in Figures 4.7.1-6, and 4.7.1-7 and summarized in Table 4.7.1.7 on page 4-465. As indicated in the figures, there would be significant impacts associated with acute non-cancer hazards from acrolein under each of the alternatives. Under some alternatives, significant impacts would occur at or near fence-line receptor sites that are identified as schools. As summarized in Table 4.7.1-10 and described on page 4-481 of the SPAS Draft EIR, even with implementation of applicable LAX Master Plan mitigation measures, acute non-cancer health hazard impacts under all of the SPAS alternatives are considered to be significant and unavoidable. Please also see Response to Comment SPAS-PC00130-459 regarding acute non-cancer hazards at or near the fence-line.

Aviation safety impacts were evaluated based on a number of factors, as identified in Section 4.7.2 of the SPAS Draft EIR. The methodology used to evaluate safety impacts did not require analysis of impacts at specific receptor locations to determine whether safety impacts of the SPAS alternatives were significant, and such a site-specific analysis is not required under CEQA. As described on pages 4-569 through 4-571 in Section 4.7.2.6.10 of the SPAS Draft EIR, impacts associated with aviation safety would be less than significant. Furthermore, implementation of Alternatives 1 through 7 would enhance the safety and efficiency of aircraft operations compared to baseline conditions (2010). The types of land uses that are currently located within the RPZ are identified in Table 4.2.7-3, and the land uses that would be located within the RPZ under each of the SPAS alternatives are identified in Tables 4.2.7-9 through 4.2.7-15. As indicated in these tables, although the northward relocation of Runway 6L/24R under Alternatives 1, 5, and 6 would move the RPZ northward, no schools or churches, including those along the Westchester Parkway corridor, would be located within the RPZ areas. In fact, the configurations of Runway 6L/24R under Alternatives 1, 5, and 6 would move the RPZ for that runway to the west, thereby avoiding existing conflicts with residential uses. Alternatives 8 and 9 focus on ground access improvements and would not have any effect on aviation safety.

Regarding aircraft noise impacts, as described on pages 4-776 through 4-778 in Section 4.9.6.10 of the SPAS Draft EIR, under Alternatives 1 through 7, some schools and churches, including those along the Westchester Parkway corridor, would be newly exposed to 65 CNEL or higher noise levels or experience an increase of 1.5 CNEL or higher within the 65 CNEL or higher noise contour compared to 2009 baseline conditions. Table 4 of Appendix I-2 of the SPAS Draft EIR provides a listing of the non-residential noise-sensitive facilities within the study area. There are a number of schools that fall within the study area, including St. Bernard High School (PVS007), Westchester High School (PBS121), St. Anastasia School (PVS093), Paseo del Rey Magnet School (PBS107), Loyola Village Elementary School (PBS099), and Visitation Catholic Elementary School (PVS011). Appendix I-2 also provides detailed discussions and listings of significantly impacted non-residential noise-sensitive receptors for

each alternative. However, as described in Section 4.10.1.8 of the SPAS Draft EIR, LAX Master Plan Mitigation Measure MM-LU-1, Implement Revised Aircraft Noise Mitigation Program, would incorporate all eligible dwellings and non -residential noise-sensitive facilities that are newly exposed to significant levels into the Aircraft Noise Management Program (ANMP) to mitigate the significant noise impacts. In addition, as analyzed in Section 4.10.1, some schools would be exposed to high single event noise levels, including Paseo del Rey Magnet School and Wish Charter Elementary School, under Alternatives 1, 2, 4, 5, 6, and 7, and Wish Charter Elementary School under Alternative 3. As summarized on pages 4-932 and 4-933 in Section 4.10.1.8, interim impacts prior to implementation of LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, and MM-LU-4 would be significant and unavoidable.

Regarding road traffic noise impacts, as summarized on pages 4-942 and 4-943 in Section 4.10.2, no off-site noise-sensitive receptors, including Wish Charter Elementary School, would experience significant impacts due to changes in road traffic noise levels under Alternatives 1, 2, 3, 4, 8, and 9. The methodology used for the Road Traffic Noise section is provided on page 4-936 in Section 4.10.2.2 of the SPAS Draft EIR. As described therein, the selection of noise-sensitive receptors to address in the road traffic noise impacts assessment focused on those roadways most likely to experience increased traffic under each of the SPAS alternatives. Such roadways included those likely to be used for driving to or from the airport. As delineated in Table 4.10.2-1 and Figure 4.10.2-1 of the SPAS Draft EIR, 15 noise-sensitive receptors near roadways carrying airport-related traffic were included in the impacts analysis. Section 4.10.2.4 of the SPAS Draft EIR identifies the threshold of significance for road traffic noise impact as being an increase of 3 dBA or more in CNEL ambient noise levels, and, as described on page 4-945 of the SPAS Draft EIR, a doubling of traffic volumes on a roadway would be necessary to result in a 3 dBA increase in sound levels. As noted above, no off-site noise-sensitive receptors would experience significant impacts due to changes in road traffic noise levels, which includes those roadways considered most likely to be affected by changes in airport-related traffic. With the exception of the Wish Charter Elementary School, located near La Tijera Boulevard, which was addressed in the SPAS Draft EIR road traffic noise impact analysis, the schools identified by the commentor are located within neighborhoods where the nearby roadways would have little, if any, airport related traffic. The locations of these other schools relative to adjacent roadways can be seen in Figure 4.10.1-7 of the SPAS Draft EIR, including St. Bernard High School (PVS007), Westchester High School (PBS121), St. Anastasia School (PVS093), Paseo del Rey Magnet School (PBS107), Loyola Village Elementary School (PBS099), and Visitation Catholic Elementary School (PVS011). As such, it is not anticipated that significant road traffic noise impacts would occur at any of these schools. Alternatives 5, 6, and 7 do not include ground access improvements and would not, in themselves, affect road traffic noise levels at off-site noise-sensitive uses; however, depending on which ground access improvements (i.e., ground access improvements associated with Alternatives 1, 2, 8, or 9) are paired with airfield improvements under Alternative 5, 6, or 7, the road traffic noise impacts would be the same as above (i.e., less than significant).

The specific noise-sensitive receptors used to calculate temporary construction traffic and equipment noise impacts are indicated in Figures 4.10.1-7 through 4.10.1-9 in Section 4.10.1, Aircraft Noise. The analysis demonstrated that for temporary construction traffic and equipment noise impacts, as shown in Table 4.10.3-4 and described on pages 4-972 through 4-974 in Section 4.10.3 of the SPAS Draft EIR, construction equipment noise impacts on some schools located in proximity to airfield improvements, ground access improvements, and construction staging areas would be significant and unavoidable under all of the SPAS alternatives. Among the schools listed by the commentor, located within the Westchester Parkway corridor, only Saint Bernard High School would be subject to significant unavoidable impacts associated with construction traffic and equipment noise.

SPAS-PC00130-743

Comment:

In 2009-10 LAWA investigated some interim runway safety improvement projects which moved Taxiways W and Y and several other actions. An NOP was released in June and ARSAC comments are attached. If they are not considered part of the proposed runway option changes, why not?

Response:

The interim runway safety improvement projects to which commentor refers are discussed in Section 3.3 in Appendix H-6 of the Preliminary LAX SPAS Report. The interim runway safety improvement projects, which include reconfigured taxiways, provide the basis for and are incorporated into Alternative 2.

SPAS-PC00130-744

Comment:

Although LAWA has inadequate funding to construct all of the program projects that it wishes, approval of any Master Plan expanding north may have consequences for surrounding communities even before delayed projects are built. Schedule uncertainty can devastate businesses which would defer new projects. It would hurt property owners as businesses vacate to more stable environments, and resident values would suffer anticipated impacts.

Response:

The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. The project's economic or social effects shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Moreover, the commentor provides no substantiation for the claim that schedule uncertainty would devastate businesses or defer new projects. Please see Response to Comment SPAS-PC00189-4 regarding impacts to property values. Please see Chapter 8 of the Preliminary LAX SPAS Report for a discussion of cost estimates and funding for the SPAS alternatives.

SPAS-PC00130-745

Comment:

PROCEDURAL ISSUES.

The initial NOP (Reference 1) calls for "project tiering" and use of prior data and studies as justification for specific project approvals. The revised NOP amends and supplements the initial one from 2008. The revised NOP states that conditions studied in support of the approved Master Plan Alternative D have changed. The Revised NOP Section 2, Project Background, acknowledges several major changes. Although it lists six specific items, far more items are of consequence, such as LAWA's purchase of the Manchester Square and Belford Square communities and numerous new development projects proposed and/or completed within the area of LAX impact. We call on LAWA to prepare a complete environmental study that does not rely on any old data and includes all of the known potential impact projects and the reasonably foreseeable [that is all that is required] worst case scenarios for projects on LAWA owned or controlled land.

Response:

The content of this comment is similar to the concerns expressed in comment SPAS-AL00007-41; please refer to Response to Comment SPAS-AL00007-41. Additionally, please note that Chapter 5 of the SPAS Draft EIR identifies all past, present, and reasonably foreseeable projects with potential impacts related or cumulative to the SPAS alternatives. Property acquisition at Manchester Square/Belford is specifically discussed in Section 5.3.4 of Chapter 5. The impacts of these and all other related projects are comprehensively evaluated in Section 5.5 of the SPAS Draft EIR.

SPAS-PC00130-746

Comment:

The LAX Specific Plan distinguishes between "green lighted" projects and "yellow light" projects which require additional consideration and study. ARSAC's interest in the "green lighted" projects is how soon these can be completed. The way the "yellow light" projects delineated in Section 7.H have been addressed to date is problematic. The Stipulated Settlement calls for enumeration of the impacts for

each of the yellow light projects in Section V. paragraphs C. (minimizing impacts) and D. ("...solutions to the problems that the Yellow Light Projects were designed to address..."). Despite numerous requests for quantifiable, detailed impacts that the new project elements are to address, LAWA has failed to provide us with the requested information. LAWA provided a handout at the NOP hearings listing general nature issues that were not quantified. A more detailed, quantified list of problems should be prepared to identify those issues that each yellow lighted project was designed to address. These highlighted, quantified issues should then be used as a gauge for assessment of the project's mitigation.

Response:

Implementation of a number of non-Yellow Light Master Plan projects has been completed or is underway, including the South Airfield Improvement Project, the Crossfield Taxiway Project, and the Bradley West Project. Detailed planning and design for the Midfield Satellite Concourse Project is currently underway.

The problems the Yellow Light Projects were designed to address were identified in the 2008 SPAS NOP and the 2010 SPAS NOP. A discussion of the problems the Yellow Light Projects were designed to address is also provided in Section 2.3 of the SPAS Draft EIR. The Stipulated Settlement does not require that the problems the Yellow Light Projects were designed to address be expressed in quantitative terms. The extent to which each SPAS alternative would provide solutions to the problems the Yellow Light Projects were designed to address is addressed in Chapter 6 of the Preliminary LAX SPAS Report. The impacts associated with the SPAS alternatives are disclosed throughout Chapter 4 of the SPAS Draft EIR, and are summarized in Chapter 1.

SPAS-PC00130-747

Comment:

LAWA has provided general descriptions of the alternatives that they identified for study in the EIR and stated that cursory review will be conducted and some will receive full assessment based on their ability to meet LAWA stated objectives. Quantifiable objectives and the judgment criteria to be used to evaluate each alternative needs to be stated prior to selection of projects to be scrutinized with a full assessment and before any elements of a "preferred" alternative are selected.

Response:

The SPAS alternatives selected for full examination in the SPAS Draft EIR reflect a reasonable range, consistent with the requirements of CEQA. An EIR need not consider every conceivable alternative, but must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a)). CEQA requires a lead agency to identify any alternatives that were considered, but ultimately rejected during the scoping process and briefly explain the reasons underlying the determination. (State CEQA Guidelines Section 15126.6(c)).

The alternative discussion complies with the provisions of CEQA. The SPAS Draft EIR identified the reasons for analyzing Alternatives 1 through 9, which represent a reasonable range of alternatives. (see Sections 1.1.2 and 202 of the SPAS Draft EIR.) Section 2.3.2 of the SPAS Draft EIR describes, in substantial detail, the alternatives considered but rejected. Additionally, Chapter 5 of the Preliminary LAX SPAS Report describes the basis, nature, and characteristics of the early alternative concepts and the associated development process.

SPAS-PC00130-748

Comment:

Stipulated Settlement section D2 ("...security, traffic, and aviation activity...") calls for inclusion of substantial security elements in any design. This is not normally a required element of an EIR, but must be assessed for each alternative along with any environmental impacts created. ARSAC notes that several of the 2003 Rand Corporation security recommendations remain unaddressed, such as incorporating blast glass in the terminals. We note that Mayor Villaraigosa has recently convened a task

force on safety and security. LAWA has failed to incorporate fixes for prior security and safety issues highlighted into the planned study options. We call for LAWA to identify the design criteria which they used to ensure that LAX is safe and secure when they designed their study options. Further, we call on LAWA to incorporate community ideas of coordinated camera systems from the community presented by Arnie Corlin (short synopsis attached) as well as security improvements such as scales and cameras embedded in each of the roadway entrances to the Central Terminal Area (CTA).

Response:

Security is not an environmental impact and, therefore, is not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a Security Assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. Summaries of the findings of the Security Assessment relative to each alternative are provided in Section 6.3 of the Preliminary LAX SPAS Report. Please see Response to Comment SPAS-PC00130-75 regarding the incorporation of security measures into the design of the SPAS alternatives. Please see Responses to Comments SPAS-PC00130-424 and SPAS-PC00130-152 regarding the implementation of security issues recommended by the RAND Corporation Please see Response to Comment SPAS-PC00130-1050 for a response to the synopsis prepared by Arnie Corlin.

SPAS-PC00130-749

Comment:

LAWA is required to conduct detail evaluations of airport efficiency in accordance with the Stipulated Settlement based on the location of gates, taxiways, and other airport features. Alternative program designs need to include the details of these elements so that this requirement can be met. LAWA should also analyze the environmental impacts that would result if all terminal buildings and taxiways specified in the plan are not built or are deferred.

Response:

Section V(D)(2) of the Stipulated Settlement calls for the SPAS (among other requirements) to focus on "security, traffic and aviation activity" of the SPAS alternatives, and the Preliminary LAX SPAS Report meets this requirement. Chapter 6 of the Preliminary LAX SPAS Report expressly evaluates the security, traffic, and aviation activity associated with each alternative.

There is no requirement in the Stipulated Settlement to conduct "detailed evaluations of airport efficiency" based on the location of gates, taxiways, and other airport features. The SPAS Draft EIR impacts analysis does, however, account for such factors related to aircraft operations, as included in the airport simulation modeling (SIMMOD) described on page 4-91 of the SPAS Draft EIR. The results of the SIMMOD modeling were used in the modeling of aircraft noise impacts and airfield-related air quality impacts associated with the SPAS alternatives.

The commentor requests that the EIR evaluate an alternative that does not build or defers all terminal buildings and taxiways in the plan (presumably the LAX Master Plan). This alternative would be infeasible because it would not accomplish any of the fundamental project objectives.

Further, this alternative would essentially be a "no build" no project alternative calling for no further airport construction. However, LAWA has the discretion to develop a no project alternative that describes existing conditions plus "what would be reasonably be expected to occur in the foreseeable future if the project were approved, based on current plans and assumptions." (State CEQA Guidelines Section 15126.6(e)(2)). When a proposed project is the revision of a plan, the Guidelines (Section 15126,6(e)(3)(A)) specifically provide that the no project alternative shall be the continuation of the existing plan into the future. For these reasons, the SPAS Draft EIR designates Alternative 3, which calls for LAX Master Plan projects to be implemented as originally envisioned, as the no project alternative.

SPAS-PC00130-750

Comment:

LAWA has separated the north runway complex from other design features and has told ARSAC that they plan to mix/match the north runway plan portion (i.e. airside) with the landside design (i.e. terminals, parking garages, etc.) option of choice. ARSAC is concerned that insufficient attention is being paid to landside projects. Only a narrow range of options is provided for vehicle traffic mitigation and elements, such as the Automated People Mover (APM) system, and it is not described with sufficient detail. One example is the APM-to-terminal interface in the Central Terminal Area.

Response:

The comment does not present specific alternatives that the commentor believes the SPAS Draft EIR should have considered.

The SPAS Draft EIR includes and addresses a broad range of landside (ground transportation system) improvement options. Alternatives 1 and 2 propose ground transportation system improvements that include development of an Intermodal Transportation Facility (ITF), parking at Manchester Square, and an elevated/dedicated busway to connect these facilities to the CTA, as well as to the future Metro Crenshaw/LAX Transit Station. Alternative 3 proposes an extensive array of ground transportation system improvements and modifications, including closing the CTA to private vehicles, development of a Ground Transportation Center (GTC), an Intermodal Transportation Center (ITC), a consolidated rental car (CONRAC) facility, two automated people mover (APM) systems, modifications to public parking areas, and construction of a west employee parking facility. Alternative 4 includes a CONRAC and construction of a parking structure at Continental City. Alternative 8 includes an ITF, a CONRAC and parking at Manchester Square, and an elevated/dedicated busway system to connect these facilities to the CTA, as well as connect with the future Metro station mentioned above. Alternative 9 offers improvements similar to Alternative 8, but proposes an elevated APM instead of the busway. There is a certain amount of interchangeability between some of the alternatives relative to the improvements described above. Based on the above, the public and decision-makers have a broad range of landside improvement options to consider for the SPAS.

SPAS-PC00130-751

Comment:

Since this is not a normal EIR but part of a settlement required SPAS Study, the identification of major cost factors should be identified. Examples include, but are not limited to, impacts from eminent domain powers, the costs of such exercise, the cost of dealing with existing tunnels, hydrology impacts, external infrastructure requirements, and construction phasing.

Response:

Preparation of an EIR for SPAS is required by Section 7.H of the LAX Specific Plan and is subject CEQA and the State CEQA Guidelines. The Stipulated Settlement includes additional requirements pertaining to SPAS, but does not mandate provisions concerning preparation of the EIR beyond stating, in Section V.E, that SPAS will be prepared pursuant to CEQA. Please see Response to Comment SPAS-PC00130-730 regarding CEQA requirements pertaining to the treatment of economic conditions in an EIR, including costs of proposed improvements. Although cost estimates are not a CEQA consideration, cost estimates were prepared during SPAS and are provided in Chapter 8 of the Preliminary LAX SPAS Report, with details included in Appendix G.

SPAS-PC00130-752

Comment:

Please annotate the Monitor Mitigation Reporting Program document prepared annually by LAWA addressing the Alternative D LAX Master Plan environmental mitigation commitments; commitments made as part of the out-of-court settlement agreement with the LAX Coalition (such as the air quality apportionment study); and commitments in Stipulated Settlement Agreement and then show how these

actions were (and will be) used in the establishment of criteria for the ultimate selection of options to be assessed.

Response:

The development concepts addressed in the SPAS Draft EIR provide a broad range of options for the public and decision-makers to consider relative to alternatives to the Yellow Light Projects associated with the LAX Master Plan, and were formulated based on the process described in Chapters 2 through 5 of the Preliminary LAX SPAS Report. It is unclear from the comment how or why a review of the LAX Master Plan Mitigation Monitoring and Reporting Program annual report, LAX Community Benefits Agreement commitments, and LAX Master Plan Stipulated Settlement Agreement commitments would provide criteria for the selection of alternatives to be assessed in the SPAS Draft EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-753

Comment:

ARSAC has, over the past five years, presented numerous runway safety and efficiency improvement projects that do not require movement of runways. If LAWA is to engage non-runway airside improvements (i.e. FAROS as in Long Beach or improved aircraft tracking with enhanced ground radar; in-cockpit airport moving maps and Electronic Fight Bags) into its plans, then how will LAWA calculate the improved efficiency for each of the options that it finally analyzes?

Response:

The types of measures suggested in the comment are within the control and jurisdiction of the FAA. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

SPAS-PC00130-754

Comment:

DESIGN OPTION ISSUES.

The possibility of installing another control tower is not addressed in any option. There have been reports in the news that LAWA and the FAA are investigating how to mitigate blind spots from the control tower at TBIT. Similar studies are necessary for the midfield terminal before it is built. To assure optimal airfield safety, Tower Controllers must have unobstructed views of the airfield to have appropriate situational awareness of aircraft and vehicles. Changes of this magnitude can impact any airside efficiency study and must be discussed in the EIR. Numerous option conditions needing study are noted in the attachments and are incorporated as a part of these comments.

Response:

Potential Air Traffic Control Tower (ATCT) line-of-sight issues are determined in conjunction with detailed planning and design. The SPAS alternatives provide development concepts for consideration at the program level. The selection and approval of a particular alternative, if any, would be followed by the preparation of more detailed plans, which would address any potential tower line-of-sight issues in consultation with FAA and ATCT staff.

SPAS-PC00130-755

Comment:

How is LAWA intending to address the environmental impacts of major safety issues such as finalizing installation of the Runway Status Lights, new roadway signs, redesign of the CTA curb areas, and other airfield safety fixes?

Response:

As indicated on page 4-502 of the SPAS Draft EIR, installation of Phase I of the Runway Status Lights program at LAX was completed in 2009 and Phase 2, for completion of the system, will occur based on FAA funding. New roadway signs are not currently proposed as part of SPAS; however, the provision of new roadway signs in and around the CTA would be evaluated in conjunction with more detailed project planning and design for the ground transportation system improvements proposed under the approved alternative, if any. The same would be true relative to any redesign of the CTA curb areas. The environmental impacts of the airfield safety improvements associated with each SPAS alternative are addressed throughout the SPAS Draft EIR.

SPAS-PC00130-756

Comment:

Is LAWA preparing a cost-benefit analysis comparing the costs of extended maintenance versus replacement of facilities such as the parking structures or pedestrian bridges from the structures to the terminals? ARSAC has identified and LAWA has acknowledged maintenance issues in the parking structures, CTA roadway, and pedestrian bridges (although there may be disagreement as to the extent of resolution required). Is LAWA planning to factor in the maintenance costs when deciding if it is desirable to modify traffic flow in the CTA? For instance, it is recognized that the passenger bridges are in need of repair. Has LAWA considered replacing them entirely with a much wider bridging structure to accommodate all foot traffic above the ground level in the CTA? We understand that closing the ground level to pedestrians would greatly improve traffic flow. Also, what reviews and options have been considered to create a third level on the CTA roadway for buses and VIP vehicles that could be used as an emergency evacuation path? Has LAWA considered moving bus and other commercial vehicle drop offs to the parking structures? How would that change the traffic flows and resultant EIR evaluations?

Response:

Please refer to Response to Comment SPAS-PC00130-411 regarding maintenance of the LAX second-level roadway. Ongoing maintenance and miscellaneous improvements were considered in the cumulative impacts analyses provided in Chapter 5 of the SPAS Draft EIR. (Section 5.3.2 of the SPAS Draft EIR.) Please see pages 5-17 through 5-22 for a description of the ongoing and planned maintenance-related improvements at LAX. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. As noted in that response, CEQA does not require a cost-benefit analysis as suggested by the commentor. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nonetheless, rough-order-of-magnitude cost estimates for the SPAS alternatives were developed as part of SPAS. The cost estimates are discussed in Chapter 8 of the Preliminary LAX SPAS Report, with detailed information provided in Appendix G.

The commentor provides no evidence or factual support for the proposition that the passenger bridges are in need of repair. The replacement of passenger bridges with wider bridging structures is not proposed as part of the SPAS alternatives. The SPAS Draft EIR analyzes the alternatives at a programmatic level. As discussed in Section 2.3.1 of the SPAS Draft EIR, specific project-level details are unknown. However, if an alternative is selected, further review would be conducted. For example, SPAS Alternative 9 includes an APM system which would access the CTA above the elevation of the departures level roadway and existing parking structures. Should the selected alternative include an APM system within the CTA, future detailed project level planning would include assessments of track alignments for the system's guideway, the location and number of stations, and passenger connectivity between terminals and APM stations. Depending on the final alignment of an APM system and the location of the stations, use of the existing pedestrian bridges may be evaluated to assess if they could be integrated with the APM system. In addition, as presented in Section 4.12.1.6.2 on pages 4-1094 through 4-1096 of the SPAS Draft EIR, when non-SPAS facility improvements, such as the Midfield Satellite Concourse Passenger Processor, Terminal 1.5 and Terminal 2.5, undergo detailed project level planning, existing and new elevated pedestrian connections to the public parking structures will be evaluated. As part of these future planning efforts, LAWA may consider pedestrian bridge capacities and assess future needs, including the addition of concession facilities and passenger check-in capacity within wider pedestrian bridge structures.

The commentor provides no evidentiary support for the proposition that closing the ground level to pedestrians would greatly improve traffic flow or eliminate a significant impact. Moreover, the comment does not raise any new significant environmental issue or address the adequacy of the environmental analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). The analysis of on-airport traffic in Section 4.12.1 of the SPAS Draft EIR did not identify any significant impacts that would be eliminated or minimized by closing all at-grade pedestrian crossings of the arrivals level outer roadway between the public parking structures and the terminal buildings within the CTA. While eliminating at-grade pedestrian crossing on the arrivals level outer roadway should allow the number of existing traffic signals to be reduced, there is no evidence to suggest that this change would equate to an improvement in traffic flow within the CTA. The existing traffic signals create gaps in traffic which, during peak activity periods, limit the number of vehicles adjacent to a given section of curbside. This allows vehicles to more easily access and depart the outer curbside and the slip-ramps between the arrivals level inner and outer roadways. Another consideration associated with eliminating at-grade pedestrian crossing on the arrivals level outer roadway is the need for additional vertical circulation capacity for passengers (including baggage) on both sides of the roadways. The physical constraints at LAX, including limited offsets between the existing public parking structures and the roadway and limited space within the existing terminals for additional vertical circulation projects (i.e., elevators and escalators), make implementation of such projects exceedingly difficult and costly, and any construction is likely to generate significant circulation problems.

SPAS-related roadway improvements have been developed at a program level of planning for SPAS. Detailed design of the roadway improvements within the CTA, including the need for and physical constraints in providing for additional evacuation routes, will be determined during project-level planning and engineering design. Please see Response to Comment SPAS-PC00130-150 regarding the suggestion of a potential addition of a third level roadway for buses and emergency vehicles. Please see Response to Comment SPAS-PC00130-217 for a discussion of emergency response plans and services.

Relocating bus and commercial vehicle drop-offs to the parking structures is not proposed as part of the SPAS alternatives. As provided in Section 4.12.1 of the SPAS Draft EIR, with the addition of Mitigation Measure MM-ST(OA) (SPAS)-1, the SPAS alternatives would have no significant impact to on-airport traffic. The commentor does not provide any evidence that relocating bus and commercial vehicle drop-off areas to the parking structures would eliminate a significant on-airport traffic impact.

Further, relocating bus and commercial vehicle drop-off areas to the parking structure would have a number of disadvantages. The existing public parking structures provide a maximum vertical clearance of eight feet, two inches, which limits the commercial vehicles that could enter the structures. Low ceiling height and limited ventilation, coupled with the increase in the number of vehicles operating within the garage at any given time, would have to be considered. Additionally, relocating commercial modes to the public parking structures would increase the number of passengers who would be required to cross the arrivals level outer roadway. As part of Options 1, 2, and 4 documented in the LAX GTS Report (on pages 9, 10, and 15, respectively) , consideration was also given to relocating passenger pick up by private vehicles to inside the public parking structures; however analyses showed that vehicle queues at the garage entrances would adversely impact traffic flow on the arrivals level roadway. Relocating commercial vehicle traffic to the public parking structures would require that new exits, and in some cases new entrances be constructed on the ground level of the structures. These would be necessary to allow a commercial vehicle picking up passengers within the public parking structure at one terminal to exit and then drive to the next terminal's public parking structure to pick up additional passengers. Currently, none of the public parking structures within the CTA have an exit onto either World Way North or World Way South which commercial vehicle use to circulate within the CTA.

SPAS-PC00130-757

Comment:

Mandated air quality studies have not been completed as scheduled but are an important part of the assessment of air quality impacts. Particle matter monitoring and assessment is a requirement for study in this DEIR. We want to ensure that LAWA includes the impacts of 0.1 micron particle size as shown to

be important in the UCLA study of LAX air quality in June 2007. See the extended comments in the Reference 2 comments to the 2008 LAX NOP.

Response:

Please refer to Response to Comment SPAS-PC00130-36 for a discussion of the status of the LAX Air Quality and Source Apportionment Study (AQSAS). Particulate matter impacts, as PM10 and PM2.5, are included in the air quality impact analysis presented in Section 4.2 of the SPAS Draft EIR. Please refer to Response to Comment PC00130-225 for a discussion of ultrafine particles (PM0.1) and the 2007 UCLA study.

Air quality-related comments contained in the commentor's comment letter on the 2008 SPAS Draft EIR NOP are comments SPAS-PC00130-826, 829, 830, 831, 879, 923, and 946 below. Please refer to the Responses to Comments SPAS-PC00130-826, 829, 830, 831, 879, 923, and 946.

SPAS-PC00130-758

Comment:

LAWA has indicated that it plans to assume displaced thresholds at each end of the northern runway, Runway 24 R. Although we are told that the portion of runway beyond the threshold limit will not be utilized for take-offs on either end, we cannot assume that these displaced thresholds won't be summarily removed and/or mid-field take offs facilitated by the longer runways. How does LAWA intend to account for threshold changes and mid-runway takeoffs in the environmental review?

Response:

The displaced threshold proposed for the Runway 6L end in numerous SPAS alternatives is intended to remove residences on the west end from the Runway Protection Zone (RPZ) for arriving aircraft. The displaced threshold proposed for the Runway 24R end is to preserve existing aircraft landing heights for aircraft arriving from the east. Implementation of a displaced threshold reduces the length of pavement available to a landing aircraft to less than the physical length of the runway. This is published by the Federal Aviation Administration (FAA) through the use of declared distances. For a complete explanation of declared distances, please refer to Response to Comment SPAS-PC00130-437. For example, Alternative 1 establishes dual displaced landing thresholds to shift the existing approach RPZ for Runway 6L eastward by 104 feet and would shift the existing approach RPZ for Runway 24 R westward by 604 feet. That westward shift should place the RPZ outside of any existing residential development (i.e., residences located east of Runway 24R would no longer be within the RPZ). (See page 4-513 of the SPAS Draft EIR.) The use of displaced thresholds will ensure compliance with FAA Advisory Circular 150/5300-13A, which specifies that residential and commercial uses are not permissible in an RPZ without further evaluation by the FAA. (See page 72 of FAA Advisory Circular 50/5300-13A, Section 4.7.2.6 of the SPAS Draft EIR, and Section 3.1.2 of the Preliminary LAX SPAS Report.)

Additionally, Runway 6L/24R is primarily an arrival runway. While departures may occur on the runway in various circumstances, the proposed design of the entrance and exit taxiways in the SPAS alternatives ensures that aircraft departing from Runway 6L/24R will be departing from the runway ends. All other taxiways for Runway 6L/24R are high-speed exit taxiways.

All SPAS Alternatives, including those that proposed modifications to the runways and which include displaced thresholds, were analyzed for environmental impacts throughout the SPAS Draft EIR. As far as "mid-runway" takeoffs are concerned, these are fairly rare and are discouraged by the FAA as a standard operating practice. A mid-runway takeoff (which is essentially a departure from any point on a runway except the very end), can be requested by a pilot. It is almost exclusively requested by pilots of small aircraft that do not require the full runway length to take off. Therefore, mid-runway takeoffs were not assumed in the SPAS Draft EIR simulation modeling for airfield operations or aircraft noise.

SPAS-PC00130-759

Comment:

Terminal 0 and use of Park One needs refinement and resolution before options are fixed.

Response:

The commentor provides no indication of what refinements are needed and/or what problems and issues need to be resolved relative to Terminal 0 and use of Park One. As such, it is not possible for LAWA to develop a specific response to this comment. However, all of the SPAS alternatives evaluated in the SPAS Draft EIR are conceptual and are analyzed at a program-level of detail. Additional, project-level design and refinement would occur prior to implementation of any component of any of the SPAS alternatives.

SPAS-PC00130-760

Comment:

LAWA knows that parking structures and pedestrian bridges are in poor condition and has discussed creating larger bridges above the ground level to improve vehicle traffic flow. LAWA has discussed using bridges as pathways to the terminals that are wide enough to include concessions and even allow for self check-in kiosks (that is becoming more normal in the airline industry) that could ultimately pay for these improvements. It would also free up space in the terminals. Why are they not included in the options to improve LAX?

Response:

Please see Response to Comment SPAS-PC00130-756 regarding maintenance of parking structures and pedestrian bridges, as well as improvements to pedestrian bridges to incorporate concessions and passenger check-in functions.

SPAS-PC00130-761

Comment:

The described roadway designs are very basic and ARSAC wants more detail on what improvements are expected to result. A roadway to TBIT directly out of the Central Terminal Area is an improvement, but why have other suggestions that have been made, such as a third level to separate buses and VIP vehicles, that would serve as emergency lanes and evacuation routes not been addressed? Why are evacuation routes, especially from the CTA, for various potential disasters not included?

Response:

In compliance with CEQA, the SPAS Draft EIR evaluates the proposed alternatives at a programmatic level. Any potential impacts associated with the proposed improvements and modifications will be analyzed further during project-level review, when design and engineering plans become available. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) This includes all potential modifications to the CTA, such as evacuation routes. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic level of review.

Specific on-airport roadway improvements associated with the proposed SPAS alternatives and non-SPAS improvements are described on pages 4-1090 through 4-1093 and pages 4-1094 through 4-1096 in Section 4.12.1.6 of the SPAS Draft EIR, respectively. The results of the on-airport traffic analysis for each of the SPAS alternatives, which is based on these improvements, are provided in Section 4.12.1 of the SPAS Draft EIR. SPAS-related roadway improvements have been developed at a program level of planning for SPAS. Detailed design of the roadway improvements within the CTA, including the need for and physical constraints in providing for additional evacuation routes, will be determined during project-level planning and engineering design. Please see Response to Comment SPAS-PC00130-150 regarding the suggestion of a potential addition of a third level roadway for buses and emergency

vehicles. Please see Response to Comment SPAS-PC00130-217 for a discussion of emergency response plans and services.

SPAS-PC00130-762

Comment:

Why have surrounding area roads outside of the CTA have not been addressed in the document to fix flows during peak hours? LAWA should present data to show the extent of vehicles entering the CTA by direction during the peak hours and adjust their designs accordingly.

Response:

The existing and projected flow of traffic within the CTA was among the considerations during the development of the SPAS alternatives. Baseline and projected traffic volumes at curbside locations within the CTA are presented in Tables 4.12.1-16 and 4.12.1-17 on pages 4-1107 through and 4-1110 of the SPAS Draft EIR. The results of the curbside impact analysis presented in Table 4.12.1-41 on page 4-1167 through 4-1169, show that one location (the inner curbside at TBIT on the arrivals level) would be significantly impacted under all alternatives under Future (2025) with Alternatives conditions. The impact would be mitigated, however, with the implementation of mitigation measure MM-ST(OA)(SPAS)-1 described on page 4-1178 of the SPAS Draft EIR.

Section 4.12.1 of the SPAS Draft EIR presents an extensive analysis of operations and potential impacts within LAX, within and beyond the CTA. Section 4.12.2 of the SPAS Draft EIR presents an extensive traffic analysis to analyze the potential for impacts to occur on roads outside the CTA. The study area extends several miles to the south, east and north of LAX. For each location where a significant traffic impact was identified, Sections 4.12.1.10 and 4.12.2.7 identify potential mitigation measures and, where feasible, recommend their implementation.

SPAS-PC00130-763

Comment:

The FAA has granted waivers to use the taxiways that were designed for smaller aircraft in the 1960's in the proximity of terminals. Since larger Group V aircraft (i.e. Airbus A340-600 and Boeing 777-300ER) and Group VI aircraft (i.e. Airbus A380, Antonov An-124 and An-225, Lockheed C-5 Galaxy) require special handling procedures. We understand that they restrict free flow of aircraft to the runways. Why do none of the options to move a runway north address this critical taxiway efficiency issue?

Response:

The SPAS Draft EIR presents many alternatives that address taxiways and runways for Aircraft Design Group (ADG) V and VI aircraft. The descriptions for these alternatives can be found in Section 2.3.1 of the SPAS Draft EIR. In particular, the Alternative 5 airfield meets the minimum design requirements for a full ADG VI airfield, including an ADG VI Category II/III outboard runway and an ADG VI Category I inboard runway. Taxiway E and Taxilane D dimensions would meet ADG VI standards.

SPAS-PC00130-764

Comment:

What will be the Automated People Mover location and how will it facilitate traffic improvements? LAWA has discussed several locations including part of Park One, the parking structures, and terminal roofs. How will each of these options impact flow in the CTA? The structural integrity of existing structures that will be expected to carry the additional weight must be addressed in the DEIR.

Response:

The Automated People Mover (APM) proposed as a part of Alternatives 3 and 9 are depicted and described in Chapter 2 of the SPAS Draft EIR, and have been developed at a program level of planning for SPAS. These alternatives do not define the final APM system alignment and station locations within

the CTA or the system technology. The SPAS Draft EIR includes two alternatives - Alternatives 3 and 9 - that would extend an APM system into the CTA. These alternatives, as well as the other alternatives addressed in the SPAS Draft EIR, are at a program level of planning and design. The alignment and design of the APM line(s) within the CTA will be determined and addressed at the project level, should one of those alternatives be approved. Issues relating to design considerations, such as structural integrity of the proposed system, would be addressed in project-level design and environmental review. Please also see Response to Comment SPAS-PC00130-816.

The APM systems proposed by LAWA to connect airport facilities outside of the CTA with the terminal area would replace a number of LAX and commercial shuttles accessing the CTA. With implementation of an APM, buses serving new facilities like the ITF, GTC, and CONRAC, as well as some other of commercial modes and about five percent of the private vehicles currently accessing the CTA, would no longer access the CTA. Instead, the passengers would be dropped off or picked up at the new facilities, and would use the APM system to connect to the CTA. The APM system would have higher capacities and operate with higher average passenger loads than would the commercial vehicles that would otherwise access the CTA. Consequently, the use of an APM system would result in a net decrease in the number of commercial vehicles accessing the CTA.

SPAS-PC00130-765

Comment:

Only movement of Consolidated Rental Car Facility (ConRAC) to Manchester Square is described in the NOP and no other options are shown in the NOP. A ConRAC should significantly reduce bus traffic into the CTA by reducing the number of bus trips required to pick up and deliver rental car clients to one location. What is the specific location proposed in Manchester Square for ConRAC placement and how will people be moved to the CTA? What will be the anticipated vehicular traffic flow from the ConRAC and how is this modeled in the overall assessments of traffic for LAX?

Response:

Please see Response to Comment SPAS-PC00130-185 regarding which SPAS alternatives include development of a CONRAC and the location under each such alternative. Please see Appendix E2-2 of the Preliminary LAX SPAS Report for a discussion of alternatives that include a CONRAC, and Figures 2-8 and 2-9 of the SPAS Draft EIR for the specific location of the CONRAC facility in Manchester Square under Alternatives 8 and 9. Under Alternative 8, a dedicated busway will be constructed and move people between Manchester Square and the CTA. Similarly, in Alternative 9, an automated people mover will provide transportation between Manchester Square and the CTA. (See Section 2.3.1.9 of the SPAS Draft EIR.)

The traffic analyses for on-airport traffic impacts and off-airport traffic impacts both took into account the absence or the presence and location of a CONRAC under each of the SPAS alternatives (specifically, Alternatives 1, 2, 3, 4, 8, and 9, which propose ground access system improvements). Please see Section 4.12 of the SPAS Draft EIR for a discussion of each alternative that included a CONRAC, the assumptions used in the analysis, and the results of evaluation.

SPAS-PC00130-766

Comment:

Measures to reduce the use of rolling billboards (rental car and hotel buses) trips through the CTA must be addressed, as they distract drivers and thus create safety hazards.

Response:

The comment is noted. Please see Response to Comment SPAS-PC00130-398 regarding LAWA's trip reduction programs for both rental car and hotel shuttle operators. Furthermore, these trips occur under existing conditions which are not impacts of the SPAS alternatives. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a); Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App.4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far

beyond its scope"].) The City of Los Angeles adopted a new ordinance in 2012, which provides for the removal of mobile billboard advertising displays; codified under Los Angeles Municipal Code Section 87.53. Such displays include advertising displays that are attached to a mobile, non-motorized vehicle, device, or bicycle that carries, pulls, or transports a sign or billboard, and is for the primary purpose of advertising. Additional regulations for motor vehicles which contain advertising affixed to the body of the vehicle, are provided under Los Angeles Municipal Code Section 87.54. These regulations preclude advertising which makes the vehicle unsafe to be driven.

SPAS-PC00130-767

Comment:

What kinds of traffic impacts are anticipated from the additional uses of Manchester Square, Belford Square and the areas between 96th Street and 98th Street? Are there plans by LAWA to help make these areas walkable from the hotels? Please describe them. Also what levels of vehicle traffic are anticipated to be added?

Response:

The future uses planned for Manchester Square vary by SPAS alternative and include parking (Alternatives 1-2), a Ground Transportation Center (Alternative 3) or parking and a consolidated rental car facility (Alternatives 8 and 9), and the traffic impacts associated with those uses are included in the transportation impact analyses of each alternative included in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR.

The comment also asks how future plans for the Belford area are addressed in the traffic impact analysis for the SPAS Draft EIR. No future land uses are assumed for the Belford area in the SPAS Draft EIR as LAWA has no development plans at this time for this property; any assumptions regarding future land uses would be purely speculative. The impacts of the SPAS alternatives are, and can be evaluated without considering future uses for the Belford area. Impacts associated with any future development of the Belford area would be addressed in CEQA documentation prepared at such time as development is proposed. Please also see Response to Comment SPAS-PC00130-216 for discussion of cumulative impact analysis methodology for transportation impacts. With regard to the question about "plans by LAWA to help make these areas walkable from the hotels," it is expected that future development there would be consistent with the objectives of the LAX Street Frontage and Landscape Development Plan Update that are listed in on page 4-12 in Section 4.1.3.1.1 of the SPAS Draft EIR, specifically, the enhancement of pedestrian, bicycle, and vehicular circulation on streets internal to or surrounding LAX.

SPAS-PC00130-768

Comment:

How will the Metro plans for a train system to LAX be accounted for in the LAX planning and the EIR? What train assumptions are made (both routes and stations)?

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00130-769

Comment:

Explain the effects the Next Generation Air Traffic Control System (NextGen) Performance-Based Navigation (PBN) may have on the environmental impact conclusions of this program level study- especially aircraft safety, aircraft traffic flows, noise, pollution (from airfield taxiing impacts and from changes to air approaches and take offs for both easterly and westerly operations), etc. Please map out the change in noise and pollution impacts for the surrounding areas. The maps should highly newly impacted areas and any increases of decreases in currently affected areas. What will be the noise and

pollution mitigation plans? Discussion of NextGen considerations need to include design and implementation of automated flight paths as well as for airspace design and obstacle clearance via Radar Area Navigation (RNAV) procedures in place and anticipated and Required Navigation Performance with on-aircraft performance and alerting capability (RNP). What percentage of Continuous Descent Approach and Tailored Arrivals are assumed now and in the future? Please address this topic in relationship to anticipated implementation per the chart below from the FAA website

(http://www.faa.gov/news/fact_sheets/news_story.cfm?newsId=8768):

Graphic in original Comment Letter in Attachment 5.

Several additional design option questions are listed in the 2008

Response:

Please see Section 2.3.2.4 of the SPAS Draft EIR and Section 5.7.4 of the Preliminary LAX SPAS Report regarding consideration of the Next Generation Air Transportation System relative to SPAS alternatives.

SPAS-PC00130-770

Comment:

What is the assumed fleet mix for the DEIR? Please list the make and model of aircraft including engine make and model and Auxiliary Power Unit (APU) make and model cross-referenced by airline. Include the current and expected fleet mixes.

Response:

The commentor is inquiring about the current and expected fleet mixes assumed in the SPAS Draft EIR analyses. Please refer to Appendix F-1 of the Preliminary LAX SPAS Report regarding the assumed 2009 Design Day Flight Schedule (DDFS) fleet mix (Table 8 on page 18) and the projected 2025 DDFS fleet mix (Table 12 on page 26). Tables 8 and 12 list the fleet mixes by Aircraft Design Group (ADG).

In response to the comment for additional details, expanded tables containing the assumed 2009 and 2025 DDFS fleet mixes by ADG and by aircraft type are provided below in Tables 1 and 2, with the key to aircraft codes provided in Table 3.

Appendix F-1 was prepared to evaluate passenger activity that may be projected to occur under the alternative airfield and terminal configurations at LAX analyzed in the SPAS Report from 2009 through 2025. Appendix F-1 did not contain engine makes and models because such information is typically part of large simulation input databases used in modeling aircraft noise and air quality, as opposed to passenger and operation forecasts. Engine makes and models are assigned by the Integrated Noise Model (INM) based on aircraft types. The Federal Aviation Administration (FAA) created a list of engine makes and models to be assumed in noise modeling as part of the model input database. In INM, each INM aircraft type is assigned an engine make and model. As discussed on page 5 in Section 2.3.3 of Appendix J1-1 of the SPAS Draft EIR, for aircraft not included in the INM aircraft database, the FAA developed a list of approved aircraft substitutions for use in the INM.

With regard to air quality modeling in EDMS v.5.1.3, FAA has identified the most common engine used with the majority of aircraft listed in that model, and those engines are used in the air quality modeling. Several commercial aircraft do not have a common engine identified, therefore, professional judgment was used to select the engine. EDMS also includes default APU assignments for each aircraft, the defaults are used in the air quality analysis. The final aircraft engines and APUs used in the air quality impact analysis are included in Table 3 noted above.

Appendix F-1 does not provide information about which aircraft would be operated by which airline because this information is not available at this time, and it would be speculative to make such assumptions. An EIR's project description should not provide extensive detail beyond that needed for

evaluation and review of a project's environmental impacts. (State CEQA Guidelines Section 15124.) Also, for the purposes of the analysis in the SPAS Draft EIR, including operational analysis, noise, and air quality, it was not necessary to identify the airlines associated with specific aircraft. The information disclosed and analyzed was sufficient to provide decision-makers with information which enables them to make a decision which intelligently takes account of the project's environmental consequences. (See State CEQA Guidelines Section 15151.)

[1] Not in EDMS v.5.1.3. Flight profile based on B767-300 with CF6-80C2B7F 1862M39 engine. Assumed same APU as B777.

Source: Ricondo & Associates, Inc., October 2012.

SPAS-PC00130-771

Comment:

What is the assumed flight schedule for the DEIR? Please include the current schedule and future expected schedule. The schedule should include time, origin or destination airport, airline, aircraft make and model, engine make and model and APU make and model.

Response:

Please note that this comment requests information on flight assumptions much more detailed than that needed to assess the environmental impacts of the SPAS alternatives. An EIR's project description should not provide extensive detail beyond that needed for evaluation and review of a project's environmental impacts. (State CEQA Guidelines Section 15124.) Nevertheless, additional details on flight assumptions requested by the comment are presented below.

Please refer to Sections 3 and 4 in Appendix F-1 of the Preliminary LAX SPAS Report regarding the assumptions, methodology, and results of the development of the 2009 and 2025 Design Day Flight Schedules. In response to the comment, the entire 2009 and 2025 DDFSs are provided in tabular format below (Tables 1, 2, 3, and 4). As requested, time, origin and destination airport, airline and aircraft make and model were provided.

Refer to Response to Comment SPAS-PC-00130-770 regarding information on engine makes and models, and auxiliary power units (APU) makes and models assumed in the SPAS Draft EIR analyses.

SPAS-PC00130-772

Comment:

For each aircraft make and model, please provide noise and pollution data for each engine configuration and APU. The noise and pollution tests should be conducted from 50 feet, 100 feet, 500 feet, 1,000 feet, 1/2 mile and 1 mile every 30 degrees from a centerpoint of the aircraft. The tests should also collect the noise and pollution data at different power levels- start, taxi, takeoff, cruise and landing.

What substances are being emitted by the engines and the APU's? Please describe the toxics. In what quantities? Are any of these substances toxic to human beings?

Response:

The methodology suggested by the commentor is not the industry or government standard for emissions analysis. The database of aircraft emission indices for each engine is included in the Federal Aviation Administration's Emissions and Dispersion Modeling System (EDMS). This model is required for use in determining air quality impacts from airports for regulatory purposes 1. The database is also available from the International Civil Aviation Organization (ICAO), on the European Aviation Safety Agency web site 2. These emission indices provide the pollutant emissions from aircraft in grams of pollutant per kilogram of fuel burned in four operating modes: takeoff, climbout, approach, and taxi/idle. The current version of the EDMS model, v.5.1.3, also contains aircraft specification data that indicates the amount of time each airframe needs to takeoff, climbout, and land. The airport simulation modeling with (SIMMOD) is used to determine the aircraft taxi and delay (taxi/idle) time on the ground.

Unlike noise, which radiates spherically in all directions from the noise generation point, air pollution travels in the direction that the wind is blowing at a given moment. Therefore, attempting to measure air quality impacts from aircraft is incredibly difficult since the monitors must be lined up directly downwind of an aircraft to actually obtain measurements of the aircraft engine emissions. A series of recent efforts to measure aircraft engine emissions from real world engines mounted on aircraft has been summarized in two reports prepared by the U.S. Environmental Protection Agency 3 and Transportation Research Board 4. The Transportation Research Board report concluded that the gaseous emissions of oxides of nitrogen (NOx) and carbon monoxide (CO) measured in the field study matched, within uncertainty limits, the engine certification emissions in the ICAO database noted above. In addition, these studies were used to develop the particulate matter and hazardous air pollutant emission indices that are included in EDMS v.5.1.3. Therefore, modeling aircraft emissions using EDMS v.5.1.3, as was done for the SPAS Draft EIR air quality impact analysis, should provide reasonable results for criteria and hazardous (toxic) air pollutants.

Measurements of air pollutant concentrations are routinely taken on LAX property at the South Coast Air Quality Management District Southwest Coastal Monitoring Station (also known as the LAX Hastings monitoring station), shown in Figure 4.2-1 (page 4-89) of the SPAS Draft EIR. The most recent five years of measurements from this station are included in Table 4.2-3 (page 4-100) of the SPAS Draft EIR.

The criteria air pollutants emitted from aircraft engines and APUs include CO, NOx, (a precursor compound in the formation of nitrogen dioxide, NO2, and ozone), particulate matter (PM10 and PM2.5) sulfur dioxide (SO2), and volatile organic compounds (VOC, another precursor compound in the formation of ozone). Many of the toxic air contaminants listed in Table 4.7.1-1 (page 4-432) of the SPAS Draft EIR are emitted by aircraft and APUs. A notable exception is diesel particulate matter (Diesel PM), which is only emitted from diesel engines. The toxicity profiles in Attachment 1 of Appendix G1 of the SPAS Draft EIR identify the potentially toxic effects of each of the compounds analyzed in the Human Health Risk Assessment conducted for the SPAS Draft EIR. The general health effects of criteria pollutants are summarized in Section 4.2.1.1 (pages 4-83 through 4-85) of the SPAS Draft EIR.

The concentrations of the criteria pollutants for each alternative under different operating conditions (visual flight rules and instrument flight rules) are included in Attachment 3 of Appendix C of the SPAS Draft EIR. The peak project concentrations of the toxic air contaminants are included in Attachment 2 through Attachment 5 of Appendix G1 of the SPAS Draft EIR.

SPAS-PC00130-773

Comment:

SPECIFIC COMMENTS TO INITIAL STUDY AND CHECK LIST DATED OCTOBER 14, 2010.

The Initial Study checklist notes existing zoning as A, L, and N. The LAX Plan figure 1 only designates Open Space, Airport Landside, and Airport Airside. Some of the land in these areas owned by LAWA are still RX, CX, or MX, especially on the Northside Development, Manchester Square and areas south along Aviation boulevard, and Belford Square. Has LAWA identified areas of discrepant zoning? Which properties are specifically zoned other than A, L, and N? The checklist states "conforms to Plan," but the zoning doesn't match the LAX Plan (the sub-Plan to the City General Plan).

Response:

There is no "discrepant zoning" as suggested by the commentor, and it is unclear what is meant by the designations RX, CX, and MX in the comment as there are no such designations in the City of Los Angeles Planning and Zoning Code. The LAX Plan and the LAX Specific Plan land use and zoning designations are consistent with each other, with the exception of the Belford Special Study Area, which is not shown on the LAX Specific Plan. The existing zoning and General Plan designations for LAX, including LAX Northside, Manchester Square, and areas south along Aviation Boulevard, are described in Section 4.9 of the SPAS Draft EIR. As shown in Figure 4.9-3, the existing LAX Plan General Plan land use designations are Open Space, Airport Airside, Airport Landside, LAX Northside, Special Study Area: Belford - Medium Residential, and Special Study Area: Belford - Regional Center Commercial. This figure is the same figure as LAX Plan Figure 1. The LAX Specific Plan Zoning designations, as shown in Figure 4.9-4 of the SPAS Draft EIR, are: LAX - A Zone: Airport Airside Sub-Area; LAX - L Zone: Airport Airside Sub-Area; and LAX - N Zone: LAX Northside Sub-Area. This figure is the same as LAX Specific Plan Figure 2. The LAX Specific Plan establishes development standards consistent with the LAX Plan (see Section 4.9.3.2 of the SPAS Draft EIR).

As previously described, the LAX Plan designates Belford as a Special Study Area. Belford and Manchester Square are currently undergoing voluntary residential acquisition/relocation as part of the LAWA Relocation Plan. This program was established because residents within these areas requested that LAWA purchase their properties rather than undertake soundproofing under the LAX Residential Soundproofing Program (see page 4-667 in Section 4.9.3.3 of the SPAS Draft EIR).

SPAS-PC00130-774

Comment:

In both the 2008 and 2010 checklists "Geology/Soils" was left unchecked indicating no significant issues, yet there may be issues with tunnels, sink holes, toxic elements from gas and oil, and aquifers. How is this to be accounted for in cost assessments? Specifically, the Manchester Tunnel which runs north-south from Lincoln Boulevard under Runway 24 R toward El Segundo was found to have latent moisture. Has the source of the moisture been identified? What remediation efforts will be required?

Response:

Please see Response to Comment SPAS-PC00130-1012 regarding the abandoned tunnel segment located beneath the north airfield, and Response to Comment SPAS-PC00130-51 regarding sink holes at LAX. The commentor provides no substantiation for the claim that gas and oil presents toxic elements at LAX.

SPAS-PC00130-775

Comment:

Below are specific EIR topics listed in the CEQA Check list that we ask LAWA to address specific issues.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-776 through SPAS-PC00130-797 below.

SPAS-PC00130-776

Comment:

I. Aesthetics
Light and glare studies for air traffic controllers. Light glare was cited as a factor by the controller responsible for the 1991 USAir/SkyWest ground collision at LAX.

Response:

As discussed on page 4-34 in Section 4.1 of the SPAS Draft EIR, there are several light and glare related LAX Master Plan commitments applicable to the proposed SPAS alternatives. Commitments that would reduce light and glare visible from the Airport Traffic Control Tower include the following:

-LI-2. Use of Non-Glare Generating Building Materials. Prior to approval of final plans, LAWA will ensure that proposed LAX facilities will be constructed to maximize use of non-reflective materials and minimize use of undifferentiated expanses of glass.

-LI-3. Lighting Controls. Prior to final approval of plans for new lighting, LAWA will conduct reviews of lighting type and placement to ensure that lighting will not interfere with aeronautical lights or otherwise impair Airport Traffic Control Tower or pilot operations. Plan reviews will also ensure, where feasible, that lighting is shielded and focused to avoid glare or unnecessary light spillover. In addition, LAWA or its designee will undertake consultation in selection of appropriate lighting type and placement, where feasible, to ensure that new lights or changes in lighting will not have an adverse effect on the natural behavior of sensitive flora and fauna within the Habitat Restoration Area.

Furthermore, FAA regulations (including FAA Advisory Circular (AC) 150/5300-13A, Airport Design; AC 150/5345-53D, Airport Lighting Equipment Certification Program; AC 150/5345-56B, Specification for L-890 Airport Lighting Control and Monitoring System; and others) outline the type, location, and intensity of lighting permitted at airports. These regulations have been formulated to avoid substantial interference with daytime and nighttime views from the Airport Traffic Control Tower or by pilots on the ground or in the air.

Development under the SPAS alternatives would be required to comply with the above LAX Master Plan commitments and FAA regulations.

SPAS-PC00130-777

Comment:

II. Agricultural and Forest Resources

Response:

The potential for the SPAS alternatives to impact agricultural and forest resources was addressed in Section II of the Initial Study included in the 2010 LAX SPAS EIR Notice of Preparation (NOP), provided as Appendix A of the SPAS Draft EIR. As explained therein, the project is located within a developed airport and is surrounded by airport uses, urbanized areas, and the Los Angeles/El Segundo Dunes. No agricultural or forest resources or operations currently exist, or have existed in the recent past, at the

project site or surrounding areas. Further, there are no Williamson Act contracts in effect for the project site or surrounding areas. The proposed project would represent a continuation of the current airport-related and urban uses and would not convert farmland to non-agricultural use nor would it result in any conflicts with existing zoning for agricultural use or a Williamson Act contract. Similarly, it would not result in the conversion of forest land to non-forest use. Therefore, no impacts to agricultural or forest resources would occur with implementation of the proposed project, and no mitigation measures are required. As such, in accordance with Sections 15063(C)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts to agricultural resources was not discussed in detail in the SPAS Draft EIR.

SPAS-PC00130-778

Comment:

III. Air Quality
Where is the Human Health Study promised in the LAX Master Plan commitments, LAX Coalition settlement and the Stipulated Settlement Agreement?
The DEIR should include study of PM 0.1 (one-tenth). Recent reports from AQMD indicate that these are potentially much more harmful to humans than the larger PM 2.5 particles. The study by John Froines of UCLA in 2007 highlighted the condition that the measurement of PM 2.5 particles is not a good monitor for the smaller particles.

Response:

Please refer to Response to Comment SPAS-PC-00130-36 regarding the status of the LAX Air Quality and Source Apportionment Study (AQSAS). Please refer to Response to Comment SPAS-PC00130-225 for a discussion of ultrafine particles (UFP, also known as PM0.1).

SPAS-PC00130-779

Comment:

IV. Biological Resources
Are there still any Riverside Fairy Shrimp at LAX? Where are they located? Are there any in Continental City?

Response:

As discussed in on pages 4-189 and 4-190 in Section 4.3 of the SPAS Draft EIR, it is assumed that Riverside fairy shrimp (Streptocephalus wootoni) is not present within the biological resources study area. Soil containing Riverside fairy shrimp cysts was removed from the LAX Master Plan project area pursuant to two Biological Opinions issued by USFWS in 2004 and 2005. As discussed in Section 4.7 of the Bradley West Project Draft EIR,1 wet-season surveys conducted in 2009 at potentially suitable seasonal pool habitat at the Continental City site for the Bradley West Project did not detect Riverside fairy shrimp. The Continental City site has been subsequently modified by construction activity associated with the Bradley West Project, for which it was used as the Southeast Construction Staging/Parking Area, such that it no longer supports suitable habitat for Riverside fairy shrimp.

1. Section 4.3 of the Bradley West Project Draft EIR is available at http://ourlax.org/pdf/LAX%20Bradley%20West%20Project%20DEIR%20Volume%202.pdf, accessed October 24, 2012.

SPAS-PC00130-780

Comment:

V. Cultural Resources

Response:

The impacts to cultural resources associated with the SPAS alternatives are addressed in Section 4.5 of the SPAS Draft EIR.

SPAS-PC00130-781

Comment:

VI. Geology and Soils
The stability of the soils in and around the Manchester Tunnel and Lincoln Tunnel under the North Airfield needs to be studied.

Response:

At a program level, the 2010 NOP Initial Study, attached as Appendix A to the SPAS Draft EIR, concludes that impacts of the SPAS alternatives related to soil stability would be less than significant. Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. As indicated in the topical response, evaluation of soil stability associated with the Lincoln Boulevard realignment would be conducted during detailed engineering for that project component, if it is a second-tier project proposed for implementation. Similar studies would be conducted for the North Airfield tunnel segment (referred to in this comment as the Manchester Tunnel) if it is part of a second-tier project proposed for implementation. Project-specific soil stability analyses would be presented in project-specific CEQA documents.

SPAS-PC00130-782

Comment:

VII. Greenhouse Gas Emissions

Response:

Greenhouse gas emission impacts associated with the SPAS alternatives are addressed in Section 4.6 of the SPAS Draft EIR.

SPAS-PC00130-783

Comment:

VIII. Hazards and Hazardous Materials
During the early and mid-1900s, the area surrounding Mines Field (now LAX) was largely an oil field. Active oil production was carried out in the tidal areas of Venice and Playa del Rey. Much of the area around LAX was owned by oil companies, including McCullough Oil, Superior Oil, and other oil companies. A major oil field still is in production in Baldwin Hills, and the Chevron refinery in El Segundo remains one of the most important economic forces in the region. Sepulveda Blvd. at its intersection with Westchester Parkway and Lincoln Blvd. is believed to be a location where numerous major oil pipelines converge. If the perimeter fence of LAX is extended outward to accommodate the north movement of the runways it will likely require the relocation of major petroleum pipelines which will have a large environmental and financial cost.

Response:

Please see Topical Response TR-SPAS-LR-1 regarding the need to relocate utilities as part of the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6. As indicated in the topical response, LAWA has not identified major utilities, including oil pipelines, in the vicinity of Lincoln Boulevard that would require relocation. Nevertheless, it is expected that numerous utilities would require relocation, which could include sewers, water lines, storm drains, electrical lines, fiber optic cables, oil pipelines, and other utilities, and the rough-order-of-magnitude cost estimates for the Lincoln Boulevard realignment include allowances related to utilities, including oil pipelines.

SPAS-PC00130-784

Comment:

1. The DEIR should include hazardous materials such as jet fuel, avgas, lubricants, Skydrol, lavatory fluid and other liquids carried by aircraft, and ammunition and weapons carried onto aircraft

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Section 4.7.3 of the SPAS Draft EIR addresses impacts associated with an increase in the use of hazardous materials and the generation of hazardous waste during routine fueling and maintenance of aircraft, buses, and vehicles as well as impacts to areas with contaminated soils and/or groundwater associated with construction, in particular grading and excavation. Compliance with the Procedure for the Management of Contaminated Materials Encountered During Construction, prepared in accordance with LAX Master Plan Commitment HM-2, would ensure that spills and releases would not create a hazard to the public or the environment, and would not result in contamination of soil or groundwater. Lavatory fluids carried by aircraft are discharged to Hyperion Treatment Plant for treatment. Ammunition and weapons carried onto aircraft are regulated by the Transportation Security Administration. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-785

Comment:

2. Parts that have fallen off aircraft including landing gear components, engine cowlings, blue ice (frozen lavatory fluid), etc. These risks should be evaluated.

Response:

Section 4.7.2 of the SPAS Draft EIR, Safety, addresses safety related impacts of the SPAS alternatives, including the potential for aviation incidents and accidents, birdstrikes, and runway incursions. Incidents such as those referenced by the commentor, (i.e., the potential for parts to fall off aircraft) are not only highly unusual, but are related to aircraft airworthiness and therefore are completely unrelated to the SPAS alternatives.

The FAA is responsible for regulating all aspects of air transportation, including aircraft airworthiness and airports. FAA regulations ensure a high level of safety in airport operations. Any aircraft parts or related substances that have fallen off or from an aircraft should be reported to FAA immediately. The FAA Los Angeles Airports District Office can be contacted at (310) 725-3644.

The FAA issues Airport Operating Certificates to airports that follow the guidance of 14 Code of Federal Regulations (CFR) Part 139. Part 139 provides numerous operational and safety standards (including regular safety inspections) to ensure safe aircraft operations. LAX operates with a Part 139 certificate. LAX is required to follow all Part 139 procedures for current and future facility configurations, which would apply to any and all SPAS alternatives.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-786

Comment:

IX. Hydrology and Water Quality

LAWA had put together a Conceptual Drainage Plan for the South Airfield Improvement Project. Please create one for the North Airfield DEIR study.

Response:

The CDP referred to by the commentor was prepared to address the LAX Master Plan improvements in their entirety, not only the South Airfield Improvement Project, although the plan was published in conjunction with publication of the South Airfield Improvement Program Draft EIR in August 2005. As described in Section 4.8 of the SPAS Draft EIR, a new mitigation measure, MM-HWQ (SPAS)-1, is proposed to tailor the CDP recommendations to the specific characteristics of the selected SPAS alternative, if an alternative other than Alternative 3 is selected. The updated CDP would address the north airfield improvements.

SPAS-PC00130-787

Comment:

Please include a study of all sewer lines running underneath LAX. There are sewer lines dating back to the 1920's and more recent ones such as the North Outfall Sewer project in the 1990's.

Response:

Please see Responses to Comments SPAS-PC00130-348 and SPAS-PC00130-898 regarding outfall sewers that lie beneath LAX. Please also see Topical Response TR-SPAS-LR-1 for a discussion as to why detailed utility plans are not required to be provided in a program-level EIR.

SPAS-PC00130-788

Comment:

X. Land Use and Planning
LAWA checked as, "No impact" that the proposed project would physically divide an established community. In the proposals to move Runway 24 Right to the north, LAWA has produced maps that show land acquisition will be necessary for the Runway Protection Zone (RPZ). The land required would take over 25% of the Westchester Central Business District which provides local residents with jobs and services; services for airport employees and visitors and reliable property tax and sales tax revenue for the City of Los Angeles.
Please explain why lopping off the Westchester Business District has no impact?
Please enumerate by address (including suite numbers where applicable), potential job losses and business tax and property tax losses.

Response:

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester Business District, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR. Therefore, the SPAS alternatives would not physically divide the Westchester Business District.

Nonetheless, Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526, addresses changes in the potential secondary or indirect impacts associated with the modification or removal of structures or uses within the RPZ, if required in the future. The subject analysis includes discussion of potential measures to reduce physical impacts. Given that neither the need for, or nature of, actions to modify or remove existing structures or uses have been determined and will not be known until project-specific EIRs, if any, are prepared, it was premature and speculative to reach land use impact significance conclusions in the SPAS Draft EIR. Information on specific options to address safety risks would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

Regarding the potential for job and tax losses due to acquisition, CEQA does not require purely social or economic impacts to be analyzed in an EIR. (State CEQA Guidelines Section 15064(e).) Therefore, as reflected in the discussion on pages 4-522 through 4-526 in Section 4.7.2 of the SPAS Draft EIR, the focus of the analysis is on indirect physical impacts of acquisition options, rather than economic or social effects such as job or tax losses.

SPAS-PC00130-789

Comment:

XI. Mineral Resources

Response:

The potential for the SPAS alternatives to impact mineral resources was addressed in Section X of the Initial Study included in the 2010 LAX SPAS EIR Notice of Preparation (NOP), provided in Appendix A of the SPAS Draft EIR. As explained therein, there are no actively-mined mineral or timber resources on the project site. Therefore, the proposed SPAS alternatives would not affect access to or the availability of valued mineral resources, and no mitigation measures are required. In addition, the project site is not within an area delineated on the City of Los Angeles Oil Field & Oil Drilling Areas map in the City of Los Angeles General Plan Safety Element. Furthermore, the project site is developed or disturbed, and the proposed project would not affect the availability of a locally-important mineral resource recovery site. As such, in accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with mineral resources was not discussed in detail in the SPAS Draft EIR.

SPAS-PC00130-790

Comment:

XII. Noise

Response:

The noise impacts associated with the SPAS alternatives are addressed in Section 4.10 of the SPAS Draft EIR.

SPAS-PC00130-791

Comment:

XIII. Population and Housing
What property acquisition is required for each concept?

Response:

The property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. In addition, Table 4.9-5 in Section 4.9 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components only, although acquisition would be required for the ground access components with which these alternatives would be paired.

SPAS-PC00130-792

Comment:

Although Manchester Square is under a voluntary residential acquisition program, would LAWA consider building in this area even if all of the residential properties have not been purchased by LAWA through the voluntary program?

Response:

If the land acquisition for Manchester Square is not completed by the time facilities planned for that area are ready for implementation, the City of Los Angeles would use the most appropriate and practical means available to ensure that the area is vacated, which could include voluntary acquisition, leasing, and/or public condemnation.

SPAS-PC00130-793

Comment:

XIV. Public Services
Please study the noise and health effects on each public and private school in the Westchester/Playa del Rey area. These include Los Angeles Unified School District Schools, church schools, private schools, Otis Art Institute and Loyola Marymount University. Identify mitigation measures and the costs of these measures that can be provided to reduce the effects of airport operations at these institutions.

Response:

The potential noise and health effects of the SPAS project on sensitive receptors, including public and private schools in the communities of Westchester and Playa del Rey, were analyzed in Sections 4.2, 4.7.1, 4.9, 4.10.1, 4.10.2, and 4.10.3 of the SPAS Draft EIR.

Regarding health impacts related to air quality on schools in Westchester and Playa del Rey, as presented in Table 4.2-17 and summarized on pages 4-156 through 4-160 in Section 4.2 of the SPAS Draft EIR, even with implementation of feasible construction-related mitigation measures, such as covering or treating ground surfaces to minimize fugitive dust emissions, minimizing off-site worker vehicle trips, and prohibiting parking adjacent to sensitive receptors, construction-related emissions and concentrations would be significant for all SPAS alternatives. Operational emissions and concentrations would also be significant for all SPAS alternatives, even with implementation of feasible operations-related mitigation measures, such as the conversion of LAX ground support equipment to low and ultra-low emissions technologies and the electrification of passenger gates.

Regarding impacts to human health associated with exposure to toxic air contaminants, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types, including school children. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types, including school children. The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Regarding aircraft noise impacts, as described on pages 4-776 through 4-778 in Section 4.9.6.10 of the SPAS Draft EIR, under Alternatives 1 through 7, some public and private schools in Westchester and Playa del Rey would be newly exposed to 65 CNEL or higher noise levels or experience an increase of 1.5 CNEL or higher within the 65 CNEL or higher noise contour compared to 2009 baseline conditions. With implementation of LAX Master Plan Mitigation Measure MM-LU-1, to achieve compatibility within both the existing and future noise impact areas associated with Alternatives 1 through 7 through implementation of a revised Aircraft Noise Mitigation Program, these impacts would be less than significant with the exception of interim impacts prior to sound insulation. A listing of private and public schools, including those located in Westchester and Playa del Rey, that would be affected by the respective SPAS alternatives is provided in Appendix I-2 of the SPAS Draft EIR. In addition, as analyzed in Section 4.10.1, some schools located in Westchester and Playa del Rey would be newly exposed to high single event noise levels, including Paseo del Rey Magnet School and Wish Charter Elementary School under Alternatives 1, 2, 4, 5, 6, and 7, and Wish Charter Elementary School under Alternative 3. As summarized on pages 4-932 and 4-933 in Section 4.10.1.8, interim impacts prior to

implementation of LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, and MM-LU-4 would be significant and unavoidable.

Regarding road traffic noise impacts, as summarized on pages 4-942 and 4-943 in Section 4.10.2, no off-site noise-sensitive receptors, including schools in Westchester and Playa del Rey, would experience significant impacts due to changes in road traffic noise levels under Alternatives 1, 2, 3, 4, 8, and 9. Alternatives 5, 6, and 7 do not include ground access improvements and would not, in themselves, affect road traffic noise levels at off-site noise-sensitive uses; however, depending on which ground access improvements (i.e., ground access improvements associated with Alternatives 1, 2, 8, or 9) are paired with airfield improvements under Alternative 5, 6, or 7, the road traffic noise impacts would be the same as above (i.e., less than significant).

Regarding temporary construction traffic and equipment noise impacts, as shown in Table 4.10.3-4 and described on pages 4-972 through 4-974 in Section 4.10.3 of the SPAS Draft EIR, under all SPAS alternatives, Saint Bernard High School, located in Playa del Rey, would be subject to significant unavoidable impacts associated with construction and equipment noise.

Please also see Response to Comment SPAS-PH100024-2 regarding Otis College of Art and Design and Loyola Marymount University.

SPAS-PC00130-794

Comment:

XV. Recreation
LAWA checked no impact for this section, however, ARSAC would like LAWA to study noise and pollution impacts on Nielsen Park, Westchester Golf Course, Westchester Park and the Del Rey Lagoon.

Response:

The commentor suggests that the Initial Study/Notice of Preparation determined that there would be "no impacts" to recreational facilities in Section XV ("Recreation") of the 2010 Initial Study. The commentor is correct in that recreation impacts the Section XV of the Initial Study were determined to have "no impact;" however, the thresholds in this section do not stand for the proposition cited in the comment. The first threshold addressed whether project impacts would result in "increasing the use of existing neighborhood and regional parks… such that substantial physical deterioration of the facility would occur." The second threshold addressed whether the project would "include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment." The Initial Study correctly determined that the alternatives would result in no impact under these thresholds. (See SPAS Draft EIR Appendix A, page A-23.)

The SPAS Draft EIR did, however, address impacts to recreational facilities, or receptors that are representative of recreational uses, in individual resource chapters. For example, as discussed in Section 4.7.1.2.2 of the SPAS Draft EIR, "TAC concentrations were also estimated at 326 grid nodes at or near the LAX property line (fence-line) and at one grid node at the LAX Theme Building (see Figure 4.7.1-1). Receptor type (i.e., recreational, residential, commercial, or school) for each grid node was dictated by land use at or near the grid node location." That is, each fence-line receptor was identified by the type of land us closest to the receptor location. Receptors identified as recreational receptors in Figure 4.7.1-1 are located close to parks/recreational facilities and these grid points are considered representative for receptors at these locations. As indicated on page 4-428 of the SPAS Draft EIR, some grid points which are on the border between recreational facilities and residential areas were assumed to be residential uses for modeling purposes. Residential receptors would have a greater exposure frequency and duration (i.e., they are assumed to be at the designated receptor location for 24 hours a day and 365 days out of the year) than recreational receptors (who would likely visit the site a few hours a day and not necessarily every day of the year); therefore, residential receptors are considered to provide a conservative analysis for recreational receptors. Please also see Response to Comment SPAS-PC00130-742 regarding the fence-line receptors evaluated in the SPAS Draft EIR.

Please see Sections 4.2 and 4.7 of the SPAS Draft EIR for a discussion of impacts associated with air quality and health risk, respectively. Similarly, please see Sections 4.9 and 4.10 of the SPAS Draft EIR

regarding noise impacts to sensitive receptors, including parks. Table 4.9-4 of the SPAS Draft EIR specifically identifies parks that were considered in the impacts analysis.

SPAS-PC00130-795

Comment:

XVI. Transportation/Circulation

Response:

The transportation/circulation impacts associated with the SPAS alternatives are addressed in Section 4.12 of the SPAS Draft EIR.

SPAS-PC00130-796

Comment:

Utilities
XVII. LAX has experienced blackouts due to antiquated and vulnerable electrical lines. In one case, a crow had flown into a transformer at 98th Street and Vicksburg. Please address in the DEIR the adequacy of utilities serving LAX (e.g. electricity, water, sewage, telecommunications including high speed Internet lines, pipelines), redundancy and security measures to protect them.

Response:

The SPAS Draft EIR addresses the adequacy of electricity and water supplies, and wastewater treatment capacity, in Sections 4.13.1, 4.13.4, and 4.13.3, respectively. As noted in those sections, supplies and capacity are sufficient to accommodate the SPAS improvements and impacts to these utilities would be less than significant. The SPAS Draft EIR is a programmatic document. Details regarding utility infrastructure, including redundancy and security, have not been determined at this level of planning. Project-level impacts to utility infrastructure associated with implementation of individual SPAS components would be assessed in future CEQA documents. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-797

Comment:

XVIII. Mandatory Findings of Significance
Are there no Mandatory Findings of Significance highlighted?

Response:

As indicated in Section XVIII (pages IS-11, AS-27, and AS-28) of the of the Initial Study that accompanied the 2010 Notice of Preparation (NOP), provided as Appendix A of the SPAS Draft EIR, it was determined during preparation of the 2010 NOP that the SPAS alternatives: 1) have the potential to degrade the quality of the environment and have the potential to affect biological and cultural resources; 2) may result in cumulative impacts when considered with other past, present, and probable future projects on the airport and in the surrounding area; and 3) may result in adverse environmental effects which could potentially result in substantial adverse effects on humans.

The potential for the SPAS alternatives to result in significant impacts to biological and cultural resources is evaluated in Sections 4.3 and 4.5 of the SPAS Draft EIR, respectively. The potential for the SPAS alternatives to contribute to cumulative adverse environmental impacts is evaluated in Chapter 5 of the SPAS Draft EIR. The potential for the SPAS alternatives to result in significant adverse impacts on humans is evaluated in various sections within Chapters 4 and 5 of the SPAS Draft EIR.

SPAS-PC00130-798

Comment:

QUESTIONS ABOUT THE NOP DOCUMENTATION AND OPTIONS TO BE EVALUATED

In the airfield alternatives, the descriptions and the figures do not match. For 100 feet north, 200 feet north, 300 feet north and 400 feet north, there is only a description of extending Runway 24 Right 604 feet west. The drawings show 604 foot runway extensions on the east and west ends of the runways. What is LAWA proposing?

Response:

The comment is specific to the 2010 SPAS Draft EIR Notice of Preparation and does not pertain to the published SPAS Draft EIR. Nevertheless, in response to the question raised in the comment, the 604-foot dimension shown at each end of Runway 6L/24R under each alternative that moves the runway northward represents the "Dual Displaced Threshold" indicated in the title of each of the related figures. With the dual displaced thresholds, the west end of the runway would be extended by 604 feet to allow more aircraft departure length; however, the aircraft landing threshold (i.e., earliest point along the runway where landing aircraft can touch down) is approximately 604 feet from the physical end of the runway.

SPAS-PC00130-799

Comment:

There is no description on the drawings (NOP Figures 12, 13 and 14) of the future midfield satellite processor where the Parking 3 and 4 garages are presently located. This future facility should be included in the DEIR.

Response:

The figures depicting terminal options in the 2010 SPAS Draft EIR NOP identify the location of the Future Midfield Satellite Processor, but do not provide a description of the facility, as the facility is a future terminal improvement associated with the LAX Master Plan, and is not a SPAS component. However, this facility is described on the list of cumulative projects in Section 5.3.2 of the SPAS Draft EIR. Moreover, the cumulative impacts of this project, in conjunction with SPAS and other cumulative projects, are analyzed in the SPAS Draft EIR.

SPAS-PC00130-800

Comment:

The runway alternatives in the NOP do not include all of the runway alternatives studied in the North Airfield Safety Study conducted by the Academic Panel and NASA. A one-runway alternative is requested in the "Consideration of other alternatives" in this letter.

Response:

The runway configuration studied in the North Airfield Safety Study is described and evaluated in Section 2.3.2.3, Three-Runway Airfield, of the SPAS Draft EIR. This section presents several operational reasons why this alternative was considered infeasible, and was likely to result in environmental impacts comparable or greater to the alternatives evaluated in detail in the SPAS Draft EIR. Therefore, this alternative was not further evaluated in the SPAS Draft EIR.

SPAS-PC00130-801

Comment:

There is no discussion of Runway Protection Zones or Runway Safety Areas and their potential impact on surrounding land uses including possible land acquisition. The FAA has stated that they will no

longer grandfather existing structures with new or existing construction. Therefore, this impact needs to be included in the DEIR.

Response:

Section 4.7.2 of the SPAS Draft EIR addresses issues related to Runway Protection Zones (RPZs) and Runway Safety Areas (RSAs) for each SPAS alternative, and Section 4.9 provides additional discussion related to land use. The commentor provides no evidence to support the claim that FAA has stated that they will no longer "grandfather" existing structures with new or existing construction. Notwithstanding, the analysis presented in Section 4.7.2 accounts for the possibility of acquisition of property within RPZ areas, being only one of several potential options for addressing incompatible structures or uses that may exist within an RPZ. As described in Section 4.7.2, should a SPAS alternative be selected for implementation, potential options for addressing any incompatible structures or uses within an RPZ would be assessed and determined in consultation with the FAA at more detailed levels of planning.

SPAS-PC00130-802

Comment:

There is a taxi and shuttle van holding lot north of 96th Street and west of Sepulveda. There is no discussion of the existence of this holding lot and any potential relocation sites if Runway 24 Left is extended to the east. Possible relocation of this holding lot should be included in the DEIR.

Response:

As indicated on page 2-55 of the SPAS Draft EIR, the existing taxi holding lot is located between Sepulveda Boulevard and Alverstone Avenue and north of West 96th Street, beneath the 96th Street Bridge. The existing shared ride van holding lot is located on Avion Drive south of Century Boulevard and the charter bus/limousine holding lot is located in the southwest corner of Jenny Street and Westchester Parkway. As indicated in Table 2-3 (specifically page 2-50) in Section 2.3.1.10 of the SPAS Draft EIR, as well as under the heading of "Commercial Vehicle Hold Lots" on page 2-55, and clarified in Chapter 5, Corrections and Additions Related to the SPAS Draft EIR, the existing taxi holding lot and commercial vehicle holding lots for the shared-ride vans and charter buses/limousines under Alternatives 1, 2, 8, and 9 would be relocated to the eastern portion of the Park One facility. Under Alternative 3, the commercial vehicle holding lot would be relocated to the Ground Transportation Center (GTC), while under Alternative 4, the taxi holding lot would likely move to Park One or Lot C and other commercial vehicle holding lots would remain in their current locations. The proposed location of the taxi and commercial vehicle hold lot is included in the on-airport traffic analysis presented in Section 4.1.12 (see in particular page 4-1091) of the Draft SPAS EIR.

SPAS-PC00130-803

Comment:

The LAX Medical Clinic and the LAWA Police Department station may be in the path of a relocated Sky Way and 96th Street bridge. Where would these facilities be relocated?

Response:

As discussed on page 2-55 in Chapter 2 of the SPAS Draft EIR, under all alternatives except Alternative 4, the existing LAWAPD station and associated facilities and the urgent care medical facility would be removed due to the realignment, or the removal under Alternative 3, of the 96th Street Bridge/Sky Way. The existing LAWAPD station could be relocated to the future LAX Public Safety Complex, which is currently being planning independent of SPAS. The site for the planned LAX Public Safety Complex is still under consideration. The urgent care medical facility could potentially be relocated elsewhere in the airport area. This facility is privately operated; any decision to relocate would be at the discretion of the facility owners.

SPAS-PC00130-804

Comment:

Where will any lost parking resulting from the closure of Park One be relocated?

Response:

As indicated in Table 2-3 and page 2-55 of the SPAS Draft EIR, under all alternatives except Alternative 4, parking at the Park One facility would be eliminated. No relocation of the parking is anticipated. However, as shown in Table 2-2 of the SPAS Draft EIR, under all of the alternatives, the total number of parking spaces would increase compared to baseline conditions with development of proposed facilities such as the Ground Transportation Center (Alternative 3), Intermodal Transportation Center (Alternative 3), Intermodal Transportation Facility (Alternatives 1, 2, 8, and 9), as well as other surface and structured parking facilities (all alternatives).

For the purpose of the SPAS analyses, parking demand from Park One was assumed to be proportionally distributed to the other public parking facilities included in Alternatives 1, 2, 3, 8 and 9 as described in Section 4.12.1.6.1 of the SPAS Draft EIR.

SPAS-PC00130-805

Comment:

The proposed Transportation Facility is on a site where parking is used for office buildings on Century Boulevard. Does LAWA own this parking lot? Are there any parking covenants or leases with the office buildings concerning the use of this parking lot?

Response:

LAWA does not own the properties which the proposed Intermodal Transportation Facility (ITF) would be situated. The proposed ITF site under Alternatives 1, 2, 8, and 9, as described and depicted in Figures 2-1, 2-2, 2-8, and 2-9 in Chapter 2 of the SPAS Draft EIR, is located between 96th Street, 98th Street, Vicksburg Avenue and Airport Boulevard. Several different businesses are currently located on the ITF site which would have to be acquired, including a parking lot that is used by tenants of the Sky View office building south of 98th Street. LAWA currently has an option to purchase the Sky View office building and existing surface parking lot north of 98th Street. Parking would need to be provided for this building, but not necessarily in its current configuration. For additional discussion of property acquisition see Section 2.3.1.11 of the SPAS Draft EIR.

SPAS-PC00130-806

Comment:

Manchester Square property acquisition is being conducted under a Voluntary Residential Acquisition Program. If Manchester Square is utilized for a Ground Transportation Center or Consolidated Rent-a-car facility, then how will LAWA assemble needed properties that are not voluntarily willing to sell? Has LAWA identified which properties are essential to make a functional GTC or ConRAC?

Response:

The precise properties required for implementation of the GTC, parking, and/or a CONRAC in Manchester Square under Alternatives 1, 2, 3, 8, and 9 have not been determined at this level of programmatic planning. The properties preliminarily assumed to be required are those shown in the applicable figures that depict each SPAS alternative (Figures 1-5, 1-6, 1-7, 1-12, and 1-13 of the SPAS Draft EIR). If the land acquisition for Manchester Square is not completed by the time facilities planned for that area are ready for implementation, the City of Los Angeles would use the most appropriate and practical means available to ensure that the area is vacated, which could include voluntary acquisition, leasing, and/or public condemnation.

SPAS-PC00130-807

Comment:

LAWA needs to identify ingress and egress for all proposed projects and resulting traffic flows.

Response:

As discussed in Section 2.3.1 of the SPAS Draft EIR, the nine proposed alternatives were formulated and evaluated at a programmatic level. Therefore, because there are no design or engineering plans, LAWA is unable to identify locations of ingress and egress at the project-level. Detailed project level planning for each of the proposed new facilities included in the selected SPAS alternative would be analyzed at a greater level of detail and include site-specific driveways and circulation roadway. This project level planning analysis would also include operational conditions at adjacent intersections and roadway segments. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

A project level analysis of the impacts of the alternatives on on-airport and off-airport traffic is provided in Section 4.12 of the SPAS Draft EIR. The program level of analysis complies with the requirements of CEQA. An EIR is not required to speculate about the environmental consequences of future development that is unspecified or uncertain. (Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502; Tracy First v. City of Tracy (2009) 177 Cal.App.4th 912.)

SPAS-PC00130-808

Comment:

LAWA needs to discuss the existence of two tunnels underneath the North Runway Complex, the Manchester Tunnel which runs south from Lincoln to the Tom Bradley terminal and the Lincoln Tunnel which runs southeast from Lincoln to the Sepulveda Tunnel. In addition, LAWA needs to study all EIR topics with the tunnels.

Response:

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment. This tunnel segment is also referred to as the Manchester Tunnel or the Lincoln Tunnel. There is only one tunnel structure located beneath the north airfield, not two as stated by the commentor. The airfield improvements proposed under Alternatives 1, 5, and 6 have been developed at a program level of planning for SPAS. Specific details regarding the effect of the north airfield improvements on the tunnel segment will be determined and addressed at the project level, should one of those alternatives be approved. Environmental impacts related to the tunnel would be addressed in project-level design and environmental review. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-809

Comment:

The DEIR must address the restructuring of the Sky Way and 96th Street Bridge.

Response:

The realignment of existing Sky Way eastward, as depicted in Figures 2-1, 2-2, 2-8, and 2-9 in Chapter 2, of the SPAS Draft EIR, would not impact the portion of the existing 96th Street structure spanning Sepulveda Boulevard. The realignment of Sky Way would require that the existing portion of the roadway west of the 96th Street bridge structure be demolished and reconstructed along the alignment depicted in Figures 2-1, 2-2, 2-8, and 2-9. This realignment of Sky Way would also result in a corresponding shift in the Sky Way and World Way North intersection on both the departures and arrivals levels to the east, permitting southbound traffic flow only to the CTA. The northbound approach

to the existing Sky Way and World Way North intersection on the arrivals level roadways would remain; however, only left-turn movements would be permitted from this approach following the realignment of Sky Way. Vehicles currently using Sky Way to exit the airport onto either Sepulveda Boulevard or 96th Street would be required to exit the CTA via the Center Way and World Way South intersection.

The Future (2025) traffic analyses for Alternatives 1, 2, 8, and 9 presented in Section 4.12.1.8, beginning on page 4-1104, of the SPAS Draft EIR, include the relocation of the Sky Way and World Way North intersections on both the departures and arrivals level roadways.

SPAS-PC00130-810

Comment:

ITEMS THAT NEED SPECIAL EVALUATION IN THE EIR

When calculating the noise impacts on surrounding communities, LAWA should not only provide the "normal" CNEL bands, along with using 3 dB increases as a threshold for significance, but also calculate out to 60 DNL levels as is done in some parts of the country. Further, to give the decision makers more information upon which to make decisions, LAWA should identify effected communities on the basis of single event frequency over 65 dB using modeling techniques as seen in reports from Wyle Labs. Air quality impacts are substantial around airports.

Response:

The noise contour figures in Section 4.10.1 of the SPAS Draft EIR provide CNEL contours out to, and including, the 60 CNEL for baseline conditions and each SPAS alternative - see Figures 4.10.1-11, 4.10.1-14, 4.10.1-17, 4.10.1-20, 4.10.1-23, 4.10.1-25, 4.10.1-28, and 4.10.1-31. To the extent the commentor is suggesting the use of the "DNL" metric, LAWA determined that CNEL was the appropriate metric to use for the SPAS Draft EIR aircraft noise analysis, because (1) CNEL is considered more conservative as it further subdivides the evening and penalizes operations between 7:00 to 10:00 PM, and (2) "For the purposes of aircraft noise analysis in the State of California, the FAA recognizes the use of CNEL." (See pages 4-781 through 4-782 of the SPAS Draft EIR.)

Section 4.10.1 of the SPAS Draft EIR includes a comprehensive analysis of single event noise impacts using the Integrated Noise Model (INM) accepted by the FAA, other agencies, and the aircraft noise modeling/analysis industry in general, which provides complete and meaningful information for the public and decision-makers. The very particular and non-standard additional aircraft noise analysis requested by the commentor is unwarranted. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-811

Comment:

What has LAWA determined are all of the noise sources and how are they currently controlled? Will there be improved control measures? If so, they must be clearly defined.

Since this is a special planning activity, what impacts on health are anticipated for noise and air quality? What controls will be initiated as mitigation?

Response:

The impacts from the SPAS alternatives associated with air quality, human health risk, and aircraft noise are provided in Sections 4.2, 4.7.1, 4.9, and 4.10.1 of the SPAS Draft EIR, respectively. Please see Sections 4.9.3.3 and 4.10.1.7 of the SPAS Draft EIR regarding the various abatement and mitigation techniques of aircraft noise analyzed in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00201-1 regarding a discussion of the mitigation measures, including source controls, for air quality and human health risk as identified in Section 4.2.5 of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-938 regarding the effects of noise on humans.

SPAS-PC00130-812

Comment:

Construction impacts and controls were highlighted in the Stipulated Settlement for the South Airfield Improvement Project and each of the subsequent project EIRs have stated that LAWA intends to handle these impacts just like the way it was done for the SAIP." Is LAWA continuing this commitment and when will we see the implementation of a construction hotline that will answer issues within minutes and a complementary Noise Plan?

Response:

It is unclear if the quoted statement in this comment ("just like the way it was done for the SAIP") reflects the commentor's opinion or if it was cited from another document. Because this statement was not included in the SPAS Draft EIR, it is assumed that it is a statement of the commentor's opinion. The commented is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

As described on page 4-2 of the SPAS Draft EIR, a number of LAX Master Plan commitments and mitigation measures, including those that address construction impacts, are applicable and would be implemented for the SPAS improvements. The LAX Master Plan commitments and mitigation measures applicable to the SPAS alternatives are identified and described throughout Chapter 4 and summarized in Table 1-6 of the SPAS Draft EIR. The LAX Master Plan commitments and mitigation measures that would be implemented for the SPAS improvements to reduce or avoid construction impacts include the following:

LAX Master Plan Commitments
- HM-2. Handling of Contaminated Materials Encountered During Construction
- C-1. Establishment of a Ground Transportation/Construction Coordination Office
- ST-2. Non-Peak CTA Deliveries
- ST-8. Limited Short-Term Lane Closures
- ST-9. Construction Deliveries
- ST-12. Designated Truck Delivery Hours
- ST-14. Construction Employee Shift Hours
- ST-16. Designated Haul Routes
- ST-17. Maintenance of Haul Routes
- ST-18. Construction Traffic Management Plan
- ST-19. Closure Restrictions of Existing Roadways
- ST-20. Stockpile Locations
- ST-21. Construction Employee Parking Locations
- ST-22. Designated Truck Routes

LAX Master Plan Mitigation Measures
- MM-DA-1. Construction Fencing
- MM-AQ-2. LAX Master Plan Mitigation Plan for Air Quality, Construction-Related Mitigation Measures
- MM-ET-3. El Segundo Blue Butterfly Conservation: Dust Control
- MM-ST-14. Ground Transportation/Construction Coordination Office Outreach Program
- MM-N-7. Construction Noise Control Plan
- MM-N-8. Construction Staging
- MM-N-9. Equipment Replacement

Regarding the implementation of a construction hotline, a construction hotline is currently in place, and has been throughout the LAX Master Plan development (beginning with the SAIP). Information on the construction hotline can be found at http://www.lawa.org/laxdev/Contact.aspx. The construction hotline phone number is (310) 649-5292.

It is unclear if the commentor is referring to construction noise plans when inquiring about a "complementary noise plan." As part of project-specific environmental analyses, construction noise plans may be prepared, to consider construction sites, construction staging areas, construction vehicle

routes, etc. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-813

Comment:

ADDITIONAL QUESTIONS

What outreach did LAWA make to other stakeholders such as the hotels, surrounding businesses, airlines and other tenants, and FAA concerning concepts in this NOP? Please provide meeting dates when LAWA met with organizations and/or individuals who were not members of the SPAS Committee to obtain input. Did LAWA solicit and respond to input or just show LAWA's intended plans options? Which community ideas did LAWA incorporate into this NOP? Which ideas were rejected and why? See the attached note from ARSAC presented to LAWA in 2006 at one of the SPAS meetings.

Response:

Please see Response to Comment PC00130-731 regarding the extensive public participation program LAWA undertook to allow stakeholders an opportunity to provide input to the SPAS planning process. Also, please see Chapter 4 of the Preliminary LAX SPAS Report. The NOP was the product of the extensive public outreach and involvement process, and incorporated comments and ideas shared at those hearings and meetings. Regarding the attached note from ARSAC referred to in this comment, it is assumed that the commentor is referring to the document dated November 9, 2006 that is included as part of their comment letter. Responses to comments in this document are provided in Responses to Comments SPAS-PC00130-1034 through SPAS-PC00130-1049 below.

SPAS-PC00130-814

Comment:

ALTERNATIVES PROJECTS NOT YET SET TO BE ANALYZED

Since LAWA is insisting on a full range of alternatives, additional alternatives for study should include the following:

1. A linear terminal to replace Terminal 1, 2 and 3. See Attachment 6 (ARSAC Concepts for SPAS PowerPoint). The linear terminal would be 200 feet wide with a 200 foot wide apron. The linear terminal would start 200 feet east of the Parking Limit Line of Taxilane "D10," which currently services Terminal 3 and the Tom Bradley International Terminal. The linear terminal would be set-up primarily for narrow body (single aisle) aircraft such as Airbus A320's and Boeing 737's. The concept of this linear terminal is Common Use for Low Cost Carriers (LCC's). A linear terminal would benefit passenger convenience by shortening the distance from the curb to the gate and increase efficiency of short-haul, high frequency airline operations such as those by LCC's. The linear terminal could be used with any concepts where Runway 24 Left is moved south.

Response:

The comment identifies several elements of a SPAS alternative concept suggested by ARSAC in November 2010. Those and other elements of that concept are described in an ARSAC PowerPoint presentation dated November 28, 2010, which was included as an attachment to this comment. The following summarizes the highlights of that alternative concept, as stated in ARSAC's presentation, and then presents LAWA's review and assessment of that concept.

In summary, six the seven main elements included in this alternative are the same or similar to elements already included in other SPAS alternatives. CEQA does not require an EIR to consider multiple variations or permutations of the alternatives analyzed in an EIR. (See, e.g., Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 477.) The seventh element, an elevated roadway system, is economically infeasible and infeasible from an engineering standpoint; an EIR need not consider alternatives (or elements of alternatives) that are infeasible (State CEQA Guidelines Section 15126.6(a)). Further, the ARSAC alternative concept is not required to be evaluated in detail in

the SPAS Draft EIR because it does not avoid or substantially lessen the SPAS alternatives' significant environmental impacts. (State CEQA Guidelines Section 15126.6(a),(b).) Also, as discussed below, the ARSAC alternative concept does not offer substantial operational advantages over the SPAS alternatives evaluated in the SPAS Draft EIR.

ARSAC Alternative Concept Highlights
- Keeps Runway 6L/24R from being moved north and moves Runway 6R/24L 340 feet south
- Terminals 1, 2, 3, and part of north wing of Tom Bradley International Terminal are torn down
- Low Cost Carrier (LCC) Terminals built to replace Terminals 1, 2, and 3 and airlines are - regrouped in terminals by airline alliances (e.g., SkyTeam, Star, oneworld)
- No changes to the parking garages in Central Terminal Area
- Consolidated Rent-a-car center (CONRAC) to be located in Manchester Square
- Automated People Mover to connect the CONRAC to the Central Terminal Area (CTA)
- Elevated roadways to connect the CTA to the CONRAC and the freeways

LAWA Analysis of ARSAC Concept
1. Keeps Runway 6L/24R from Being Moved North and Moves Runway 6R/24L 340 Feet South: This airfield improvement concept is no different from that in SPAS Alternative 3. ARSAC indicates that a benefit of this concept is that it moves airport and related operations away from residential communities and makes communities safer, quieter, and healthier. As demonstrated in the impacts analysis presented in Chapter 4 of the SPAS Draft EIR, that stated benefit would, at most, be limited to areas immediately north of the airport, and adverse environmental impacts to areas east of the airport and to the region would generally be worse than would otherwise occur by moving Runway 6L/24R northward and keeping Runway 6R/24L in its current location. As indicated in Table 1-16 of the SPAS Draft EIR, the number of residential units and population newly exposed to 65 dBA CNEL aircraft noise levels under Alternative 3 would be 5,056 and 13,443, respectively. The number of homes and population newly exposed to 65 CNEL under Alternative 1 (move Runway 6L/24R 260 feet north), Alternative 5 (move Runway 6L/24R 350 feet north), and Alternative 6 (move Runway 6L/24R 100 feet north) would be comparable to, or in several cases, greater than those of Alternative 3. That is also the case, if not more so, relative to homes and population that would experience a 1.5 dBA CNEL increase over 65 CNEL. Although moving Runway 6R/24L south by 340 feet would shift the north airfield noise contour away from the Westchester and Playa del Rey communities located immediately north of the airport, the changes in the overall airport noise contours including both the north and south airfields would encompass additional areas northeast and east of the airport, such as in Inglewood and unincorporated areas of the County, that are more intensely developed and more densely populated. In addition, the proposed configuration offers essentially the same safety profile of Alternative 3, which addresses many of the aviation safety objectives, except that it retains residential uses within the Runway Protection Zone (RPZ) of Runway 6L/24R.

As indicated in Tables 4.2-13 through 4.2-16 of the SPAS Draft EIR, the airfield-related (i.e., aircraft) air pollutant emissions and concentrations associated with Alternative 3 would be greater than those associated with Alternatives 1, 5, and 6 relative to carbon monoxide, volatile organic compounds, nitrogen oxides emissions (peak nitrogen dioxide concentrations would be slightly lower for Alternative 3), sulfur dioxide emissions (peak sulfur dioxide emissions concentrations related to the California Ambient Air Quality 1-hour standard would be slightly lower for Alternative 3), and particulate matter. As such, both local and regional air quality impacts would generally be worse in moving Runway 6R/24L south by 340 feet and in moving Runway 6L/24R northward.

Within the ARSAC presentation describing north airfield configurations that should be considered in the SPAS alternative airfield concepts, it was also suggested that the runway designs include runway status lights on all runways and taxiway entrances, Enhanced Final Approach Runway Occupancy Signal (eFAROS), and improved runway and taxiway lighting, signage, and striping. As described on page 4-502 of the SPAS Draft EIR, Phase 1 of installing runway status lights at LAX was completed in 2009 and Phase 2 to complete the installation is anticipated to occur with FAA approval of funding. Regarding Final Approach Runway Occupancy Signal (FAROS) and eFAROS technology, such systems are still in the testing and development phases, including at Dallas-Fort Worth International Airport (eFAROS) and Long Beach International Airport (FAROS). The FAA is currently working to publish an Advisory Circular (AC) for this system, so that any airport receiving AIP funding can procure a FAROS system and install it on the basis of the AC.1 All runway and taxiway lighting, signage, and striping associated with airfield improvements under any of the SPAS alternatives would occur in

compliance with FAA requirements. Such would also be the case relative to the width of runways in the north airfield, as determined in consultation with the FAA at more detailed design and engineering levels of planning.

ARSAC also recommended that the SPAS Draft EIR consider each runway concept with and without a centerline taxiway between Runways 6L/24R and 6R/24L. SPAS Alternatives 2 and 4 already reflect such a design and it is not necessary to consider each of the remaining five alternatives both with and without a centerline taxiway.

2. Terminals 1, 2, 3, and Part of North Wing of Tom Bradley International Terminal Are Torn Down: That aspect of the ARSAC alternative concept is the same as proposed under SPAS Alternative 3. Regarding terminal design described by the commentor, all elements listed by ARSAC in their LCC concept could be accommodated by SPAS Alternative 3, but some of the ARSAC-proposed design elements have operational disadvantages compared to Alternative 3.

The footprint and associated apron of the proposed north linear concourse assumed under SPAS Alternative 3 were inherited from the LAX Master Plan Alternative D concept. While ARSAC suggests that their LCC terminal design is comparable to that of John Wayne Airport (SNA) and San Jose Airport (SJC), the SNA and SJC terminal configurations were established based on narrow airport property configurations leaving minimum areas left for terminal and apron after required runway, taxiway, and landside access requirements are met. In other words, the terminal configurations for those two airports are the result of their particular physical constraints and are not indicative of them being able to specifically accommodate LCC operations.

The design of a linear concourse under Alternative 3 would result in simplified facilities, and would most definitely involve passenger conveyance through elevators and escalators, as requested in the ARSAC alternative concept. SPAS Alternative 3 provides for 20 gates with a combination of narrow and wide-body gates, only 3-4 gates less than the ARSAC alternative concept. The ARSAC configuration has more restricted gate sizing, and therefore is less flexible in providing needed wide-body gates during off-peak LCC operations.

The number of stories of the proposed North Linear Concourse would be determined during project-level design and CEQA review, should a SPAS alternative be selected for implementation. Such a concourse would be constructed following LEED standards or equivalent.

The ARSAC-suggested airside/landside terminal and concourse level stacking is typical of most existing or new terminals with the exception of the interstitial level for baggage screening and handling which often raises the passenger circulation and gate levels to unacceptable heights except for much larger (taller) wide-body aircraft.

Single-use terminals such as the one recommended by ARSAC have more restricted gate utilization from an aircraft parking standpoint than mixed-use terminals, since the flexibility of accommodating other different sized aircraft is lost during off-peak LCC time periods. Single-loaded (linear) concourses are also less efficient (with longer passenger walking distances for connecting passengers, more spread-out airline staffing) and more costly (one side of the concourse is unused) than double-loaded (aircraft gates on both sides) concourses.

3. Low Cost Carrier (LCC) Terminals Built to Replace Terminals 1, 2, and 3 and Airlines Are Regrouped in Terminals by Airline Alliances (e.g., SkyTeam, Star, oneworld): The basic physical design of the terminals proposed under the ARSAC alternative concept is essentially the same as the linear concourse proposed under SPAS Alternative 3. The details of that design would be determined in conjunction with the completion of project-level planning, design, and engineering should a SPAS alternative be selected for implementation; all of the SPAS alternatives are currently at only a program level of detail.

The ARSAC presentation indicates that their proposed terminals design provides opportunities to both LCC and alliance carriers and would allow airline locations to be arranged logically by alliances; however, such opportunities for both LCC and alliance carriers to operate together would be available under any and all of the SPAS alternatives. No assumption used in the SPAS Draft EIR gating analysis, as discussed in Section 4.3 of Appendix F-1 of the Preliminary LAX SPAS Report, would preclude LCC

and alliance carriers to efficiently co-locate and/or operate at LAX. The gating approach used in the SPAS Draft EIR does not constitute or reflect a LAWA policy decision in terms of future airline assignments or agreements.

Notwithstanding the above, the ARSAC alternative concept to locate the LCCs along the linear concourse designed for that purpose, which would replace Terminals 1, 2, and 3, would be of very limited benefit to overall airport operations and, if anything, could be detrimental. In August 2011, LCC passengers represented only 24.5 percent of all passengers. Based on today's operations, converting Terminals 1, 2, and 3 into LCC-only terminals would force some international and alliance operations into already busy south CTA terminals, operations which need wide-body gates to operate. This would result in an "imbalance" between the northern and southern portions of the airport, both in terms of landside operations and relative to airside operations (i.e., larger aircraft arriving on or departing from the north airfield would have longer taxiing times and distances by being served primarily on the west and south sides of the CTA).

Common Use Terminal Equipment (CUTE) systems, as suggested in the ARSAC alternative concept, are not limited to new or particular types of airline terminals. For example, the existing Terminal 3 could be retrofitted with CUTE services without reconstruction in the ARSAC suggested linear alternative.

Rapid aircraft turn round times can also be achieved in SPAS Alternative 3 as two narrow-body aircraft can be accommodated at once on each wide-body position depicted in Figure C in Appendix F-1 of the Preliminary LAX SPAS Report.

4. No Changes to the Parking Garages in Central Terminal Area: This element of the ARSAC alternative concept is no different than that of SPAS Alternatives 1, 2, 4, 5, 6, and 7, all of which are addressed in the SPAS Draft EIR.

5. Consolidated Rent-a-car Center (CONRAC) to be Located in Manchester Square: This element of the ARSAC alternative concept is no different than that of SPAS Alternatives 8 and 9, which are addressed in the SPAS Draft EIR.

6. Automated People Mover to Connect the CONRAC to the CTA: This element of the ARSAC alternative concept is no different than that of SPAS Alternatives 3 and 9. Although the ARSAC presentation includes several specific recommendations regarding the design of the APM, such as the alignment within the CTA, the location of stations, and whether the system has one or two tracks, such design considerations would be determined at more detailed levels of planning, design, and engineering, and CEQA review, should a SPAS alternative be selected for implementation.

7. Elevated Roadways to Connect the CTA to the CONRAC and the Freeways: The ARSAC alternative concept proposes a network of elevated roadways connecting the 405 Freeway (I-405) to the CTA. The in-bound route would extend west from I-405 at Century Boulevard to an access ramp for the CONRAC proposed at Manchester Square, then north to an access ramp connecting with Lot C on 96th Street, and then follow the 96th Street bridge alignment at Sepulveda Boulevard, then turn south to connect with the CTA at the World Way entrance bridge (i.e., relocated Sky Way). The in-bound route also envisions a built-in vehicle security screening area along the 96th Street portion the elevated roadway. The out-bound route from the CTA would extend east as an elevated roadway on piers along the grass median on the south side of Century Boulevard and then turn south at Aviation Boulevard to continue east along 102nd Street to connect with I-405. A separate elevated out-bound roadway would be constructed along Aviation Boulevard between the CONRAC at Manchester Square to connect with the main elevated roadway at 102nd Street.

This alternative concept for an elevated roadway network between I-405 and the CTA was has been reviewed and considered by LAWA, and was not carried forth into the SPAS alternatives for the reasons described below.

Implementation of this elevated roadway network would be very expensive to construct, would have construction-related traffic disruption, would be unlikely to result in substantial improvements in traffic conditions around the airport, and would not provide substantial traffic benefits over the ground transportation system improvements proposed within the current range of SPAS alternatives. Because there is no evidence that this concept would reduce any of the significant and unavoidable impacts of

the SPAS alternatives analyzed in the SPAS Draft EIR, it is not necessary to analyze this alternative in detail.

Based on the alignments depicted in the ARSAC presentation, it is estimated that this elevated roadway system would be approximately five miles in length and would include two new interchanges with I-405. Although ARSAC did not provide any cost estimates for this concept, the key features of the system are somewhat analogous to elements of the SPAS alternatives transportation system improvement options for which LAWA completed rough order of magnitude (ROM) cost estimates that are presented in Appendix G of the Preliminary LAX SPAS Report. Table GA-2 in that appendix includes estimates for construction of the elevated busway, which would be a 36-foot-wide elevated platform constructed on piers primarily along existing roadways. Such a system design would be generally analogous to the elevated roadway system identified in the ARSAC alternative concept. Based on an estimated total length of 5,300 linear feet (LF) of elevated busway at a total estimated construction cost of $50,533,300, the cost per LF would be $9,535. For a five-mile-long system, the total cost would be approximately $251,724,000. Table GA-8 in Appendix G includes a ROM cost estimate of $341,757,000 for construction of a new interchange with the I-405, as envisioned under SPAS Alternative 3. Under the ARSAC alternative concept, construction of the five-mile-long elevated busway system and two new interchanges with the I-405, the ROM estimated total cost would be approximately one billion dollars ($935,238,000). In comparison, the ROM estimated cost of the elevated busway system associated with SPAS Alternatives 1, 2, and 8 is approximately $98,000,000, including the bus stations along the way (see Table GA-1 in Appendix G of the Preliminary LAX SPAS Report). Based on this approximately ten-fold cost differential, the elevated roadway system is considered economically infeasible.

In addition to the very high cost of this system, the proposed locations of the new I-405 interchanges are infeasible from an engineering standpoint. For the in-bound route, the ARSAC alternative concept shows the elevated roadway near the CONRAC as having connection ramps with both the northbound lanes and southbound lanes of the I-105 just north of Century Boulevard. Although there is currently an exit from the southbound I-405 at that location, that interchange would need to be redesigned and reconstructed to allow for separation of LAX traffic going up onto the elevated roadway from local traffic staying at ground level. For the northbound I-405 ramp connecting to the elevated roadway, it is highly uncertain whether a flyover ramp going above all travel lanes on the I-405 could be constructed within any area that is not already occupied by the many existing freeway on-ramps and off-ramps at and north of Century Boulevard. There are similar major engineering and design feasibility uncertainties relative to developing both northbound and southbound freeway ramps for the outbound elevated roadway system at 102nd Street and the I-405. The existing at-grade southbound ramp at that location would need to be redesigned and reconstructed to allow for the connection of the elevated roadway, and the construction of a new flyover ramp to connect with the northbound I-405 lanes would need to extend a substantial distance above ground to pass above the existing freeway ramps at Century Boulevard or would require redesign and reconstruction of those existing ramps.

Even if this alternative concept roadway system could be successfully developed, it is not anticipated to draw a substantial amount of traffic away from other roads and access routes serving LAX. Based on traffic volumes and conditions anticipated to occur in 2025 (the planning horizon year for SPAS) on the I-405 near LAX, the vast majority of which would be regional traffic including as related to the I-105 interchange near LAX, and not necessarily airport traffic, it is likely that travelers to and from LAX may still seek alternative routes.

Another disadvantage is that construction of the elevated roadway system above numerous roadways around LAX would result in traffic disruption, delays, and detours during the construction periods.

Lastly, development of the elevated roadway system proposed under the ARSAC alternative concept would not offer a substantial traffic benefit over the systems proposed under certain SPAS alternatives. Alternatives 1, 2, and 8 include an elevated/dedicated busway system that would connect Manchester Square, which includes a CONRAC under Alternative 8, and a proposed Intermodal Transportation Facility located south of and adjacent to Lot C, and the CTA. Alternative 9 is similar to Alternative 8, but would use an APM in place of the busway. Access to the CONRAC at Manchester Square under Alternatives 8 and 9 would include integration with the existing southbound off-ramp at the I-405. Additionally, that proposed system under all of these alternatives includes a connection at the future Metro Crenshaw/LAX Transit Corridor and Station.

In summary, the ARSAC alternative ground transportation system concept was not carried forth by LAWA because it would be economically infeasible, would be infeasible from an engineering standpoint, would have substantial construction-related traffic disruption, would be unlikely to result in substantial improvements in traffic conditions around the airport, and would not provide substantial traffic benefits over the ground transportation system improvements proposed within the current range of SPAS alternatives.

U.S. Department of Transportation, Federal Aviation Administration, Advanced Technology Development and Prototyping Group (AJP-67), Final Approach Runway Occupancy Signal (FAROS), Available: http://www.faa.gov/about/office_org/headquarters_offices/ang/offices/ac_td/td/projects/faros/, accessed December 5, 2012.

SPAS-PC00130-815

Comment:

2. Please add to the DEIR study of North Airfield concepts the following:
a. A single runway concept with Runway 24 Left. In this concept, Runway 24 Right is closed and covered or removed.
b. Relocating Runway 24 Left 340 feet to the south and Runway 24 Right 240 feet to the south
c. Relocating Runway 24 Left 340 feet to the south and Runway 24 Right 140 feet to the south
d. Relocating Runway 24 Left 340 feet to the south and Runway 24 Right 40 feet to the south
e. For items b, c, and d above, consider no centerline taxiway and adding a centerline taxiway between the two relocated runways equidistant between the two runway centerlines.

Response:

Regarding concept "a." in the comment suggesting the elimination of one runway in the north airfield and leaving LAX with a three-runway airfield, please refer to Response to Comment SPAS-PC00130-800. Regarding concepts "b., c., and d." and the associated "e.", Section 2.3.2.6, Dual Runway Relocations, of the SPAS Draft EIR presents reasons why such an approach to reconfiguring the north airfield is considered infeasible, impractical, and likely to result in environmental impacts comparable or greater to the alternatives evaluated in detail in the SPAS Draft EIR. Further, Section 2.3.2.6 describes why this alternative is not within the range of the alternatives that the SPAS Draft EIR evaluates in detail. An EIR need not consider multiple variations on the range of alternatives evaluated in detail. (Village Laguna of Laguna Beach Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022,1028.)

SPAS-PC00130-816

Comment:

3. Please add to the DEIR study of APM's two APM lines: a north line servicing Terminals 1, 2, 3 and terminating at the Tom Bradley International Terminal and a south line servicing Terminals 4 to 8 and terminating at TBIT. Ideally, these tracks will be above the terminals. The eastern end of each line would terminate at Manchester Square. There should be two options for trackage for the north and south lines. Option 1 is one set of tracks for north and south. Option 2 is two sets of tracks for north and south. For both options, the tracks will converge east of Sky Way and World Way into two tracks leading back to Manchester Square via 98th Street.

Response:

The SPAS Draft EIR includes two alternatives - Alternatives 3 and 9 - that extend an APM system into the CTA. These alternatives, as well as the other alternatives addressed in the SPAS Draft EIR, are at a program level of planning and design. The number, design, and alignment of the APM line(s) within the CTA, as well as the number and location of APM stations within the CTA, are all considerations that will be determined and addressed at the project level, should one of those alternatives be approved. It is appropriate for a first-tier, program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App. 4th 29, 37.)

Detailed designs of the APMs are not needed for the EIR to meaningfully evaluate the Draft EIR's alternatives' environmental impacts at a program level. An EIR's project description is supposed to include a "general description" of the project's technical characteristics, and should not provide extensive detail beyond that needed for evaluation of environmental impacts. (State CEQA Guidelines Sections 15124 and 15124(c).

SPAS-PC00130-817

Comment:

DEIR COMMENT PERIOD

When the Draft EIR is completed we anticipate that it will be of the length seen in before Alternative D was approved. Since this could be many thousands of pages, ARSAC requests that the comment period be set for 120 days or at least 90 days based on the volume of data to be reviewed to allow the public adequate opportunity to study and comment on this complicated DEIR.

Response:

The commentor's request for an extended public comment period for the SPAS Draft EIR is noted. Please see Response to Comment SPAS-AL00007-59 regarding the length of the public review period for the SPAS Draft EIR.

SPAS-PC00130-818

Comment:

We understand that we have identified an enormous amount of issues with the proposed plans and look forward to working with LAWA to refine them into forward planning proposals. Please contact us if you have any questions: (310) 641-4199 or (213) 675-1817, denny@welivefree.com

Response:

The comment is noted. Issues were identified by ARSAC in comments letters on both the 2008 and 2010 NOPs for the SPAS Draft EIR. Copies of ARSAC's comment letters on the 2008 and 2010 NOPs are included as part of the comment package on the SPAS Draft EIR submitted by ARSAC. Copies of these comment letters are provided in the first part of Appendix A (pages 79 through 214) and the second part of Appendix A of the SPAS Draft EIR (pages 151 through 230), respectively. The comments in both NOP comment letters were considered and addressed in the SPAS Draft EIR. In addition, please see Responses to Comments SPAS-PC00130-729 through SPAS-PC00130-970, which address each separate comment provided in ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR.

Comment:

Comments re: Notice of Preparation of a Draft Environmental Impact Report (SCH No. 1997061047), Los Angeles International Airport (LAX) Master Plan Specific Plan Restudy

Dear Mr. Glasgow:

The Alliance for a Regional Solution to Airport Congestion (ARSAC) appreciates this opportunity to comment on the Notice of Preparation for the Specific Plan Amendment Study. In addition to these comments, ARSAC has adopted the attached "Petitioners' Overview of Guiding Principles for Environmental Analysis: LAX Specific Plan Amendment Study EIR."

A. The Proposed Reliance on Tiering is Problematic.

The NOP (p.4.) indicates that "[t]he SPAS EIR will be a Supplemental EIR that is tiered from the LAX Master Plan EIR..." This statement requires clarification, and the tiering approach requires

reconsideration by LAWA. While tiering may be appropriate when a Lead Agency has already certified an EIR for a project, in this case ARSAC strongly cautions against relying too heavily on the previous Master Plan EIR. Tiering is only appropriate when the later project is "consistent with the program, plan, policy, or ordinance for which an environmental impact report has been prepared and certified." Pub. Res. Code § 21094(b). Case law also stresses the need for consistency between the subsequent project and previously certified EIR. See Koster v. County of San Joaquin (1996) 47 Cal. App. 4th 29, 36. The very purpose of the project now proposed is to change some of the key underlying assumptions of the Master Plan EIR. Therefore, it is very difficult to argue that the SPAS EIR project could be consistent with the previously certified Master Plan EIR.

The NOP for the SPAS EIR proposes significant changes to the Master Plan, including movement of Runway 6R/24L; changes to the proposed closure of the CTA to surface traffic; development of an off-site ticketing facility; and the future of Terminals 1, 2, and 3. Given the magnitude of the changes, ARSAC questions the viability of the Master Plan as a document off of which LAWA may appropriately tier the SPAS EIR. While some aspects of the Master Plan remain unchanged, the better approach would be to incorporate by reference the portions of the Master Plan unaffected by the proposed changes (see Guidelines Section 15150), but develop the SPAS EIR as a primarily stand alone document that address the significant, and previously unstudied, impacts of the project now proposed.

In addition, tiering is not appropriate under Section 21094(b) when a Lead Agency determines that the provisions of Public Resources Code Section 21166 apply. The existence of the NOP and proposal for the SPAS EIR make the applicability of Section 21166 self evident. Section 21166 requires a subsequent or supplemental EIR when "[s]ubstantial changes are proposed in the project which will require major revisions to the environmental impact report." Pub. Res. Code §21166(a). LAWA has rightly determined that this section applies. However, because this section applies, the tiering provisions of Section 21094 are inapplicable, and LAWA should prepare a primarily stand-alone document.

LAWA should also rethink the proposal to develop a Supplemental EIR. Preparation of a Supplemental EIR should occur when "[o]nly minor additions or changes would be necessary to make the previous EIR adequately apply to the project in the changed condition." Guidelines §15163(a)(2). By contrast, a Subsequent EIR is required when "[s]ubstantial changes are proposed in the project which will require major revisions of the previous EIR..." Guidelines §15162(a)(2). The proposed changes are clearly substantial and go well beyond "minor additions" to the Master Plan. Therefore, LAWA should not treat the SPAS EIR as a Supplement to the Master Plan, but rather as a stand-alone Subsequent EIR.

Response:

The content of this comment is similar to the concerns expressed in comment SPAS-AL00007-41; please refer to Response to Comment SPAS-AL00007-41.

SPAS-PC00130-820

Comment:

B. Analysis of Impacts.

The checklist of impacts in the subject NOP includes specific comments that raise numerous concerns for ARSAC. First, greenhouse gas emissions should be specifically addressed in the impacts analysis, as is acknowledged on the Initial Study, Attachment A, p. 3. However, the scope of that analysis appears too narrow. Since greenhouse gas emissions were not analyzed in the 2004 EIR, the analysis of emissions should not be limited to the construction and operation of the LAX SPAS alternatives, but should include all airport operations.

Response:

Section 4.6 of the SPAS Draft EIR provides a comprehensive analysis of greenhouse gas (GHG) emissions and impacts associated with each of the SPAS alternatives. The commentor does not provide any examples of sources that were omitted. As discussed in Section 4.6.2 of the SPAS Draft EIR, the EIR analyzed numerous operational sources of GHGs, including aircraft, ground support equipment, traffic traveling to or from LAX, and stationary sources such as natural gas combustion, purchased electricity, water delivery, wastewater treatment, and solid waste disposal. Section 5.5.6 of

the SPAS Draft EIR provides a cumulative analysis of GHGs. The analysis considers other projects that would contribute to cumulative impacts related to GHGs, as well as the contribution of the SPAS alternatives to those cumulative impacts.

SPAS-PC00130-821

Comment:

ARSAC expects LAWA and the City will have to find significant impacts in the areas of aesthetics, air quality, emission of greenhouse gases, biological resources, cultural resources (i.e. the "Sea to Shining Sea" mosaic tile mural in Terminal 3), geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, transportation/circulation, and utilities.

Response:

The comment is noted. Table 1-4 in Chapter 1 of the SPAS Draft EIR summarizes the environmental impacts after mitigation of the SPAS alternatives as identified in Chapter 4 of the SPAS Draft EIR and identifies which of the environmental topics raised in this comment were found to result in significant impacts and under which SPAS alternatives those significant impacts would occur. Table 1-5 in Chapter 1 of the SPAS Draft EIR provides additional summary information regarding the nature and extent of the unavoidable significant impacts associated with the nine SPAS alternatives. Detailed discussions of the significance conclusions for each environmental topic where significant impacts would occur are provided in Chapter 4 of the SPAS Draft EIR.

As described on page 7-6 in Section 7.7 of the SPAS Draft EIR, the Initial Study included in the October 2010 LAX SPAS EIR Notice of Preparation, provided as Appendix A of the SPAS Draft EIR, determined, for the reasons explained therein, that effects on the following resource areas raised in this comment would result in no impact, or less than significant impacts, and were therefore not discussed in detail in the SPAS Draft EIR: geology and soils, population/housing, and recreation. Please see Response to Comment SPAS-PC00130-53 for further discussion of the specific issue areas where it was determined, in accordance with the State CEQA Guidelines, that detailed discussions were not required in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00201-11 for a discussion as to why the mosaic mural attached to the wall of the tunnel that is part of Terminal 3 is not an eligible or designated historical resource under CEQA.

SPAS-PC00130-822

Comment:

1. The list of impacts proposed for study is incomplete.

a. Geology/Soils.

Although LAWA has not checked off plans to study geology and soils, population and housing and recreation, LAWA should include these in the EIR. Geology and soils are critical concerns with any construction project. Several projects and/or ongoing geology/soils concerns should be considered in the EIR. Presently, there are proposals to build a ground water runoff retention basin on the northwest corner of the LAX airfield. An underground storage facility is also proposed. LAWA should examine the potential for leaks, and to the Impacts on the soil above. As this location is near the El Segundo Dunes, the soil tends to contain more sand than the eastern boundaries of the LAX property. Additionally, there are old sewer lines running underneath LAX dating back to the 1920's. Some of these lines in Playa del Rey (such as on Zitola Terrace) have collapsed, and the City of Los Angeles has had to buy out certain homeowners (e.g. James Marcinkus). Another proposed project could affect LAX is the Woodside Natural Gas pipeline that will use part of LAX property in the El Segundo Dunes and will traverse underneath Westchester Parkway to a facility near 98th Street and Bellanca. The EIR should address potential cumulative geology/soils impacts.

Response:

As described on page 7-6 in Section 7.4 of the SPAS Draft EIR, the Initial Study included in the October 2010 LAX SPAS EIR Notice of Preparation, provided as Appendix A of the SPAS Draft EIR, determined, for the reasons explained therein, that effects on the following resource areas would result in no impact, or less than significant impacts, and were therefore not discussed in detail in the SPAS Draft EIR: agricultural resources, geology and soils, mineral resources, population/housing, and recreation. In particular, the NOP determined that all geology and soils impacts would be less than significant. Please see Response to Comment SPAS-PC00130-921 for an explanation of why such impacts would be less than significant.

The comment regarding the proposal to construct a stormwater infiltration and treatment facility on airport property is noted. This project was included in the list of cumulative projects evaluated in the SPAS Draft EIR (see page 5-22 in Section 5.3.5 of the SPAS Draft EIR). The potential for the stormwater infiltration and treatment facility project to result in leaks and impacts to soils would be addressed in environmental documentation prepared for that project, and there is no evidence that such impacts, if they were to occur, would add to any geology and soils impacts of the SPAS alternatives.

Please see Response to Comment SPAS-PC00130-898 regarding the presence of sewer lines beneath LAX.

The Woodside Natural Gas pipeline project referred to in this comment was suspended by the project proponent subsequent to preparation of this comment.1 Therefore, this project was not included in the cumulative analysis in the SPAS Draft EIR.

The comment does not present any facts or evidence suggesting that the impacts of the SPAS alternatives related to geology and soils would be cumulatively considerable.

1. Woodside Petroleum Ltd., Woodside Suspends Oceanway Development, January 16, 2009.

SPAS-PC00130-823

Comment:

b. Population/Housing.

Population and housing are expected to increase in the Westchester/Playa del Rey/Playa Vista community plan area. Although this area presently has over 50,000 residents, Playa Vista will be adding more housing stock as will the new apartment complex on the corner of Manchester and Lincoln (former Furama Hotel site). Furthermore, the proposed revision to the Housing Element to the City of Los Angeles General Plan seeks to double housing in the Westchester/Playa del Rey/Playa Vista area. With increased housing and population come increased traffic and pollution impacts as well as additional stresses on infrastructure such as roads, water usage, power consumption and sanitation (trash pick-up and sewer). The EIR should address any cumulative impacts.

Response:

As described on page 7-6 in Section 7.4 of the SPAS Draft EIR, the Initial Study included in the October 2010 LAX SPAS EIR Notice of Preparation, provided as Appendix A of the SPAS Draft EIR, determined, for the reasons explained therein, that effects on the following resource areas would result in no impact, or less than significant impacts, and were therefore not discussed in detail in the SPAS Draft EIR: agricultural resources, geology and soils, mineral resources, population/housing, and recreation. The NOP determined that all impacts related to population and housing would be less than significant (2010 SPAS NOP, pages A-20 and A-21). As discussed therein, it is not expected that the growth implications associated with operation of the LAX SPAS alternatives would be materially different than those previously addressed in the LAX Master Plan EIR. Moreover, neither the LAX Master Plan nor the SPAS alternatives include residential or business development and do not involve the expansion or extension of infrastructure into under-developed or undeveloped areas. Thus, they are not anticipated to result in substantial direct or indirect growth. Therefore, in accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with population/housing was not discussed in detail in the SPAS Draft EIR, as it was determined not to

be significant at either the project or the cumulative level. Although the SPAS Draft EIR did not evaluate impacts to housing, as explained in Section 5.2 of the SPAS Draft EIR, the analysis of cumulative impacts was based on regional projections of population and housing growth prepared and adopted by SCAG in the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS; see Table 5-1 of the SPAS Draft EIR). In addition, in conjunction with the use of the SCAG data, the analysis considered 140 planned projects in the LAX area. (See Section 5.1 of the SPAS Draft EIR.) This list of projects is provided in Table 5-2 of the SPAS Draft EIR, and includes the Village at Playa Vista project (Project #128) and other past, present, and reasonably foreseeable future projects. The cumulative impact analysis, including the adopted growth projections and identified specific past, present, and reasonably anticipated future projects, is "reasonable and practical", and sufficient to determine whether the effects "of the project should be considered significant in the context of the existing cumulative effect." (See Environmental Protection Information Center v. California Department of Forestry and Fire Protection (2008) 44 Cal.4th 459, 525; see also Communities for a Better Environment v. California Resources Agency (2002) 103 Cal.App.4th 98, 118.)

These regional growth projections were used as the basis for the cumulative impact analysis of traffic and air quality, among other topics. Cumulative impacts related to public utilities were based on planning documents prepared by the agencies or entities with jurisdiction, which consider future demand based on regional growth projections. As identified in Section 5.5.13.4, cumulative impacts related to water usage considered the entire LADWP service area and were based on LADWP's 2010 Urban Water Management Plan and considered growth projections from SCAGs 2012-2035 RTP/SCS. As identified in Section 5.5.13.1 of the SPAS Draft EIR, cumulative impacts related to power consumption considered regional growth and were based on future projections of electricity and natural gas demand and supply from the City of Los Angeles' Power Integrated Resource Plan and the annual California Gas Report, respectively. As stated in Section 5.5.13.2, cumulative solid waste impacts relied on regional projections of landfill availability provided in the 2010 Annual Report of the Countywide Summary Plan and Countywide Siting Element. Cumulative wastewater impacts were based on the City of Los Angeles Department of Water and Power's Integrated Resources Plan updates, which consider regional growth. Therefore, cumulative impacts associated with increased housing and population were addressed in the SPAS Draft EIR.

SPAS-PC00130-824

Comment:

c. Recreation.

Recreation is another area that must be studied. For nearly two decades, LAWA has promised to restore the 3 holes removed from Westchester Golf Course when Westchester Parkway was constructed. The Westchester Golf Course is one of the most heavily used golf courses in the City of Los Angeles. Earlier this year, LAWA also held a public meeting at Loyola Marymount University to gather ideas for uses of the LAX Northside property. Many of these uses that garnered positive responses were recreation uses. Furthermore, LAWA may be deficient in producing this EIR if LAX Northside land use issues were not discussed. The FAA's 2005 Record of Decision on the LAX Master Plan specifically excluded approval of the LAX Northside from the Airport Layout Plan on the basis of inconsistency due to, "markedly different assumptions underlying the analysis of environmental impacts that may be expected to result form the LAX Northside portion of the LAX Master Plan."

Response:

Please see Response to Comment SPAS-PC00130-821 concerning why recreation was not studied in the SPAS Draft EIR.

The Westchester Golf Course Three-Hole Restoration Project was completed in 2010, subsequent to the commentor's submittal on the 2008 SPAS Draft EIR NOP on June 17, 2008. (See page 5-22 in Chapter 5 of the SPAS Draft EIR.) This project is not related to SPAS elements. (See Section 5.3 of the SPAS Draft EIR.)

The LAX Northside is identified in Figure 5-2 and on page 5-22 in Chapter 5 of the SPAS Draft EIR as a land development and miscellaneous improvement at or adjacent to LAX which is not related to the SPAS alternatives. This project, and the proposed LAX Northside Plan Update, are evaluated under

cumulative impacts in Section 5.5 of the SPAS Draft EIR. As described in that section, formulation of a new reduced land use development program for the LAX Northside is currently in process, which will be followed by completion of environmental review studies.

SPAS-PC00130-825

Comment:

We request that each of these potential impact areas be thoroughly addressed, even when LAWA feels that impacts can be avoided or reduced by feasible mitigation measures or alternatives.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-822 through SPAS-PC00130-824 above.

SPAS-PC00130-826

Comment:

2. Specific Concerns Regarding Particular Impacts.

a. Traffic Impacts.

Sources of pollution outside of those from LAX operations are cumulatively significant and must be included in the study. In addition to pollution sources from vehicular traffic, aircraft flying in the skies surrounding LAX are also expected to have increased impacts. Additionally, pollution from local refineries, treatment plants, and other sources should be considered additive when determining impact significance.

Response:

The cumulative impacts analysis for air quality is included in Section 5.5.2 of the SPAS Draft EIR, and the projects that were considered in the cumulative impacts are noted in Sections 5.2 and 5.3 of the SPAS Draft EIR. Both construction and operational impacts of all SPAS alternatives were determined to have cumulatively considerable impacts on air quality. The impacts of air pollutant emissions from SPAS-related traffic and aircraft on ambient air quality are presented in Section 4.2.6 and Appendix C of the SPAS Draft EIR.

SPAS-PC00130-827

Comment:

The communities surrounding LAX are generally used as thoroughfares for north-south traffic and few alternative routes exist. The 405 freeway, Vista del Mar and Pershing on the west, Lincoln Blvd., Sepulveda Blvd., and La Cienega all bear heavy traffic, including that associated with LAX operatives. The environmental impact analysis must include those above and beyond the normal operations of LAX, but also the impacts on traffic by travelers and cargo operations forced to go long distances within Southern California to get to LAX. Traffic on the 405 freeway can become bumper-to-bumper at any time of the day or evening. The 405 traffic "spill off" can cause level E and F service on the few other major routes or other alternative routes through the communities. The economic impacts and health impacts of these delays should be identified and quantified.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Section 4.12.2 of the SPAS Draft EIR for a discussion of impacts to the off-airport roadway system. As described in Section 4.12.2.2.2 of the SPAS Draft EIR, the traffic analysis in the SPAS Draft EIR employed a focused travel demand forecasting model to assist in estimating the routes that airport-generated traffic would use, as well as the routes of other traffic in the vicinity. Development of the model for use in this study included both static and dynamic validation tests. Because the model was determined to operate within

accepted standards for accuracy, it was found to be appropriate for the SPAS Draft EIR traffic impact analysis. Figure 4.12.2-2 of the SPAS Draft EIR shows the model process, which includes iterative traffic assignment until traffic is optimally distributed over the freeway and street network. The volume of project-related traffic assigned to each route is partly determined by the roadway capacity and the demand volume on those routes. This dynamic assignment process accounts for traffic diversion from congested routes, including the I-405 Freeway, to other available routes.

As discussed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

As indicated on page 4-83 in Section 4.2 of the SPAS Draft EIR, the air quality analysis conducted for the SPAS alternatives addresses criteria pollutant emissions from operational activities, including off-site regional traffic, that would occur at buildout in the horizon year of 2025. Section 4.7.1 of the SPAS Draft EIR addresses the potential human health risk for people exposed to toxic air contaminants (TACs) resulting from construction and operation, including TACs from motor vehicles, associated with the SPAS alternatives.

Regarding economic effects, "economic or social effects of a project shall not be treated as significant effects on the environment." (State CEQA Guidelines Section 15131(a).) While economic (and social) effects can be part of a chain of relationships that ultimately result in physical impacts on the environment, analysis in the SPAS Draft EIR fully evaluates environmental effects associated with traffic (Section 4.12) and air quality impacts (Section 4.2). The air quality analysis also included emissions associated with vehicle trips, as described in greater detail in Section 4.2.2.2 of the SPAS Draft EIR; emissions associated with construction are described in Section 4.2.2.1. Section 4.7.1 provides a Human Health Risk Assessment.

SPAS-PC00130-828

Comment:

Community growth is increasing the number of people within the communities surrounding LAX. We want to ensure that any related impacts to the community growth are included in the total impact. Population growth and traffic increases resulting from all further land utilization allowed by zoning within community plans must also be considered. LAWA should use maximum use zoning in their analysis, not just those projects that have been approved. City Community Plans call for substantial increases in housing density with resultant traffic and increased numbers of people who will be impacted by airport related pollution. The numbers projected by the Westchester-Playa del Rey Community Plan EIR should be used after modification for further increases enabled by other LA City ordinances such as transit corridor bonuses and affordable housing bonuses and the Housing Element of the LA City General Plan.

Response:

Cumulative impacts related to community growth are analyzed in Chapter 5 of the SPAS Draft EIR. As described on pages 5-1 and 5-2 of the SPAS Draft EIR, CEQA requires a discussion of cumulative impacts. A discussion of cumulative impacts must include "either (1) a list of past, present, and reasonably anticipated future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or (2) or a summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact." (State CEQA Guidelines Section 15130.) The cumulative impact analysis presented in Chapter 5 considers the adopted growth projections set forth in the Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and also identifies and addresses specific projects at or near LAX, including those that would be carried out or approved by LAWA, as well as those outside of LAWA's

control. Table 5-1 provides background for the evaluation of cumulative impacts based on the adopted growth projections set forth in the SCAG RTP/SCS for population, households, and employment. The reasonably foreseeable growth occurring in the SPAS study area is based on the demographic projections adopted by SCAG as extrapolated for 2025, the year of project buildout. SCAG's forecasts are developed in consultation with jurisdictions such as the City of Los Angeles and are derived in part from the potential buildout of communities pursuant to their approved land use plans. In conjunction with the review and use of SCAG data, the cumulative impact analysis has also considered a total of 140 projects in the LAX area as illustrated in Figure 5-1 and described in Table 5-2 of the SPAS Draft EIR. These include both approved and proposed projects. As further described on page 5-2, the 140 projects on the list were evaluated against SCAG's RTP forecast data by traffic analysis zone, relative to residential density and diversity of land use types. If it appeared that projects were not fully accounted for in the SCAG forecast numbers, the numbers were adjusted upward. Therefore, the methodology used to analyze cumulative traffic impacts considers numbers projected in the Westchester Playa del Rey Community Plan as well as existing and proposed projects at or adjacent to LAX.

The commentor suggests that maximum "use zoning" or buildout should be used in the analysis. However, maximum buildout is unlikely and would be speculative, given that population fluctuations, building demands, and building restrictions affect the total buildout. (See Save Round Valley Alliance v. County of Inyo (2007) 157 Cal.App.4th 1437 [holding the DEIR did not need to assume second dwelling unit (theoretical build-out) would be constructed even though allowed by zoning]; Sondermann Ring Partners-Ventura Harbor v. City of San Buena Ventura 2008 WL 1822452 (Unpublished) ["Sondermann asserts the EIR does not comply with CEQA because it does not analyze impacts of full build-out under the updated general plan…The updated general plan analyzes growth potential over the 20-year life of the plan. [A]n EIR is not required to engage in speculation in order to analyze a 'worst case scenario.'"]; Sierra Club v. County of Tehama (2012, Case C066996) 2012 WL 5987582 (Unpublished) ["this [theoretical buildout] projection, is purely a unit per acre calculation and does not reduce units because of environmental, infrastructural or other type of constraints that would limit the number of units on a parcel…[a]s a result, the Draft EIR does not consider the maximum development potential for the whole of the project…Thus, the EIR in this case was not required to analyze specific impacts of the theoretical buildout."]). By using growth projections, the City is able to capture the net effect of these other constraints which cannot be individually quantified. As discussed above, the conservative approach used, namely to use the RTP/SCS projections and specific projects, complies with CEQA. The cumulative impacts analysis looks at a substantial number of projects and was prepared with a sufficient degree of analysis to provide decision-makers with information which will enable them to make a decision which intelligently accounts for environmental consequences.

SPAS-PC00130-829

Comment:

LAX physical layout changes and/or operations at LAX should be considered when determining ground traffic pollution contributions.

Response:

The air quality impact analysis incorporates the layouts of each alternative, including roadways, runways, taxiways, and terminal facilities, into the evaluation. The results of the analysis are included in Section 4.2.6 and Appendix C of the SPAS Draft EIR. In general, construction emissions were found to be significant for carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), and particulate matter (PM10 and PM2.5) under all alternatives. Concentrations of nitrogen dioxide (NO2) and PM10 were found to be significant under all alternatives. Operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 were found to be significant under all alternatives, as were operational concentrations of NO2, PM10, and PM2.5. A summary of air quality impact significance findings is included in Table 1-7 (page 1-63) of the SPAS Draft EIR.

SPAS-PC00130-830

Comment:

b. Air Quality Impacts and Public Health.

Recent studies of pollution sources have identified serious impacts by air pollution on human health. LAWA should consider the latest air quality information from AQMD and California Air Resources Board to assess the various project alternatives for pollution impacts. Average pollution over a long period of time should be determined, but also pollution concentrations in any four-hour period since air and ground traffic tend to have peak hours.

Please see and analyze in the EIR the attached reports from the following websites as examples of the air impacts that have been studied.

http://www.arb.ca.gov/newsrel/nr052208.htm
http://www.arb.ca.gov/research/health/pm-mort/pm-mort.htm
http://www.arb.ca.gov/research/health/pm-mort/pm-mortdraft.pdf

Response:

CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.) The studies listed in the comment describe methodologies and results for estimating premature deaths associated with long-term exposures to fine airborne particulate matter (PM2.5) in California. Such studies are appropriate for use by regulatory agencies for developing and updating ambient air quality standards for PM2.5 on a statewide or national basis. It is not appropriate to include such studies in a site-specific CEQA study. The CEQA analysis included in Section 4.2 of the SPAS Draft EIR correctly addresses the significance of PM2.5 relative to ambient air quality standards and South Coast Air Quality Management District CEQA thresholds. These standards and thresholds should be based on findings of research studies such as those listed in the comment. The ambient concentrations of PM2.5 were found to be significant under all SPAS alternatives, as shown in Section 4.2.6 of the SPAS Draft EIR.

SPAS-PC00130-831

Comment:

LAWA is conducting an air pollution contribution apportionment study to fulfill a Settlement promise. Along with an air pollution contributions analysis, LAWA will be following up a study contract ("Monitoring and Modeling of Ultrafine Particles and Black Carbon at Los Angeles International Airport," Froines, John, ARB Contract 04-325, 3-5-2007) in which ultra fine particle studies smaller than those normally measured were correlated with aircraft operations. Additionally a 2000 report by McDonnell (http://www.nature.com/jes/journal/v10/n5/pdf/7500095a.pdf) highlighted a method to investigate particle impacts on health that should be followed in the assessment of air quality impacts. "This study did not have direct measures of PM2.5 but relied on TSP and PM10 data. In a follow-up analysis (McDonnell et al. 2000), visibility data were used to estimate PM2.5 exposures of a subset of males who lived near an airport." We ask that air quality measurements be taken on LAX property and in surrounding communities that are in close proximity to LAX.

Response:

Please refer to Response to Comment SPAS-PC00130-225 for a discussion of ultrafine particles (UFP, also known as PM0.1), and the 2007 UCLA study. Please refer to Response to Comment SPAS-PC00130-36 regarding the status of the LAX Air Quality and Source Apportionment Study (AQSAS).

The South Coast Air Quality Management District routinely collects particulate matter (PM10) measurements at its Southwest Coastal Monitoring Stations (also known as the LAX Hastings monitoring station) the located of which is shown in Figure 4.2-1 of the SPAS Draft EIR. The most recent five years of measurements from this station are included in Table 4.2-3 of the SPAS Draft EIR.

SPAS-PC00130-832

Comment:

c. Operations Analysis.

In examining all alternatives, LAWA must examine the use of, and the impact of, operating the LAX in various configurations including Westerly operations, Easterly operations and Over-Ocean operations. Safety impacts of the varied scenarios must be assessed. Furthermore, other operational scenarios using outboard runways for take-offs and inboard runways for landings need to be considered, as well as parallel landings on the north or the south runway complexes. Further, any changes in facilities should trigger personnel safety reviews to identify and mitigate potential hazards on both the landside and airside of LAX.

Response:

The SPAS Draft EIR analyzed the operations, and the impacts of operations, of the various alternative configurations of LAX. Appendix F-2 of the Preliminary LAX SPAS Report, studied, among other things, alternative configurations, aircraft operations and movement statistics, and travel paths of aircraft. In order to identify the four runway operating configurations that were modeled, annual weather conditions and FAA operating data from the Federal Aviation Administration's (FAA) Aviation System Performance Metrics (ASPM) Airport Efficiency module from January 2000 to June 2008 were analyzed.

The introduction of additional operational scenarios not currently used at LAX were not evaluated due to compliance with FAA Air Traffic Control (ATC) procedures. Additionally, segregation of arrivals and departures between the north and south airfields would not be beneficial due to the increased amount of taxiing traffic volume and time. The range of alternatives considered in the SPAS Draft EIR included those that could feasibly accomplish the basic objectives of the project and avoid or substantially lessen one or more of the significant effects. (State CEQA Guidelines Section 15126.6(c)). CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.)

Section 4.7.2 of the SPAS Draft EIR addresses the safety analyses related to the SPAS alternatives.

SPAS-PC00130-833

Comment:

C. Specific Questions that Should be Addressed.

ARSAC's comments in the attached "Table of NOP Comments" pose questions that should be addressed in the course of the EIR preparation. The comments have been made to correspond with the NOP document organization.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-856 through SPAS-PC00130-961 below.

SPAS-PC00130-834

Comment:

We understand project impacts deleted from Alternative D by the Stipulated Settlement, and designated as "yellow light projects," will not be analyzed, except for the no action alternative. However, the EIR should analyze the worst case for each of the individual projects' impacts. Further, if a derivative of a yellow light project is proposed in one of the alternatives (e.g., moving runway 24L 340'south), the impacts shall be segregated and not tied to a requirement to impose other yellow light elements, but any worst-case alternative use must be included.

Response:

It is not clear what the commentor is referring to in the statement that "the EIR should analyze the worst case for each of the individual projects' impacts." The SPAS Draft EIR comprehensively evaluates the impacts of nine alternatives. Conservative assumptions are made throughout the analysis to present reasonably-foreseeable impacts associated with each alternative. The impacts of individual

components of the SPAS alternatives were not evaluated separately (i.e., they were not "segregated," as requested by the commentor). CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended by or demanded by commentors. (State CEQA Guidelines Section 15204.) The SPAS Draft EIR was prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.) Section 7.H.1 of the LAX Specific Plan, as amended, requires LAWA to initiate a complete LAX Specific Plan Amendment Study prior to seeking an LAX Plan Compliance determination for any one of the Yellow Light Projects. To evaluate the impacts of the components separately could result in a "piecemealed" analysis and could understate the impacts of the entire SPAS program.

SPAS-PC00130-835

Comment:

In 2004, LAWA took credit for the reduction in development at the Northside Development area from the 4.5 million square feet assumed in the 1982 EIR to 1.5 feet 5 million square of light industrial and commercial space. However, the ROD excluded the Northside Development. The DEIR should clearly specify what is planned at this time, and the full impact of such development. Similarly, all proposed uses of the Belford Square area should be delineated in the assumptions used to assess the impacts.

Response:

Both the LAX Master Plan EIR and the SPAS Draft EIR assume that LAX Northside will be developed with up to 4.5 million square feet of uses, as provided for in the approved development plan, subject to a limitation on the total number of vehicle trips. As indicated on page 5-22 of the SPAS Draft EIR, formulation of a new reduced land use development project for LAX Northside is currently in process. The LAX Northside Plan Update is intended to create a vibrant, sustainable center of employment, retail, restaurant, office, hotel, research and development, higher education, civic, airport support, recreation, and buffer uses that support the needs of surrounding communities and of LAWA. Potential impacts related to implementation of the LAX Northside Plan Update will be addressed in the LAX Northside Plan Update Draft EIR. However, as a new land use plan has not yet been developed or adopted, the SPAS Draft EIR assumed that the approved land use plan will be implemented. Please see Response to Comment SPAS-PC00130-175 regarding land uses in the Belford area.

SPAS-PC00130-836

Comment:

The new alternatives all contain a new transportation center at Century and Imperial. Changes to traffic flows and pollution impacts should be highlighted along with those from any automated people movers (APM) that would go from that facility to the central terminal area. The stops of the APM can have a significant impact on ground traffic. The locations assumed for stops must be identified in detail.

Response:

It is unclear what the commentor is referring to relative to a "new transportation center at Century and Imperial." Under all of the alternatives that include ground access components (i.e., Alternatives 1, 2, 3, 4, 8, and 9) except for Alternative 4, Manchester Square, located at the intersection of Century and Aviation Boulevards, would be used for airport-related facilities. However, only Alternative 3 would include a Ground Transportation Center in this location. The other alternatives would provide parking (Alternatives 1 and 2) or parking and a CONRAC (Alternatives 8 or 9) in this area. Alternatives 1, 2, 8, and 9 would provide a new transportation center between 98th and 96th Streets, west of Airport Boulevard.

Please see Response to Comment SPAS-PC00130-764 regarding the impacts from a potential APM system connecting airport facilities outside of the CTA with the terminal area. As discussed in this response, the APM systems proposed as a part of Alternatives 3 and 9 have been developed at a program level of planning. Station locations along the routes outside the CTA are identified in the SPAS Draft EIR. As indicated on page 2-22 of the SPAS Draft EIR, under Alternative 3, APM 1 between the ITC and the CTA would have a stop at the CONRAC proposed to be located in the Lot C area; APM 2,

which would connect the GTC and the CTA, would not have any intermediate stops. Under Alternative 9, the APM would include a stop at the ITC as well as at the planned Metro Aviation/Century Station. Alternatives 3 and 9 do not define the final APM system alignment and station locations within the CTA. The alignment and design of the APM line(s) within the CTA will be determined and addressed at the project level, should one of those alternatives be approved. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

The analyses of air quality, on-airport transportation, and off-airport transportation impacts under Alternatives 3 and 9 consider all of the components of each alternative, including proposed transportation centers and APMs.

SPAS-PC00130-837

Comment:

Although the Consolidated Rental Car facility location was approved for project analysis by the Stipulated Settlement in the Lot C location, it is our understanding that alternative locations have been considered. The impacts on ground traffic should be assessed separately for each alternative location.

Response:

Please see Response to Comment SPAS-PC00130-765 regarding the fact that the locations of the CONRAC proposed under various SPAS alternatives were accounted for in the SPAS Draft EIR analyses.

SPAS-PC00130-838

Comment:

One alternative discussed modifications to the ingress/egress along the 98th Street bridge for the Central Terminal Area near the present Terminal 1. This proposed solution called for a structure in the area where Park One currently is located. This proposal allows people going to the north terminal, especially Terminal 1, an opportunity for drop off without entering the major CTA traffic loop. The benefits from this potential project should be segregated so that they may be added to any of the alternatives.

Response:

Please see Response to Comment SPAS-PC00130-703 and Response to Comment SPAS-PC00130-809 regarding consideration of alternatives to allow passenger drop-off east of Terminal 1 and traffic to exit out of the CTA northbound via the proposed Sky Way realignment.

SPAS-PC00130-839

Comment:

Each of the new alternatives contains a Midfield Terminal and the addition of gates to the backside of Tom Bradley International Airport. LAWA should specify the locations of the taxiways and taxiway intersections. All ground and air impacts of this set of projects must be included in the analysis of each of the alternatives.

Response:

Please see Response to Comment SPAS-AL00007-44 regarding the relationship of the Midfield Satellite Concourse and Bradley West projects to the analysis of the SPAS alternatives. As indicated in that response, and as discussed in Sections 5.3 and 5.5 of the SPAS Draft EIR, although these projects are not components of SPAS, these and other cumulative projects were assumed in the simulation analysis of future conditions with implementation of the SPAS alternatives. Therefore, the simulation analysis represents future conditions with the airfield and terminal changes associated with each of the SPAS alternatives as well as changes associated with these and other cumulative projects. As the assessment of air quality impacts relied upon data from the simulation analysis, these projects were

included in the analysis of air quality impacts. Similarly, passenger activity for all CTA terminals, including the MSC and TBIT with implementation of the Bradley West Project, was assumed in the Design Day Flight Schedule (DDFS), which was the basis for the on-airport transportation analysis. The off-airport transportation analysis assumed total future passenger activity levels at LAX, including activity associated with the MSC and Bradley West projects.

The locations of taxiways and taxiway intersections for each alternative are provided in Figures 2-1 through 2-9 in Chapter 2 of the SPAS Draft EIR.

SPAS-PC00130-840

Comment:

In examining all alternatives, LAWA must examine the use of, and the impact of, operating LAX in various configurations including Westerly operations, Easterly operations and Over-Ocean operations. Safety impacts of the varied scenarios must be assessed. Furthermore, other operational scenarios using outboard runways for take-offs and inboard runways for landings need to be considered, as well as parallel landings on the north or the south runway complexes.

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-832; please refer to Response to Comment SPAS-PC00130-832.

SPAS-PC00130-841

Comment:

D. Analysis of Alternatives.

1. The Proposed Alternatives.

The NOP identifies two no project alternatives and four alternatives. ARSAC is unalterably opposed to the alternative of moving the runway 24R 340 feet to the north, and strongly supports analysis of the alternative of keeping the existing runways at the present location and implementing operational improvements to enhance safety. Only if safety risks remain after such operational improvements have been implemented can the costs and disruption of runway movement be justified. LAWA has demonstrated the capability of landing Group VI aircraft on both the north and south complexes, albeit with some adjacent taxiway use restrictions. When the South Airfield Project was presented for approval, LAWA indicated that it would be capable of handling the Group VI aircraft and it is our understanding that a ground terminal access route using the south runway 25L has been formally approved for use by the FAA. In the ground air traffic analysis, LAWA should consider the benefits of moving the runways south, and how that would improve the deficient (but legal) taxiways near the terminal gates.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-842

Comment:

When analysis is performed on the north and south runway complexes, we want the assumptions for operational efficiency and safety impacts of the Runway Status Lights to include both the proposed Pilot Program, which is promised to be installed in 2009, and a complete system which includes the other runways and taxiway intersections which have not been included.

Response:

As indicated on page 4-502 of the SPAS Draft EIR, the FAA and LAWA are deploying Runway Status Lights (RWSL) technology at LAX, with a Prototype Program (Phase 1) installed and operating since June 2009. The FAA is scheduled to enter construction on Phase 2 of the implementation of RWSL in 2013. As the RWSL system, in general, is still in the testing phases, actual (i.e., real world) operational efficiency and safety impacts of the system have not been published at this time.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-843

Comment:

In addition to the alternatives already under consideration, ARSAC requests that an additional alternative, moving runway 24L 340 feet to the south with the revised terminal configuration described in the attachment to this letter, be analyzed as part of this EIR. This alternative reduces the impacts on Westchester and Playa del Rey, while improving airport efficiency.

Response:

Please see Response to Comment SPAS-PC00130-814 regarding LAWA's review of the ARSAC alternative concept.

SPAS-PC00130-844

Comment:

Besides analyzing alternative runway configurations and diverting flights to other airports, the EIR must consider and provide a quantification of all airfield operational scenarios in evaluating the alternatives-westerly operations, easterly operations and over-ocean operations. The noise, pollution and safety impacts on the surrounding communities differ depending upon the operational state. For example, during easterly operations, aircraft taking off on the north runway complex have cut across parts of Westchester such as Westport Heights that are normally not over flown by aircraft at very low altitudes.

Response:

The SPAS Draft EIR analyzes the impacts of the alternatives on, among other things, hazards and hazardous materials (Section 4.7), air quality (Section 4.2), noise (Section 4.10), and safety (Section 4.7.2). In each of the resource-area subsections, the EIR discusses the baseline conditions affecting the surrounding environment and analyzes whether a given alternative would result in any significant environmental impacts.

For a detailed discussion of the potential resource impacts on surrounding communities, please review the specific subsection relating to that resource-area. Please also see Appendix F-2 of the Preliminary LAX SPAS Report for the quantification of impacts for all airfield operational scenarios.

SPAS-PC00130-845

Comment:

The February 2006 Stipulated Settlement specified in SECTION V. LAX SPECIFIC PLAN AMENDMENT STUDY PROCESS, Item C states a goal of "...minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA." In particular we want detailed analysis of the north runway complex impacts to show that they are less than that of the current condition of no runway change or in the worst case, Alternative D that was previously approved.

Response:

Minimizing environmental impacts on surrounding communities, and creating conditions that encourage airlines to go to other airports in the region are some of the goals set forth in Section V(C) of the Stipulated Settlement. This provision also requires the SPAS to identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 million annual passengers while enhancing safety and security.

Alternative 4 represents a scenario whereby the north airfield essentially remains in its current condition, with no improvements other than the federally-mandated runway safety area improvement at the east end of Runway 6R/24L, which does not affect normal daily operations. Alternative 3 reflects the north airfield improvements proposed under LAX Master Plan Alternative D. The impacts of each of these two alternatives can be reviewed and compared to the impacts of each of the other SPAS alternatives, as well as to each other, with the information presented throughout the SPAS Draft EIR.

SPAS-PC00130-846

Comment:

When any of the alternatives are examined for impacts, a key element that must be assessed is the quality of life. Will a runway protection zone require the removal of homes and businesses? The analysis should include all cost factors of eminent domain and loss of values for the surrounding communities that might lose their community serving businesses.

Response:

Regarding impacts on quality of life, eminent domain costs, and impacts on community values, CEQA does not require purely social or economic impacts to be analyzed in an EIR. (State CEQA Guidelines Section 15064(e).) As required by CEQA, the SPAS Draft EIR evaluates physical impacts on the environment associated with over 20 topical issues and how such impacts have the potential to affect residents in surrounding communities.

Regarding RPZs and the potential for acquisition of homes and businesses, please see Response to Comment SPAS-AL00007-26. It is not proposed or certain that acquisition would occur due to changes in RPZs. As discussed in Section 4.7.2.6.1 of the SPAS Draft EIR, there are various potential options for dealing with incompatible structures or land uses within an RPZ including: (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. Information on specific options to address safety risks would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification.

SPAS-PC00130-847

Comment:

In terms of ground traffic analysis, petitioners are allowed to add up to15 additional intersections for review, and these intersections may require additional mitigation in several communities. Regardless, the Settlement does not limit the intersections and highways that must be mitigated to accommodate LAX projects.

Response:

The comment, which was originally submitted on the Notice of Preparation for the SPAS Draft EIR, states that the Stipulated Settlement allows petitioners to add up to 15 additional intersections for review and does not limit the locations that must be mitigated to accommodate LAX projects. Section V.G of the Stipulated Settlement also provides that LAWA will propose feasible mitigation measures, if any, to mitigate any potentially significant impact. The LAX Master Plan EIR traffic analysis assessed project impacts at 164 study intersections. Since that analysis was completed the petitioners were provided an opportunity to add study locations and did so. The SPAS Draft EIR off-airport transportation analysis (Section 4.1.2) assessed potential traffic impacts at 200 study intersections and 30 CMP freeway monitoring stations; the analysis includes the additional study locations requested by petitioners. The SPAS Draft EIR also identifies mitigation measures.

SPAS-PC00130-848

Comment:

2. Consideration of Additional Alternatives.

The NOP provides the opportunity for the submittal of additional reasonable alternatives to be studied within the EIR. ARSAC submits two additional proposals to be included in the EIR and the North Runway Complex Safety Study. ARSAC has generated these proposals to increase the range of alternatives that may be considered. The narratives of both proposals are included as attachments. A short summary is below. ARSAC feels that it imperative that no alternative be selected as a preferred alternative until after the North Runway Safety Studies and analysis have been completed and examined. Furthermore, ARSAC requests data from the South Airfield Improvement Program to determine the effectiveness of those improvements, such as the centerline taxiway, in reducing incursions.

Response:

The SPAS Draft EIR includes a full range of airfield improvement alternatives, proposing seven different options that range from moving Runway 6L/24R 350 feet north, to moving Runway 6R/24L 340 feet south, to not moving either runway but making taxiway improvements, to not making any notable airfield improvements other than federally mandated safety improvements, and other options. As further described below and also addressed in Responses to Comments SPAS-PC00130-849 and SPAS-PC00130-850, the major elements in the additional proposals offered by ARSAC are either not feasible, do not respond to the project objectives, have environmental impacts that are similar to or worse than the alternatives addressed in the SPAS Draft EIR, and/or are already reflected in the range of alternatives addressed in the SPAS Draft EIR.

The comment does not indicate any environmental advantages of a three-runway configuration relative to the alternatives evaluated in the SPAS Draft EIR. The three-runway configuration studied in the North Airfield Safety Study is described and evaluated in Section 2.3.2.3 of the SPAS Draft EIR. This section presents several operational problems associated with this alternative and indicates that it would likely result in environmental impacts comparable or greater to the alternatives evaluated in detail in the SPAS Draft EIR. Therefore, this alternative was not evaluated in detail in the SPAS Draft EIR.

The South Airfield Improvement Program, which included the development of a centerfield taxiway, was completed in June 2008. As indicated in Table 4.7.2-7 on page 4-510 of the SPAS Draft EIR, there have been no serious runway incursions (i.e., Category A or Category B) on the south airfield since that time.

SPAS-PC00130-849

Comment:

b. 340 feet south / Airline Alliance Plan.

This plan, presented to LAWA Executive Director Gina Marie Lindsey on May 7, 2008, is similar to Alternative D except that in place of replacing Terminals 1, 2 and 3 with a concourse for widebody aircraft, Low Cost Carrier terminals would be constructed. Airlines that have airline alliances would be

relocated to terminals with their domestic airline partners, or to the Tom Bradley International Terminal for most foreign airlines. The Central Terminal Area (CTA) parking garages would not be torn down in this plan. The Consolidated Rent-A-Car (RAC) facility would be located in Manchester Square and connected to the CTA by an Automated People Mover. An elevated roadway would connect the 405 freeway to the RAC and CTA.

Response:

Please see Response to Comment SPAS-PC00130-814 regarding LAWA's review of the ARSAC alternative concept.

SPAS-PC00130-850

Comment:

3. The Need for Development of a Regional Plan.

ARSAC continues to believe in a regional solution to airport congestion. The Stipulated Settlement provided that "The first regional strategic planning initiative will be prepared by December 31, 2006." Unfortunately, this commitment was not kept. Not only was the Plan only recently submitted to the County of Los Angeles, but it has now been withdrawn. ARSAC is disturbed by LAWA's failure to aggressively pursue development of a Regional Strategic Plan, and asks that members of the SPAC have an opportunity to comment upon the draft plan prior to the time it is finalized and adopted by the Board of Airport Commissioners, and that this effort be treated as a high priority by LAWA.

Regardless of what is done with the Regional Strategic Plan, LAWA should examine in the DEIR the increased utilization of LAWA controlled airports at LA/Ontario International (ONT) and LA/Palmdale Regional Airport (PMD), as opposed to expanding LAX. There is precedent for this kind of study. During the late 1990's, in the LAX Terminal 4 EIR to modernize the American Airlines terminal, a cursory examination was made of shifting some flights to ONT and/or PMD. The failure of the Terminal 4 EIR was that it did not fully examine all of the environmental effects through increased utilization of ONT and PMD, versus LAX. ONT and PMD are large investments for LAWA and they both have the potential for greater economic, operational and environmental value if properly marketed. For example, the "Fly Ontario" marketing campaign did increase the public's awareness of ONT and several new flights were added to ONT, with the notable addition of ExpressJet's west coast hub.

The EIR should analyze all of the environmental benefits to the area surrounding LAX that would occur if some international flights were shifted to ONT. ONT currently has staffed Federal Inspection Facilities (FIS- Immigration, Customs, Agriculture). Additionally, LAWA should analyze the benefits of shifting some cargo flights from LAX to ONT.

LAWA should also consider the impacts of benefits of shifting some domestic flights to PMD, as was identified in the 2001 TriStar Marketing report on PMD and subsequent destination studies. LAWA should also discuss the LAWA/US Air Force Plant 42 Joint Use Agreement (JUA) for PMD, and how the JUA could be revised to accommodate more flights, allow for development of the LAWA owned property, and remove the domestic flight restriction to allow for international traffic at PMD.

LAWA should discuss how a "multi-airport discount rate" system could encourage the shift of flights or the addition of new flights to ONT and PMD. The "Multi-Airport Discount Rate" would give airlines that operate at LAX, ONT and PMD more favorable landing fees and terminal rents than operating solely at LAX. Airlines that operate solely at ONT and/or PMD would get even better rates for not operating to LAX. The "multi-airport discount rate" plan should be available to international carriers, as well as domestic carriers. For international flights, there would have to be parity between those international flights operated by domestic and foreign airlines.

LAWA should examine changing the financing model at LAX (residual vs. compensatory) to allow for cross-subsidization of ONT and PMD to support the "multi-airport discount rate" system.

European and Asian airlines have expressed interest in operating out of ONT. Please discuss how new, smaller, highly efficient widebody aircraft such as the Boeing 787 Dreamliner and the Airbus A350XWB can help make ONT more viable for international flights, while lessening the impact on the environment.

Many foreign airlines have ordered these aircraft. Continental and Northwest are the only U.S. airline customers for the Boeing 787, while US Airways and Hawaiian Airlines are the only U.S. airlines to order the Airbus A350 XWB. Domestic airlines are adding international routes to meet demand for more non-stop services between new cities, and to feed their domestic networks. Also, please discuss how new multi-lateral and bi-lateral agreements, such as the United States-European Union Open Skies Agreement and the new US-Australia Bilateral Air Services Agreement, can provide ONT with more opportunities for international air service development. Discuss LAWA's past, current and future efforts to attract more air service to ONT and PMD.

Finally, LAWA needs to address the issue of Orange County residents using LAX for their air travel needs. It has been estimated that one-third of the passenger traffic through LAX is destined for Orange County, and that LAX handles 90% of Orange County's air cargo. LAWA should discuss the possibility of working with the Walt Disney Company to rename LA/Ontario International Airport to Walt Disney International Airport and then re-package the airport as the gateway airport to the Disneyland Resort, and the primary international gateway airport for the Orange County and Inland Empire regions. In your analysis, please assume that the Right of Way can be obtained for a monorail or high-speed rail between ONT and the Disneyland Resort and/or the Anaheim Transportation Center. This way, ONT will be provided with the necessary critical mass for ground transportation. The rail line could be operated by LAWA, Disney, or in cooperation with the California-Nevada Super Speed Rail Commission.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. The subject Topical Response also discusses efforts to shift LAX aviation activity to LA/Ontario International Airport (ONT) and Palmdale Regional Airport (PMD). The commentor's suggestions regarding ways to shift aviation activity from LAX to other airports are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration.

The comment presents no facts or evidence showing that greater service at other airports would mitigate significant adverse impacts of the SPAS alternatives. As described in Section 6.2 of the SPAS Draft EIR, shifting LAX aviation activity to other airports could cause significant adverse impacts at those airports.

As it relates to the suggestion that LAWA should consider a "multi-airport discount rate," it is assumed the commentor is suggesting that LAWA provide discounted fees at LAX for air carriers that also offer service at ONT or PMD. Under federal regulation, an airport sponsor is required to set rates, fees, rentals, and other charges without unjust discrimination (49 U.S.C. Sec. 47107). This requirement has been interpreted to mean that an airport sponsor must charge substantially comparable rates, fees, rentals, and other charges to airlines for a similar use of their facilities. Providing discounted rates for certain carriers because they offer service at another LAWA airport could be viewed by the FAA as discriminatory, in that it offers preferential treatment for some "local benefit", similar to providing preferential treatment for carriers that also lease additional maintenance or storage space from an airport sponsor, an action prohibited by the FAA. For these reasons, LAWA will not consider "multi-airport discount rate" in connection with the SPAS process.

As to the comment about the Residual Financial model currently being used at ONT, this comment does not relate to the SPAS process, but it is noted and will be forwarded to decision-makers for consideration apart from SPAS. Changes to the Residual Financial model currently being used at ONT could not be imposed unilaterally by LAWA. A change in the financial model currently implemented by LAWA is subject to negotiation with the air carriers who have service at ONT.

The commentor suggests that certain new and future aircraft, such as the Boeing 787 and the Airbus A350XWB, could serve ONT from distant international locations without incurring the business costs

associated with flying that route with older, wide-body aircraft. This observation has no bearing on SPAS, since increased service at ONT by these aircraft would not supplant the need to accommodate the large, wide-body ADG V and VI aircraft at LAX. The future fleet mix at LAX used in SPAS, detailed in Appendix F-1 of the Preliminary LAX SPAS Report, was developed by experts in the field of aviation forecasting, and reflects that, inclusive of expected changes in aircraft and international flight patterns, the projected 2025 future fleet mix at LAX will contain a significant number of ADG V and VI daily flights at LAX.

Please see Response to Comment SPAS-PC00130-313 regarding Open Skies and Bilateral Agreements.

As it relates to the marketing and renaming of ONT by LAWA, the marketing of ONT is a matter taken seriously by LAWA, and will continue to be developed independent of any decisions on SPAS. LAWA has initiated conversations with the air carriers serving ONT to expand marketing efforts, as documented in the August 2, 2012 letter to Herman J. Hettinger, III.1,2 In addition, Chapter 7 of the Preliminary LAX SPAS Report contains a potential amendment to the LAX Specific Plan that would trigger a new market survey of regional air passengers when LAX reaches 75 MAP that could better inform future marketing efforts for other regional airports, including ONT.

The commentor also suggests that LAWA consider the possibility of a high-speed rail station at ONT connecting to the proposed Anaheim Regional Transportation Intermodal Center (ARTIC), and potentially serving the Inland Empire and Las Vegas. While such a project has been proposed in the past, funding is not identified for the project in the SCAG 2012 Regional Transportation Plan (RTP), which has a horizon year of 2035, beyond the planning horizon of SPAS. The project has also not undergone environmental review, which would likely be required under CEQA and NEPA (if any federal funds were to be used for the project). As a result, the feasibility of the project is speculative, and CEQA does not require analysis of speculative alternatives or impacts. Furthermore, as mentioned above, the SPAS forecast used in the development of this EIR was developed by experts in the field of aviation forecasting, and is inclusive of changes in aviation demand at LAX through 2025.

SPAS-PC00130-851

Comment:

E. Enhancing Airport Security.

Security is another matter that needs to be carefully examined in the EIR. RAND performed two security studies on the LAX Master Plan. The first was done at the request of Congresswoman Jane Harman. The second study was commissioned by the Board of Airport Commissioners (BOAC). To date, the public is unaware of how, if at all, LAWA is implementing the RAND recommendations. Please discuss what, if any, follow up with RAND has been occurred, and the status of implementation of its recommendations.

Response:

Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan.

Please see Responses to Comments SPAS-PC00130-424 and SPAS-PC00130-495 above regarding implementation of recommendations in the RAND Corporation's security studies of LAX. In addition to implementing several of the recommendations made by the RAND Corporation, LAWA has implemented numerous recommendations provided by other security experts and agencies including

the Transportation Security Administration, Federal Bureau of Investigation, Department of Homeland Security Office of Critical Infrastructure Protection, international experts, and others. The details regarding the security measures considered and implemented is considered Sensitive Security Information under federal law and is therefore not subject to disclosure.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-852

Comment:

F. Processing of the EIR.

Although the NOP has been released, ARSAC believes the NASA study should be completed and evaluations conducted by the selected members of the academic community have been published before the Draft EIR is released so that the studies will inform the selection of a preferred alternative. This would also allow LAWA to first have experience with operations at the South Runways before selecting a preferred alternative.

Response:

This comment pertains to the 2008 NOP for the SPAS Draft EIR, which was issued prior to initiation of the North Airfield Safety Study (NASS) conducted by NASA Ames. LAWA, in essence, temporarily suspended preparation of the SPAS Draft EIR while the NASS was being completed, resuming in 2010 with issuance of the Revised NOP. The results of the NASS are summarized in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00130-853

Comment:

When the Draft EIR is released, ARSAC requests that it, and all related documents, be provided electronically in searchable format, as well as in hard copies.

Response:

The electronic versions of the SPAS Draft EIR and the Preliminary LAX SPAS Report were provided via disk and on www.laxspas.org. The documents provided were searchable files. A limited number of hard copies of these documents were distributed; ARSAC was among those receiving hard copies of both documents. Hard copies were also made available at six area libraries.

SPAS-PC00130-854

Comment:

To the extent that the new EIR relies upon the 2004 LAX Master Plan Environmental Impact Report, that EIR contained many conflicting comments within its 17,000 pages, and numerous deficiencies that were identified by ARSAC and other petitioners in the lawsuit that resulted the Stipulated Settlement of 2006. To assure greater clarity, and avoid some of the problems that occurred in the past, whenever any of the prior documentation is referenced in the upcoming EIR, we request that specific paragraphs and page number references be included for documents referenced in the DEIR. We also strongly request that the EIR and all supporting documents be provided in a format that is searchable electronically.

Response:

Please see Response to Comment SPAS-PC00130-14 regarding incorporation by reference of information from the LAX Master Plan Final EIR. The electronic versions of the SPAS Draft EIR and the Preliminary LAX SPAS Report provided via disk and on www.laxspas.org are searchable files.

SPAS-PC00130-855

Comment:

Finally, so that the best possible public review and participation will occur, we also ask that the Draft EIR circulation time be increased from 45 to 120 days. Forty-five days for review of an extremely complex and technical document is simply inadequate.

Response:

The commentor's request for an extended public comment period for the SPAS Draft EIR is noted. Please see Response to Comment SPAS-AL00007-59 regarding the length of the public review period for the SPAS Draft EIR.

Comment:

2.0 Project Background
2
In the City Council hearings 07-0541-S1 8-30-2007 a Specific Plan Amendment to remove the west satellite concourse from the projects requiring maximum scrutiny was approved. The "Midfield Terminal" discussed during these hearings was equated to the "west satellite concourse." Does the approval of this amendment authorize use of only project level EIRs for the Midfield Terminal including the concourse, additional gates on the back of TBIT, and associated taxiways and taxilanes?

Response:

The Midfield Satellite Concourse ("MSC"), referred to as the "West Satellite Concourse" in the LAX Master Plan, was a component of Alternative D and was addressed in the program-level LAX Master Plan EIR. The MSC, including the concourse and gates, associated taxiways, and passenger processing facilities, will be subject to a project-level EIR when the project is proposed for implementation. It should be noted that the additional gates on the west side of TBIT were approved as part of the Bradley West Project, and are currently under construction.

SPAS-PC00130-858

Comment:

3.0 Project Description
4
Clarification: The gate limitation is not 153, but no more than 153 per Section IV C of the Stipulated Settlement.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-859

Comment:

SPAS Options
5
What are the northside runway complex airfield restrictions that were resolved by Alternative D? If the north runway complex is not reconfigured, what will be the operational restrictions on NLAs? Which restrictions can be mitigated by changing the locations of taxiways and runway intersections or gate locations rather than moving runways?

Response:

Alternative 3 represents what would reasonably be expected to occur in the foreseeable future if all of the LAX Master Plan ("Alternative D") improvements were implemented as originally envisioned. (See Section 2.3.1.3 of the SPAS Draft EIR.) Section 4.7.2, in particular Table 4.7.2-8, of the SPAS Draft EIR provides detailed information regarding operational restrictions and limitations for New Large Aircraft (NLA) on the existing airfield and under each of the SPAS alternatives.

The alternatives analyzed represent a reasonable range of alternatives designed to address the project objectives, including, among others, providing north airfield improvements that support the safe and efficient movement of aircraft at LAX. For example, Alternative 2 does not propose any runway relocation. Please see the discussion of Alternative 2 for information about what restrictions can be alleviated by development other than runway relocation.

SPAS-PC00130-860

Comment:

340' option, Alt D
5
With the extension of runway 24L 1000' to the east, this 340' S option says takeoffs would be closer to the community all the way back to Sepulveda. What specific sections and paragraphs in the 2004 EIR provided impact analysis? How many flights would be taking off from this newly located east end of the runway? What noise and pollution studies were included in the 2004 EIR in the assessment? What will be the impacts in easterly operations or in over-ocean operations?

Response:

The SPAS Draft EIR provides a comprehensive analysis of impacts specific to each of the nine alternatives considered therein. The SPAS Draft EIR analysis is based on a current baseline from which to measure impacts and evaluates impacts based on the characteristics of each alternative. Although the improvements associated with SPAS Alternative 3 are essentially the same as those

proposed under the LAX Master Plan Alternative D, the analysis of SPAS Alternative 3 is not based on the LAX Master Plan Final EIR's analysis of Alternative D.

Please see Section 1.4.5 in Appendix F-2 of the Preliminary LAX SPAS Report for runway use levels.

The impacts of easterly operations for items such as air quality, noise, etc., are discussed in Chapter 4 of the SPAS Draft EIR.

SPAS-PC00130-861

Comment:

Move 24L 100' South
6
LAWA should identify what relocations and runway extensions they plan to study. Are these decisions being made on the basis of simulations underway with the NASA study? How will the alternatives for this be evaluated and compared for environmental impacts? Will location selections of taxiways be done to improve operational efficiency of NLA? What specific criteria are being used to evaluate the improvements? What will be the impacts in eastern operations or over ocean operations?

Response:

Please see Section 2.3.1 of the SPAS Draft EIR and associated figures regarding the various airfield alternatives being studied under the SPAS effort. Chapter 4 of the SPAS Draft EIR identifies the various environmental impacts related to the SPAS alternatives.

Taxiway improvements incorporated into the various alternatives have been developed to improve operational efficiencies for New Large Aircraft (NLA). As provided in Section 2.2 of the SPAS Draft EIR, an objective of the project is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. The alternatives analyzed represents a reasonable range, and include alternatives that relocate runways, propose a centerline taxiway, and relocate and reconstruct taxilanes. Please see Section 2.3.1 of the SPAS Draft EIR for a discussion of the taxiway developments associated with each alternative and Appendix F-2 of the Preliminary LAX SPAS Report for an analysis of the efficiency of each alternative.

Please see Appendix F-2 of the Preliminary LAX SPAS Report which identifies the operational impacts of all operation scenarios including eastern operations or over ocean operations. As identified above, the environmental impacts from all the operational scenarios are included in Chapter 4 of the SPAS Draft EIR.

The thresholds of significance used to evaluate the impacts of each alternative are listed and discussed in each resource areas section. (See Chapter 4 of the SPAS Draft EIR.) Additional aspects of each alternative are discussed throughout the various sections of the EIR.

LAWA is considering a number of factors in identifying and evaluating alternatives to the north airfield improvements called for in the LAX Master Plan. Please see page 2-2 of the SPAS Draft EIR for an list of those attributes that will be used to evaluate the alternatives ability to comply with the objective to provide improvements that support the safe and efficient movement of aircraft.

SPAS-PC00130-862

Comment:

Keep existing locations
6
This option was supposed to include an as yet unidentified taxiway and intersection modifications to improve aircraft movement. When this alternative is evaluated for safety and operational effectiveness, what assumptions will be made about the gate locations? What about taxiway and intersection locations? What will be the impacts in eastern operations or over ocean operations?

Response:

The projected gate positions for Alternatives 2 and 4, which keep Runway 6L/24R and 6R/24L in their existing locations, are depicted in Figures 14 and 28 of Appendix F-2 of the Preliminary LAX SPAS Report.

Additionally, the airfield layout used for modeling can also be found in Appendix F-2 of the Preliminary LAX SPAS Report. Alternative 2 is depicted in Figures 20 and 21. Alternative 4 is depicted in Figures 29 through 33.

These are the configurations that were assumed in Section 4.7.2 of the SPAS Draft EIR, which addresses the safety impacts of the SPAS alternatives. For further information regarding the airport operating configurations analyzed as part of the SPAS Draft EIR, please refer to Response to Comment SPAS-PC00130-832.

SPAS-PC00130-863

Comment:

Move 24R 100' North
6
This 100' N says takeoffs would be closer to the community all the way back to Sepulveda. How many flights would be taking off from this location? Where is the noise and pollution study to justify this? This appears to be one of the deficiencies of the original EIR. What would be the impacts on eastern operations or over ocean operations? This 100' N alternative should include two sub-options: extension of 24R west and no further extension that are both evaluated.

Response:

The future runway use percentages for the SPAS alternative scenarios are presented under each of the alternative sections in Appendix J1-1 of the SPAS Draft EIR. For Alternative 6, which would relocate Runway 6L/24R 100 feet northward, approximately 0.7 percent of the daily departures would take-off from that runway in 2025. Based on the average annual day (AAD) estimates for 2025 conditions, there would be 1,937 daily operations at LAX in 2025, half of which would be departures, which would equate to approximately 8 take-offs per day on Runway 6L/24R.

The SIMMOD data presented in Appendix J1-1 of the SPAS Draft EIR was used for the aircraft noise modeling and aircraft air pollution estimates in the analyses of noise and air quality impacts under each alternative, including Alternative 6. The results of those analyses are presented in Sections 4.10.1 and 4.2, respectively, of the SPAS Draft EIR. The SIMMOD data accounts for eastern operations and over-ocean operations, as described in Appendix J1-1.

The design of Alternative 6 assumes no westerly extension of Runway 6L/24R and it is not necessary to carry a sub-option that assumes a westerly extension. Other alternatives, such as Alternatives 1 and 5, include a westerly extension of the runway, and are sufficient to provide a general basis of comparison for decision-making at the program level of planning. The SPAS alternatives constitute a reasonable range of alternatives, sufficient to allow informed decision-making. (State CEQA Guidelines Section 15126.6(a); City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.) The SPAS Draft EIR includes sufficient information about each alternative to allow meaningful evaluation, analysis and comparison with the proposed project. (State CEQA Guidelines Section 15126.6(a)). The commentor does not provide any evidence that the proposed "sub-options" offer any substantial environmental advantages and, therefore, no further analysis is required. (City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.)

SPAS-PC00130-864

Comment:

Move 24R 100' North
7
If terminal demolition of 1,2, 3 is "yellow-lighted," why doesn't LAWA consider the associated taxiways or other CTA activity related to this issue "yellow-lighted" instead of presuming only a project EIR is

required? If changes are to be made, what are they to be and how would it affect the CTA traffic (and any environmental issues related thereto)?

Response:

Section 7.H of the LAX Specific Plan, as amended in 2007 by Ordinance No. 179,148, identifies five specific projects that were later termed "Yellow Light Projects." It is unclear what the commentor means by "why doesn't LAWA consider the associated taxiways or other CTA activity related to this issue "yellow-lighted" instead of presuming only a project EIR is required?" The Yellow-Light Projects are well-defined throughout the Preliminary LAX SPAS Report and SPAS Draft EIR, and the alternatives are designed to address the problems that these projects were intended to solve. The definition of "Yellow Light Projects" in the Stipulated Settlement also identifies the same five projects identified in the LAX Specific Plan. Improvements to taxiways or other CTA activity are not identified in the LAX Specific Plan, as amended, or in the Stipulated Settlement as Yellow Light Projects and there is no reason that LAWA should consider these projects to be Yellow Light Projects. Changes associated with the relocation of Runway 6L/24R 100 feet to the north (i.e., SPAS Alternative 6) are identified in Section 2.3.1.6 of the SPAS Draft EIR. Environmental impacts of this alternative are addressed throughout Chapter 4 of the SPAS Draft EIR, and are summarized in Chapter 1. In particular, effects on CTA traffic are addressed in Section 4.12.1 of the SPAS Draft EIR.

Comment:

3.1.2 CTA Demolition
7
The NOP states: "Under the LAX Specific Plan and Stipulated Settlement, only the Demolition of Terminals 1-3 is a Yellow-Light Project. If the terminal demolition is yellow-lighted, why aren't the taxiways or other CTA activity related to CTA demolition also treated as yellow-light per the Stipulated

Settlement? If changes are to be made, what are they and how will it affect the CTA traffic (and any environmental issues related thereto)?

Response:

The content of this comment is similar to comment SPAS-PC00130-864; please refer to Response to Comment SPAS-PC00130-864.

SPAS-PC00130-868

Comment:

3.1.3 Ground Transportation Center; Problem to be addressed
8
LAWA has stated that they want to improve CTA traffic flows and in the surrounding community, but has never provided a quantified measure of levels of traffic that are needed to be accommodated in various locations. For instance, how many cars (per hour and at peak periods) much be accommodated along the curbsides within the CTA?
What were the levels of adverse impacts that were to be mitigated by the GTC that was eliminated by the Stipulated Settlement? The aggregate numbers are important so that replacement concepts can be measured and judged against a consistent yardstick. Is it 1000 cars per day and 50 cars during peak hours in the CTA or is it 100 times that?

Response:

The estimated number of vehicles which entered the CTA, traveled on each roadway link and parked at each curbside during the Baseline (2009) Departures and Arrival peak hours are provided in Section 4.12.1.3.13, Tables 4.12.1-8 on page 4-1077 and 4.12.1-12 on page 4-1084. Similarly, the number of vehicles estimated to enter the CTA, travel on each roadway link and park at each curbside during the Future (2025) Departures and Arrival peak hours for Alternatives 1, 2, 4, 8, and 9 are presented in Section 4.12.1.8, Tables 4.12.1-16 on page 4-1107 through 4.12.1-21 on page 4-1117.

Consistent with the terms of the Stipulated Settlement, the Specific Plan Amendment Study (SPAS) evaluates potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the "Yellow Light Projects" were designed to address. The GTC is one of the Yellow Light Projects, and as such, is part Alternative 3. Alternative 3 represents implementation of the improvements contemplated in the approved LAX Master Plan. As discussed on page 4-1043 in Section 4.12.1.1, the SPAS Draft EIR does not include an on-airport quantitative analysis of Alternative 3 and comparison with the other proposed alternatives since Alternative 3 proposes to limit CTA traffic to scheduled bus service and authorized vehicles only, while also eliminating private vehicle trips in the CTA. Under these conditions, Alternative 3 is expected to result in improved on-airport transportation conditions in comparison to baseline (2009) conditions; therefore no further on-airport traffic analysis was warranted.

SPAS-PC00130-869

Comment:

How will traffic be segregated and how will any proposed mitigations address the traffic impacts in the CTA as well as in the surrounding community? What alternatives been identified such as van and bus drop offs and pickups in the parking structures or another location? What plans exist for a people mover to accommodate passengers dropped off outside the CTA in an area local to LAX for people to get into the CTA? Please provide detail information about the way in which cars currently enter and leave the terminal areas. Ensure that the directional information is broken down by hours and volume from each of the directions entering the CTA (Sepulveda N, Sepulveda S, 98th street bridge, and Century Boulevard.

Response:

The SPAS Draft EIR is a programmatic document, and therefore specific design details, including traffic segregation in the CTA, are not known or analyzed. There are currently no plans to change the way

traffic is segregated in the CTA (i.e., arrivals and departures), but if any project-level changes are proposed, those changes would be subject to further environmental review.

Please see Section 4.12.1.10.2 of the SPAS Draft EIR for a discussion of the mitigation measures and the effects the mitigation measures would have on on-airport (i.e., CTA) traffic. Similarly, please see Section 4.12.2.7.2 of the SPAS Draft EIR for a discussion of the recommended off-airport traffic mitigation program, the specific mitigation measures, and the effect of implementing the mitigation measures.

As defined and depicted in Chapter 2, Alternatives 1, 2, 3, 8, and 9 each provide facilities which allow specific commercial and public transportation modes and private vehicles to pick up and drop off passengers outside of the CTA. As described in Topical Response TR-SPAS-T-1, Alternatives 1, 2, 8, and 9 would all include ground access facilities at Century and Aviation Boulevards in Manchester Square, as well as a new Intermodal Transportation Facility (ITF) between 96th and 98th Streets, and between approximately Vicksburg Avenue and Airport Boulevard. Under Alternatives 1 and 2, parking would be provided in Manchester Square. Under Alternatives 8 and 9, Manchester Square would be developed with a Consolidated Rent-A-Car (CONRAC) facility as well as parking. The passenger conveyance system proposed in Alternatives 1, 2, and 8 would employ a busing operation on a dedicated, elevated busway to transport passengers between these facilities and the CTA. Within the CTA, the buses would travel in mixed flow traffic.

Under Alternative 9, an Automated People Mover (APM) would be used instead of a busway. Alternative 3 includes a Ground Transportation Center (GTC) in Manchester Square, an Intermodal Transportation Center (ITC) in the area known as Continental City at Aviation Boulevard and Imperial Highway, and a CONRAC in the Lot C area. Alternative 3 includes two separate APM systems: one APM would convey passengers between the ITC, CONRAC, and CTA, while a second APM would transport passengers between the GTC and the CTA. Under Alternative 3 as originally planned as part of the LAX Master Plan (i.e., Alternative D), an elevated pedestrian bridge would link the ITC to the Metro Green Line Aviation/LAX station, which at the time was the closest existing or planned transit station to LAX. With the now-planned transit station at Century and Aviation Boulevards, Alternative 3 would also provide connectivity with the new transit station as well.

Please see Section 4.12.1.3 of the SPAS Draft EIR for a discussion of the on-airport conditions and facilities that existed at the time of the NOP. The volume of traffic entering the CTA during the departures and arrivals level peak hours is presented in Tables 4.12.1-4 and 4.12.1-8 in Section 4.12.1 of the SPAS Draft EIR. Table 4.12.1-4 presents directional traffic volume data in the CTA area for over 100 locations. The data in Table 4.12.1-8 for the departures level roadway segregate traffic volumes by terminal, while on the arrivals level roadway traffic is segregated first by terminal and then by either the inner or outer curbside. Page 4-1178 in Section 4.12.1.10.2 identifies the recommended mitigation program to address on-airport transportation impacts associated with Alternatives 1, 2, 4, 8, and 9. Please refer to Response to Comment SPAS-PC00130-762 regarding traffic volumes entering the CTA.

SPAS-PC00130-870

Comment:

What levels of vehicle types can be accommodated by the no project, existing conditions? LAWA has established programs to reduce the number of vans and busses in the CTA. What assumptions are made about the effectiveness of these programs and what baseline numbers are used in the assessments? What programmatic changes are "in the works" that apply as a baseline condition for the numbers of hotel and car rental courtesy rolling billboard busses that frequently block curbside access for cars?

Response:

The estimated number of vehicles which entered the Central Terminal Area (CTA), traveled on each roadway link and stopped at each curbside during the Baseline (2009) Departures and Arrival peak hours are provided in Table 4.12.1-8 on pages 4-1077 and 4-1078 and Table 4.12.1-12 on pages 4-1084 through 4-1087 in Section 4.12.1 of the SPAS Draft EIR. The assumptions for the Future (2025) With Alternative scenarios are provided in pages 4-1096 through 4-1104 in Section 4.12.1.7 of the SPAS Draft EIR. The number of vehicles estimated to enter the CTA, travel on each roadway link and

stop at each curbside during the Future (2025) Departures and Arrival peak hours for the alternatives are provided in Tables 4.12.1-16 through 4.12.1-21 on pages 4-1107 through 4-1117 in Section 4.12.1 of the SPAS Draft EIR.

The commentor also asks "what programmatic changes are 'in the works' that apply as a baseline condition for the number of hotel and car rental courtesy rolling billboard buses that frequently block curbside access for cars." Please see Responses to Comments SPAS-PC00130-398 and SPAS-PC00130-766 regarding LAWA's trip reduction programs for both rental car and hotel shuttle operators.

SPAS-PC00130-871

Comment:

Close Access to GTC
8
Identify how luggage would be handled. Would the approved tunnel be constructed? Although the Manchester Square GTC was yellow-lighted by the Settlement, the tunnel was not specifically mentioned.
How would safety/security for the tunnel be handled? What would be the mitigations for ground traffic associated with the use of the tunnel? How will disabled and elderly travelers be handled? Adults with excessive baggage or with children? Since the methods for handling people and location/directions of car trips would dramatically change, how is this to be addressed for environmental impacts?

Response:

Please see Response to Comment SPAS-PC00130-501 regarding the GTC and associated facilities, such as the baggage tunnel, included in Alternative 3. Please also see Responses to Comments SPAS-PC00130-235 and SPAS-PC00073-1 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project. As indicated therein, the SPAS alternatives, which include Alternative 3 with the GTC, are only at a program level of planning and consideration. The commentor's specific questions regarding how safety and security would be handled for the baggage tunnel between the GTC and CTA would be addressed at future more detailed levels of planning and design for that alternative, if approved, as would also the specific details regarding the processing of luggage/baggage handling and how the disabled, elderly, and children would be accommodated in traveling between the GTC and the CTA.

With regard to the commentor's question about mitigation for traffic associated with the baggage tunnel between the GTC and the CTA, it is unclear as to what type of traffic impact warranting mitigation is of concern given that the baggage tunnel would be underground and would not likely have any effect on surface traffic other than during construction. A project-level analysis would be conducted for each of the specific improvements, including the baggage tunnel if Alternative 3 is approved, prior to construction or implementation, and would include analysis of traffic impacts and discussion of mitigation measures for any significant impacts identified in the analysis.

The traffic analysis in the SPAS Draft EIR accounts for the changes in trip generation, distribution, and local traffic patterns associated with closure of the CTA to private vehicles under Alternative 3. That unique aspect of Alternative 3 is clearly acknowledged on page 4-1043 of the SPAS Draft EIR in the introduction to the on-airport transportation section (Section 4.12.1), and is also acknowledged in the off-airport transportation section (Section 4.12.2) of the SPAS Draft, including, but not limited to, the discussion on page 4-1207 and in Table 4.12.2-10 (i.e., see relative differences in CTA trip generation for Alternative 3 compared to all other alternatives).

SPAS-PC00130-872

Comment:

Is there an assumption that better traffic flow is facilitated by improved signage over the lanes and along the CTA terminals? How much improvement is expected from signage improvements?

Transportation Center at Manchester Square and Aviation/Imperial and new Terminal 1 drop-off where Park One is located

9
A connection to the APM or a moving sidewalk can provide access to all of the north side terminals. How many and what percentage of people do you expect to be served by this new access? Would this increase total access capacity? By how much?

Response:

The program level on-airport transportation analysis conducted for the SPAS Draft EIR (Section 4.12.1) did not quantify potential improvements in Central Terminal Area (CTA) traffic operations resulting from the installation of improved signage within the CTA because the lack of project-specific details on signage prevents such quantification.

Alternative 9, described and depicted in Chapter 2 of the SPAS Draft EIR, includes an Automated People Mover (APM) connecting Manchester Square with the CTA. The APM would connect the Consolidated Rental Car Facility, public parking, the Los Angeles County Metropolitan Transportation Authority (Metro) light rail station and the Intermodal Transportation Facility (ITF) to the CTA as illustrated in Figure 2-9 in Chapter 2. The estimated number of passengers to be served and the corresponding number of trips to be removed from the CTA roadways if an APM connection as proposed in Alternative 9 are provided in the table below. As shown in Table 4.12.1-14 of the SPAS Draft EIR, the passenger demand at the curbside is greater during the Arrivals level peak hour compared to the Departures level peak hour. Passenger mode splits are provided in Table 4.12.1-15 of the SPAS Draft EIR are provided in the table below and were used to estimate the number of passenger by mode which would be expected to use the APM if available. The number of trips expected to be removed from the CTA with the inclusion of an APM are based on an average occupancy per vehicle mode.

The implementation of an APM system would increase the overall landside access capacity by providing an additional mode for passengers to enter the CTA separate from the existing roadways. This would result in an increase in the overall passenger access capacity for the CTA equal to the access capacity of the APM system. Construction of an APM would be expected to have no impact on the CTA's roadway capacity as it would not change the physical characteristics of the roadways.

Passengers Served and Trips Removed from CTA by APM
SPAS Alternative 9 Future (2025)

Mode	Passengers Served	Percentage by Mode	Trips Removed	Percentage
Rental Car	684	9.50%	90	2.83%
Transit Bus	42	2.5%	11	0.35%
LAX Shuttle	345	1.03%	27	0.85%
Door to Door Shuttle	288	4.00%	70	2.21%
FlyAway	223	3.10%	8	0.25%
Kiss-and-Ride	184	2.55%	135	4.25%
All Modes	1,766	22.68%	354	10.75%

Please see Response to Comment SPAS PC00130-334 for further discussion of the future development of off-site and on-site signage, consistent with the transportation and planning functions of LADOT.

SPAS-PC00130-873

Comment:

3.2 No Action Alternatives
11

Given that there are two different "no project" alternatives-one with all of the yellow-light projects of Alternative D and one based on the existing configuration with several non-Master Plan improvement projects that are underway. The second paragraph segregates the "no project" into two conditions; when all yellow light projects are assumed to have been built and when none are built. How will the EIR assess the overall impacts of these two "baselines" if some yellow-light projects are subsequently built? If the yellow-light projects overlap with other project elements that have been approved and are therefore part of the "other" base how will the other alternatives be assessed in comparison to the baseline? If, for instance, a newly designated intermodal transportation were built at Century/Aviation to accommodate a Green Line extension would all of the impacts of the totality of the baseline projects be used to assess other project impacts in addition to the yellow-project designated ones?

Response:

The comment notes that the 2008 SPAS Draft EIR NOP preliminarily identified two different potential No Project alternatives. These included a No Project/No Development alternative that assumed that none of the Yellow Light Projects, or options thereto, would be implemented. The No Project/No SPAS alternative assumed that all of the Yellow Light Projects would be implemented as originally planned and that none of the new options developed as part of the SPAS process would be implemented.

Subsequently, as described on page 1-18 of the SPAS Draft EIR, only one CEQA No Project alternative was carried forward into the EIR. The CEQA No Project Alternative studied in the SPAS Draft EIR is Alternative 3, and represents what would reasonably be expected to occur in the foreseeable future if the LAX Master Plan (i.e., "Alternative D") and all of the LAX Master Plan improvements, including the Yellow Light Projects, were implemented as originally envisioned. This is analogous to the No Project/No SPAS alternative identified in the 2008 SPAS NOP. The No Project/No Development alternative identified in the 2008 SPAS NOP was also included in the SPAS Draft EIR, but as Alternative 4 rather than as the No Project alternative.

It should be noted that neither Alternative 3 (the No Project alternative) nor Alternative 4 was used as the baseline for the evaluation of impacts in the SPAS Draft EIR. Rather, as indicated on pages 4-4 and 4-5 of the SPAS Draft EIR, the SPAS Draft EIR used a baseline of existing conditions at the time of publication of the SPAS NOP (i.e., October 2010) or, in the case of certain environmental topics, 2009 baseline conditions, consistent with Section 15125(a) of the State CEQA Guidelines.

Also, please see Responses to Comments SPAS-AL00007-3, SPAS-AL00007-7, and SPAS PC00130-749 regarding the CEQA "No Project" Alternative.

SPAS-PC00130-874

Comment:

3.3 Probable Environmental Effects
13
Under aesthetics, the NOP acknowledges excessive lighting is a potential issue. Does this include runway lights if moved north? Are Northside development impacts included? If yes, what version (s) of the Northside development?

Response:

The potential light and glare impacts of the proposed SPAS alternatives, including the potential light and glare impacts on light-sensitive receptors to the north associated with the proposed movement of Runway 6L/24R northward under SPAS Alternatives 1, 5, and 6, is evaluated in Section 4.1 of the SPAS Draft EIR. The analysis includes impacts from runway and taxiway lights. The analysis of cumulative aesthetic and light and glare impacts is provided in Section 5.5.1 of the SPAS Draft EIR. The cumulative impacts analysis in Chapter 5 focuses on the currently-approved development plans for LAX Northside, while acknowledging that a new land use development program is currently being formulated. However, the cumulative analysis of aesthetics and light and glare impacts addresses the cumulative impacts of both the previously-approved LAX Northside development, as well as the potential cumulative effects associated with the LAX Northside Plan Update that is currently under consideration.

As indicated on pages 4-44 and 4-45 in Section 4.1 under Alternative 1, which also applies to Alternatives 5 and 6, the light and glare impacts on the Westchester neighborhood associated with the proposed movement of Runway 6L/24R to the north, including impacts associated with runway lights, would be less than significant for the following reasons: (1) the several hundred feet between the new runway location and the nearest sensitive receptors would function to attenuate the intensity of the relocated runway lights; (2) an earthen berm and opaque perimeter fence intervene between most of the Westchester neighborhood and the airport property, thus blocking direct views from most sensitive receptors; (3) the Westchester Golf Course and a 12-foot-high noise wall atop an 8-foot-high berm buffer the airport from view by residential uses north and immediately east of the golf course; (4) the runway lighting would replace existing runway lighting already located along Runway 6L/24R, and thus would not represent new lighting; (5) the relocated runway lighting would be at ground-level and directed at oncoming aircraft rather than at off-site sensitive receptors; (6) the runway lighting would not include substantial expanses of glass or other surfaces that could generate substantial glare; and (7) the proposed relocated runway lighting would be subject to applicable light and glare requirements of LAX Master Plan Commitments DA-1, Provide and Maintain Airport Buffer Areas, LI-2, Use of Non-Glare Generating Building Materials, and LI-3, Light Controls, and LAMC Section 93.0117, which have been formulated to avoid light spillover and substantial light and glare impacts on sensitive receptors. Impacts to areas north of the airport associated with other sources of light and glare, including terminal improvements, are also addressed in the SPAS Draft EIR and were determined to be less than significant.

The potential light and glare impacts of the proposed relocation of Runway 6L/24R under Alternatives 1, 5, and 6, combined with the light to be generated in the LAX Northside area under the adopted 1984 LAX Northside Plan (and the LAX Northside Plan Update, which is currently underway), are evaluated in Section 5.5.1 of the SPAS Draft EIR. As indicated in the analysis on pages 5-30 and 5-31 of the SPAS Draft EIR, under Alternative 1, which also applies to Alternatives 5 and 6, development under the LAX Northside Plan (and associated update in process) would create a noticeable increase in ambient light and glare in the area. However, development under the LAX Northside Plan would be subject to the height restrictions, setback requirements, and lighting and landscape guidelines and requirements contained in the LAX Northside Plan, LAX Northside Design Plan and Development Guidelines, and the LAX Specific Plan, which have been formulated to avoid land use conflicts, and would also be subject to LAX Master Plan Commitments DA-1, LI-2, and LI-3, which have been formulated to avoid both light spillover onto adjacent light-sensitive uses and substantial light and glare impacts. As further indicated, development under the LAX Northside Plan would create intervening development between the existing residential uses in the Westchester neighborhood and LAX, including Runway 6L/24R, such that many of the Westchester residences which currently have views of the runway lighting would no longer have views of that lighting with development under the LAX Northside Plan. Finally, as indicated, because the existing and relocated runway lighting would not spillover over onto existing adjacent light-sensitive receptors regardless of new development under the LAX Northside Plan, relocated runway lighting under SPAS Alternatives 1, 5, and 6 would not have the potential to add to any light spillover that might occur under the LAX Northside Plan. Thus, cumulative light and glare impacts associated with the proposed relocation of Runway 6L/24R would be less than significant.

SPAS-PC00130-875

Comment:

What new Manchester Square development is assumed? Are there any other projects such as APMs and where would they stop and flow/to from? This could impact local communities with noise, pollution and traffic in various ways depending upon the paths used and the locations of the stops.

Response:

Under Alternatives 1 and 2, Manchester Square would be used for public and employee parking. Under Alternative 3, the GTC would be located within Manchester Square. Under Alternatives 8 and 9, Manchester Square would be used for parking and a CONRAC. In addition to the two APM systems under Alternative 3, Alternative 9 includes an APM linking the ground access facilities in Manchester Square to the CTA, with a stop at the ITC and connectivity with the future Metro transit station. Impacts associated with the APM are not evaluated independently within the SPAS Draft EIR; rather, the impacts of an entire alternative are analyzed comprehensively. Noise, air quality, and traffic impacts

specific to the APM would be evaluated in a project-level CEQA document, if Alternative 3 or Alternative 9 are selected for implementation.

SPAS-PC00130-876

Comment:

This is another concern for neighbors and also for the flora and fauna. Introduction of new species from LAX arrival flights? Although good faith attempts to stop the arrival of foreign plants and animals is made, the locations of the aircraft and the handling of baggage and cargo can impact how an unwanted species can be spread to the surrounding areas outside of LAX.

Response:

The SPAS alternatives would not increase the risk of introducing invasive floral and faunal species from arriving flights to the surrounding areas outside of LAX, nor to sensitive habitat associated with LAX including the Los Angeles/El Segundo Dunes. The SPAS alternatives would not result in an increase in the number of arriving flights at LAX, as increased flights would occur even without implementation of the SPAS alternatives. Rather, the runway/taxiway reconfigurations associated with Alternatives 1 through 3 and 5 through 7 would allow more efficient use of the north runways by larger aircraft. Additionally, the standards for baggage and cargo handling would remain the same as baseline conditions. Some SPAS alternatives include changes in the configuration of Terminals 1, 2, and 3, and construction of a new Terminal 0, at which baggage and cargo would be loaded and unloaded from aircraft; however, baggage and cargo handling activities would be limited to the developed terminal areas. Given that the baggage and cargo handling areas are well-removed from native habitats, it is unlikely that an invasive species could be introduced to undeveloped portions of the airport property directly from baggage and cargo handling operations and then spread to surrounding areas.

SPAS-PC00130-877

Comment:

What about impacts on Riverside Fairy shrimp locations? LAWA was caught filling in Continental City with asphalt-laden dirt about 2003. LA Building & Safety halted the non-permitted filling. Where are all of the areas impacted by the 2003 action? What sensitive species are in surrounding areas? Why did the relocation area for the Riverside Fairy Shrimp change from the former El Toro Marine Corp Air Station to an area in Redondo Beach? Can LAWA simply leave the Riverside Fairy Shrimp in tact at LAX and place some sort of netting or fishing lines over the shrimp habitat so that the shrimp will not have to be moved?

Response:

As discussed on pages 4-189 and 4-190 in Section 4.3 of the SPAS Draft EIR, based on evidence from recent biological surveys, the SPAS Draft EIR assumes that no Riverside fairy shrimp are present within the biological resources study area. Accordingly, the SPAS Draft EIR concludes that no impacts to Riverside fairy shrimp are associated with the SPAS alternatives, and no mitigation is necessary.

Soil containing Riverside fairy shrimp cysts was removed from the LAX Master Plan project area pursuant to two Biological Opinions issued by USFWS in 2004 and 2005. The Riverside fairy shrimp relocation site did not change from the former Marine Corps Air Station (MCAS) El Toro to Redondo Beach. Rather, LAWA is currently considering relocation of the Riverside fairy shrimp to Madrona Marsh in the City of Torrance. The consideration of Madrona Marsh is the result of a study conducted by LAWA subsequent to publication of the LAX Master Plan EIS/EIR which found that the former MCAS El Toro did not contain suitable soils or adequate watershed to support a vernal pool complex. No sensitive floral or faunal species are currently associated with the Continental City site or the surrounding areas, as depicted by Figures 4.3-2 and 4.3-3 of the SPAS Draft EIR. As discussed in Section 4.7 of the Bradley West Project Draft EIR, wet-season surveys conducted in 2009 at potentially suitable seasonal pool habitat at the Continental City site did not detect Riverside fairy shrimp. The Continental City site has been subsequently modified by construction activity associated with the Bradley West Project such that it no longer supports suitable habitat for Riverside fairy shrimp.

In the past, LAWA deposited uncertified fill in Continental City. (Uncertified fill is material that may not meet requirements for fill material, may not have been compacted to meet engineering standards, and was deposited without inspection.) This action was not illegal and did not require a permit, nor was the activity halted by the City of Los Angeles Department of Building and Safety. All of the uncertified fill was subsequently removed and the area is being backfilled with certified fill. It should be noted that certified fill is only required if a site will be used for a future construction project.

SPAS-PC00130-878

Comment:

Where are the earthquake prone areas?

Response:

The potential for the SPAS alternatives to expose people or structures to hazards associated with geology and soils, including seismic-related hazards, was addressed in Section VI of the Initial Study included in the 2010 LAX SPAS EIR Notice of Preparation (NOP), provided in Appendix A of the SPAS Draft EIR. As explained therein, while the site is located within the seismically active southern California region, it is not located within an Alquist-Priolo Special Study Zone. Geotechnical literature indicates that the Charnock Fault, a potentially active fault, may be located near or through eastern portions of LAX property. However, as stated in Section 4.22 of the LAX Master Plan EIR, recent evaluation indicates that the Charnock Fault is considered to have low potential for surface rupture independently or in conjunction with movement on the Newport-Inglewood Fault Zone, which is located approximately three miles east of LAX. The Initial Study also indicates that the LAX site has a very low susceptibility to liquefaction. Therefore, impacts to people or structures resulting from rupture of a known earthquake fault are considered less than significant, and no mitigation measures are required. In accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with geology and soils, including seismic-related hazards, was not discussed in detail in the SPAS Draft EIR.

SPAS-PC00130-879

Comment:

What are the amounts and types of pollutants from aircraft? How will these pollutants be mitigated?

Response:

Aircraft pollutant emissions are presented in Attachment 2 of Appendix C, and summarized in Section 4.2.6.3 of the SPAS Draft EIR. Applicable air quality mitigation measures are presented in Section 4.2.5 and 4.2.7 of the SPAS Draft EIR. Table 4.2-14 (pages 4-126 through 4-129) of the SPAS Draft EIR indicates that Alternatives 1, 2, 5, 6, and 7 would have lower aircraft emission than Alternative 4. This result indicates that the airfield improvements under the "build" alternatives would reduce aircraft emissions compared to Alternative 4 which has no substantial change to the existing airfield.

SPAS-PC00130-880

Comment:

What will be done to reduce the greenhouse gases from LAX operations?

Response:

Table 4.6-4 of the SPAS Draft EIR delineates transportation-related air quality mitigation measures that would also serve to reduce GHG emissions associated with LAX operations, and Tables 4.6-7 and 4.6-8 also identify other measures that LAWA is implementing that would serve to reduce GHG emissions from LAX operations. As indicated therein, such other measures, in addition to transportation-related measures, include energy efficiency measures, water conservation and efficiency, and solid waste measures.

SPAS-PC00130-881

Comment:

3.4 Comments and Next Steps
13
45 days circulation for review is inadequate. This should be as much as 120 days so that the maximum time will elapse to obtain South Airfield incursion experience.

The NASA study should also be complete before this comment period begins.

Response:

As indicated in Section 3.4 of the 2008 SPAS Draft EIR NOP (page 13), LAWA established a 90-day review period for the NOP, commencing on March 12, 2008 and closing on June 18, 2008. It should be noted that the LAX North Airfield Safety Study was released in February 2010, with a Final Report in May 2010. While not within the review period of the 2008 NOP, this study was completed prior to the publication of the Revised NOP for the SPAS Draft EIR and prior to the comment period for the SPAS Draft EIR.

SPAS-PC00130-882

Comment:

Figure 1- Project Location None The grayed area shows all of LAX, but also lands that were transferred from the Westchester-Playa del Rey Community Plan to the LAX Plan during Alt D approval. Not all of this is being considered for cumulative impacts during the EIR reviews of the SPAS airport projects. Please delineate which areas are specifically included in the impact studies.

Response:

The grayed area in the figure represents the current airport boundaries (with the exception of properties within the voluntary acquisition area in Manchester Square that are not owned by LAWA, which are also shown in gray). It does not include any land proposed for acquisition as part of the LAX Master Plan but not currently owned by LAWA, including areas within the Westchester Playa del Rey Community Plan Area located south of 96th Street between Sepulveda Boulevard and Airport Boulevard, or LAX Master Plan-related acquisitions within and south of Manchester Square. The airport and non-airport projects considered in the analysis of cumulative impacts are identified in Chapter 5 of the SPAS Draft EIR. As discussed in Section 5.4 of the SPAS Draft EIR, the geographic scope for cumulative impact analysis also varies by environmental topic.

SPAS-PC00130-883

Comment:

Figure 2- Existing Airport
What is the date of this photo? On what date is the existing airport based? This photo does not show the completed the SAIP project, but we assume that it is part of the existing airport.

Response:

Figure 2 of the 2008 SPAS NOP is based on an aerial photograph taken on July 30, 2007. The SAIP is under construction in the photograph. It is unclear what the commentor means by the statement "On what date is the existing airport based?" If the commentor is asking about the baseline year used in the SPAS Draft EIR analysis, please see Response to Comment SPAS-PC00130-52. As indicated in that response, the baseline assumed in the SPAS Draft EIR is generally October 2010, with operational conditions based on 2009. As noted on page 5-17 of the SPAS Draft EIR, the SAIP was completed in 2008, and is therefore part of the airport in the baseline conditions used in the SPAS Draft EIR analysis.

SPAS-PC00130-884

Comment:

Earlier in the document, Paragraph 3.2 identified two different no action alternatives. Please detail what airport elements are part of the two "no action" alternatives and their relationship to the baseline conditions against which new projects are being judged.

Response:

Please see Response to Comment SPAS-PC00130-873 regarding the No Project alternative that was carried forward into the SPAS Draft EIR. As indicated in that response, only one No Project alternative, Alternative 3, was carried into the SPAS Draft EIR. The airport elements that make up this alternative are described in Section 2.3.1.3 of the SPAS Draft EIR. The impacts of Alternative 3 were compared to existing conditions throughout Chapter 4 of the SPAS Draft EIR.

SPAS-PC00130-885

Comment:

Figure 9- Potential Alternative -Runway 6R124L 100' South
Green Line stop is shown along Century instead of in Intermodal Transportation Center. How much traffic of each transport mode is expected? How would the traffic impact the type and quantity of mitigations required?

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

Under Alternative 3 as originally planned as part of the LAX Master Plan (i.e., Alternative D), an elevated pedestrian bridge would link the ITC to the Metro Green Line Aviation/LAX station, which at the time was the closest existing or planned transit station to LAX. With the now-planned Metro transit station at Century and Aviation Boulevards, Alternative 3 would also provide connectivity with this station as well. Therefore, Alternative 3 plans for connectivity at both Metro stations (see Figure 2-3 of the SPAS Draft EIR).

Section 4.12.1.7.2 of the SPAS Draft EIR, beginning on page 4-1100, provides detailed information on the number of trips by mode accessing the CTA and parking at each curbside. Table 4.12.1-15 on page 4-1103 provides the airport passenger mode of transportation percentages or mode splits for baseline (2009) and future (2025) conditions under Alternatives 1, 2, 4, 8 and 9. Passenger mode splits represent the proportion of total airline passengers using each mode during the peak hours analyzed. Also provided in the bottom portion of the table is information summarizing how passengers would use specific sub-modes for transport between airport facilities and the CTA (i.e., APM and LAX shuttles). Tables 4.12.1-16 and 4.12.1-17 on pages 4-1107 through 4-1110 provide the total number of vehicles dropping off passengers at each terminal on the departures level and the number of vehicles by mode picking up passengers at each individual curbside on the arrivals level for each alternative. Tables 4.12.1-18 and 4.12.1-19 on pages 4-1110 through 4-1115 provide the peak hour volume of vehicles traveling on each roadway link, while Tables 4.12.1-20 and 4.12.1-21 on pages 4-1115 through 4-1117 provide the peak hour vehicle turning movements for the on-airport intersections on both the departures and arrivals level roadways.

Section 4.12.1.9 of the SPAS Draft EIR defines the traffic related impacts to the on-airport curbsides, roadways, and intersections, while Section 4.12.1.10 provides the proposed on-airport traffic related mitigation measures.

SPAS-PC00130-886

Comment:

Figure 11- Runway 100' North

Green Line stop is shown along Century instead of in Intermodal Transportation Center. Although ARSAC supports the extension this is not part of the approved Master Plan or existing condition. Environmental improvements from this project are not part of the baseline and should be included in the assessment accordingly.

Response:

The commentor's support for the Metro Green Line stop along Century Boulevard is noted and is hereby made part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR assumes that the Metro LAX/Crenshaw Light Rail Transit line will be completed prior to the Future (2025) horizon year. However, as discussed in Section 4.12.2.2.1 under the heading of "CMP Transit System" on page 4-1199 of the SPAS Draft EIR, "options to extend the Metro Green Line to LAX are currently being studied by Metro. However, given that this proposed extension to LAX is in its early environmental planning stage, has not been approved, and if approved and constructed would not be operational until after the SPAS horizon year, it was not included in the 2010 or the 2025 scenarios." LAWA looks forward to working cooperatively with Metro on such a connection; however, given that specific information about such a connection is not currently available, it could not be relied upon to further reduce the alternatives' traffic impacts beyond the mode share/split assumptions already included in the SPAS Draft EIR.

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

Evaluation 6)

IS-3
The document acknowledges the requirement to document source reference in detail. Anything less makes it difficult to identify what has been done and its validity.

Response:

This comment cites to guidance provided for preparation of a CEQA Initial Study checklist and pertains to the 2008 SPAS Draft EIR NOP. Please see Response to Comment SPAS-PC00130-14 regarding materials incorporated by reference in the SPAS Draft EIR.

SPAS-PC00130-890

Comment:

Environmental factors potentially affected
IS-3
Three additional impact areas should have been checked.

Geology/soils. Proposals to move the runways could be in areas where there are sand dunes and other soil with high liquefaction potential.

Response:

The comment is noted. Please see Response to Comment SPAS-PC00130-913 below regarding potential impacts related to liquefaction.

SPAS-PC00130-891

Comment:

Transportation/Traffic. To accomplish some of the projects in the LAWA 340' north alternative what housing would be impacted as well as the community serving businesses. Please identify all units that are subject to removal by any federal or state law regardless of whether it is believed that these laws would be enforced.

Response:

The commentor appears to be referencing Alternative 5 which would relocate Runway 6L/24R 350 feet to the north.

A discussion of property acquisition and other facilities that would be affected under the SPAS alternatives is provided in Tables 2-3, 2-4, 2-5 and Figures 2-10 and 2-11 in Chapter 2 and Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR. Specific to Alternative 5, no acquisition is proposed since this alternative focuses on airfield and terminal components only, although acquisition would be required for the ground access components with which this alternatives would be paired. As identified in Section 4.9.6.5 of the SPAS Draft EIR, Alternative 5 would result in the removal of some community-serving uses including an urgent care facility, Travelodge Hotel, and Denny's Restaurant.

Regarding RPZs and the potential for acquisition of homes and businesses, please see Response to Comment SPAS-AL00007-26. Potential impacts associated with changes in the RPZ for the SPAS alternatives are addressed in Section 4.7.2 of the SPAS Draft EIR. As described in Section 4.7.6.5 of the SPAS Draft EIR, under Alternative 5 the 350-foot northward shift of Runway 6L/24R would place portions of two multi-story structures and rooftop utilities within Part 77 surfaces and result in additional businesses in Westchester, near Sepulveda being located within the RPZ, as shown in Figure 4.7.2-15. As indicated in Section 4.7.2.6.1, of the SPAS Draft EIR, there are several options that can be considered relative to addressing potential safety hazards associated with incompatible structures and uses being located within controlled airspace areas; however, a determination as to the most suitable and practical option cannot be made until more detailed levels of planning and engineering on the selected alternative, if any, can be conducted in consultation with the FAA. It would be premature and speculative to say at this time whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. Such information would be developed during project-specific CEQA review

should an alternative with incompatible structures or uses within an RPZ be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) As described in Section 4.7.2.6.5 of the SPAS Draft EIR Alternative 5 would result in the RPZ no longer encompassing any homes.

SPAS-PC00130-892

Comment:

Population/Housing. To accomplish some of the projects in the LAWA 340' north alternative housing would be impacted as well as the community serving businesses. Please identify all units that are subject to removal by any federal or state law regardless of whether it is believed that these laws would be enforced.

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-891; please refer to Response to Comment SPAS-PC00130-891.

SPAS-PC00130-893

Comment:

VI. Geology & Soils (a)
IS-6
There is some seismic potential. A plume of the Inglewood/San Andreas faults is near some of the areas where projects have been suggested along Century, for instance. We call on LAWA to review the most current USGS maps to assess earthquake susceptibility. The 340' N alternative, for instance, calls for moving Lincoln Boulevard and burying its connection to Sepulveda. Additionally we call upon LAWA to address the sandy soil conditions toward the Northside development along Westchester/Playa del Rey and western sections of LAX property for impacts from building any tunnels or from impacts from existing tunnels, underground utilities or sewer lines.

Response:

At a program level, the 2010 NOP Initial Study, attached as Appendix A to the SPAS Draft EIR, concludes that impacts of the SPAS alternatives related to seismic risks and soil stability would be less than significant. Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. Evaluation of seismic risks associated with the Lincoln Boulevard realignment and sandy soil conditions mentioned in the comment would be conducted during detailed engineering for that project component, if it is a second-tier project proposed for implementation. Project-specific seismicity and soil stability analyses would be presented in project-specific CEQA documents.

Comment:

VII Hazards & Hazardous Matls. (a)
IS-7
Could run off with fuel and rubber off the runways create a hazard?

Response:

Water quality impacts associated with contaminants in runoff are addressed in Section 4.8 of the SPAS Draft EIR. As indicated in that section, increases in pollutant loads associated with the SPAS alternatives would be a significant impact. With implementation of existing recommendations in LAX Master Plan Commitment HWQ-1 and revisions to the Conceptual Drainage Plan required by Mitigation Measure MM-HWQ (SPAS)-1, the water quality impacts associated with the SPAS alternatives, including runoff potentially containing fuel or rubber from the runways, would be less than significant.

SPAS-PC00130-895

Comment:

VII Hazards & Hazardous Matls. (f)
IS-7
The ability to get medical care can be impaired since the Medical Center on Sepulveda could be closed off within the boundaries of LAX if an emergency occurs. Insufficient trauma facilities are available within the local area if a medical emergency occurs. The closest is UCLA that would be impossible to get to during most of the day due to heavy traffic on the 405.

Response:

Please see Responses to Comments SPAS-PC00094-2, SPAS-PC00130-217, and SPAS-PC00130-944 regarding emergency response plans and services.

Comment:

VIII Hydrology & Water Quality (i)
IS-8
There was some question about the 100-year flood plain structures in the last EIR due to the drainage canals being fed with much greater runoff due to all of the local developments surrounding LAX. A new urban run-off facility has been suggested for construction at the northwest corner of the LAX airfield. What effect will this facility have on LAX and water quality issues?

Response:

As noted on page 4-619 of the SPAS Draft EIR, the Dominguez Channel is currently over capacity off-site and downstream from LAX. Additional drainage into the Dominguez Channel resulting from implementation of the SPAS alternatives was identified as a significant but mitigable impact in the SPAS Draft EIR with implementation of Mitigation Measure MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update. Please see Section 4.8 of the SPAS Draft EIR and Response to Comment SPAS-PC00130-463 for further information regarding this mitigation measure.

The City of Los Angeles Bureau of Sanitation Stormwater Infiltration and Treatment Facility involves development of a 22-acre stormwater infiltration facility north of Westchester Parkway and east of Pershing Drive that would treat stormwater flows from the Argo watershed. This is identified as a cumulative project on page 5-22 of the SPAS Draft EIR. The facility would receive flows from several drains in the Westchester area as well as from the Argo Drain, provide water quality improvement and infiltration for a significant portion of the wet weather flows, and discharge higher flows through County Drain 5421 to Dockweiler State Beach downstream of the Argo Drainage Channel. This cumulative project would have no impact of the ability of the Argo Drainage Channel to carry stormwater flows off the airport and would provide for some water quality improvement for the portion of flow that is diverted from the Argo Drainage Channel to the facility.

SPAS-PC00130-898

Comment:

The sewer lines near and underneath LAX date back to the 1920s. Are these sewers adequate and structurally sound? If not, what hazards do these sewer lines present?

Response:

There are a number of sewer lines near and beneath LAX, including three major outfall sewers that traverse the airport, including the North Central Outfall Sewer (NCOS), the North Outfall Replacement Sewer (NORS), and the Central Outfall Sewer (COS). The NCOS was constructed in 1957, NORS was completed in 1993, and the COS was constructed in 1907 and rehabilitated in the 1940s.1 Responsibility for maintaining these sewers lies with the City's Bureau of Sanitation, Wastewater Engineering Services Division.

Please see Response to Comment SPAS-PC00130-348 and Topical Response TR-SPAS-LR-1 regarding the relationship between sewer lines and the north airfield improvements and Lincoln Boulevard realignment, respectively. As indicated in those responses, none of the outfall sewers that lie beneath LAX would be affected by the SPAS alternatives. As explained on page 4-3 of the SPAS Draft EIR, the SPAS Draft EIR is a programmatic document. If a SPAS alternative is selected for implementation, detailed engineering and project-specific CEQA analysis would be performed to evaluate impacts of project components on utilities, including sewer lines and the adequacy of these lines relative to the proposed improvements. If it is determined during engineering design that any underground utilities do not have sufficient structural strength to withstand the proposed improvements, proven measures would be taken to strengthen the infrastructure or the soils for additional support. Please see Response to Comment SPAS-PC00130-1012 regarding measures that could be used to address these circumstances.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

1. City of Los Angeles Department of Public Works, Bureau of Sanitation, Wastewater Engineering Services Division, City of Los Angeles Sewer Odor Control Master Plan, August 2010.

SPAS-PC00130-899

Comment:

XII Population & Housing (a)
IS-9
LAX traffic causes severe impacts on the local communities. Westchester-Playa del Rey and the other surrounding communities have become thoroughfares for people traveling from the South Bay and further south and the LA Westside. LAX traffic exacerbates this. Has the new LA City General Plan traffic increases due to changes in the housing element been taken into consideration?

Response:

The comment asks if future changes in traffic associated with a new City of Los Angeles Housing Element have been considered in the SPAS Draft EIR. The current update to the City of Los Angeles Housing Element is not yet complete and the timeframe for its completion is unknown. Therefore, changes that may result from that process are unknown, and it would have been speculative to evaluate them in the SPAS Draft EIR. The SPAS off-airport transportation analysis employed a travel demand forecasting model in the development of future traffic projections. One element of the model, described in Section 4.12.2.2.3 of the SPAS Draft EIR, is socio-economic data including land use projections, which is consistent with regional growth projections at the time the technical study was initiated.

SPAS-PC00130-900

Comment:

XIV Recreation
IS-9
Holes were removed from the Westchester Golf Course to accommodate previous LAX expansion in the 1970s. Restoration of these holes has been a LAX promised mitigation ever since. When will this be accomplished and what other recreation opportunities will be created for the surrounding communities?

Response:

The Westchester Golf Course is identified in Figure 5-2 and page 5-22 in Chapter 5 of the SPAS Draft EIR as a land development project not related to the SPAS alternatives. As described on page 5-22 of the SPAS Draft EIR, the replacement of the three holes at the Westchester Golf Course was completed in 2010, subsequent to the submittal of ARSAC's comments on the 2008 SPAS NOP.

As indicated in the Initial Study checklist on page IS-10, and discussed on pages A-22 through A-24 of the 2010 NOP included in Appendix A of the SPAS Draft EIR, similar to LAX Master Plan Alternative D, the SPAS alternatives would not contribute to increases in park demand or physically impact/alter any public park or recreation areas (i.e., the Initial Study determined that the SPAS alternatives would have "no impact" on parks or on recreation resources). Therefore, the SPAS alternatives would not result in the need for new/altered parks and, in accordance with CEQA, no mitigation measures, such as development of additional recreational facilities, are required.

Comment:

Attachment A V Cultural Resources (a)
A-4
Under historic elements, other buildings that are impacted such as the Paradise Building, Centinela Adobe, Randy's donuts should also be addressed due to off airport projects that facilitate these projects. Others items such as the LAX Theme Building and the "Sea to Shining Sea" mosaic tile air travel mural in Terminal 3 should also be addressed.

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. The SPAS alternatives would have no impact on the Paradise Building at the corner of Sepulveda Boulevard and Westchester Parkway, the Centinela Adobe at 7634 Midfield Avenue, or Randy's Donuts at 805 West Manchester Boulevard in Inglewood. Regarding the mosaic mural in the underground tunnel from the concourse to the satellite of Terminal 3 at LAX, please refer to Response to Comment SPAS-PC00201-11.

SPAS-PC00130-902

Comment:

Attachment A V Cultural Resources (b)
A-5
Have any burial sites been identified? What about pottery or other Indian relics?

Response:

As stated on pages 4-360 through 4-363 in Section 4.5.3.3 of the SPAS Draft EIR, a cultural resources records search through the South Central Coastal Information Center was completed that identified eight recorded archaeological resources, seven of which are Native American cultural resources, on LAX property and within the cultural resources study area for SPAS. None of the seven Native American cultural resources is a burial site. Descriptions of the artifacts associated with each of these sites are provided on pages 4-360 through 4-363 of the SPAS Draft EIR. These resources would not be

impacted by any of the SPAS alternatives. In addition, a pedestrian survey of the undeveloped portions of the LAX property potentially affected by the SPAS alternatives was conducted to identify previously unknown archaeological or Native American resources. As stated on page 4-363 in Section 4.5.3.3 of the SPAS Draft EIR, no resources were identified during the pedestrian survey.

SPAS-PC00130-903

Comment:

What about prehistoric bones on the west and north areas in and around LAX due to the high incidence of oil reserves in the area?

Response:

A paleontological resources record search conducted through the Natural History Museum of Los Angeles County was completed in 2009 that identified one fossil locality within or immediately adjacent to the LAX property. The fossil locality produced the fossil remains of a mammoth in the vicinity of the Theme Building approximately 25 feet below the surface during construction excavations. No other paleontological resources have been identified within, or in the immediate vicinity of, LAX.

As indicated on page 4-337 of the SPAS Draft EIR, potential impacts on paleontological resources were addressed in the revised LAX SPAS EIR Notice of Preparation/Initial Study (October 2010), included as Appendix A, Notice of Preparation/Scoping, of the SPAS Draft EIR. As discussed therein, impacts on paleontological resources were evaluated in the LAX Master Plan EIR and, with implementation of mitigation measures required pursuant to that EIR (Mitigation Measures CR-1 and CR-2), impacts would be less than significant. These mitigation measures require conformance with the LAX Master Plan Paleontological Management Treatment Plan (PMTP) during construction activities. Requirements outlined in the PMTP include specific procedures for paleontological monitoring, identifying and assessing the significance of resources, and the recovery and curation of resources when warranted. For example, a paleontological excavation program to remove the resources may be implemented, if deemed necessary. Finally, the PMTP details the reporting requirements to document the paleontological monitoring effort and provides guidance as to the proper curation and archiving of paleontological resources in accordance with industry and federal standards.

SPAS-PC00130-904

Comment:

Prior LAX layouts have included N-S runways such as the one that existed in the area behind Tom Bradley International Terminal. Are any of these old structures historically significant?

Response:

It is not clear what the commentor is referring to relative to a north-south runway behind Tom Bradley International Terminal (TBIT). Taxiways Q and S, which were located to the west of TBIT prior to the construction of the Bradley West Project, were demolished as part of the Bradley West Project construction. In addition, during construction of the South Airfield Improvement Project, a 1,200-foot, 1940s-era abandoned runway was discovered buried underneath the airfield. The abandoned runway was demolished prior to construction of the new Runway 7R/25L. Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. Section 4.5 of the SPAS Draft EIR is based in part on more comprehensive information contained in Appendix E of the SPAS Draft EIR. None of the former or existing runways or taxiways at LAX are considered historically significant structures. The runways have been altered and relocated over the years and do not retain integrity or possess significance as historic structures either individually or as contributors to a historic property or district. The 2011-2012 survey also included buildings over 45 years in age that are presently situated on the airport midfield, west of TBIT/Bradley West and between the north and south airfields. As discussed on pages 4-354 through 4-356 in Section 4.5 of the SPAS Draft EIR, listed in Table 4.5-2 on page 4-355, and documented on DPR survey forms in Appendix E, surveyed properties in the airport midfield do not meet CEQA's definition of historical resources under State CEQA Guidelines Section 15064.5; these properties have undergone considerable alterations and/or additions and do not retain sufficient integrity and/or

historical/architectural significance to merit eligibility under any of the applicable federal, state, or local criteria.

SPAS-PC00130-905

Comment:

Are there any historic elements from the Bennett Ranch or previous ranch owners that used the land that is the present day LAX?

Response:

Historical and archaeological resources identified within the LAX SPAS study area are discussed in Section 4.5 of the SPAS Draft EIR. The historic context of the rancho period in the area now occupied by LAX is discussed in the LAX Master Plan EIR Section 106 Report and the LAX Master Plan Supplemental Section 106 Report, and discussed on pages 4-349 through 4-354 in Section 4.5 of the SPAS Draft EIR. The Section 106 Report and Supplemental Section 106 Report for the LAX Master Plan are provided in Appendix I and Appendix S-G of the LAX Master Plan Final EIR, respectively, (see page 9-6 in Chapter 9, References, [i.e., the Final EIR for the LAX Master Plan Improvements, which includes all appendices and technical reports, including Appendix I and Appendix S-G]. As discussed on page 1-105 in Section 1.7 of the SPAS Draft EIR, the LAX Master Plan Final EIR, including Appendix I and Appendix S-G, are available for public review at Los Angeles World Airports, Capital Programming and Planning Division, One World Way, Los Angeles, CA 90045, and are also accessible via the internet at www.ourlax.org). There are no historic elements from previous ranches or ranch uses that exist today within LAX or the SPAS cultural resources study area.

SPAS-PC00130-906

Comment:

Attachment A V Cultural Resources (c) Mitigation CR2
A-6
The NOP says that mitigation reduces the impact to less than significant and therefore nothing else will be done. Please identify which areas are subject to higher potential impact mitigation per the existing paleontology mitigation program.

Response:

Areas that are subject to additional paleontological mitigation are areas in close proximity to previously documented fossil localities and areas where undisturbed (or native) soils exist. Per the LAX Master Plan Paleontological Management Treatment Plan (PMTP),1 this includes the CTA, where a fossil specimen was encountered approximately 25 feet below the surface during construction excavations sometime before 1973.2 The presence or absence of undisturbed soils varies throughout the LAX property and project-specific evaluations to determine the presence or absence of these soils would be conducted on a project-by-project basis per the PMTP.

Comment:

VI Geology and Soils:
A-7

What about the water filtration system that is being proposed for the Northside development area? How could this filtration project interface with the potential building set for the entire Northside development area?

Response:

The water filtration system referred to in the comment appears to be the City of Los Angeles' Bureau of Sanitation Stormwater Infiltration and Treatment Facility. This facility is an independent project subject to its own environmental review process. This project is identified as a cumulative project in Section 5.3.5 of the SPAS Draft EIR, and the cumulative impacts of this project, in conjunction with SPAS and other cumulative projects, are analyzed in Chapter 5. The relationship of this project to the LAX Northside development is not within the scope of the SPAS Draft EIR, but the project will be addressed as a related project in the LAX Northside Plan Update Draft EIR. The Initial Study for the LAX Northside Plan Update identified impacts related to flooding and geology and soils as potentially significant, and these topics will be addressed in the Draft EIR being prepared in conjunction with the update of the LAX Northside development plan.

SPAS-PC00130-908

Comment:

The prior EIR claimed that earthquake susceptibility was not significant, but at an SPAC meeting it was acknowledged that there earthquake fault areas that would impact the tunnel that was approved in Alternative D. Where else would earthquake faults impact building or construction?

Response:

As required by Section 15128 of the State CEQA Guidelines, the SPAS Draft EIR contains a statement indicating the reasons that various possible significant effects of the project were determined not to be significant and were therefore not discussed in detail in the EIR. (See Section 7.4 of the SPAS Draft EIR.) The Initial Study included in the October 2010 LAX SPAS EIR Notice of Preparation, included as Appendix A, includes a discussion of the resource areas that were determined to have no impact or less than significant impact. As indicated on pages A-7 and A-8 of that document, LAX is not located within an Alquist-Priolo Special Study Zone. The Charnock Fault, a potentially active fault that may be located near or through eastern portions of LAX property, is considered to have low potential for surface rupture. Therefore, the NOP concluded that impacts to people or structures are considered less than significant and this topic required no further analysis in the SPAS Draft EIR. In this context, structures include tunnels as well as elevated structures such as the APM or elevated roadways or busways.

SPAS-PC00130-909

Comment:

Soil conditions under the north runway may or may not be significant but more detail is required to ensure against construction or maintenance issues.

Response:

Improvements to the north airfield have been developed at a program level of planning for SPAS, and therefore have been analyzed at a program level in the SPAS Draft EIR. Details regarding soil conditions and other considerations would be determined and addressed at the project level during engineering design, and would be subject to further environmental review under CEQA, at which time feasible mitigation measures to reduce any significant impacts to a less than significant level would be required.

SPAS-PC00130-910

Comment:

VI Geology & Soils (a) ii.
A-8

Seismic ground shaking. During the Northridge quake several back up power systems failed at LAX. Are alternative energy supplies available?

Response:

Regional power outages within the LADWP system result in a loss of power at LAX. LAX has generators that provide emergency back-up power in the event of a regional power outage. The back-up power capacity only supports emergency evacuation and essential systems for life safety. Regional power outages result in an interruption of normal airport operations until such type as primary power can be restored. Non-essential services, such as baggage systems, elevators/escalators/moving walkways, screening systems, passenger boarding bridges, area lighting, and HVAC systems are all off-line until primary power is restored. In the event of a loss of power at the CUP, a back-up generator provides back-up power to all emergency lighting and power circuits, including the Control Room servers, fire alarm, Uninterruptable Power System (UPS), Facility Monitoring and Control System (FMCS), and communication systems.

Regarding the loss of power following the Northridge earthquake, as noted above, during regional power outages, such as occurred following the Northridge earthquake, there is a loss of primary power at LAX. LAWA records do not indicate that back-up power failed during this time period, nor do staff recall any failures of the back-up power supply. While the loss of primary power at LAX is an inconvenience and affects airport operations, there are no environmental impacts associated with a loss of primary power during such events.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-911

Comment:

What are the evacuation procedures to be followed for the airport in case of an earthquake, and how will this impact the local communities?

Response:

SPAS-PC00130-912

Comment:

VI Geology & Soils (a) iii.
A-8
Seismic related ground failure. Several major water runoff and sanitation processing lines go under LAX. If any of these are seriously damaged what is the potential for sinkholes or other damage to structures at the surface?

Response:

Please see Topical Response TR-SPAS-LR-1 regarding the depth to outfall sewers that lie beneath LAX and Response to Comment SPAS-PC00130-348 regarding the relationship between sewer lines and the north airfield improvements. As indicated in those responses, none of the outfall sewers that lie beneath LAX would be affected by the SPAS alternatives. Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX.

SPAS-PC00130-913

Comment:

Since the LAX area was built on a Coastal plain, what impacts would liquefaction have?

Response:

The potential for the SPAS alternatives to expose people or structures to hazards associated with seismic-related ground failure, including liquefaction, was addressed in Section VI.iii of the Initial Study included in the 2008 LAX SPAS EIR Notice of Preparation (NOP) and in the 2010 NOP Initial Study, provided as Appendix A of the SPAS Draft EIR. As explained therein, the potential for seismic-related ground failure caused by liquefaction at LAX is considered low. As part of the proposed project, all construction would be designed in accordance with the provisions of the Uniform Building Code (UBC) and the City of Los Angeles Building Code (LABC). The Initial Study determined that, since the proposed project would comply with UBC and LABC requirements, potential impacts associated with seismic-related ground failure would be less than significant, and no mitigation measures are required. As such, in accordance with Sections 15063(C)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with liquefaction was not discussed in detail in the SPAS Draft EIR.

SPAS-PC00130-914

Comment:

Is there potential for natural gas leakage pathways along fault lines from natural sources since the entire Playa del Rey area was once an oil field? Can gas leakage occur at LAX along a fault line from the Gas Company reservoir that is under the bluff in Playa del Rey and under the wetlands near Playa Vista?

Response:

There are no known natural gas leakage pathways along fault lines near LAX property. Please see Response to Comment SPAS-PC00130-878 regarding faults in the vicinity of LAX.

SPAS-PC00130-915

Comment:

What effect, if any, would the proposed Woodside Energy Natural Gas project have on LAX? Please describe how each of the components may affect LAX - gas line connection in or through the coastal bluff, high pressure lines running underneath Westchester Parkway, distribution facility at 98th Street and Bellanca near the Neutrogena offices, and WallyPark parking garage.

Response:

The Woodside Natural Gas pipeline project referred to in this comment was suspended by the project proponent subsequent to preparation of this comment.1 Resumption of this project is not reasonably foreseeable at this time, therefore, the project was not included in the cumulative analysis in the SPAS Draft EIR.

SPAS-PC00130-918

Comment:

What UBC (Universal Building Code) and LABC (LA Building Code) requirements are applicable? The LAX Specific Plan Sec. 3 "Relationship to the Los Angeles Municipal Code and other Ordinances" negates Site Plan and "Major" Development Project Ordinances (item D).

Response:

As noted in Sections 3.A and 3.B of the LAX Specific Plan, the regulations of the Specific Plan are in addition to those set forth in the planning and zoning provisions of the Los Angeles Municipal Code (LAMC) and any other relevant ordinances, although provisions of the Specific Plan shall prevail if specific regulations in the Specific Plan are different from those in the LAMC or other relevant ordinances. As noted by the commentor, Section 3.D does state that Site Plan Review and "Major" Development Projects approvals shall not apply within the Specific Plan Area. This is because projects will be reviewed at a detailed level through the LAX Plan Compliance Review Process established under the LAX Specific Plan, rendering these other approvals duplicative and unnecessary. The Uniform Building Code (UBC) and Los Angeles Building Code (LABC) will continue to apply to all development at LAX, including projects associated with the SPAS alternatives. The SPAS Draft EIR is a programmatic document. Details regarding which building code requirements would apply to specific construction projects would be determined at detailed levels of planning and engineering design.

SPAS-PC00130-919

Comment:

VI Geology & Soils (c) soil stability
A-10
Is there any plan to add earthen berms on the north and south borders of LAX to reduce the transmittal of low frequency noise?

Response:

Acoustical barriers are only useful for reducing noise impact from aircraft activity on the ground, and their benefits are greatly affected by surface topography and wind conditions. The effectiveness of a barrier depends on the distance of the noise source from the receiver and the distance of each from the barrier itself, as well as the angle between the ends of the berm and the receiver. While noise berms and noise walls can attenuate noise, they would be largely ineffective for attenuation of aircraft overflight noise. The noise levels at LAX are so dominated by the noise of aircraft in flight, the reductions of ground noise single-events by berms is not considered effective for noise abatement. Section 4.10.1.7 of the SPAS Draft EIR discusses various abatement and mitigation techniques of aircraft noise at LAX to reduce the impacts of the SPAS alternatives. Please also see Response to Comment SPAS-PC00170-1.

SPAS-PC00130-920

Comment:

Since we don't know precisely where major sewage and drainage pipes are precisely located, and the soil is very sandy, what is the likelihood of sewer or pipes being disrupted? Have there been any ground issues such as sinkholes at LAX in the past?

Response:

Please see Response to Comment SPAS-PC00130-898 regarding the presence of sewer lines beneath LAX. Please see Response to Comment SPAS-PC00130-348 and Topical Response TR-SPAS-LR-1 regarding the relationship between sewer lines and the north airfield improvements and Lincoln Boulevard realignment, respectively. As indicated in those responses, none of the outfall sewers that lie beneath LAX would be affected by the SPAS alternatives. As explained on page 4-3 of the EIR, the SPAS Draft EIR is a programmatic document. Project-level impacts associated with implementation of individual components would be assessed in future CEQA documents, including impacts associated with utilities such as wastewater lines. Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX.

Comment:

VI Geology & Soils general
A-11
Since the size and location of facilities is not delineated in the NOP, what special assessments will be made to determine how stable the ground is in areas of new construction?

Response:

The potential for the SPAS alternatives to expose people or structures to hazards associated with geology and soils was addressed in Section VI of the Initial Study included in the 2008 LAX SPAS EIR Notice of Preparation (NOP) and in the 2010 NOP Initial Study, provided as Appendix A of the SPAS Draft EIR. As explained therein, as part of all SPAS alternatives, all construction would be designed in accordance with the provisions of the Uniform Building Code (UBC) and the City of Los Angeles Building Code (LABC). Since all SPAS alternatives would comply with UBC and LABC requirements, potential impacts associated with geology- and soils-related hazards would be less than significant, and no mitigation measures are required. As such, in accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with geology and soils was not discussed in detail in the SPAS Draft EIR. Prior to implementation of any of the components of the SPAS alternatives, project-specific geotechnical studies would be conducted as necessary during detailed engineering design to identify issues associated with soil stability or other geotechnical concerns. Measures to address any project-specific issues that are identified would be incorporated into the project design.

SPAS-PC00130-922

Comment:

Given that there have been issues with sewer drains in the area and that the area has hundreds of formerly used oil wells that had water pumped into them, is there any likelihood that additional problems will arise slowing construction or requiring special measures?

Response:

Please see Topical Response TR-SPAS-LR-1, and Response to Comment SPAS-PC00130-348 regarding sewers located beneath LAX. Please see Response to Comment SPAS-PC00130-113 regarding plugged and abandoned oil wells at LAX. As indicated in that response, although there are no active wells at LAX, there are seven plugged or abandoned wells located within the airport property (see Figure F4.17.2-1 in Section 4.17.2 of the LAX Master Plan Final EIR). Compliance with existing

regulatory requirements pertaining to construction near plugged and abandoned oil wells would ensure that construction near these wells would not cause significant adverse impacts.

SPAS-PC00130-923

Comment:

VII Hazards &
Hazardous Matl.
A-12
Since there are numerous carcinogenic items in use at an airport including aviation fuel, could the repeated spillage and evaporation cause a health hazard? What about fuel that is dumped during emergencies or fuel that is released in flight from major accelerations and landing?

Response:

From the speciation profile developed by the California Air Resources Board for aircraft jet kerosene (Jet A), most of the compounds readily found in Jet A are not carcinogenic. Unlike gasoline, Jet A has relatively low volatility and thus is more likely to be absorbed onto soils while microbial activity tends to reduce the soil concentrations of Jet A over time.

Fuel dumping from aircraft (either while on the ground or airborne) is not allowed at LAX or any U.S. airport, except for emergency situations. There are important regulatory, economic, safety, and environmental reasons for this.

For example, FAA regulations prohibit the dumping of fuel from certificated aircraft. (Please see 14 CFR Part 34 and FAA Advisory Circular 34-1B regarding fuel venting regulations). FAA has promulgated strict guidelines on the location, route, and altitude should fuel dumping become necessary. These precautions are designed to avoid or minimize hazardous conditions in the air and on the ground as well as the potential environmental impact. Additionally, the cost for fuel is one of the largest expenses for airlines and cargo carriers. Therefore, fuel conservation is an important and significant cost-saving measure.

In summary, fuel dumping is extremely rare and only occurs in emergency situations to reduce the landing weight and the risk of fire for the distressed aircraft. Whenever possible, it is done at higher altitudes (i.e., greater than 5,000 feet above ground level) and over the ocean so the fuel can evaporate or disperse before reaching ground level.

Often, the white vapor trails emanating from the wing tips of landing aircraft are mistaken for fuel venting. These trails are actually the runoff of water vapor that has condensed on the wings as the colder aircraft descends into the warmer, more humid atmosphere.

SPAS-PC00130-924

Comment:

What about the potential for terrorism with hazardous materials since LAX is one of the most potent targets on the west coast?

Response:

The commentor provides no substantial evidence in support of its assertion regarding the potential for hazardous materials to be used in association with a terrorist action. Under CEQA, speculation is not substantial evidence, and therefore does not require analysis in an EIR. (Public Resources Code Section 21082.2; State CEQA Guidelines Section 15064(f)(5).) Please note that a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Comment:

VII Hazards & Hazardous Matl. (e)
A-13
There are many impacts to the community if the runways are moved north. There are many hazardous materials transported through the community. We expect transportation routes for hazardous materials to be carefully delineated and monitored. We expect LAWA to review and consider all of the suggestions from the 2004 Rand study as well.

Response:

As noted on page A-12 of the 2010 SPAS NOP, and summarized on page 4-573 of the SPAS Draft EIR, construction and operation of the SPAS alternatives would involve the routine transport of potentially hazardous materials or substances. Compliance with existing federal, state, and local regulations, and with the Procedure for the Management of Contaminated Materials Encountered During Construction, prepared in accordance with LAX Master Plan Commitment HM-2, would reduce the potential for accidental release of a hazardous material or substance to occur and would minimize the impact of an accident should one occur. Therefore, as concluded in the SPAS Draft EIR, none of the SPAS alternatives would create a significant hazard to the public or the environment through the routine transport of hazardous materials and substances.

LAWA has no jurisdiction over the delineation of routes for transporting hazardous materials and substances outside of airport property. Please see Response to Comment SPAS-PC00130-424 regarding the implementation of security issues recommended by the RAND Corporation.

SPAS-PC00130-926

Comment:

VII Hazards & Hazardous Matl. (g)
A-13
A-13 Are there any hazard control plans for LAWA that need to be updated? We are certainly concerned that if any disaster occurs the medical care facility that is most convenient would likely be blocked from community use by closure of Sepulveda Blvd.

Response:

Please see Responses to Comments SPAS-PC00094-2, SPAS-PC00130-217, and SPAS-PC00130-944 regarding emergency response plans and services.

SPAS-PC00130-927

Comment:

VII Hazards & Hazardous Matl. (h)
A-14
Although LAWA noted the lack of concern for wild fires etc. there is still concern that an air accident could cause a major fire due to the amount of fuel held by aircraft. We expect that a valid plan will be identified and any access issues will be resolved. At least one of the plans calls for relocation of Lincoln Blvd that includes a portion of the road inside of a tunnel. A fire in this area could be very disastrous, as would poisonous gas clouds. We are aware of several radioactive containers that have been damaged before or after arrival at LAX. There needs to be very specific plans on how to handle such incidents.

Response:

Safety risks associated with aviation accidents and incidents are analyzed in Section 4.7.2 of the SPAS Draft EIR. The adequacy of fire protection services and emergency response is analyzed in Section

4.11.1 of the SPAS Draft EIR. At a program level, these sections conclude that impacts of the SPAS alternatives would be less than significant. If the Lincoln Boulevard realignment is proposed for implementation, project-specific safety and fire protection analyses would be presented in project-specific CEQA documents.

As noted on page 4-994 in Section 4.11.1 of the SPAS Draft EIR, aircraft rescue and fire fighting is regulated by FAA under FAR Sections 139.315 through 139.319. Emergency response procedures in the event of an aircraft-related incident are described in Section 4.11.1. Fire safety on roadways is governed by state and local regulations, which are summarized on pages 4-995 through 4-997 of the SPAS Draft EIR. In addition, as noted on page 4-997, LAWA has developed the LAX Airport Emergency Plan, which addresses essential emergency-related and deliberate actions to ensure safety and the provision of adequate emergency services for LAX and surrounding communities.

Also, please note that the comment does not present any facts or evidence related to fire risks, poisonous gas clouds, or radioactive container damage.

SPAS-PC00130-928

Comment:

VII Hydrology and Water Quality (a)
A-14
A-14 A master plan for grey water usage should be created to work with Hyperion even though LAWA has a good record in this area.

Response:

LAWA's policies and achievements regarding the use of reclaimed water are outlined in Section 4.13.4 of the SPAS Draft EIR. As indicated on page 4-1382 of that section, LAWA's Sustainability Plan includes targets for increasing the use of reclaimed water in airport facilities. As noted on page 4-1380, LAWA uses reclaimed water to irrigate over 35 percent of its landscaped areas. Approximately 40.2 million gallons, or 123 acre-feet, of water is conserved each year through use of reclaimed water.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-929

Comment:

As aircraft and support equipment are produced with new exotic materials there can be a potential runoff issue when repairs are initiated or during maintenance.

Response:

The commentor provides no documentation or evidence to support the statement that "new exotic materials" are being used in aircraft and support equipment that would result in some sort of "potential runoff issue when repairs are initiated or during maintenance." LAWA is required to review and update its SWPPP annually. As part of the annual update, any changes in operations that could result in new chemicals or materials being used at any airport facilities are identified. If there were to be new materials in use at an airport facility that could affect water quality, LAWA would determine if the existing source control or treatment control BMPs in the SWPPP are adequate to prevent or minimize the discharge of the new materials in stormwater runoff, and, if necessary, revise practices or add additional BMPs to address the new pollutants.

SPAS-PC00130-930

Comment:

VII Hydrology and Water Quality (c)

A-15
There are independent plans being established currently for projects to supplement drainage filtration by the LA Sanitation Dept. in the north quadrant of LAX and in the Northside Development area.

Another potential issue is damaging of critical sewage and dry/wet water runoff control channels during construction and adversely impacting the gravity feed requirements of that system.

Response:

The drainage filtration project referred to in the comment appears to be the City of Los Angeles Bureau of Sanitation Stromwater Infiltration and Treatment Facility. Please see Responses to Comments SPAS-PC00149-15, SPAS-PC00130-897, and SPAS-PC00130-907 regarding this facility. Design and construction of the SPAS improvements would be undertaken so as not to damage critical wastewater and stormwater pipelines. Please see Topical Response TR-SPAS-LR-1 regarding the relationship between the Lincoln Boulevard realignment and the outfall sewers that are located beneath the airport.

SPAS-PC00130-931

Comment:

IX Land Use and Planning (a)
A-17
If eminent domain is exercised on a significant portion of the business district there could be separation of businesses into less than a critical mass to draw local community support. Also, if the runway protection zones are enforced and homes are taken on the northeast end of LAX, small pockets of remaining homes could be created. This potential must be fully disclosed.

Response:

A discussion of property acquisition that would occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. In addition, Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components, although acquisition would be required for the ground access components with which these alternatives would be paired. As indicated in these figures and tables, no acquisition is proposed within the Westchester Business District.

Regarding the potential for changes in the RPZ to have an impact on the business district and homes and that eminent domain would be exercised, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester Business District, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

As indicated in Section 4.7.2.6.1 of the SPAS Draft EIR, there are several options that can be considered relative to addressing potential safety hazards associated with incompatible structures and uses being located within an RPZ; however, a determination as to the most suitable and practical option cannot be made until more detailed levels of planning and engineering on the selected alternative, if any, can be conducted in consultation with the FAA. It would be premature and speculative to say at this time whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. Information on specific options to address safety risks would be developed during project-specific CEQA review should an alternative with incompatible structures or uses within an RPZ be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526 includes an analysis of impacts associated with modification or removal of structures and uses within the RPZ, should that be proposed in the future.

SPAS-PC00130-932

Comment:

IX Land Use and Planning (b)
A-17
There is some question as to how homes will be impacted if the runways move north. Several large apartment complexes and some schools will be much closer to runway activity with attendant noise and pollution as well as safety issues.

Response:

The potential noise, air quality, and safety impacts of the proposed SPAS alternatives were analyzed in Sections 4.2, 4.7.1, 4.7.2, 4.9, 4.10.1, 4.10.2, and 4.10.3 of the SPAS Draft EIR. The commentor is referred to these sections for further details. Please also see Response to Comment SPAS-PC00130-742 for a discussion of impacts on nearby schools.

SPAS-PC00130-933

Comment:

A 1980 study on LAX area school children showed that airport noise affected learning abilities. Newer, more effective methods for mitigating noise have been developed since soundproofing was provided to impacted schools. Does LAWA plan to offer sound proofing upgrades and air conditioning to LAUSD, private, and public schools to those located within the 1992 Noise Impacted Contour or for any who will sustain a 1.5 dB increase in noise? When new noise contours are estimated using updated aircraft mix estimates LAWA should assess the impacts.

Response:

The commentor does not discuss the "newer, more effective methods of mitigating noise." alleged in the comment, nor does the commentor explain how such methods would reduce or avoid a significant environmental impact caused by SPAS. With implementation of the noise insulation program, LAWA has substantially reduced noise levels in indoor areas well below existing conditions at the time of installation. SPAS-related aircraft noise impacts to schools are addressed in Section 4.10.1 of the SPAS Draft EIR (which includes information on the fleet mix as described in Section 4.10.1.6 of the SPAS Draft EIR). Significant aircraft noise impacts resulting from SPAS alternatives would be mitigated through LAX Master Plan Mitigation Measures MM-LU-3 and MM-LU-4, as summarized on pages 4-932 and 4-933 of the SPAS Draft EIR. MM-LU-1 is also applicable to schools (see page 4-686 of the SPAS Draft EIR). Please also see Response to Comment SPAS-PC00130-947.

While LAX Master Plan Mitigation Measures MM-LU-3 and MM-LU-4 would be implemented as LAX Master Plan requirements and are acknowledged in the SPAS Draft EIR, they have hereby been incorporated into Section 4.9.5 of the EIR, and the SPAS Draft EIR has been revised. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-PC00130-934

Comment:

IX Land Use and Planning
(c)
A-17
Habitat issues remain not only in the formal "Blue Butterfly dunes" area, but also the plains areas that were the site of homes on the Northside development property. There were also some habitats on the east end of LAX that may need to be examined including Continental City.

Response:

Potential impacts to habitat are addressed in Section 4.3 of the SPAS Draft EIR. The biological resources study area addressed by the analysis is depicted in Figure 4.3-1 and is coincident with the

Airport Property Line depicted in the figure. As stated on page 4-164 of the SPAS Draft EIR, the biological resources study area includes all areas within the airport boundary, as well as adjacent areas with biological resources. Biological resources in the vicinity of the airport were also considered; however, areas immediately adjacent to the airport boundaries are fully developed and provide little to no habitat and do not contain biological resources that would be affected by the proposed project or alternatives. The biological resources study area includes the El Segundo blue butterfly habitat in the Los Angeles/El Segundo Dunes and the Dockweiler Beach habitat restoration area recently colonized by this species, the former home sites within LAX Northside, and areas within the east end of LAX including Continental City, which is proposed to be used as Construction Staging Area G under the SPAS alternatives.

SPAS-PC00130-935

Comment:

Street traffic is another major issue. Although LAWA is rerunning the traffic studies with a maximum of 15 additional intersections, it must still address all of the central terminal traffic as well. Further, greater use of mass transit must be evaluated.

Response:

The SPAS Draft EIR addresses on-airport traffic impacts (i.e., within the CTA) and off-airport traffic impacts in Sections 4.12.1 and 4.12.2, respectively. Existing and future (2025) Central Terminal Area (CTA) traffic conditions for each of the SPAS alternatives are assessed in Section 4.12.1 of the SPAS Draft EIR. Section 4.12.1.10 presents the proposed mitigation measures to address significant impacts to the on-airport transportation system from implementation of the SPAS alternatives. Table 4.12.1-15 on page 4-1103 shows that the percentage of airline passengers using transit increases to 2.5 percent.

As described in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 2, 3, 8, and 9 each include one or more new off-airport facilities such as an Intermodal Transportation Facility (ITF), a Ground Transportation Center (GTC), or an Intermodal Transportation Center (ITC) intended to offer passengers alternative locations outside of the CTA to park or be dropped off, and allow them convenient access to the CTA via an Automated People Mover (APM) or consolidated busing operation. As also discussed on page 4-1199 of the SPAS Draft EIR, "options to extend the Metro Green Line to LAX are currently being studied by Metro. However, given that this proposed extension to LAX is in its early environmental planning stage, has not been approved, and if approved and constructed would not be operational until after the SPAS horizon year, it was not included in the 2010 or the 2025 scenarios." For additional discussion of transit improvements within the horizon year of the project, please see page 4-1103 of the SPAS Draft EIR.

SPAS-PC00130-936

Comment:

Open space must be maintained and so must community serving commercial. Wherever the airport has displaced affordable housing it should generate at least that much replacement affordable housing.

Response:

A discussion of potential impacts on open space and community serving commercial that could occur under the SPAS alternatives is provided in Chapter 2 and Section 4.9 of the SPAS Draft EIR. Specifically, as analyzed in Section 4.9.6 of the SPAS Draft EIR, because the SPAS alternatives are located within the boundaries of the LAX Plan, the only open space areas that would be affected are changes to navigational aids within the Los Angeles Airport/El Segundo Dunes Specific Plan area under Alternatives 1, 2, 3, 4, 5, 6, and 7. These impacts were determined to be less than significant, since the navigational aids are consistent with permitted uses within the Open Space designation of the Dunes Specific Plan. In addition, no public or notable open space areas would be acquired or affected under the SPAS alternatives as indicated in Tables 2-3, 2-4, 2-5, and Figures 2-10 and 2-11 in Chapter 2 and Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR. As also indicated in Tables 2-4 and 4.9-5, no residential acquisition is proposed under any of the alternatives.

Regarding community serving commercial uses, as indicated in Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR, the majority of properties that would be acquired under the SPAS alternatives are primarily airport-related rather than community serving uses. However, development of the SPAS project would require the removal of some community serving commercial uses located on LAWA property including an urgent care facility, Travelodge Hotel, Burger King Restaurant, and Denny's Restaurant. Relocation of these uses would be a business decision.

Regarding the potential for changes in the RPZ to have an impact on community serving commercial uses and that affordable housing would be displaced, as indicated in Section 4.7.2.6.1 of the SPAS Draft EIR, there are several options that can be considered relative to addressing potential safety hazards associated with incompatible structures and uses being located within an RPZ; however, a determination as to the most suitable and practical option cannot be made until more detailed levels of planning and engineering on the selected alternative, if any, can be conducted in consultation with the FAA. It would be premature and speculative to say at this time whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

In the event that it is determined in the future that acquisition due to changes in RPZs is necessary, impacts would be addressed and mitigated in future project-specific CEQA documents. Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526 includes an analysis of impacts associated with modification or removal of structures and uses within the RPZ, should that be proposed in the future.

SPAS-PC00130-937

Comment:

XI Noise
A-18
Topography and single noise events should be taken into consideration when determining the areas impacted by noise. Placement of the terminal gates and taxiways, as well as any other relocated or new facilities should take into consideration so that the impacts from aircraft engines are minimized. When calculating noise, the proper aircraft mix should be used and an estimate of the runway uses should be confirmed as well. Although the preferred runway alternative for taking off is inboard, LAWA estimates that 10% are done on the outboard.

Response:

The commentor suggests that "topography and single noise events should be taken into consideration when determining the areas impacted by noise."

As described in Appendix J1-1 of the SPAS Draft EIR, modeled aircraft Community Noise Equivalent Level (CNEL) noise exposure maps are used as planning tools to allow the comparison of different scenarios of operations over a broad geographical area. The CNEL contour is used to develop the baseline conditions and the future (2025) conditions at buildout of the SPAS alternatives, and to delineate areas of significant impact for FAA analyses of noise exposure in California. CNEL predicts the weighted average noise conditions, which measures logarithmic averages of noise for multiple flights by applying noise penalties to evening and night flights. This is the method universally used in describing transportation noise occurring over a sustained period of time. The CNEL metric takes into consideration all single event noise levels to which every portion of the airport environs is exposed on an average day of the year. The use of the CNEL metric normalizes the effect of the noise energy exposure across all users in a manner that allows comparison between different areas exposed to different characteristics of noise. This method of comparing the total noise received at each location appropriately considers the effect of a proposed project and is critical in determining the noise mitigation required to minimize noise impacts.

The U.S. Geological Survey (USGS) terrain data for LAX and the surrounding communities were used as one of the input variables in the aircraft noise modeling for the SPAS alternatives. The FAA's

Integrated Noise Model (INM) uses terrain elevations to adjust observer-to-aircraft distances when computing aircraft noise levels. All the aircraft noise analyses for the SPAS Draft EIR were conducted with the USGS sourced 1/3 arc-second National Elevation Dataset in the GridFloat format. The National Elevation Dataset is available at the USGS website, http://seamless.usgs.gov, which provides a map interface that allows for the terrain data to be downloaded within a defined area of interest.

The commentor also mentions the use of proper fleet mix and runway use. As described in Section 3.1.1.4 of Appendix J1-1 of the SPAS Draft EIR, the baseline (2009) aircraft fleet mix and operations were derived from the FAA Air Traffic Control Tower Counts and LAWA's noise and operations monitoring system data. Table 3 in Appendix J1-1 of the SPAS Draft EIR provides the average annual day operations and fleet mix for the baseline (2009) conditions. The average annual day operations used for aircraft noise modeling in the future alternative scenarios were developed from the 2025 Design Day Flight Schedule (DDFS) developed for the SPAS Draft EIR. Table 8, Appendix J1-1 of the SPAS Draft EIR provides the average annual day operations and fleet mix for the future 2025 conditions.

As described in Section 3.1.1.1 of Appendix J1-1 of the SPAS Draft EIR, the percentage use of the existing runways for the baseline (2009) conditions was based on information provided by LAWA's flight data through analysis of records of flight operations from the FAA Airport Traffic Control Tower radar data at LAX. Based on the data, the majority of the flights departed off the inboard runways and about 5 percent of the flights used the outboard runways for departures in 2009. Table 1 in Appendix J1-1 of the SPAS Draft EIR provides the 2009 conditions runway utilization percentages. Future runway assignments were developed utilizing SIMMOD airfield and airspace simulation model. The future runway use percentages for the Alternative scenarios are presented under each of the alternative section in Appendix J1-1 of the SPAS Draft EIR.

SPAS-PC00130-938

Comment:

The health impacts of noise exposure must also be addressed.

Response:

An overview of the effects of noise on humans, including hearing loss, communication interference, sleep disturbance, physiological responses, and annoyance, is provided in Section 4.10.1.1.3 of the SPAS Draft EIR. In addition to potential effects related to hearing loss and annoyance, as described in Section 4.10.1.2.3, the aircraft noise analysis completed for the SPAS Draft EIR includes an evaluation of the effects of single event aircraft noise relative to the potential for increased aircraft activity (i.e., number of arriving or departing flights) occurring at night to result in increased nighttime awakenings (sleep disturbance), and relative to potential disruption of classrooms and the educational process from overflights of additional aircraft during school hours. The aircraft noise impacts, including single event noise impacts, associated with the SPAS alternatives are discussed in Section 4.10.1.6 of the SPAS Draft EIR.

SPAS-PC00130-939

Comment:

The use of noise canceling equipment is required to the extent feasible, and the most sophisticated equipment available should be identified and analyzed. Which noise canceling speaker systems been considered?

Response:

Please see Section 4.10.1.7 of the SPAS Draft EIR regarding the various abatement and mitigation techniques of aircraft noise analyzed in the SPAS Draft EIR.

Regarding of the use of noise cancelation speaker systems, please see Response to Comment SPAS-PC00050-4, which addresses a similar suggestion.

SPAS-PC00130-940

Comment:

Please provide a contour map of areas subjected to at least 30 airport/aircraft noise events at 65 dB or above in a day, and/or were subjected to at least two 65 dB or greater events from midnight to 7 a.m.

Response:

Section 4.10.1 of the SPAS Draft EIR provides a comprehensive analysis of aircraft noise impacts for a variety of scenarios including daily total aircraft noise exposure levels, presented in terms of Community Noise Equivalent Level (CNEL), and single event noise. The analysis accounts for the various aircraft types, time of operations including evening and nighttime when noise "penalties" are assigned to each event (see Section 4.10.1.1.1 of the SPAS Draft EIR for further explanation), specific runway assignments, and other detailed assumptions as described in Section 4.10.1 and Technical Appendix J1-1 of the SPAS Draft EIR. The aircraft noise analysis contained in the SPAS Draft EIR is sufficient and appropriate for addressing the potential impacts of the SPAS alternatives, and the very particular and non-standard aircraft noise analyses requested by the commentor are unwarranted. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-941

Comment:

XII Population and Housing (c)
A-20
This could be significant depending on the home and business displacements for alternatives that propose moving runways north.

Response:

Regarding the displacement of homes and businesses within the RPZ for alternatives proposing moving runways north, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931.

SPAS-PC00130-942

Comment:

When LAWA does it's analysis it must assume that Manchester and Belford Square areas are empty and that everything that is constructed there adds to the area traffic.

Response:

The content of this comment is similar to comment SPAS-PC00130-767; please refer to Response to Comment SPAS-PC00130-767. Additionally, please see Section 4.12 of the SPAS Draft EIR for a discussion and analysis of the traffic impacts associated with the SPAS alternatives. The analysis appropriately considers all reasonably foreseeable construction, and accurately describes existing conditions.

SPAS-PC00130-943

Comment:

XIII Public Services (a-c)
A-21
The EIR for the Westchester-Playa del Rey Plan states that a substantial increase in fire and police protection manpower is required to meet current zoning estimates. Much of the community to the north relies on Fire Station 5 for rapid community response. This station deploys both the Manchester Boulevard and Westchester Parkway. This dual access must be maintained.

Response:

It is acknowledged that increases in fire and police protection manpower would be required in association with new development that could occur within the Westchester-Playa del Rey Plan area under current zoning. Alternatives 1 through 9 would not affect the fire and emergency service area of Fire Station 5, which includes LAX and portions of Westchester, Loyola Village, Playa del Rey, and Vista del Mar.

Construction-related impacts related to ground access improvements that include the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6 may have the potential to hamper or delay emergency response along Westchester Parkway. However, as discussed in Section 4.11.1, construction-related impacts such as temporary roadway delays, would be reduced or avoided through LAX Master Plan Commitment C-1, Establishment of a Ground Transportation/Construction Coordination Office. In addition, LAX Master Plan Commitments ST-9, Construction Deliveries, ST-12, Designated Truck Delivery Hours, ST-14, Construction Employee Shift Hours, ST-17, Maintenance of Haul Routes, ST-18, Construction Traffic Management Plan, ST-19, Closure Restrictions of Existing Roadways, ST-21, Construction Employee Parking Locations, and ST-22, Designated Truck Routes, would serve to further reduce potential traffic congestion that would have the potential to hamper or delay emergency response during construction.

Operation of the realignment of Lincoln Boulevard, which would involve relocating a portion of the roadway below grade and/or in a tunnel, would not the affect operation and access of fire protection and emergency services along Manchester Boulevard and Westchester Parkway.

SPAS-PC00130-944

Comment:

For emergency services at LAX there must be a good emergency health care plan in place with capacity to meeting both LAX and community needs.

If an event occurs at LAX that causes airport closure this facility will be unavailable to the surrounding community. The nearest urgent care for local residents is located on Sepulveda north of Century. In view of the closure of several emergency rooms and Daniel Freeman Hospital does the needed capacity still exist? If not, what solution is proposed?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As discussed in Response to Comment SPAS-PC00130-217, Section 4.11.1 of the SPAS Draft EIR evaluated whether any of the SPAS alternatives would result in restricted emergency access, increased response times, or extended station response distances beyond the standards maintained by the agencies serving LAX and the surrounding communities. LAX Master Plan Commitments FP-1, LAFD Design Recommendations, and PS-2, Fire and Police Facility Space and Siting Requirements, as well as enforcement of Federal Aviation Regulations and state and local fire code requirements, would ensure maintenance of adequate fire and emergency response times; LAFD staffing, including EMT and paramedic personnel; equipment; facilities; and emergency access. As noted on page 2-55 of the SPAS Draft EIR, the urgent medical care facility on Sepulveda Boulevard would be removed under all of the SPAS alternatives except Alternative 4. The facility could potentially be relocated elsewhere in the airport area. This facility is privately operated; any decision to relocate would be at the discretion of the facility owners. It should be noted that the urgent care facility provides unscheduled, walk-in care outside of a hospital emergency department. Currently, in the event of an emergency at LAX requiring medical attention, emergency response is provided by the Los Angeles Fire Department and affected persons are transported to a nearby hospital, if required. The LAFD does not transport emergency cases to the urgent care facility.

SPAS-PC00130-945

Comment:

Several schools will be subjected to increased noise and pollution.

Response:

The potential noise and pollution impacts of the proposed SPAS alternatives on schools are analyzed in Sections 4.2, 4.7.1, 4.9, 4.10.1, 4.10.2, and 4.10.3 of the SPAS Draft EIR. As further described in these applicable analyses, there would be significant and unavoidable air quality impacts under all of the SPAS alternatives; significant and unavoidable acute non-cancer health hazard impacts under all of the SPAS alternatives; significant and unavoidable interim aircraft noise impact prior to mitigation under Alternatives 1, 2, 3, 4, 5, 6, and 7; less than significant road traffic noise impacts under Alternatives 1, 2, 3, 4, 8, and 9; and significant and unavoidable construction noise impacts under all of the SPAS alternatives. Please also see Response to Comment SPAS-PC00130-742 for further discussion of impacts to sensitive uses along Westchester Parkway.

SPAS-PC00130-946

Comment:

Air pollution especially must be assessed for not only 10 and 2.5 micron size but also smaller (i.e. 0.1 as done in the 2007 CARB study of LAX particle pollution).

Response:

Please refer to Response to Comment SPAS-PC00130-225 for a discussion of ultrafine particles (UFP, also known as PM0.1) and the 2007 UCLA report. Air quality impacts of PM2.5 and PM10 are included in Section 4.2.6 of the SPAS Draft EIR. Impacts of PM2.5 and PM10 were found to be significant for all alternatives.

SPAS-PC00130-947

Comment:

Although several schools have been previously sound proofed during earlier programs, determination should be made if another round of soundproofing is appropriate. Several churches and schools may be subjected to enough noise to cause learning impairment under EPA or other standards (i.e. NIH).

Response:

Impacts associated with schools and places of worship (including churches) were addressed in SPAS DEIR Section 4.10.1.6 of the SPAS Draft EIR. As described in Section 4.9.3.3 of the SPAS Draft EIR, sound insulation is a component of the existing LAWA Aircraft Noise Mitigation Program (ANMP), which will continue to be implemented.

SPAS-PC00130-948

Comment:

XIII Public Services (d)
A-22
Some airport land, such as Nielson Field and the Westchester Golf Course, is currently used for open space. If this use is diminished or if promised elements (i.e. Golf Course) is not restored the negative impacts of this should be analyzed and mitigated.

Response:

None of the SPAS alternatives propose changes to the Carl E. Nielsen Youth Park or the Westchester Golf Course. Please see Response to Comment SPAS-PC00130-900 regarding restoration of the three holes at the Westchester Golf Course, a project that was completed in 2010. For discussion of the alternatives' impacts, please see Chapter 4 of the SPAS Draft EIR.

SPAS-PC00130-949

Comment:

XIII Public Services (e)
A-22
Some other governmental uses should be investigated, as well as new housing opportunities for Manchester Square.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

The intent of the referenced section of the 2008 SPAS NOP is to determine if the SPAS alternatives would result in "substantial adverse physical impacts associated with new or physically altered governmental facilities, construction of which could cause significant environmental impacts," not to investigate other governmental uses that could be proposed in lieu of the SPAS improvements. As indicated on page 1-9 of the SPAS Draft EIR, SPAS must focus on potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address. It is not the purpose of SPAS to investigate other governmental uses or new housing opportunities for Manchester Square. The comment provides no evidence that other governmental uses would (1) achieve the basic objectives of the project and (2) could avoid or substantially lessen one or more of the significant effects. (State CEQA Guidelines Section 15126.6(a).) The SPAS alternatives represent a reasonable range of alternatives that would attain most of the basic objectives of the project, sufficient to allow informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).)

SPAS-PC00130-950

Comment:

Certainly the need for additional road access is evident due to the increases of traffic from current levels to the "nominal" 78.9 MAP. Also cargo and other related causes of traffic need to be assessed fully. Traffic should be diverted away from residential communities. Even if there are only moderate increases in traffic from LAX the overall impact may still be substantial due to major increases in present and authorized development zoning changes.

Response:

The comment indicates that increases in passenger and cargo traffic at LAX need to be assessed, as well as "other related causes of traffic," and that traffic should be diverted from residential communities. The use of Los Angeles' travel demand forecasting model in the traffic analysis takes into account the traffic associated with the activities discussed in the comment. As described in Section 4.12.2.2.2 of the SPAS Draft EIR, the model includes growth dynamically and iteratively assigns traffic over the entire roadway network, including both freeways and surface streets. Figure 4.12-2-2 illustrates the model components and process. As described on page 4-1208 in Section 4.12.2.2.3, the 2025 forecasts included growth projected by SCAG for the surrounding region, which was adjusted where necessary to ensure that it accounted for all known development projects in the study area.

SPAS-PC00130-951

Comment:

XV
Transportation/Circulation
A-23

Potential traffic changes in the CTA must be assessed. Are there better ways to direct the traffic from the surrounding areas into LAX? LOS around LAX is marginal on many streets already. LAX modifications such as the location of the cargo support businesses, consolidated rental car facility, integrated transportation near Continental City and more must be included in the assessments. The total costs and fair share allocations of improvements must be addressed.

Response:

The SPAS Draft EIR analyzes both on-airport and off-airport traffic associated with the development of the SPAS alternatives. As discussed in Sections 4.12.1 and 4.12.2, mitigation measures are proposed for those significant impacts identified by the analysis. Importantly, the SPAS Draft EIR analyzes alternatives that are designed to achieve the project objectives, including improving the ground access system at LAX. The type and number of alternatives considered represent a reasonable range of alternatives that will foster informed decision-making by allowing the decision-makers to evaluate the comparative merits of the alternatives. (State CEQA Guidelines Section 15126.6(a).)

Section 4.12.1.6 of the SPAS Draft EIR provides an overview of the key on-airport traffic related elements of the SPAS alternatives, and briefly describes how they were taken into account in the impact analysis. Pages 4-1094 through 4-1096 in Section 4.12.1.6.2 of the SPAS Draft EIR defines a number of non-SPAS improvements within the Central Terminal Area (CTA), which are expected to be implemented by 2025 including the proposed new Terminal 1.5, Terminal 2.5, and the Midfield Satellite Concourse Passenger Processor, which will add needed curbside to the CTA.

While curbside currently exists between Terminals 1 and 2, the site of the proposed new Terminal 1.5, it is severely underutilized on both the arrivals and departures level roadways since there is no terminal building with passenger processing functions adjacent to this section of curbside. The construction of a new Terminal 1.5 will attract vehicles to this underutilized section of curbside, provided needed relief to the curbs at both Terminals 1 and 2. The Midfield Satellite Concourse Passenger Processor will create more than 500 feet of additional curbside on both the arrivals and departures level roadways, new curbside which currently does not exist.

Currently LAX traffic is directed to the major arterial roadways such as Century Boulevard, Sepulveda Boulevard, Aviation Boulevard, La Cienega Boulevard, etc. SPAS Alternatives 1, 2, 3, 8, and 9, described and depicted in Chapter 2 of the SPAS Draft EIR, each include one or more new off-airport facilities such as an Intermodal Transportation Facility (ITF), a Ground Transportation Center (GTC) or an Intermodal Transportation Center (ITC) intended to offer passengers alternative locations outside of the CTA to park or be dropped off, and allow them convenient access the terminal area via an Automated People Mover (APM) or busing operation. In addition, SPAS Alternatives 3, 4, 8, and 9 each include a proposed Consolidated Rental Car Facility (CONRAC) intended to provide a central location for rental car activity and reduce the number of shuttle buses serving the CTA by consolidating each of the individual rental car company shuttle operations into a single operation.

The comment states that "LOS around LAX is marginal on many streets already." Table 4.12.2-11 on pages 4-1219 through 4-1224, of the SPAS Draft EIR presents the level of service analysis results for the Baseline (2010) without Alternative scenario. As shown, and summarized on pages 4-1217 and 4-1218, 30 of the 200 study intersections operate at LOS E or LOS F during at least one analyzed peak hour, including locations lying on Sepulveda Boulevard, La Cienega Boulevard, Prairie Avenue, Imperial Highway and El Segundo Boulevard.

Please see Chapter 8 of the Preliminary LAX SPAS Report for a general discussion of the costs of each alternative. LAWA would be responsible for the costs of the on-airport ground transportation system improvements proposed by LAWA under the various SPAS alternatives such as the CONRAC facility proposed under Alternatives 3, 4, 8, and 9, the ITF proposed under Alternatives 1, 2, 8, and 9, the GTC and ITC proposed under Alternative 3, the elevated busway proposed under Alternatives 1, 2, and 8, and the APM proposed under Alternatives 3 and 9. As described on page 4-1230 of the SPAS Draft EIR, LAWA would contribute funding on a fair share basis for off-airport ground transportation system improvements, such as intersection improvements. However, LAWA's financial contribution for off-airport ground transportation system improvements would be based upon the proportion of, traffic impacts attributable to the implementation of the LAX Master Plan, and would occur at the time the individual future improvements are implemented, subject to federal approval regarding airport revenue

diversion. Additionally, it should be noted that LAWA's funding responsibilities for any off-airport traffic mitigation measures would be limited by constitutional nexus and rough proportionality requirements (State CEQA Guidelines Section 15041(a)).

SPAS-PC00130-952

Comment:

XV Transportation/Circulation
A-24
Locations and stops, methods for supporting baggage handling, etc., must be identified.

Response:

It is unclear what the commentor referred to as "locations and stops."

Regarding "methods for supporting baggage handling, etc..." the SPAS Draft EIR analyses assumed that baggage handling and check-in locations would remain in their current configurations and locations in 2025, with the exception of additional locations at the new Terminal 1.5, as discussed in Section 4.12.1.6.2 on page 4-1095 of the SPAS Draft EIR. This was considered to be a conservative assumption from the perspective of the on-airport traffic analyses.

SPAS-PC00130-953

Comment:

XV Transportation/Circulation
A-24
Movement of the runways will modify the flight tracks of approaching and departing aircraft. This change must be studied to assess impacts on the number and urgency of go-arounds and other noisy, polluting flight maneuvers.

Response:

An aircraft noise impacts analysis was conducted for each of the SPAS alternatives and the results are included in Section 4.10.1 of the SPAS Draft EIR. An air quality analysis was conducted for each of the SPAS alternatives and the results are included in Section 4.2 of the SPAS Draft EIR. These and other related analyses in the SPAS Draft EIR account for the runway movements associated with each alternative.

SPAS-PC00130-954

Comment:

A July 2007 Airline Pilots Association White Paper on incursions notes modest air traffic increases have resulted in major increases in the number of incursions. Air capacity assessments must be identified and quantified for all key factors, not just the first order limiting factor of capacity growth. Although gate capacity is the current capacity limiting factor, if it is resolved several others can become significant. Several factors of concern are, but not limited to, the number of cars entering the CTA, taxiway routes for aircraft to get to gates, and the number of aircraft operations per unit time as the required separation distance in the sky that limits the number of takeoffs and landings. Otherwise, if the limiting factor for capacity is the only factor addressed, as soon as the Settlement limitation on embarkation gates expires, capacity may be dramatically increased without a former EIR review.

Response:

As described in Section 2.2 of the SPAS Draft EIR, LAWA is seeking to provide airfield improvements that support the safe and efficient movement of aircraft at LAX, including reducing the potential for airfield hazards and enhancing the overall safety of airfield operations through runway and taxiway design. There is no evidence that any of the SPAS alternatives would result in air traffic capacity increases. As discussed in Section 1.4 of the SPAS Draft EIR, the majority of operational-related impacts are primarily attributable to future growth in aircraft and passenger activity levels independent

of SPAS. Section 4.7.2, Safety, of the SPAS Draft EIR addresses whether and how the proposed alternatives could affect the potential for aviation incidents and accidents, as defined under NTSB Regulation Part 830, as well as runway incursions, as defined by the Civil Aviation Organization. (See Section 4.7.2.1 of the SPAS Draft EIR.) As further explained on page 4-486 in Section 4.7.2 of the SPAS Draft EIR, "the impacts of an airport's projects on airspace are typically addressed in a separate analysis performed by the FAA following completion of environmental review."

The commentor referred to "air capacity assessments." It is assumed that the commentor meant to refer to "airspace" capacity assessments. In simple terms, an "airspace capacity assessment" is an evaluation of airspace used for aircraft operations to determine the capacity of that airspace based on FAA air traffic procedures. Airspace capacity assessments were not an objective of the SPAS effort. Please Section 2.2 of the SPAS Draft EIR for a discussion of the SPAS objectives.

As explained in Section 6.2 of the Preliminary LAX SPAS Report, the 78.9 MAP activity level forecast relied upon in the EIR reflects that fact that all of the SPAS alternatives include (i) no more than 153 gates and (ii) the amendment of the LAX Specific Plan section 7.H requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. Both this physical gate limit and the proposed amendment to the LAX Specific Plan reflect the fact that the practical capacity of LAX is based on market assumptions, as well as the expected physical characteristics of the various functional elements of the airport and how they are planned and expected to work together, given how the market is likely to respond and use LAX.

Regarding conducting capacity assessment of other related facilities, please see Response to Comment SPAS-AL00008-27. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-955

Comment:

Traffic from parking areas must be assessed after the parking locations are determined. This traffic is a source of noise and pollution, as well as frustrating easy access to the central terminal area.

Response:

Both the on-airport traffic analysis (see pages 4-1046 and 4-1047 in Section 4.12.1.2.1 of the SPAS Draft EIR) and off-airport traffic analysis (see page 4-1209 in Section 4.12.2.2.4 of the SPAS Draft EIR) included vehicles entering or exiting both on-airport and off-airport parking facilities. In the on-airport traffic analysis, these vehicles are included in both the intersection and roadway capacity analyses. Please see Section 4.10.2 of the SPAS Draft EIR for discussion of road traffic noise, and as discussed in Section 4.2.2.1 and 4.2.2.2, the air quality analysis included emissions associated with motor vehicles.

SPAS-PC00130-956

Comment:

Better signage and other types of improvements must also be identified as mitigations for areas around LAX and inside the CTA.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As indicated in Sections 4.12.1.5 and 4.12.2.5 of the SPAS Draft EIR, a number of LAX Master Plan commitments and mitigation measures related to the on- and off-airport transportation systems are applicable to the SPAS alternatives. As part of LAX Master Plan Commitment ST-18, Construction Traffic Management Plan,

and LAX Master Plan Mitigation Measure MM-ST-2, Modify CTA Signage, additional signage within and adjacent to the airport will be installed during construction to notify the public of detours and to separate construction traffic from non-construction traffic to the extent feasible. In addition, project-specific design specifications for ground transportation and terminal improvements will include new signage/wayfinding to assist the public and to reduce congestion within and adjacent to the airport.

SPAS-PC00130-957

Comment:

XV Transportation/Circulation
A-25
Alternative transportation uses must be closely examined. LAWA should look into how and where the new flyaway programs can be used and how all of the bus movements inside the CTA can be reduced to eliminate or at least reduce traffic jams.

Response:

Throughout 2011, LAWA operated four FlyAway routes between LAX and remote boarding locations at Van Nuys, Union Station, Westwood/UCLA, and Irvine Station. In 2011, the network realized an average daily ridership of 3,790 passengers, reduced vehicle emissions by almost 24 tons per day, and removed 3,221 vehicles trips per day (i.e., approximately 1,175,700 trips over the course of the year), traveling a combined total of 65,505 miles per day on roads approaching LAX.1 The operation of the FlyAway site at the Irvine Transit Center was suspended on August 31, 2012 due to low ridership which was resulting in greater emissions from FlyAway buses traveling the 100-mile round trip between LAX and the Irvine Transit Center several times per day with very few, or often no, passengers than would occur if those few passengers drove directly or utilized a shared-ride van/shuttle service. LAWA staff continues to work on establishing additional FlyAway sites in order to comply with the Stipulated Settlement. The next FlyAway service, connecting LAX with the Metro Exposition light rail line at its Expo/LaBrea station, was approved by the LAWA Board of Airport Commissioners in October 2012 and is expected to begin service in spring 2013. Other potential LAX FlyAway locations which LAWA staff is currently evaluating for service include Santa Monica, Long Beach, Torrance, Hollywood, and Glendale.

In support of the FlyAway program, LAWA provides detailed information on the LAWA website about the FlyAway program and other alternative modes of transportation to and from LAX (lawa.org/welcome_LAX.aspx?id=132) and also provides FlyAway information brochures at transit centers, such as Union Station, and to major employers upon request as part of their transportation demand management/trip reduction programs.

Please see Response to Comment SPAS-PC00130-398 regarding LAWA's trip reduction programs for both rental car and hotel shuttle operators, which serve to reduce bus movements within the CTA. Also, as described in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 2, 3, 8 and 9 each include one or more new off-airport facilities such as an Intermodal Transportation Facility (ITF), a Ground Transportation Center (GTC), or an Intermodal Transportation Center (ITC) intended to offer passengers alternative locations outside of the CTA to be dropped off or picked up, and allow them convenient access to the CTA via an Automated People Mover (APM) or consolidated busing operation. These elements of the SPAS alternatives are intended to reduce traffic volumes and potential congestion within the CTA. An analysis of potential impacts to on-airport traffic are discussed in Section 4.12.1 of the SPAS Draft EIR.

1. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP), 2011 Annual Progress Report, October 2012.

SPAS-PC00130-958

Comment:

There are many new potential airside issues. Taxiway locations (especially around the terminal gates) have been noted by LAWA and the FAA to restrict aircraft movement that reduces operational efficiency and adds pollution and noise. Studies must address the movement of taxiways, taxiway/runway

intersections, and gate locations to determine more efficient ways to handle ground aircraft movement to reduce noise and pollution promulgated into the surrounding communities.

Response:

As discussed on pages 1-10 and 1-11 in Section 1.2.1 of the SPAS Draft EIR, one of the objectives associated with the completion of the SPAS process is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. This includes adding improvements that are consistent with FAA design standards and providing sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft, among others.

Section 2.3.1. identifies, for each alternative, the modifications to taxiways, taxiway/runway intersections, and terminals/gates to allow for more efficient ways to handle ground aircraft movements. As identified in Section 2.2 of the SPAS Draft EIR, LAWA sought to identify and apply ways to avoid, reduce, or minimize environmental impacts on surrounding communities. Section 4.2 of the SPAS Draft EIR identifies the impact these modifications would have to air quality and Section 4.10 of the SPAS Draft EIR identifies the impact these modifications would have related to noise. Additionally, Table 4.7.2-16 in Section 4.7.2 provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield.

SPAS-PC00130-959

Comment:

XVI Utilities
A-25
Utility systems should be assessed to determine where additional capacity is required and where back-up systems are required.

Response:

The SPAS Draft EIR addresses the adequacy of electricity and water supplies, and wastewater treatment capacity, in Sections 4.13.1, 4.13.4, and 4.13.3, respectively. As noted in those sections, supplies and capacity are sufficient to accommodate the SPAS improvements and impacts to these utilities would be less than significant.

The SPAS Draft EIR is a programmatic document. Utility systems that would be affected by the SPAS alternatives have not been determined at this level of planning. Project-level impacts associated with implementation of individual SPAS components will be assessed in future CEQA documents, including impacts associated with utility systems. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS Project.

SPAS-PC00130-960

Comment:

XVI Utilities
A-26
Although sufficient solid waste capacity is presumed, there are many opportunities for reducing the generation of solid waste. If we continue the same methods of disposal to Sunshine Canyon and other remote landfills, and there is a substantial increase in waste, we will be adding much pollution and noise due to the long haul disposals.

Response:

Please see Responses to Comments SPAS-PC00130-210 and SPAS-PC00130-144 regarding recycling operations at LAX and Sunshine Canyon landfill capacity. Evaluation of air quality and noise impacts associated with the regional transportation of solid waste is beyond the scope of the SPAS Draft EIR.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-961

Comment:

XVII Mandatory findings of Significance
A-27
The cumulative effects of increased traffic will increase pollution and has serious adverse economic impacts in terms of reduced productivity along with adverse health impacts.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please note that conclusions in this comment are not supported by any facts or evidence.

As indicated in Section 4.12.1 of the SPAS Draft EIR, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Alternatives 1, 2, 8, and 9 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect on-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. As described on pages 5-127 and 5-128 in Chapter 5 of the SPAS Draft EIR, cumulative impacts to on-airport transportation are incorporated into the analysis provided in Section 4.12.1, the results of which are described above.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. As described on page 5-128 in Chapter 5 of the SPAS Draft EIR, cumulative impacts to off-airport transportation are incorporated into the analysis provided in Section 4.12.2, the results of which are described above.

Regarding air pollution, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable. As described on page 7-1 in Chapter 7 of the SPAS Draft EIR, the SPAS alternatives would result in a cumulatively considerable contribution to significant cumulative construction-related air quality impacts, based on significant construction-related project impacts summarized above.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant

and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives. As described on page 7-1 in Chapter 7 of the SPAS Draft EIR, the SPAS alternatives would result in a cumulatively considerable contribution to significant cumulative operational air quality impacts, based on significant operational project impacts summarized above.

As indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant. As described on page 7-1 in Chapter 7 of the SPAS Draft EIR, Alternatives 1, 3, 4, 8, and 9 would result in a cumulatively considerable contribution to acute non-cancer hazards.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR.

SPAS-PC00130-962

Comment:

Petitioners' Overview of Guiding Principles for Environmental Analysis:
LAX Specific Plan Amendment Study EIR

Submitted by Petitioners: City of El Segundo, City of Inglewood, City of Culver City, County of Los Angeles, and Alliance for a Regional Solution to Airport Congestion (ARSAC).

Background: In January of 2005, Petitioners filed lawsuits challenging the approval of the LAX Master Plan Program and the associated Environmental Impact Report (EIR) prepared by Los Angeles World Airports (LAWA) under the California Environmental Quality Act (CEQA). These suits were resolved by a 2006 Stipulated Settlement between LAWA and Petitioners. In response to the Notice of Preparation (NOP) recently released by LAWA for the Specific Plan Amendment Study (SPAS) Draft EIR, Petitioners now jointly submit this overview of principles that should guide LAWA in that environmental review process. Petitioners will also submit detailed individual comments.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-963 through SPAS-PC00130-968 below.

SPAS-PC00130-963

Comment:

LAWA's Obligation to Avoid and Reduce Impacts to Surrounding Communities. As LAWA proceeds with refinement and analysis of options as part of the SPAS process, it must continually recognize its obligation to avoid and mitigate impacts to the communities that surround LAX. Options under consideration must be evaluated and ranked based on how they would impact the environment, public health and safety in surrounding communities (e.g., noise, air quality, traffic). All alternatives should be subject to a full and fair evaluation in the SPAS DEIR and LAWA should remain open to options that would avoid or mitigate impacts to its neighbors, taking care not to prematurely select a preferred alternative.

Response:

The content of this comment is identical to comment SPAS-AL00007-54; please refer to Response to Comment SPAS-AL00007-54.

SPAS-PC00130-964

Comment:

Continued Consultation with Surrounding Communities. The alternatives described in the SPAS NOP were developed and selected by LAWA during a lengthy consultation process with Petitioners. That consultation process grew out of the 2006 Stipulated Settlement, which states, in relevant part, that "An LAX Specific Plan Amendment Process Advisory Committee shall be created consisting of representatives of the City of Los Angeles, County of Los Angeles, El Segundo, Inglewood, Culver City, and ARSAC. LAWA shall consult with the Committee during each significant step of the LAX Specific Plan Amendment Process." Petitioners wish to recognize LAWA's compliance to date with this provision of the Stipulated Settlement. LAWA must now ensure that it continues to consult with Petitioners as the EIR process proceeds and the SPAS alternatives are developed in more detail. In particular, LAWA should take care to consult with Petitioners regarding the details and analysis of the alternatives supported by any Petitioner.

Response:

The content of this comment is identical to comment SPAS-AL00007-55; please refer to Response to Comment SPAS-AL00007-55.

SPAS-PC00130-965

Comment:

Extension of Gate Constraint. LAWA, FAA and the Petitioners all agree that limiting the number of gates at LAX will promote efficient passenger operations and encourage other airports in the Los Angeles basin to increase capacity to serve aviation demand. Accordingly, the long term success of the regional approach to serving aviation demand depends on maintaining appropriate gate constraints at LAX. The 2006 Stipulated Settlement between LAWA and the Petitioners limits the number of permissible gates at LAX to 163 and, commencing in 2010, requires LAWA to begin reducing the number of operating gates at LAX to 153. This settlement provision is operative through December 31, 2020. As part of the SPAS process, LAWA must analyze the continuation of the LAX gate constraints beyond 2020, as well as the possible enhancement of those constraints at a level that will efficiently serve up to 78.9 million annual passengers at LAX, while encouraging growth elsewhere in the region, including at the other airports owned and operated by LAWA.

Response:

The content of this comment is identical to comment SPAS-AL00007-56; please refer to Response to Comment SPAS-AL00007-56.

SPAS-PC00130-966

Comment:

Airfield Balance. In the NOP, LAWA indicates that under the LAX Master Plan, one of its goals is to "provide a better balance in operations between the North Airfield and the South Airfield." Petitioners support this goal and urge LAWA to conduct a full analysis of whether and to what extent each of the proposed SPAS alternatives would help achieve better airfield balance. Petitioners agree that total flight operation balance can lead to less operational crowding, which is good for all.

Response:

The content of this comment is identical to comment SPAS-AL00007-57; please refer to Response to Comment SPAS-AL00007-57.

SPAS-PC00130-967

Comment:

Regional Approach. Petitioners strongly support a regional approach to accommodating passenger and cargo aviation demand throughout Southern California. Because the area around LAX is fully developed, and because we must reduce vehicle miles traveled to improve air quality, decrease greenhouse gases, and increase productivity, a regional solution to serving aviation demand is essential. The regional approach, which is fully supported by the Southern California Association of Governments, must be a key component of everything LAWA does, including in the SPAS process. LAWA should vigorously pursue accommodating aviation demand at Palmdale and Ontario, and work aggressively with other airport operators and local governments to advance the regional approach.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. Regarding the traffic, air quality, and greenhouse gas impacts associated with regionalization, please refer to Section 6.2 of the SPAS Draft EIR.

SPAS-PC00130-968

Comment:

DEIR Public Review Period. The NOP indicates that LAWA intends to provide just 45 days for public review and comment on the Draft SPAS EIR. In light of the complexity of this project and LAWA's tendency to produce lengthy CEQA documents, Petitioners anticipate that 45 days will not be sufficient

Response:

The content of this comment is identical to comment SPAS-AL00007-59; please refer to Response to Comment SPAS-AL00007-59.

SPAS-PC00130-969

Comment:

ATTACHMENT 3 to ARSAC LAX Master Plan NOP Comment Letter, 6-17-08

One Safe Single North Runway Proposal

Background: The Stipulated Settlement Agreement provided for a re-examination of Yellow Light projects such as the north runway complex by the Specific Plan Advisory Committee and to come up-with other efficient and community friendly alternatives. The One Safe Single North Runway proposal aims to address safety, efficiency and being community friendly.

Runway incursions continue to be cited as a reason for making improvement to the north airfield complex at LAX. Despite numerous requests, one idea that has not and should be included and fully studied in the NASA north airfield safety study and in the LAX Master Plan NOP and EIR/EIS is this "One Safe Single North Runway." This proposal can provide safety and keep LAX within the desired 78.9 Million Annual Passenger (MAP) limit.

The only runway designs in the world that have been most effective in preventing runway incursions are designs where aircraft do not have to cross one runway to get to another. Munich Franz Josef Strauss Airport (MUC) in Germany was designed with one runway on each side of the terminal complex as a way to prevent runway incursions. Since MUC opened in 1992, there has been only one runway incursion (2006). MUC handled 34 MAP in 2007.

London Heathrow Airport (LHR) in the United Kingdom, the world's busiest international airport, has a similar runway layout with one runway on each side of the terminal complex. LHR has traffic signals

operated by two tower controllers, at each runway to permit aircraft to enter the runways. LHR has not had incursion problems. At LHR, one runway is used for take-offs and one runway is used for landings. This is known as Single Mode Operation. In 2007, LHR handled 68 MAP.

London Gatwick Airport (LGW) is a single runway airport that operates in Multi-Mode Operation. In 2007, LGW handled 35 MAP. According to its operator, BAA, "Gatwick is the busiest single-runway airport in the world, the second largest airport in the UK and the sixth busiest international airport in the world." Clearly, a single runway airfield can be successful!

Requirements for all concepts:
- Runway 24 Right closed and either covered with fill dirt or removed
- Enhanced runway/taxiway lighting, striping and signage on Runway 24 Left
- ASDE-X and Runway Status Lights on Runway 24 Left
- Noise contours cannot increase in Westchester/Playa del Rey
- No taking of land in Westchester/Playa del Rey
- No northward runway movement and no placement of taxiways north of runway

Concept 1:
- Use Runway 24 Left in its existing configuration.

Concept 2: "Super Runway"
- Rebuild Runway 24 Left in its current location to a new 200-foot wide runway and 10,000 feet in length. The runway would be extended up to 1,000 to the east. The associated taxiways near Terminals 1, 2 and 3 and the Tom Bradley International Terminal would be rebuilt as required. Movement toward the center of the two existing runways facilitates the least expensive upgrades to the present inadequate, congestion producing taxiways and taxilanes adjacent to the terminals.

Response:

Please refer to Response to Comment SPAS-PC00130-800 regarding the reasons why the SPAS Draft EIR did not evaluate in detail the alternative of eliminating one runway in the north airfield.

SPAS-PC00130-970

Comment:

Response:

The content of this comment consists of a copy of ARSAC's comment letter on the 2008 NOP for the SPAS Draft EIR. ARSAC's 2008 NOP comment letter is item 7 of ARSAC's LAX SPAS Draft EIR comments package (see Attachment 5 of this Final EIR). ARSAC's 2008 NOP comment letter is also included in ARSAC's comments on the SPAS Draft EIR as an attachment to their 2010 NOP comment letter. (ARSAC's 2010 NOP comment letter has been designated in the SPAS Final EIR as SPAS-PC00130-729 through SPAS-PC00130-818. The 2008 NOP comment letter that is attached to the 2010 NOP comment letter has been designated SPAS-PC00130-819 through SPAS-PC00130-969.) The two versions of the 2008 NOP comment letter are nearly identical to one another. There is only one difference between the version of ARSAC's 2008 NOP comment letter in this subject comment and the version included as an attachment to ARSAC's comment letter on the 2010 NOP. Attachment 4 of the original 2008 NOP comment letter was a Power Point presentation titled "340' south/airline alliance realignment proposal," dated June 17, 2008. In the version of the 2008 NOP comment letter that was attached to ARSAC's 2010 NOP comment letter, this attachment was replaced with a Power Point presentation titled "ARSAC Concepts for the LAX Specific Plan Amendment Study--North Airfield, Terminal 1, 2, & 3; Consolidated Rent-a-car Facility, Automated People Mover and Elevated Roadways," dated November 28, 1010. Please see Responses to Comments SPAS-PC00130-819 through SPAS-PC00130-969 above for responses to ARSAC's comment letter on the 2008 NOP for the SPAS Draft EIR. Please note that responses to the alternatives suggested in the two attachments are provided in Responses to Comments SPAS-PC00130-736, 800, 814, 815, 816, 843, 848, 849, and 969 above.

SPAS-PC00130-971

Comment:

Included in this attachment a 2007 LAX Town hall presentation by Denny Schneider and David Voss which questions some of the assumptions made by LAWA early on and promulgated into the report and DEIR which we feel are invalid. When is LAWA going to address these?

Opposition to LAWA's North Runway
Complex Expansion Proposal
Denny Schneider, President
Alliance for a Regional Solution to Airport Congestion
David Voss, Former Airport Commissioner
Chair - Airport Relations Cmte.,
Neighborhood Council of Westchester Playa del Rey
Chair LAX Coastal Chamber of Commerce, Airport
Policy Cmte.

Moving North Runway Closer to
Westchester is Unnecessary

1) LAWA's PROPOSAL HARMS WESTCHESTER/PDR AND VIOLATES SETTLEMENT DEAL
2) RUNWAY SEPARATION IS UNNECESSARY
3) LAWA's HIDDEN AGENDA: "LOAD BALANCING"

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-972 through SPAS-PC00130-988 below.

SPAS-PC00130-972

Comment:

Community Under Assault over 25 years
- 1983 - CTA Second level added -capacity about 40 million annual passengers (MAP) - 1 million annual tons (MAT) cargo.
- 1994 New Master Plan update started.
- 1994-2005 Small, incremental growth projects enacted gate additions, taxiway updates, terminal remodels.
- 2005 Alternative D passed - flawed Plan and flawed EIRs.
- 2005 Legal Challenge Settlement creates Specific Plan Amendment Committee for cooperation in development of new Master Plan.

Response:

LAWA disagrees with the commentor's characterization of events described in this comment. Nevertheless, the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-973

Comment:

1) HARMS WESTCHESTER/PLAYA DEL REY
The Three Pillars:
- No "Ring Road" or design that pushes traffic into community

- No Further damage to business district or additional homes
- No Western terminal with traffic access from west

- No new study of noise contours from moving runway North and making them longer

1) HARMS WESTCHESTER/PLAYA DEL REY

Settlement Broken: LAWA's proposal violates the settlement by going beyond the Alt. D worst case scenario - Requires new EIR!

consistent with previous local and federal approvals, identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 million annual passengers while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. The comments alleging generalized harm to Westchester and Playa del Rey are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-974

Comment:

1) HARMS WESTCHESTER/PLAYA DEL REY
RPZ tears out the heart of the Westchester Business District

Response:

The main point in this comment is similar to the concerns expressed in comment SPAS-PC00130-253; please refer to Response to Comment SPAS-PC00130-253.

SPAS-PC00130-975

Comment:

2) RUNWAY SEPARATION IS NOT NEEDED
a. Airport improvements can be made that are not airfield facility dominated

Reduce air traffic and time bunching-regionalize. (Added flights increases pollution and noise ensuring more health impacts for our area.)
More Complete Staffing of Tower. Controllers Union has called for more staff and less hours.
Runway Status Lights and other collision avoidance systems.
In-Cockpit Voice Warning System.
Better air traffic control system equipment.
Better taxiway and runway signage

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00096-5; please refer to Response to Comment SPAS-PC00096-5.

SPAS-PC00130-976

Comment:

2) RUNWAY SEPARATION IS NOT NEEDED
a. Runway "Incursions" Not Solved by Centerline Taxiway

Stats of other airports are presently worse than our North runway experience without changes.
An incursion is two aircraft or aircraft and another entity coming too close on ground.
Types of Incursions range from imminent danger "A" to minor infraction of rules with low likelihood of any collision "D."
LAX North runway accident in 1990s (or other examples raised by LAWA) were controller/pilot errors that would not have been averted by runway changes.

2007 Incidents Mischaracterized: Only prove that South Runways are NOT safer and do not support centerline taxiway on North

End Around Solution

Response:

The inclusion of a centerline taxiway will improve safety and minimize the risk of incursions on the north airfield complex. As described in Section 4.7.2 of the SPAS Draft EIR, there were studies done to address safety of the north airfield. All of those studies concluded, among other things, that, in conjunction with additional improvements, the addition of a centerfield parallel taxiway would reduce the risk of incursions on the north airfield complex.

Additionally, the current north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase aircraft delay. (Section 2.2 of the SPAS Draft EIR and Chapter 2 of the Preliminary LAX SPAS Report.) The SPAS alternatives, which seek to promote safety and efficiency through changes to the north airfield, are evaluated throughout the EIR. Specifically, the ability of the alternatives to improve efficiency and safety are discussed in Section 4.7.2 of the SPAS Draft EIR. Increased separation of the runways is also needed to comply with the standards in FAA Advisory Circular 15/5300-13A.

Regarding the number of incursions on the south airfield, Section 4.7.2.3 on pages 4-510 and 4-511 of the SPAS Draft EIR discusses how even though data indicates that the number of Category C incursions on the south airfield increased following completion of the South Airfield Improvement Project (SAIP) compared to prior years; the comparative change is the result of the definition change by the Federal Aviation Administration (FAA) and is not a reflection of actual events.

Additionally, please see Responses to Comments SPAS-PC00130-160 regarding the runway incursions on the south airfield.

SPAS-PC00130-977

Comment:

2) RUNWAY SEPARATION IS NOT NEEDED

b. Health and Safety Improvements other than Moving Runways North

Reduce air traffic and time bunching-regionalize. (Added flights increases pollution and noise ensuring more health impacts for our area.)
More Complete Staffing of Tower. Controllers Union has called for more staff and less hours.
Runway Status Lights and other collision avoidance systems.
In-Cockpit Voice Warning System.

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00096-5; please refer to Response to Comment SPAS-PC00096-5.

SPAS-PC00130-978

Comment:

LAWA Released 5 north runway "studies" at the end of last week

- Safety Risk Assessment (Washington Consulting)
- Special Peer Review
- Airline Pilots Assn comments
-Northfield Assessment (URS)
- LAX North Airfield Alternatives (Internat'l Aviation Mgmt Grp)

Do the Studies Answer the Basic Question of
Is the north complex safe? And if not, area
set of alternatives identified?

NO

Safety Assessments

- Assumptions and questions not all relevant to basic question.
- All push for "operational efficiency" and capacity enhancement rather than addressing if current conditions are unsafe.
- None address inadequate taxiways along terminals and all dismiss going south.
- Don't consider "End Around"
- All dismiss impacts on local community as irrelevant.
- Where is OUR NASA Study???

Response:

The comment was provided in an attachment to ARSAC's comments on the 2008 NOP. With the subsequent completion of the SPAS Draft EIR, seven independent assessments of north airfield safety were completed, are summarized in Section 4.7.2 of the SPAS Draft EIR, and are included in the appendices of the Preliminary LAX SPAS Report (see Appendices H-1 through H-7). Included within the subject studies is the North Airfield Safety Study (NASS) completed by NASA-Ames.

SPAS-PC00130-979

Comment:

"Safety Risk Assessment" - WCG, Inc.

- Found that the "The hazards and risks associated with the current LAX North Airfield configuration ...have been mitigated to an acceptable level of risk based on present day usage...
- Substantial portion of assessment is on south complex.
- Assumptions Section states "The proposed North Airfield Runway configuration specifically facilitates these concerns."

Safety Risk Assessment "Remote"

- Identified risks are deemed at worst "remote" with 8 of 10 extremely remote or extremely improbable.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-980

Comment:

"Special Peer Review"

- REVIEW DONE IN ONE DAY
- GIVEN ONLY ONE ALTERNATIVE TO CONSIDER!
- BIASED INDUSTRY GROUP

- Assumes safety, operational, and efficiency problems...that required significant redesign to solve...
- LAWA provided assumptions that includes larger operational loads and balancing requirement.
- Operational safety was only one of three major elements upon which to base conclusions.
- No mention of inadequate taxiway size or spacing

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-981

Comment:

ALPA Review

- "Expect virtually every B747-400 to be replaced with an A-380 [Group VI] ... in the next ten years." - NOT CREDIBLE
- "Severe operational penalties, restrictions, and human factors issues will occur if the south field is used for Group VI aircraft operations"
- "Because of South Side problems, Group VI aircraft must be accomplished on the North Side"
- "Human factors errors will likely increase"
- Suggests 623' increase separation for max efficiency did not discuss south separation.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-982

Comment:

"URS - North Airfield Assessment"
- Never states that existing cannot operate safely
- Expressly notes many airports including LAX are given waivers from FAA "standards"
- Never considers moving south due to cost of moving terminals

- Recommends largest possible movement for operational factors.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-983

Comment:

IAMG "North Airfield Alternatives"

- Never says that current airfield is unsafe
- Calls for wider spacing for operational efficiency
- Enhanced Technologies: ASDE-X airfield surface detection equipment as "part" of any solution.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-984

Comment:

Advantages of Moving South
- Efficiency in Operation
  - The Unified Plan minimizes the distances between connecting flights
  - New linear design of terminals 1, 2 and 3 eliminates the need for towing on the north side
  - Flexibility in gate design reduces idling while waiting for gates
  - Allows for extending and widening 24L to balance aircraft loads on runways

- Safety on the Airfield
  - Runways separated by additional 100 ft would allow for a desired centerline taxiway
  - Fixes the substandard taxiways on the North Airfield - this reduces controller activity and provides the controllers with a greater margin of error

- Modernized Facilities / Improved Customer Service
  - Consolidates TSA and FIS activities
  - Only the Unified Plan addresses the dilapidated terminals in the CTA
  - The Unified Plan minimizes the distances between connecting flights

Advantages of Moving South

- Accommodate the A380 and other NLAs
  - The Unified Plan proposes back-siding TBIT - this is a green light project that can be implemented today - allows quicker build-out of NLA gates
  - The Unified Plan never requires the use of remote gates to service NLAs
  - The Unified Plan reconfigures terminals 1, 2 and 3, which provides more flexibility in handling the NLAs

- Minimize Impacts to Community and Environment
  - Only the Unified Plan proposal moves the noise and pollution away from the community

- Does not destroy additional local businesses
- New linear design of terminals 1, 2 and 3 eliminates the need for towing on the north side, thereby reducing pollution
- Flexibility in gate design reduces idling while waiting for gates

Response:

Please see Response to Comment SPAS-PC00130-814 regarding LAWA's review of the ARSAC alternative concept. As described therein, the southward movement of Runway 6R/24L and associated replacement of the Terminals 1, 2, and 3 with a linear concourse would engender certain operational inefficiencies relative to an imbalance in the gating of large aircraft between the north concourses of the CTA and the south concourses, which, in turn would result in greater air quality impacts due to aircraft having to taxi farther distances. Also, as described therein, aircraft noise impacts related to the total number of homes newly exposed to 65 CNEL or to a 1.5 CNEL increase would generally be greater in moving Runway 6R/24L southward than in moving Runway 6L/24R northward, due to more intensely developed areas east of the airport being more impacted by aircraft noise associated with a southward movement of the runway.

Relative to airfield safety associated with moving Runway 6R/24L 100 feet southward, the safety and efficiency benefits of such a runway move would be the same as those of SPAS Alternative 7, as addressed in Section 4.7.2 of the SPAS Draft EIR.

While the commentor indicates that advantages associated with moving Runway 6R/24L southward also include never requiring the use of remote gates to service NLAs and does not destroy additional local businesses, it should be noted that SPAS Alternatives 1, 5, and 6, which move Runway 6L/24R northward, would do the same.

SPAS-PC00130-985

Comment:

3) LOAD BALANCING

Assumptions all include "Load Balancing" as a goal
El Segundo and LAWA want airport operations changed so that more of the very large aircraft traffic/noise is shifted from the South side of the airport to the North side of the airport.

On page 11 in LAWA's "Concept Development Goals" #3 is "Balance long-haul departing aircraft operations between North and South Airfield."

Load balancing in layman's terms means moving more take offs and landings - and in particular "Long Haul Heavy Aircraft Departures" - from the South Airfield, to the North Airfield. Despite the fact that on p.17 they point out that currently "existing North and South Airfields are generally in balance based on Total Operations" on p.18 they point out that 75%-80% of the Long Haul Heavy Aircraft Departures occur on the South runway complex. This is because the South runways are longer.

There is no safety need for "Load Balancing"

Response:

The content of this comment is similar to comment SPAS-AL00007-57; please refer to Response to Comment SPAS-AL00007-57. Specifically, please refer to the portion of Response to Comment SPAS-AL00007-57 that discusses how the operation of large aircraft (i.e., ADG V and VI) is expected to increase markedly by year 2025. (See Table 8 and Table 12 of Appendix F-1 of the Preliminary LAX SPAS Report.) Therefore, if the north airfield complex where not updated to handle such large aircraft, the number of large aircraft taxiing to the south complex will increase by the year 2025.

SPAS-PC00130-986

Comment:

Conclusion

- Modernize LAX - YES
- Improve Mass Transit!
- Reject Expansion/Building for own sake
- Perform proper reviews! Determine inexpensive LAX fixes that can be done and get on with it...
- If LAWA or FAA feels strongly about unsafe north runway conditions then CLOSE THE RUNWAYS IMMEDIATELY until changes are enacted or revert to a one runway configuration.

Response:

All of the SPAS alternatives reflect modernization of LAX, and with the exception of Alternative 4, all of the alternatives provide for improved airport access to mass transit. The alternatives do not expand LAX and the bases for seeking improvements to LAX are reflected by the project objectives presented in Section 2.2 of the SPAS Draft EIR. LAWA has completed very complete and comprehensive reviews of all the SPAS alternatives, as presented in the SPAS Draft EIR and the Preliminary LAX SPAS Report, including fiscal considerations. Neither the FAA or LAWA would allow the unsafe operation of runways at LAX; the objective of the proposed airfield improvements is to improve the safety and efficiency of the north airfield, as explained in Section 2.2 of the SPAS Draft EIR. Regarding the suggestion to revert to a one runway configuration in the north airfield, please see Response to Comment SPAS-PC00130-800.

SPAS-PC00130-987

Comment:

Runways Not Shown to be Unsafe

- North runway complex incursion rate history is superior to similar airport complexes that have already been "fixed."
- Neither LAWA nor the FAA can identify any north complex incursion that would have been averted by runway separation that could not be addressed by less expensive measures.

Response:

Section 4.7.2 of the Draft EIR addresses airfield safety issues associated with each of the SPAS alternatives that involve airfield improvements (i.e., Alternatives 1 through 7). Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

SPAS-PC00130-988

Comment:

Is North Runway Complex "safe?"

When the FAA felt that the south runway complex was unsafe they were vocal calling for changes. On the north side the FAA is unwilling to mandate changes, but says they will "evaluate any LAWA proposals presented."
NTSB and LAWA says "One incident is too many!" but no runway can be ABSOLUTELY SAFE; what is the incremental improvement of a runway movement cost over lower cost alternative improvements?
No Separation/taxiway improvement data has ever been presented.
FAA NASA Aames 2002-4 south runway simulation studies do not correlate to north side; no north simulations have been planned.
Many factors impact safety...i.e. North / South sides are both dual, parallel runways, but 80% of incidents occur on South!

5-6 "Peer" reviews were promised, but not delivered. None will be formal analysis, but will be full of "educated opinion."
Runway protection zone issue on north.

Response:

The comment was provided in an attachment to ARSAC's comments on the 2008 NOP. With the subsequent completion of the SPAS Draft EIR, seven independent assessments of north airfield safety were completed, are summarized in Section 4.7.2 of the SPAS Draft EIR, and are included in the appendices of the Preliminary LAX SPAS Report (see Appendices H-1 through H-7). Section 4.7.2 also addresses RPZ issues associated with the north airfield.

SPAS-PC00130-989

Comment:

Released LAX Specific Plan Amendment Draft Environmental Impact Report (DEIR) is an Affront to Angelinos' Common Sense*

The DEIR and Specific Plan Amendment Report released today cost millions to prepare but fails to fix the most basic airport services that visitors to the City of Los Angeles and region deserve. The LAX state of disrepair is embarrassing and must be fixed NOW.

ARSAC President Denny Schneider stated, "Our crumbling LAX needs more than a makeover of fresh paint. The LAX Plan will be neither convenient nor safer yet will cost billions to implement. LAWA ignored solutions to the poor tourist and traveler service."

Mr. Schneider continued, "LAWA has lost its fiscal sanity. They capitulated to special business interests by including costly, unnecessary, runway construction instead of critically needed landside infrastructure changes and repairs. Their cost estimates are as big a joke as the ones in 2004 when they approved a plan cost that has grown from $12 Billion to well over $100 Billion. "

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS alternatives include a number of new and modified facilities at LAX, including airfield, terminal, and ground access improvements. These improvements are substantially more than a "makeover of fresh paint." Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. With the exception of Alternative 4, all of the SPAS alternatives provide for improvements to terminals and ground access infrastructure, as well as changes to the north airfield. The commentor provides no evidence for the claim that costs associated with the approved LAX Master Plan have grown to over $100 billion.

Also, please note that the comment presents personal opinions about the SPAS alternatives that are not supported by facts or evidence.

SPAS-PC00130-990

Comment:

Read FAST. Only five years behind in their draft release schedule, LAWA is allowing the public 75 days to fully assess and vet the approximately 6000 pages of documents.

Please see our attachment for additional details.

ARSAC is a grass roots organization formed in 1995. ARSAC's mission is to establish a powerful, unified voice of elected officials and business and community leaders promoting a regional solution to the future commercial aviation demands of the entire Southern California region.

Response:

This comment is noted. Regarding the release date of the SPAS Draft EIR, LAWA determined, in consultation with the SPAS Advisory Committee, that it would wait until the LAX North Airfield Safety Study (NASS) was complete prior to finalizing the SPAS alternatives and completing the SPAS Draft EIR. The NASS was released in February 2010, with a Final Report in May 2010. Following completion of the NASS, LAWA released a Revised NOP for the SPAS Draft EIR in October 2010 and commenced preparation of the SPAS Draft EIR.

Please see Response to Comment SPAS-AL00007-59 regarding the length of the public comment period for the SPAS Draft EIR. Please see Responses to Comments SPAS-PC00130-992 through SPAS-PC00130-1014 for responses to comments raised in the attachment referred to in this comment.

SPAS-PC00130-991

Comment:

*The release date of this News Release is one day ahead of the DEIR based on our knowledge of LAWA intent to release their documents on Friday, July 27. We expect that LAWA will have released preliminary information copies to you. We have not seen the draft EIR nor been briefed on project details or the assumptions used to analyze alternatives. These comments are based upon what we have been told and promised by LAWA prior to the release.

Response:

The comment that the press release was published one day prior to the release of the SPAS Draft EIR is noted. The SPAS Draft EIR was released on July 27, 2012. Electronic copies of the SPAS Drat EIR were available to the public at www.laxspas.org on that date. Electronic and hard copies of the SPAS Draft EIR and Preliminary LAX SPAS Report were also provided directly to ARSAC on this release date. LAWA met with the Advisory Committee on June 28, 2012, approximately one month prior to release of the SPAS Draft EIR. ARSAC was in attendance at this meeting. At the meeting, LAWA outlined the methodologies and key assumptions used in the SPAS Draft EIR, presented the preliminary analytical results, and reviewed the plans for public outreach related to the release of the SPAS Draft EIR. Project details pertaining to the nine SPAS alternatives evaluated in the SPAS Draft EIR were presented to ARSAC at an Advisory Committee meeting held on March 12, 2012. Power Point presentations from both the June 28, 2012 and the March 12, 2012 Advisory Committee meetings are provided in Appendix D-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-992

Comment:

ARSAC Alliance for a Regional Solution to Airport Congestion
Attachment to July 26 New Release

1. LAX NEEDS REPAIRS FAR MORE THAN IT NEEDS EXPANSION NORTH. NO EXPANSION SHOULD EVEN BE CONSIDERED BEFORE BASIC IMPROVEMENTS TO PASSENGER BOARDING AND CARGO HANDLING ALONG WITH TRAFFIC AND ACCESS IS FULLY ACCOMPLISHED .

Every issue comes down to priorities and money. There will never be enough to do everything that LAWA wants to do. The Tom Bradley Terminal Improvements is one of the biggest LA projects ever done, yet is only a drop in the proverbial bucket in terms of what is really needed to fix and modernize LAX. Runways are not the capacity constraint and safety is already high.

There are ways to facilitate further improvements at more reasonable expense, not by proposing runway movements.

LAX WORK MUST BE DELAYED NO LONGER. CTA and infrastructure projects provide twice the number of construction jobs as runway projects and eight times more economic impact for the local economy. THEY MUST TAKE PRIORITY.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements and Response to Comment SPAS-PC00130-168 regarding runway safety. Also, please note that cost estimates and employment impacts are purely economic impacts not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PC00130-993

Comment:

There is no safety problem on the north. Destruction of a business corridor and impacting more residents is unjustified. Few incursions, historically, even occur on the north. Only during construction of the South Airfield Improvement Project (SAIP) in 2008, when most air traffic was redirected to the north airfield complex, did the number of incursions increase. When runway safety was raised as an issue, LAWA commissioned a multimillion dollar Northside Safety Review. LAWA selected a panel of top academic experts and funded NASA simulations. The experts concluded that runway safety is not a justification for spending billions of dollars.

Response:

Please refer to Response to Comment SPAS-PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel.

SPAS-PC00130-994

Comment:

Sound mitigation and other actions were taken in the past to reduce airport impacts. Hundreds of thousands of people along the flight path would be affected by runway movements, not only those adjacent to LAX. Even those not "impacted" by legal terms will be subjected to sleepless nights and pollution by any changes.

Response:

Please see Response to Comment SPAS-PC00008-1 regarding existing programs to address high levels of aircraft noise.

A discussion of project impacts resulting from aircraft noise under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR, including discussion of sleep disturbance. The commentor is also referred to Section 4.2 of the SPAS Draft EIR for discussion of air quality impacts.

SPAS-PC00130-995

Comment:

Expansion proponents used incursion experience as their basis to call for increasing runway spacing and a center line taxiway to accommodate the newer, larger aircraft. The small number of newer, larger aircraft (projected to be 12-14 per day within the next seven years) is but a small fraction of far less than one percent of the total daily aircraft operations. This is poor justification to spend billions of dollars when these aircraft are already being handled safely.

Response:

As indicated in Table 12 in Appendix F-1 of the LAX Preliminary LAX SPAS Report, the number of ADG VI (i.e., New Large Aircraft such as the Airbus A380) operations is projected to increase to 39 per day by 2025. Accommodating ADG VI aircraft in a safe and efficient manner is only one of several reasons why LAWA is considering improvements to the north airfield. Please see Response to Comment SPAS-PC00130-328 for a review of several other reasons, as presented in Section 2.2 of the SPAS Draft EIR. Also, please see Section 4.7.2.3 of the SPAS Draft EIR for a discussion of previous north airfield safety studies and the safety improvements precipitated by the inclusion of a centerfield taxiway.

SPAS-PC00130-996

Comment:

Runway safety can always be better even if already "extremely safe." ARSAC has been calling for implementation of economically justifiable safety improvements for LAX. We were the driving force encouraging Mayor Villaraigosa to implement the decades long "FAA experiment" conducted at other airports to include runway status lights (RSL) at LAX. RSL are traffic signals at runway/taxiway intersections to alert pilots of impending danger. The initial RSL installation three years ago did not include all critical intersections. We look forward to the promised completion this year of the system to cover all intersections.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-997

Comment:

Many billion dollars of capital projects are necessary for maintenance and improvements to the landside, passenger experience at LAX.

The action/project priorities listed below will cost billions of dollars to accomplish and must precede any runway movements. Each enhances LAX safety, efficiency and/or passenger service:

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-998

Comment:

- Visibility from the tower is critical to safety. Non-visible areas remain a serious issue. The 1991 north runway air disaster occurred at a blind runway intersection when one controller gave take off instructions to a small aircraft at a midfield runway intersection while a second controller authorized a larger aircraft to land on that same runway at the same time. Increased runway separation has no impact on this kind of incident. The disaster was addressed by building the existing tower to replace the old tower (which is now the administration building) so that the full runway became visible. New Tom Bradley International Terminal construction and other new projects have created new "non-visibility" locations on the airfield. A new tower is in order but it is not even on LAWA's list. SFO is adding a new tower to support FAA NextGen satellite based control and better ground aircraft tracking. LAWA is silent on this issue.

Response:

Please see Responses to Comments SPAS-PC00130-362 and SPAS-PC00130-577 regarding ATCT line-of-sight.

SPAS-PC00130-999

Comment:

- The upper roadway in the CTA is a cantilevered bridge, built for the 1984 Olympics. It is defective and a safety risk. CalTrans inspectors have repeatedly reported since 2003 to LAWA that the expansion joints are failured and issues of creeping rust have existed for the last decade. This should have been already addressed, but is finally gaining LAWA attention.
- The passenger bridges from the parking lots to the terminals have severe rust and are in need of structural reconstruction. The parking lots also have signs of water seepage that needs resolution.

Response:

This comment addresses alleged issues with existing conditions and does not comment on the analysis provided in the SPAS Draft EIR. The upper-level roadway within the CTA has operated safely since its construction almost 30 years ago and is regularly inspected to maintain appropriate safety levels. The commentor provides no evidence or documentation to support the claim that "it is defective and a safety risk." The commentor also provides no evidence or documentation that the passenger bridges from the parking lots to the terminals have severe rust and are in need of structural reconstruction.

Caltrans' staff from the Structure Maintenance & Investigations section inspect the CTA upper level roadway and bridges every two years. Caltrans presented reports to LAWA on May 7, 2008 and on June 7, 2010 describing the conditions of the upper level roadway and bridges in the CTA, along with recommendations to improve these facilities. Using the Caltrans' recommendations presented in these reports, LAWA staff developed the "Request For Proposals for Design Services for the Second Level Roadway Joint and Deck Repairs at Los Angeles International Airport," which was released on April 28, 2011. Through this procurement process, a consultant team was chosen to design improvements to the expansion joints, bearing pads and wearing surface of the upper level roadway. As of this writing, 100% project design plans for this non-SPAS project were under review by LAWA staff. Construction is scheduled to begin in 2013. This planned improvement project within the CTA is included in the SPAS Draft EIR cumulative impacts analysis, as specifically identified on page 5-21 of the SPAS Draft EIR, although it is now proposed to begin in 2013 instead of 2014.

In addition to the project referenced above, LAWA's ongoing maintenance program provides inspection, assessment, and repair, if/as appropriate, of facilities throughout LAX including, but not limited to, roadway expansion joints, passenger bridges from parking lots to terminals, and parking lots.

It should be noted, however, that is not known what the commentor is referring to as "creeping rust" and, contrary to the commentor's statement, there is no such issue identified in the aforementioned Caltrans inspection reports.

SPAS-PC00130-1000

Comment:

- Terminal restrooms are frequently flooding from numerous plumbing problems.
- Terminal roofs should not be leaking after a rain storm.
- Passenger gate bridges to access aircraft have collapsed while passengers were boarding.
- The parking structures also need to be rebuilt to eliminate water issues and improve access.

Response:

This comment addresses alleged issues with existing conditions and does not comment on the analysis provided in the SPAS Draft EIR. Therefore, no further response is required. However, the commentor is incorrect in, and provides no evidence for, the claim that "Terminal restrooms are frequently flooding from numerous plumbing problems."

LAWA agrees that terminal roofs should not be leaking after a rain storm, and seeks to repair such leaks when and where they occur.

There has been one incident where a passenger boarding bridge at LAX failed while passengers were boarding; specifically, two passengers were injured on August 25, 2011 when the boarding bridge flooring on a piece of equipment maintained by an airline collapsed. LAWA is implementing a $22 million passenger boarding bridge replacement program at LAX to address any outstanding issues relating to LAWA-managed boarding bridges.

There are no "water issues" or access issues that warrant the rebuilding of the parking structures at LAX, nor has the commentor provided any substantial evidence to support the assertion that water issues exist.

SPAS-PC00130-1001

Comment:

- The 2004 RAND Study and subsequent security consultants recommended blast glass for terminal windows, but LAWA has failed to install them.

Response:

Please see Response to Comment SPAS-PC00130-424 regarding blast-resistant glass.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1002

Comment:

- Improve the staffing of the control tower with additional, highly experienced controllers.
- Three years ago LAWA suggested changing north complex taxiway configurations to improve runway safety. ARSAC went further and suggested numerous other field taxiway improvements. All these should be done immediately to improve ground efficiency and safety.
- Implement better field signage and marking, pilot training, and ground radar improvements to improve safety.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1003

Comment:

- Rescheduling flights to other than peak hours is another safety improvement endorsed by ARSAC. Safe spacing between aircraft has become difficult to maintain during peak hours as the number of operations per hour increases. This change would reduce overcrowding of the skies over adjacent airport communities and lower the risks of air collisions.

Response:

Regarding the "rescheduling of flights to other than peak hours," LAWA has no control over airline flight schedules. The scheduling of flights depends upon many considerations outside of LAWA's control, such as airline scheduling practices, hubbing practices, airline network capacity, etc.

The suggestion that during peak hours spacing between aircraft is reduced is not an accurate statement. Air traffic controllers abide by airspace procedures and provide the proper spacing between all flights. During peak time, spacing between aircraft on approach or departing does not change. Delays on the ground for departure and in the air for arrival might occur at peak time, but safe spacing between aircraft is maintained regardless.

It is unclear to which "change" the commentor is referring when writing "This change would reduce overcrowding of the skies (…)". If the commentor is referring to "rescheduling of flights", although rescheduling flight to and from LAX might alleviate congestion, LAWA has no control over flight scheduling as discussed above.

SPAS-PC00130-1004

Comment:

- LAWA is taking good designs and, in an effort to reduce construction costs, "scaling back" or eliminating critical design project elements. In the Central Utilities Plant, for instance, the design initially called for easy access trenches for wiring and pipe guide ways. They were never built in an effort to reduce current costs and to meet the construction time schedules. When a problem occurs full lengths of pipes or wires must be unearthed to discover where the problem has occurred before repairs are made. This should be readdressed and done before moving runways.

Response:

This comment pertains to the Central Utility Plant Replacement Project (CUP-RP) and is not related to SPAS or the SPAS Draft EIR. The preliminary design for the CUP-RP carried both a Utilidor as a component of the originally proposed project and a Direct Burial Alternative, with the advantages and disadvantages of each described in the CUP-RP Final EIR. As noted on page 2-30 of that document, while the Utilidor would have incurred less long-term maintenance cost due to the ease of accessing utility lines within a concrete tunnel, compared to the Direct Burial Alternative, the Utilidor would have had substantially higher overall costs and greater construction impacts due to more extensive excavation. LAWA identified the Direct Burial Alternative as the environmentally superior alternative and this construction technique was included in the project that was approved by BOAC. Although long-term maintenance costs will be greater with the Direct Burial Alternative, it will still substantially reduce current maintenance costs and will also minimize long-term maintenance costs through the incorporation of design technologies. With the installation of the these technologies, the maintenance costs associated with the Direct Burial Alternative will be considerably reduced compared to a more standard installation and, overall, the Direct Burial Alternative will be far less costly than the Utilidor would have been.

Contrary to the commentor's indication that "full lengths of pipes or wiring must be unearthed to discover where the problem has occurred before repairs are made," there a numerous means for identifying the location of pipeline problems, such as ground-penetrating radar and fiber optic camera systems. Moreover, with the installation of new piping, problems, if any, will typically be limited to joint areas, which are being precisely mapped during installation.

SPAS-PC00130-1005

Comment:

- Traffic accessibility into and around the airport is currently at level F during major parts of the day. The current 62 Million of Annual Passengers (MAP) is nowhere near the already approved 78.9 MAP or the much greater MAP levels desired by LAWA. Major changes in traffic access must be made before moving any runway.

Response:

As indicated in Table 4.12.2-11 in the SPAS Draft EIR, only 11 of the 200 intersections that were evaluated around the airport operated at LOS F during either the morning (AM) peak commute hour, the mid-day airport peak hour, or the afternoon (PM) peak commute hour for baseline conditions. Those intersections are as follows:

- Overland Avenue & Culver Boulevard in Culver City (AM Peak Hour)
- Hawthorne Boulevard & El Segundo Boulevard in Hawthorne (PM Peak Hour)
- Inglewood Avenue & Imperial Highway in Hawthorne (PM Peak Hour)
- Sepulveda Boulevard & Imperial Highway in El Segundo and City of Los Angeles (PM Peak Hour)
- La Brea Avenue/Overhill Drive & Stocker Street in Los Angeles County (PM Peak Hour)
- La Cienega Boulevard & Stocker Street in Los Angeles County (AM and PM Peak Hours)
- Sepulveda Boulevard & Rosecrans Avenue in El Segundo/Manhattan Beach (PM Peak Hour)
- Walgrove Avenue & Washington Boulevard in Culver City (PM Peak Hour)
- Sepulveda Boulevard & Manhattan Beach Boulevard in Manhattan Beach (PM Peak Hour)
- La Cienega Boulevard & Jefferson Boulevard in City of Los Angeles (PM Peak Hour)
- Aviation Boulevard & Artesia Boulevard in Redondo Beach/Manhattan Beach (AM and PM Peak Hours)

Within the CTA, according to Tables 4.12.1-10 and 4.12.1-12, all intersections operate at LOS B or better and all roadway links operate better than LOS F with the exception of the Terminal 2 outer curb, west of the exit to the inner curb, TBIT outer curb, south of the entrance from the inner curb, and Terminal 4 outer curb, after the entrance from the inner curb.

The commentor provides no support for the statement that LAWA desires a MAP level higher than 78.9 MAP. The SPAS is intended to identify modifications and improvements to LAX that are designed for a practical capacity of 78.9 MAP and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA. (Section 1.1.2 of the SPAS Draft EIR.)

The SPAS is designed to, among other things, improve the ground access system at LAX to better accommodate airport-related traffic. (Section 2.2 of the SPAS Draft EIR.) A specific listing of the project objectives, as they relate to traffic improvements, is provided in Section 2.2 of the SPAS Draft EIR. Please see Section 2.3.1 of the SPAS Draft EIR for a discussion of the specific ground transportation modifications and improvements proposed under each alternative. These improvements include, among other things, dedicated busways and automated people movers.

The traffic analyses for on-airport and off-airport transportation systems presented in Sections 4.12.1 and 4.12.2, respectively, of the SPAS Draft EIR address future (2025) traffic conditions at 78.9 MAP. As described in Section 4.12.1, significant impacts to on-airport intersections and roadways in 2025 would be limited to one intersection and between one and five roadway links, depending on alternative. Relative to off-airport traffic impacts in 2025, as indicated in Section 4.12.2, as amended by corrections and additions to the SPAS Draft EIR identified in Chapter 5 of this Part of the Final EIR, between 37 and 42 of the 200 intersections analyzed would have unavoidable significant impacts.

SPAS-PC00130-1006

Comment:

- Getting mass transit into LAX remains a mystery to LAWA. Their prime solution is a bus! Adding more busses to the already congested horse shoe Central Terminal Area will make it nearly impossible to get close to the terminal curbs.

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Please see Response to Comment SPAS-PC00130-139 for a discussion of future mode splits and how they are affected by the proposed alternatives.

SPAS-PC00130-1007

Comment:

- The 2004 approved consolidated rental car facility for which LAWA has collected fees from every vehicle rental contract since 2008 remains unplanned. LAWA is now opposing construction indefinitely leaving tourists and business visitors to experience the current extreme delays and confusion.

Response:

Please see Response to Comment SPAS-PC00130-443. As discussed in that response, LAWA has continued to consider and analyze the inclusion of a CONRAC at LAX. The SPAS alternatives are designed to improve the ground access facilities at LAX, through the inclusion of various improvements. (Section 2.2 of the SPAS Draft EIR.) The SPAS process, including the formulation of concept options for overall ground transportation system improvements, provided the basis for further evaluation of the need for, and the location of, a CONRAC at LAX.

SPAS-PC00130-1008

Comment:

- The difficulty getting to connecting flights from terminal to terminal with luggage, wheel chairs, strollers, or children continues to remain unresolved by LAWA Plans.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code 21091(d); State CEQA Guidelines Section 15204(a)).

Potential issues related to connecting between terminals, with luggage, wheelchairs, strollers and children are issues that ongoing improvement projects at LAX take into consideration. These are potential issues that LAWA strives to solve. These are not issues that would be created as a result of the SPAS alternatives, and the SPAS Draft EIR is not required to provide solutions to these specific potential issues. However, as described in Section 1.2.1 of the SPAS Draft EIR, one of the objectives of the SPAS project is to improvement ground access inside the Central Terminal Area (CTA) and among terminals. Such improvements, described on pages 1-11 and 1-12, would contribute to solving some of the potential connection issues among terminals.

Additionally, all SPAS-related construction projects that affect normal operation of ground transportation would be required to submit a Construction Traffic Management Plan (CTMP) under LAX Master Plan Commitment ST-18. The CTMP could include measures such as pedestrian re-routing to avoid or reduce construction-related impacts to the on-airport transportation system. (See Section 4.12.1.9.4.1 of the SPAS Draft EIR.)

SPAS-PC00130-1009

Comment:

- Security check in and baggage handling must also be improved before runway movements are considered.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Security is not an environmental impact and, therefore, is not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a Security Assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. Summaries of the findings of the Security Assessment relative to each alternative are provided in Section 6.3 of the Preliminary LAX SPAS Report. Please see Response to Comment SPAS-PC00130-75 regarding the incorporation of security measures into the design of the SPAS alternatives. Please see Responses to Comments SPAS-PC00130-424 and SPAS-PC00130-152 regarding the implementation of security issues recommended by the RAND Corporation.

SPAS-PC00130-1010

Comment:

The LAWA alternatives prioritize international (25%) passenger experience over the domestic (75%) passengers. Improvements for all passengers must be addressed.

Response:

The commentor suggests that "the LAWA alternatives prioritize international (25%) passenger experience over the domestic (75%) passengers," without providing specific references to the SPAS Draft EIR to support this statement.

Contrary to the commentor's suggestion, the SPAS improvements analyzed throughout the SPAS Draft EIR would benefit not only all LAX passengers regardless of origin or destination, but also visitors, employees, and vendors that use and access LAX facilities every day.

As discussed in Section 1.2.1 of the SPAS Draft EIR, these improvements include improvements to:
- LAX terminals and concourses with new facilities being planned and existing facilities being improved (such as the Midfield Satellite Concourse, Terminal 0, and Terminal 3) which all would accommodate both domestic and international passengers;
- Ground access system within the Central Terminal Area (CTA) serving all terminals;
- Safety of the north airfield aircraft operations which would benefit all passengers regardless of origin or destination transported on aircraft assigned to the north airfield;
- Safety and security at LAX which would apply to all passengers, regardless of origin or destination.

SPAS-PC00130-1011

Comment:

2. LAWA MUST SUPPORT ALL OF ITS AIRPORTS TO ENSURE FUTURE REGIONAL CAPACITY INSTEAD OF PUSHING TRAVELLERS TO LAX.

LAWA understood regionalization in the past. In the 1988 LAX Master Plan EIR LAWA highlighted reasons for procuring Palmdale and Ontario airports. They knew LAX could never meet total future regional demand and that a backup set of airports was necessary. LAX percentages of the total regional MAP continues to increase. LAWA has not even prepared a valid master plan for either Ontario airport or Palmdale airport. Ontario has become an underutilized, abused step child of LAWA with emptied terminals, while Palmdale airport has zero commercial flights. LAWA demonstrated its Palmdale commitment by returning its operating license to the federal government.

"Regionalization" no longer exists. LAX now handles over 75% of all air commerce and traffic in the Southern California region. The FAA has projected up to a million operations at LAX by 2030 with virtually no growth of any other Southern California airport.

LAWA is withholding marketing and other support from their other operated airports to further a claim that further LAX expansion is needed. We expect that regionalization is not included in the DEIR as a way to improve traffic and other current LAX passenger bottlenecks.

LAWA is severely delinquent in meeting their "regionalization" responsibilities restated in the 2006 Stipulated Settlement. LAX is located in an area where the 405 freeway is gridlocked daily.

Ontario wants local control, but LAWA continues to resist. ARSAC supports local control because LAWA has done so little in support of ONT and regionalization. The Ontario proponents who want local control have estimated that 1.6 million vehicles are unnecessarily being forced into the 405 freeway gridlock because flights are unavailable in Ontario. This will only get worse as time goes on if corrective action is not taken. This hurts all Angelenos by making movements along the freeways much longer-a direct cost to all businesses relying on goods movement or employees who must visit other facilities.

In the year 2000 LAX handled 67.3 MAP and ONT 6.7 MAP for a total of 74 MAP. In 2011 with less total air traffic of 66.4 MAP, LAX handled a greater percentage (61.9 vs 4.5 MAP) of total traffic at the

expense of ONT. LAWA recently changed their marketing contract with LA Inc. to exclude ONT. This year passenger traffic is projected to be even more greatly concentrated at LAX.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. The commentor provides no facts or evidence to support the claim that an estimated "1.6 million vehicles are unnecessarily being forced into the 405 freeway gridlock because flights are unavailable in Ontario. This will only get worse as time goes on if corrective action is not taken."

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses the status of LAWA's management initiatives and marketing efforts for the LA/Ontario International Airport.

SPAS-PC00130-1012

Comment:

3. LAWA IS EXERCISING FISCAL INSANITY BY PRIORITIZING EXPENDING $BILLIONS TO EXPAND RUNWAYS WITH LITTLE BENEFIT LEAVING INSUFFICIENT FUNDS TO REPAIR, MODERNIZE, AND MAINTAIN CRITICAL LAX FACILITIES.

Air gridlock occurred in 2001 when LAX handled 800,000 operations in the year. In 2011 there was about 600,000 operations. Increased runway separation will be of little benefit for a very long time. The Northside Safety Study estimated only nominal improvements. The costs and risks of moving runways north is unjustified. This effort can become Los Angeles' equivalent of the Boston "Big Dig" because risks of construction have been understated by LAWA to make them look more palatable.

We have heard that the estimated costs for the 2004 LAX Master Plan Alternative D have projected increases of ten fold since approval. We suspect equivalent optimism has permiated LAWA's cost estimates for the current alternatives.

Runway expansion is greatly complicated by LAX proximity to developments and the major infrastructure going under the airport. Moving the runways will be outrageously expensive:

- Runway movement north will necessitate redesigning Lincoln Boulevard to below grade (into a tunnel) and fully revising the intersection at Sepulveda Boulevard. This impacts major traffic flow as it is one of the few north-south corridors to supplement the gridlocked 405 freeway.
- Runway movement north will necessitate mitigating unstable substrata surrounding the decommissioned six-lane, 740' long, "Manchester Tunnel" built in the 1960s. The original CalTrans plan was to build a north-south freeway corridor tunnel entirely under LAX to link Westchester with El Segundo and the South Bay. The tunnel project, however, had to be abandoned because it was destabilizing the one north runway. Sink holes were problematic. The remainder of the decommissioned tunnel extends under the current north runway, 24R, from Lincoln Boulevard to 50' of the interior north runway, 24L. Any runway movement north will require reevaluation and mitigation of an unknown water source which caused flooding and subsequent abandonment of the tunnel project. We do know that construction of the tunnel required an artesian well to reduce the water table level. When LAWA inspected the tunnel about two years ago standing water was inside despite six years of drought. Construction can cause water movements and cause destabilization in new, surrounding areas. LAWA has refused to reenter the tunnel subsequent to the high rain seasons. The unknown water source must be found and re-evaluated to determine if it can be redirected and/or if this presents a new fresh water source for LA City. Once opened for construction, the tunnel will be destabilized. This would possibly necessitate closure of both north runways until mitigations are completed over an indeterminate time period.
- Currently beneath the north runways are three major sewer lines connecting the entire City and Valley Regions to the Hyperion Sewage Treatment Plant just southwest of LAX. One of these sewers is located near the intersection where Lincoln and Sepulveda are to reconnected. The LAWA proposed below grade roadway will necessitate moving this sewer at a major cost.

- Additional underground utilities and crude oil pipes linking active oil fields to refineries in El Segundo may require movement as well.
- Any runway movement north will cause major demise of the commercial corridor north of LAX eliminating hundreds of businesses and thousands of jobs when the economy is already fragile. The previous business destruction required more than twenty years of revitalization efforts. This will deprive Los Angeles of much needed tax revenue.

Response:

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) The comment pertaining to gridlock at the airport is not supported by facts or evidence. As indicated in Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR, improvements to the north airfield would result in enhancements to safety and efficiency. Please also see Response to Comment SPAS-PC00149-2 for a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. The commentor provides no substantiation for the claim that costs associated with the approved LAX Master Plan have increased by tenfold since approval. The comments pertaining to the cost estimates for the other SPAS alternatives are similarly not supported by facts or evidence. The estimated costs to complete the remaining projects associated with the approved LAX Master Plan (i.e., Alternative 3), as well as the estimated costs associated with the other SPAS alternatives, are presented in Chapter 8 of the Preliminary LAX SPAS Report, with details provided in Appendix G.

Please see Topical Response TR-SPAS-LR-1 regarding the realignment of Lincoln Boulevard. As indicated in the topical response, realignment of Lincoln Boulevard would not require substantial alterations to the intersection of Lincoln and Sepulveda Boulevards, although a minor modification to the right turn movement from southbound Sepulveda Boulevard to westbound Lincoln Boulevard may be required.

The north airfield abandoned tunnel segment (referred to by the commentor as the Manchester Tunnel, and sometimes referred to as the Lincoln Tunnel) is not, nor has it ever been, an actual tunnel. Rather, in 1969 or 1970, a concrete structure was placed beneath the runway to allow for implementation of a future tunnel that would extend Lincoln Boulevard beneath the north airfield. The northerly limits of the tunnel begin approximately 280 feet north of the northern edge of Runway 6L/24R, at the service road that lies to the north of Runway 6L/24R and south of the Argo Drainage Channel. The segment runs perpendicular to the runway and extends south to a point approximately 270 feet north of the northern edge of Runway 6R/24L. The tunnel is approximately 722 feet in length. The tunnel consists of two separate tubes, each approximately 49 feet wide and with an interior height of 29 feet. The roof of the tunnel is not integrated into the airfield pavement above but, rather, rests approximately 15 feet below grade. The tunnel is concrete lined on its sides and top; the floor of the tunnel is dirt. The tunnel is not vented.

In 2010, LAWA entered the tunnel to perform an evaluation. Water was found at the base of the steel supports in the tunnel segment. The floor of one of the tunnels was found to be dry; the floor of the second tunnel had some muddy soil. Given the humidity of the tunnel, the source of the water may be condensation, as the natural moisture in the soil has no means to exit the sealed, unventilated space. Alternately, the source of water could be subsurface intrusion from beneath the tunnel or dripping from the ceiling from a drainage issue above the tunnel. There were no signs of erosion that would be associated with flowing water. In a boring drilled when the tunnel segment was installed, the depth to groundwater was 59 feet. No evidence was found of any contamination or any hazardous materials in the tunnel segment during the investigation.

The inspection conducted in 2010 found the tunnel to be in good condition. The tunnel is stable and presents no short- or long-term hazards to the airfield. At no time has the tunnel been found to be destabilizing the runway and no distress has been observed to date. Moreover, it is incorrect to say that the tunnel was abandoned due to problems with flooding or stability or for any other reason. As stated above, the structure is not an actual tunnel but, rather, was constructed in anticipation of a future underground roadway extension which never occurred. There have never been any sink holes associated with the north airfield tunnel segment. (See Response to Comment SPAS-PC00130-51

regarding sink holes at LAX.) There is no reason for further inspection of the tunnel segment; LAWA has not refused to re-enter the tunnel, as stated by the commentor. Detailed engineering design has not yet been completed for the north airfield improvements. Therefore, no engineering details have been developed concerning the tunnel segment and whether or not it would require any modification with implementation of the SPAS alternatives.

Similarly, it has not been determined if work on the tunnel segment, if required, would necessitate any runway closures. Further engineering analysis would be performed in the subsequent phase to evaluate the adequacy of the existing tunnel to handle the aircraft loading. If it is determined during engineering design that segments of the tunnel do not have sufficient structural strength to withstand the weight of a fully-loaded aircraft, measures would be taken to strengthen the tunnel or the soils for additional support. One such measure would involve reinforcing the overlying soils above the box culvert with a ground improvement method to provide additional support for the aircraft loading. If it were determined that the tunnel segment was required to be filled, it would be filled with engineered material, not with sand. With the use of engineered fill, and the presence of the concrete-lined top and walls, the tunnel segment would not have the potential to create a sink hole.

The comment that "construction of the tunnel required an artesian well to reduce the water table level" is an erroneous statement. An artesian well is defined as a confined aquifer containing groundwater under positive pressure, which causes the water level in a well to rise and, in some cases, flow to the surface naturally. An artesian well is not constructed in order to reduce the water table. Moreover, as noted above, borings taken prior to construction of the tunnel segment showed that the water table was 59 feet below the surface, much deeper than the depth of construction of the tunnel segment, and recent investigations showed no evidence of shallow groundwater beneath the tunnel.

Please see Response to Comment SPAS-PC00130-348 regarding the relationship between sewer lines and the north airfield improvements. As indicated in that response, none of the outfall sewers that lie beneath LAX would be affected by the SPAS alternatives. Please see Topical Response TR-SPAS-LR-1 regarding oil pipelines in the vicinity of LAX.

As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. Therefore, there would be no impacts to tax revenues associated with dislocated businesses within Westchester. Moreover, "[e]conomic or social effects of a project shall not be treated as significant effects on the environment." (State CEQA Guidelines Section 15131.)

SPAS-PC00130-1013

Comment:

Finally, ARSAC has raised numerous issues over the past six years and in our Notice of Preparation comments. LAWA has conducted numerous outreach meetings, but has generally failed to act or cure any of the issues raised.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-730 through SPAS-PC00130-969, which address each separate comment provided in ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR. The comments in both NOP comment letters were fully considered during preparation of the SPAS Draft EIR. Responses to all of the comments raised by ARSAC in its comment package on the SPAS Draft EIR are provided in Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-1051.

SPAS-PC00130-1014

Comment:

Aside from the destruction of a viable business corridor which pays taxes to the City. The number one LAWA failure is to address gridlocked airport access and needed Central Terminal improvements which could jeopardize tourism. Airport construction costs are financed by LAWA and ultimate the airlines and travelers, but money for infrastructure projects such as expanded roadways around LAX which are not

exclusively used by LAX traffic, must come from the City general fund. General fund money consumed reduces projects throughout the rest of LA and the region. Similarly, some CalTrans, LADWP, LA Sanitation and other required work will not be covered by LAWA and be cause for rate increases and more "fees."

Response:

It is not clear what viable business corridor is being referenced by the commentor. Please see Response to Comment SPAS-PC00130-931 regarding acquisition associated with the SPAS alternatives. Although some businesses along 98th Street would be acquired under the SPAS alternatives, as well as some businesses along the Aviation Boulevard corridor under Alternative 3, no acquisition is proposed within the Westchester Business District.

Regarding the comment that LAWA should address gridlocked airport access, existing on or near airport gridlock is not a significant environmental impact that would be caused by any of the SPAS alternatives. The SPAS alternatives include a number of ground access facilities to address traffic in and around the airport, including a redesigned entry road, new curbside in front of a new Terminal 0, the ITF, additional parking outside the CTA, connectivity with the future Metro transit station, a dedicated transportation corridor from the parking facilities and ITF to the CTA and, in some alternatives, a CONRAC. Improvements within the CTA were addressed in the LAX Master Plan and include a new passenger processor associated with the future MSC and improvements to the north terminals. LAWA is also undertaking a number of non-Master Plan projects within the CTA, as identified in Sections 5.3.2 and 5.3.3 of the SPAS Draft EIR, including south terminal improvements, in-line baggage screening, the "New Face" of the CTA, and other projects.

Comments regarding funding and economic questions need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-1015

Comment:

Comments presented for incorporation into the LAX Master Plan Update EIR Notice of Preparation (NOP)

Dear Ms. Lindsey,

We appreciate the opportunity to provide some preliminary comments to the impending NOP. We desire that the NOP comment period be extended to at least sixty days. Although we do not know the exact timing of the NOP release, we note that the holiday season is almost upon us and want to ensure that full attention can be maintained by the public and all stakeholders. This is not your normal environmental review process so we suggest that as part of the NOP process there be several public scoping meetings to better define the alternatives prior to the evaluations.

Response:

The request for an extension of the 2010 SPAS Draft EIR Revised NOP comment period to 60 days is noted. The Revised NOP was circulated for a 46-day review period, commencing on October 14, 2010 and closing on November 29, 2010 consistent with the requirements of State CEQA Guidelines Section 15082. Although the review period included the Thanksgiving holiday, the close of the comment period was well in advance of the winter holidays. Two public scoping meetings were held during the review period for the Revised NOP, including meetings on November 3, 2010, and November 6, 2010.

SPAS-PC00130-1016

Comment:

The Stipulated Settlement of 2006 was conceived to create a process of cooperation resulting in projects to which all parties agreed. The Specific Plan Amendment Study (SPAS) process that will be used to update the approved LAX Master Plan Alternative D is a major element of that agreement. Throughout the negotiations and subsequently ARSAC has championed a safe, secure, and convenient LAX. Projects upon which there was general agreement were to be started almost immediately under a less rigorous review by the LAX Specific Plan than the "yellow light" projects which had serious negative impacts on the surrounding community. ARSAC is disappointed that the agreeable projects have not progressed as quickly as anticipated.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As discussed in Section 5.3.1 of the SPAS Draft EIR, subsequent to approval of the LAX Master Plan, LAWA has undertaken a series of major capital improvements to implement LAX Master Plan projects. These include the South Airfield Improvement Program, completed in 2008, which relocated Runway 7R/25L to the south and added a centerfield taxiway in the south airfield; the Crossfield Taxiway Project, completed in 2010, which added a new north-south taxiway (Taxiway R) to improve aircraft access between the north and south runway complexes, extended Taxilane D to the west, and built a new, state-of-the-art fire station/aircraft rescue and fire fighting facility (ARFF); and the Bradley West Project, currently under construction, which will replace the existing concourses at TBIT with new, improved concourses, add new aircraft gates along the west side of TBIT, including gates specifically designed to accommodate ADG VI aircraft such as the Airbus A380 and Boeing 747-8, expand the central core of TBIT with modern facilities and passenger amenities associated with ticketing, baggage check/claim, security screening, and concessions to better serve existing and future international passengers, and relocate the two north-south taxiways/taxilanes that lie to the west of TBIT. LAWA is currently in the planning stages for the Midfield Satellite Concourse Program, which will construct a new concourse and gates west of TBIT, along with new passenger processing facilities in the CTA, and has conducted preliminary planning for improvements to the north terminals, consistent with the LAX Master Plan approvals.

SPAS-PC00130-1017

Comment:

The Settlement objective is to find mutually acceptable alternatives addressing the issues corrected by the "yellow light" projects while keeping capacity to current levels. Equal in demanding a safe, secure, and convenient airport we have steadfastly repeated strong opposition alternative changes which would impose increased noise and other environmental impacts on the airport neighbors or result in greater removal of homes or businesses. During the Settlement Process moving the runway complex north or extend west was never considered because it was a condition that was found to be unacceptable in the past. It will be important to quantify the effects on noise and pollution on the west end for all operational conditions-eastern and western operations-especially the impacts that can be caused by early turns, go-arounds, and when both runways are used for take-offs or landings.

Response:

The aircraft noise impacts analysis provided in Section 4.10.1 of the SPAS Draft EIR and air quality impacts analysis in Section 4.2 address impacts associated with aircraft operations under each SPAS alternative. The analyses are based on reasonable and appropriate operational assumptions for future airspace operating procedures, as described in Appendix F-2 of the Preliminary LAX SPAS Report. Please also see Response to Comment PC00112-1 regarding early turns. Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. The purpose and focus of the SPAS process are identified in Section V of the Stipulated Settlement.

SPAS-PC00130-1018

Comment:

The planned schedule for the SPAS has been seriously delayed by LAWA actions to raise alternatives which were known to be unacceptable to airport neighbors. Using a rationale of "airport safety improvement" LAWA demanded runway changes that would have devastated one-third to one-half of the Westchester Business District and removed and/or increased impacts on Los Angeles and Inglewood homes and businesses.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. The most notable action LAWA took that resulted in a 2.5+ year extension in preparing the SPAS Draft EIR was the Board of Airport Commissioners' (BOAC's) agreeing to the 2007 request by City Council, as initiated by Councilman Rosendahl, that an additional airfield safety study be undertaken, completed, and reviewed prior to release of the NOP for the LAX Master Plan Restudy (i.e., SPAS). The resultant North Airfield Safety Study was completed in May 2010 and LAWA subsequently published a Revised NOP in October 2010, replacing the original NOP that was published in March 2008.

The assertion that LAWA has "demanded runway changes that would have devastated one-third to one-half of the Westchester Business District and removed and/or increased impacts on Los Angeles and Inglewood homes and businesse." is untrue. The commentor provides no factual support or evidence to support the assertion that any of the proposed "runway changes" would adversely affect one-third to one-half of the Westchester Business District or increase impacts on homes and businesses in Los Angeles and Inglewood.

The SPAS Draft EIR addresses a broad range of airfield improvement alternatives with various options for runway improvements. As indicated in Section 2.3.1.11 of the SPAS Draft EIR, none of the alternatives propose or require acquisition of any homes or businesses in Westchester; the only property acquisitions needed under certain alternatives affect parcels immediately east of the airport, which are occupied primarily by airport-related businesses. Chapter 4 of the SPAS Draft EIR addresses the impacts associated with each alternative, including those to the communities adjacent to LAX. In many cases, the impacts specific to each community vary depending on the alternative considered; however, it should be noted that for certain issues such as aircraft noise and airfield-related air pollution, the impacts associated with future conditions where no airfield improvements are implemented, as would be the case under Alternative 4, would be greater (i.e., worse) than the impacts that would occur with the proposed airfield improvements. See Response to Comment SPAS-PC00149-2 for further discussion.

SPAS-PC00130-1019

Comment:

LAWA unilaterally commissioned safety studies designed to support moving runways north. A subsequent uproar was supported by elected officials of Los Angeles and surrounding communities at all levels who denounced the thinly veiled expansion plan and a promise that expansion north would not be tolerated unless it was clearly shown to be a major safety issue. A million dollar plus NASA/Acclaimed Academic Panel review of safety was then performed on the North runway complex to resolve the issue. Those favoring expansion denounced the review results which stated unequivocally that safety will not justify the runway movement north.

Response:

Please refer to Response to Comment SPAS-PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel.

SPAS-PC00130-1020

Comment:

We have been told that even more onerous runway options will be included by LAWA into the impending NOP. We are disappointed that even greater movement north and west have been proposed and remain adamantly opposed to them.

Given that it is still a LAWA decision of what alternatives to include, several key elements/issues are identified below which should be included in the upcoming Notice of Preparation.

1. The methodology and criteria by which each alternative is assessed must be fully defined in advance of discarding any alternative from full evaluation. We propose that all options be fully assessed/analyzed. Per the Stipulated Settlement assessment of options must be judged to see how they address the issues that the "yellow light" projects were to have fixed. These issues should be identified and quantified.

Response:

The commentor requested certain information on alternatives to be included in the NOP. However, such information is not required to be included in an NOP. (See State CEQA Guidelines Section 15082(a)(1).)

The SPAS Draft EIR does present the information requested by the commentor. It includes and addresses a broad range of options embodied in nine alternatives. The formulation and refinement of the preliminary concepts leading to the nine alternatives addressed in the SPAS Draft EIR analysis are summarized in Chapters 2 through 5 of the Preliminary LAX SPAS Report.

SPAS-PC00130-1021

Comment:

2. ARSAC opposes any proposed movement of a runway north or west because it causes greater impacts (and effects-less than a "legal" impact) in accordance Section V, C (p9) of the settlement. If LAWA insists on evaluating project options such as the 100', 200', 300' or 400' north as they have indicated that they intend to do, they must separate efficiency assessments for each option allocating the improvements between the improvements due to restoring the taxiways/taxilanes/gate configurations to fully compliant widths and separation distances, and then fully assess those new options against the comparable option runway north option for efficiency, noise, and other environmental impacts.

Response:

The commentor's opposition to movement of a runway north or west is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The commentor provides no evidence supporting a conclusion that alternatives moving a runway north or west would cause greater impacts or effects, and at any rate Section(V)C of the Stipulated Settlement does not prohibit evaluation of such alternatives (or any other alternatives) in the EIR.

The SPAS Draft EIR includes a broad range of airfield improvement options, embodied in seven airfield improvement alternatives, including variations on runway moves, taxiway/taxilane configurations, and gating plans. Airport simulation modeling (SIMMOD) was conducted to delineate aircraft movement characteristics for various options, which, in turn, was used to determine aircraft noise impacts and airfield-related air quality impacts associated with each alternative. Also, please see Response to Comment SPAS-PC00130-749 for a discussion of how the Preliminary LAX SPAS Report addresses "efficiency" issues.

SPAS-PC00130-1022

Comment:

3. ARSAC thanks LAWA for its recent inclusion of a north runway 24L movement 100' S and expects it to be fully assessed.

Response:

The SPAS Draft EIR provides a comprehensive analysis of the airfield improvement concept that moves Runway 6R/24L 100 feet south, which is SPAS Alternative 7.

SPAS-PC00130-1023

Comment:

4. All new data must be utilized as so much of the old EIR is outdated and was conflicting. Tiering on changes of this magnitude is unrealistic and unwarranted.

Response:

Data representative of current baseline conditions and impacts analyses specific to each SPAS alternative were used in development of the SPAS Draft EIR. The source and basis of such information and analyses are described in the Methodology subsection of each environmental topic section in Chapter 4 of the SPAS Draft EIR. Please also refer to Response to Comment SPAS-AL00007-41 regarding how the SPAS Draft EIR did not tier off of the 2004 LAX Master Plan Final EIR.

SPAS-PC00130-1024

Comment:

5. Detailed build assumptions must be spelled out for each of the assumptions; i.e. two midfield taxiways or one?, gate locations of TBIT and/or midfield taxiway?, location of ends of runways and any changes to taxiways, all technological improvements assumed and the extent of implementation (ie full runway status lights at ALL intersections). If partial completions are contemplated before the 2020 date then options must be separated to account for incomplete "baseline" changes. This includes FAA tower operational organization and staffing levels.

Response:

Characteristics of each of the SPAS alternatives are identified in Chapter 2 of the SPAS Draft EIR. The assumptions regarding terminals, gates, and airfield configurations are included in Appendix F-2 of the Preliminary LAX SPAS Report.

The SPAS Draft EIR analyzed impacts at a programmatic level; thus, it is reasonable to assess the baseline and build-out year as was done because specific details about individual project construction schedules are not available at this time. Interim year evaluations would be conducted for the project level EIRs as each specific project is undertaken. An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.) Here, it would be infeasible to evaluate future development or actions on an interim year basis because the details of such actions are not sufficiently well-defined. (See Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 503.)

SPAS-PC00130-1025

Comment:

6. Details of how the assessments will be conducted should be provided for public evaluation as well.

Response:

Each environmental topic section (i.e., Aesthetics, Air Quality, Biological Resources, etc.) in Chapter 4 of the SPAS Draft EIR includes a methodology subsection that explains the analytical approach and assumptions. For sections that involve very technical analyses, such as in the modeling of aircraft noise, additional detailed information regarding approach and assumptions is provided in the technical appendices referenced in each such section.

SPAS-PC00130-1026

Comment:

7. Flight mixes must be assessed, details enumerated, and projection sources documented. During environmental assessments will any of the environmentally friendly fuel alternatives be assumed? What about more efficient engines?

Response:

Please see Response to Comment SPAS-PC00130-770 regarding details of the assumed fleet mixes in the 2009 and 2025 Design Day Flight Schedules (DDFS).

Regarding the projections of aircraft types, please refer to Appendix F-1 of the Preliminary LAX SPAS Report. Assumptions used to develop the 2025 DDFS fleet mix are listed in Section 4.1 on page 22 of Appendix F-1, with the methodology and results discussed in Section 4.2, starting on page 23.

Regarding the assumption of environmentally friendly fuel alternatives and more efficient engines in the fleet mix, as described in Sections 4.1 and 4.2 of the Appendix F-1 of the Preliminary LAX SPAS Report, older and less fuel-efficient aircraft were assumed to be retired by 2025. Newer, more fuel-efficient aircraft such as the Boeing 787 and the Airbus 380 were added in the 2025 DDFS fleet mix. Please also refer to Section 4.13.1 on page 4-1330 in the SPAS Draft EIR regarding a discussion of the airlines' objectives to operate fuel-efficient aircraft fleets.

SPAS-PC00130-1027

Comment:

8. When noise is assessed, modeling should include theoretical assessments showing flight frequency impacts out to 60 DNL (CNEL) using models similar to that from Wyle which includes topographical impacts. What assumptions are made about controlled landing and takeoff approach changes since new nav aid systems are not being developed by the FAA AND separate contractors for airlines. How is the new GPS/satellite control FAA plans (NextGen) integrated into the assessments? What airspace realignments are assumed?

Response:

The aircraft noise impact analysis discussed in Section 4.10.1 of the SPAS Draft EIR included the mapping of CNEL noise contours ranging from 60 CNEL to 75 CNEL for the 2009 baseline case and the various alternatives. The aircraft noise analyses were conducted using the Federal Aviation Administration's Integrated Noise Model (INM), which is the accepted state-of-the-art modeling program for determining the total effect of aircraft noise exposure at and around airports. In order for the INM to generate CNEL aircraft noise exposure contours, the following inputs to the model are required: runway layout geometry; annual temperature and humidity; aircraft operations by time of day and aircraft type; runway use information by aircraft type; location and use of flight tracks; and aircraft arrival and departure profiles. Terrain elevation data obtained from the United States Geological Survey (USGS) were also included in the INM noise analyses as explained in Responses to Comments SPAS-PC00130-209 and SPAS-PC00130-937. The aircraft noise modeling input data and assumptions are described in Appendix J1-1 of the SPAS Draft EIR. In addition to CNEL contours, which research has determined to be correlated with reported annoyance caused by noise, other noise metrics were used to assess other potential noise impacts, including awakenings and speech disruption in the classroom. These additional metrics are discussed in details in Section 4.10.1 of the SPAS Draft EIR.

Please refer to Response to Comment SPAS-PC00130-301 regarding information on the FAA's Southern California Optimization of Airspace and Procedures in the Metroplex (OAPM) project.

SPAS-PC00130-1028

Comment:

9. How will aircraft routing on the ground be determined? What air approaches are assumed (i.e. use of preferential runways-landing outboard, takeoff inboard) and what impacts are expected based on ATC staffing or reallocation of tower responsibilities? Is the preferential runway usage assumed? What percentage and time of day is assumed for other configurations of take offs/landings since time of day impacts the amount of air quality impacts due to several factors including wind directional flow. What safety measures are assumed (i.e. full runway status lights, ground radar tracking systems, FAROS, etc.)?

Response:

Please see Appendix F-2 of the Preliminary LAX SPAS Report for information on aircraft routing on the ground, aircraft routing in the air, preferential runway usage, and runway configurations.

Air Traffic Control Tower (ATCT) staffing and tower responsibilities is the responsibility of the Federal Aviation Administration (FAA) and is beyond the scope of the SPAS Draft EIR.

No safety measures (runway status lights, ground tracking radar systems or Final Approach Runway Occupancy Signals - FAROS) were assumed for the SPAS analysis. Safety measures for individual runways, such as runway status lights, will be determined on a project level basis once the selection of an alternative has been made. However, LAX currently utilizes an ASDE-X ground surveillance radar for tracking aircraft and vehicle movements on the airfield.

SPAS-PC00130-1029

Comment:

10. What are the assumed placement of new ground access roadways and their impacts on traffic?

Response:

As described and depicted in Section 2.3.1 of the SPAS Draft EIR, Alternatives 1, 2, 8, and 9 propose the realignment of the existing Sky Way connection to the Central Terminal Area (CTA) to the east. This is proposed to accommodate Terminal 0 and results in the closure of the current Park One public parking lot. Access from southbound Sepulveda Boulevard and 96th Street would remain unchanged except that the intersection of Sky Way and World Way North (on both the arrivals and departures level roadways) would be shifted east towards Sepulveda Boulevard as illustrated in Figure 2-1 on page 2-11 of the SPAS Draft EIR. This shift will provide additional distance for vehicles entering the CTA to move to their desired lane prior to the Terminal 1 curbsides.

As described and depicted in Section 2.3.1 of the SPAS Draft EIR, Alternatives 1, 2, and 8 propose the construction of an elevated busway connecting Manchester Square, the new Crenshaw/LAX light rail station and the ITF to the CTA. The buses proposed by LAWA to operate on the elevated busway are non-articulated buses similar to the existing LAX shuttles. While the total number of LAWA-operated shuttles accessing the CTA would increase under Alternatives 1, 2 and 8, the total number of commercial vehicles accessing the CTA would effectively decrease. This is because, buses serving new off-airport facilities like the Intermodal Transportation Facility (ITF) under Alternatives 1, 2, and 8 and the Consolidated Rental Car Facility (CONRAC) under Alternative 8, as well as some other commercial modes and about 5 percent of the private vehicles currently accessing the CTA, would no longer access the CTA when the elevated busway is in place. Instead, the passengers would be dropped off or picked up at the off-airport facilities where passengers would be consolidated into groups and boarded onto high capacity LAWA-operated buses that would be used to transport passengers into the CTA. These buses would have higher capacities and operate with higher average passenger loads than would the commercial vehicles that would otherwise access the CTA. Consequently, the use of

the consolidated busing operation would result in a net decrease in the number of commercial vehicles accessing the CTA.

Between Manchester Square and the CTA, the elevated busway is proposed to be constructed primarily within the 98th Street corridor. Columns would be constructed on new raised median islands in the center of the street. While eastbound and westbound through traffic is not expected to be impacted by these columns, there may need to be prohibitions on some left turns to and from driveways along 98th Street, depending on the specific locations of the columns. This would be determined during project-level design of the elevated busway, if an alternative including the elevated busway is selected for implementation.

SPAS-PC00130-1030

Comment:

11. What growth factors are assumed for the area in general and LAX traffic for autos, buses, vans, taxis? How is cargo growth to be assessed and new vehicles associated with it?

Response:

The comment asks how traffic growth was projected for LAX-generated passenger and cargo trips and for regional development. Section 4.12.2.2.4 provides an explanation of the process used to estimate future trips generated by activities at LAX. Specific growth factors for passengers, employees, and cargo during each analyzed time period are presented in Table 4.12.2-9. As discussed at page 4-1211 in the SPAS Draft EIR, future cargo traffic was assumed to increase in proportion to the growth in annual cargo tonnage between Baseline (2010) Without Alternative conditions and Future (2025) conditions. Vehicle trip generation estimates for the Existing (2010) Baseline and Future (2025) Alternatives are presented in Table 4.12.2-10, (this table includes trip generation by cargo facilities) and additional detail on the location of traffic generators within LAX is provided in Appendix K2-8.

SPAS-PC00130-1031

Comment:

12. What is the planned usage of all LAWA properties not specifically identified or traffic attributed and impacts on environmental assessments (i.e. we are told Belford Square use is not specified)? If a usage has not "planned" then a range of usages should be assessed and combined with the other usages to assess total impacts.

Response:

In a comment originally submitted September 15, 2010 on the 2010 Notice of Preparation, the commentor asked for additional detail regarding land uses on all LAWA properties and recommends a methodology for analyzing impacts where future uses are unknown. The SPAS Draft EIR uses appropriate methodologies to analyze impacts associated with the SPAS alternatives.

Please see Response to Comment SPAS-PC00130-175 regarding land uses in the Belford area.

SPAS-PC00130-1032

Comment:

13. Since this is a unique set of changes and conditions for the modification of a Master Plan, additional study information beyond a normal EIR should be provided for each runway/taxiway/taxilane/gate configuration. LAWA should study and report: 1. Safety 2.Security 3. Pollution 4. Aircraft compatibility (Group IV, V and/or VI) 5. Capacity and 6. Cost and scheduling of implementation. Safety should include both aircraft and restoration of landside structures which need to be repaired.

Response:

The nature, scope, and level of analysis provided in the SPAS Draft EIR are based on the specific characteristics of the SPAS alternatives and meet the requirements of CEQA. (See State CEQA Guidelines Sections 15146, 15151; Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 369.) Additional data and analyses developed by LAWA in conjunction with the formulation and evaluation of the SPAS alternatives address the types of information requests indicated by the commentor. Specifically: (1) safety is addressed in Section 4.7.2 of the SPAS Draft EIR and is also considered in Chapter 6 of the Preliminary LAX SPAS Report; (2) security considerations associated with each alternative are addressed in Chapter 6 of the Preliminary LAX SPAS Report; (3) pollution is addressed throughout Chapter 4 of the SPAS Draft EIR, including in Section 4.2 for air quality, Section 4.8 for hydrology and water quality, and Section 4.10 for noise; (4) aircraft compatibility, in terms of aircraft size (ADG IV, V, VI) is accounted for throughout both documents, including Section 4.7.2 of the SPAS Draft EIR relative to each alternative's compatibility with FAA airfield design standards for different aircraft size groups; (5) capacity is accounted for through each alternatives being designed in accordance with the Stipulated Settlement's requirement that the proposed improvements are planned in a manner that is designed for a practical capacity of 78.9 MAP and provide for no more than 153 passenger gates; and (6) cost is addressed in Chapter 8 of the Preliminary LAX SPAS Report.

Relative to scheduling of implementation, as stated on page 2-8 of the SPAS Draft EIR, the nine SPAS alternatives addressed within the SPAS Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. In general, however, it is anticipated that all of the improvements proposed under each alternative would be completed by 2025, with construction beginning in 2015.

Relative to the commentor's suggestion that safety include both aircraft and restoration of landside structures, the former is addressed in Section 4.7.2 of the SPAS Draft EIR and the latter would be assessed in conjunction with the formulation of detailed design and engineering plans for SPAS improvements that are integrated with existing landside structures.

SPAS-PC00130-1033

Comment:

14. We also encourage LAWA to consider other alternatives that are "out of the normal box" to achieve results. Each of the LAWA plans includes a center line taxiway that the FAA claims some benefits, but we note it also adds some new modes for incursions as well. The Academic Panel conducting the NORSAC safety study, for instance, added a single, longer runway in place of 24L to achieve Group VI status. Their findings noted that there was only nominal loss of capacity from this option and removed the highest source of risk-runway crossings. LAWA and the FAA demonstrated the capability to operate on three runways throughout the period of the South Airfield Improvement Program (SAIP) construction.

Response:

Please refer to Response to Comment SPAS-PC00130-800 regarding the problems and infeasibility of eliminating one runway in the north airfield.

The comment does not fully or accurately reflect the conclusions of the academic panel relative to the operational characteristics of a three-runway system (i.e., one runway in the north airfield and two runways in the south airfield). As stated in Section 17.5 of the North Airfield Safety Study (NASS), "The capacity results for the three-runway configuration were less encouraging: the reduction in arrivals and departures observed at FFC [Future Flight Central] could have adverse direct and indirect consequences. Given that mixed operations would occur on the North Airfield (i.e., landings and takeoffs on the same runway), arranging for departures in the face of frequent arrivals would be challenging. It is also true that unexpected conditions -- such as the temporary shutdown of a runway -- can cause considerably more disruption when there are only three runways rather than four. The AP [Academic Panel] fears, therefore, that the capacity limitations in the three-runway case would be unduly constraining in peak conditions, which would prevail for nine hours of the day under the 2020 forecast." As further stated in the main conclusions of the NASS, specifically Section 17.7, "Moving to a

three-runway configuration could cause major difficulties, in terms of flight schedule reliability and congestion, even under visual flight conditions."

SPAS-PC00130-1034

Comment:

November 9, 2006

Specific Plan Amendment procedural improvement questions and suggestions that are presented for discussion purposes rather than as position stances:

Committee Operation

LAWA has been presenting their proposals at the meeting and we are supposed to respond on the spot. Discussion topic handouts should be distributed before our meeting.

Response:

The questions and suggestions presented by ARSAC concerning meetings of the SPAS Advisory Committee are noted. The Advisory Committee meeting process is described in Chapter 4 of the Preliminary LAX SPAS Report. As noted in that section, between March 2006 and June 2012, LAWA held 24 Advisory Committee meetings. Materials from these meetings are provided in Appendix D-2 of the Preliminary LAX SPAS Report. LAWA distributed materials to committee members in advance where possible. When it was not possible, discussion topics spanned more than one meeting, if warranted. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1035

Comment:

Public expectation is that the green light items were to go forward and the yellow not. What specific, quantified parameters are not met by the green light projects? What "quick fixes" and procedural changes can address these instead of major construction projects?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, the response below is provided for informational purposes.

Please see Response to Comment SPAS-PC00130-394 regarding LAWA's progress towards implementation of non-Yellow Light LAX Master Plan projects. It is not the purpose of the SPAS Draft EIR to evaluate the LAX Master Plan non-Yellow Light projects or to determine if there are procedural changes that could address the problems these projects were designed to address in lieu of implementing the approved projects.

The project objectives of the SPAS, as discussed in Section 2.2 of the SPAS Draft EIR, provide information about the problems and issues the alternatives were designed to address. The SPAS alternatives represent a reasonable range of alternatives that would attain most of the basic objectives of the project, sufficient to allow informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).) The commentor does not provide any evidence of "quick fixes" that would offer substantial environmental advantages and, therefore, no further analysis is required. (City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.)

SPAS-PC00130-1036

Comment:

We need to go back to ground zero and first establish acceptance of specific, measurable objectives. In the case of "yellow light functionality review" we need concrete goals. If there is inadequate CTA traffic capacity, for instance, what is it now and what must it be in each location around the circle? How much curb space is necessary versus what exists now? Where are the anticipated difficulties with air quality? Approximately how much is produced per aircraft? Where are the traffic bottlenecks creating auto/van air quality issues? For traffic gridlock issues how many cars must get to certain locations and what "quick fixes" can be done to reduce these impacts?

Response:

Section 2.2 of the SPAS Draft EIR presents the SPAS project objectives. The impacts analyses presented throughout Chapter 4 of the SPAS Draft EIR provide quantitative and qualitative evaluations of the performance of each alternative, including on-airport traffic and curbside performance within the CTA (Section 4.12.1), off-airport traffic impacts (Section 4.12.2), and air quality impacts associated with airfield operations and motor vehicle travel (Section 4.2). For those impacts determined to be significant, the analyses also identify feasible mitigation measures.

See also Table 1-2 in Chapter 1 of the SPAS Draft EIR which presents an evaluation of the relationship between each project objective and each SPAS alternative. Table 1-3 of the SPAS Draft EIR also provides elements of comparison on how alternatives meet the SPAS Draft EIR objectives.

CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.) An EIR must be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.) Here, the SPAS Draft EIR analyzes, in significant detail, the environmental impacts of the proposed alternatives, and presents the information in a manner sufficient to facilitate informed decision-making.

SPAS-PC00130-1037

Comment:

It's time to present full up options that includes all aspects of a Plan rather than piece mealing. Each part has an impact on the others.

Response:

The SPAS Draft EIR includes nine alternatives, including four "fully-integrated" alternatives that address airfield, terminal, and ground transportation improvements (Alternatives 1 through 4), three alternatives that focus on airfield and related terminal improvements (Alternative 5 through 7) and two alternatives that focus on ground transportation system improvements (Alternatives 8 and 9). Each of the focused alternatives (Alternatives 5 through 9) can be paired with certain other alternatives to provide a full complement of airfield, terminal, and ground transportation system improvements similar to the fully-integrated alternatives. A comprehensive impacts analysis of each alternative is presented in Chapter 4, Environmental Impact Analysis, of the SPAS Draft EIR.

SPAS-PC00130-1038

Comment:

Public Outreach
There is no trust established with the public yet because of past history. When ideas are "floated" people think that they will be rammed down their throats. Ideas that are not truly anticipated to be implemented should be identified as so even if you want to evaluate them for support of a "range of options." Information must be presented prior to the meetings.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-1034 regarding the Advisory Committee meeting process. In addition to Advisory Committee meetings, LAWA undertook an extensive public participation program in 2006, the outset of the SPAS process, to solicit public input from interested stakeholders. Please see Response to Comment SPAS-PC00130-731 for details regarding these meetings. The public meetings were interactive and included an open dialog with members of the public concerning SPAS-related planning issues. At the Community Advisory meetings and the public meetings, operational objectives were identified and input on solutions sought. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1039

Comment:

State openly what is NOT on the table and what the LAWA objectives are in terms of operations. People hear all of the proposals and do not believe that the plans are not laying the groundwork for another future expansion.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-1038 and SPAS-PC00130-731 regarding the nature of the Advisory Committee meetings and SPAS community meetings. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1040

Comment:

During the meetings the questions must be answered for individuals with actual factual materials and/or where the answers can be found. After the meetings post the answers to these questions and allow for follow up. If you don't know the answer, just say so! Don't make them up as you go along.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-1038 and SPAS-PC00130-731 regarding the nature of the Advisory Committee meetings and SPAS community meetings. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1041

Comment:

Re: Runway Safety on the North

Arm waiving that we need better and "one is too many" won't cut it when trying to convince most people that major construction and future noise and other environmental impacts will be imposed upon them.

What specifically needs to be addressed? What are the specific human factors that must be addressed for safety? What physical factors? What mechanical factors?

Response:

Please refer to Section 4.7.2 of the SPAS Draft EIR which identifies all the safety factors that were evaluated as part of the SPAS analyses. Please also see Responses to Comments SPAS-PC00130-1042 through SPAS-PC00130-1049 below.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1042

Comment:

What technologies are available? Distinguish between facilities "improvements" and procedural factors? Ie traffic load, pilot familiarity and marking of runways, controller workload, impacts of various aircraft types?

Response:

The types of airfield safety system improvements that are at LAX are summarized on pages 4-501 and 4-502 of the SPAS Draft EIR. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1043

Comment:

What is NOT in place at LAX that would improve safety? Ie AMAS and collision avoidance systems, status light systems, etc?

Response:

The FAA and LAWA have worked together in recent years to deploy new technologies and enhanced training to improve airfield safety at LAX. Pages 4-501 and 4-502 of the SPAS Draft EIR, provides a summary of these recent and ongoing improvements, including the installation of runway status lights. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1044

Comment:

What can be done about spacing of aircraft coming here to avoid bunching?

Response:

The volume of aircraft arriving at LAX at any given time is dependent upon numerous variables that are beyond the control of LAWA or the FAA. These would include airline schedules at other airports, weather, a variety of operational delays, etc. Regardless of the number of aircraft approaching and

arriving at LAX, they are all handled by the FAA air traffic controllers who provide the proper spacing for a safe operation.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1045

Comment:

If history is our best predictor... What makes our runway on the north unsafe?

Response:

Please see pages 4-502 through 4-506 in Section 4.7.2 of the SPAS Draft EIR for a summary of studies addressing the safety of the north airfield, In particular, please see Table 4.7.2-5 on page 4-504 for a list of hazards associated with aircraft operating on the existing north airfield identified in the 2007 North Airfield Safety Risk Assessment. Further, the February 2010 Los Angeles International Airport North Airfield Safety Study identifies the facilities and operations that pose a safety risk on the north airfield.

SPAS-PC00130-1046

Comment:

Over the past many years there has been two accidents on the north. What where their specific causes and how would have, if at all, separating or lengthening the runways fix this? What are the specific causes of incursions that are being avoided? Ie hold bar errors? Lost way on airport? Lost track of aircraft? Etc...

Response:

Based on the data acquired from the National Transportation Safety Board, and as shown in Table 4.7.2.6 on page 4-509 of the SPAS Draft EIR, although aircraft accidents have occurred in flight, at the west helipads, or on the south airfield, no accidents or fatal injuries have occurred on the north airfield in the past 10 years (see far right column "Location").

Regarding the number of incursions on the south airfield, pages 4-510 and 4-511 in Section 4.7.2.3 of the SPAS Draft EIR discuss how even though data indicates that the number of Category C incursions on the south airfield increased following completion of the South Airfield Improvement Project (SAIP) compared to prior years, the comparative change is the result of the definition change by the Federal Aviation Administration (FAA) and is not a reflection of actual events.

Additionally, please see Response to Comment SPAS-PC00130-160 regarding the reduction in incursions on the south airfield following the completion of the South Airfield Improvement Project.

SPAS-PC00130-1047

Comment:

How does the incursion experience at LAX differ with that of comparable sites? I understand that LAX has less on the north than comparables. If this is not sufficient, what kinds of issues are of greatest concern and how should they be addressed?

Response:

Aircraft incursions are influenced by a number of factors including, but not limited to, the airfield design and operational characteristics specific any given airport. The commentor gives no indication as to what constitutes "comparable sites" and provides no basis or citation for the claim that "LAX has less [incursions] on the north than comparables." As such, it is not possible to address the comment directly. However, the Los Angeles International Airport North Airfield Safety Study does note the

following on pages 157 and 158 in Section 17.4.3 of Appendix H-6 of the Preliminary LAX SPAS Report.

"Because such a proposal would essentially replicate on the North Airfield what has already been done on the South Airfield, the AP put considerable weight on evidence about whether incursions have dropped on the South since its reconfiguration. While only about 18 months of data are at hand about safety under the new arrangements, they suggest that the changes have reduced incursion risk on the South by about 40 percent. The apparent reason for the improvement is the new centerline taxiway, which causes landing planes to slow down before crossing the takeoff runway and which gives controllers greater flexibility in deciding when and where planes landing on Runway 25-L should cross Runway 25-R."

Additionally, please see Response to Comment SPAS-PC00130-160 regarding the reduction in incursions on the south airfield following the completion of the South Airfield Improvement Project.

SPAS-PC00130-1048

Comment:

Explain why the south side has four times as many incursions as the north.

Response:

Table 4.7.2-7 of the SPAS Draft EIR details the number and category of runway incursions at LAX from 2001 through 2011. Based on the data provided, over a ten year period, the south airfield had 72 runway incursions to the 31 on the north airfield. However, the benefits of a centerfield taxiway can be seen by comparing the south airfield runway incursion data pre- and post- South Airfield Improvement Project (SAIP) (completed in 2008).

In regards to the number of incursions on the south airfield, pages 4-510 and 4-511 in Section 4.7.2.3 of the SPAS Draft EIR discuss how, even though data indicates that the number of Category C incursions on the south airfield increased following completion of the SAIP compared to prior years; the comparative change is the result of the definition change by the Federal Aviation Administration (FAA) and is not a reflection of actual events.

Additionally, please see Response to Comment SPAS-PC00130-160 regarding the reduction in incursions on the south airfield following the completion of the South Airfield Improvement Project.

SPAS-PC00130-1049

Comment:

A recent article in the Breeze stated over 50% of the runways in the US fail to have complete RPZ. What waivers has given by the FAA for the north side? What would have to be changed to make them fully compliant?

Response:

Per FAA Advisory Circular 150/5300-13 on page 70, Runway Protection Zones (RPZs) are located at the end of each runway and are defined by a set dimension regardless of what is located in that area. Therefore, all runways have a complete or proper sized RPZ. It is assumed that the commentor is referring to a Runway Safety Area (RSA) because many RSAs at airports in the U.S. do not meet RSA standards. The FAA does not issue waivers for non-compliant RSAs and has an ongoing program to identify and improve RSAs around the country. The options for improving the RSAs at LAX and bringing them into compliance are summarized in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00130-1050

Comment:

LAWA Community Stakeholder Public Safety Initiative

Arnie Corlin

November 22, 2010

Community members, Business owners and LAWA must acknowledge public safety as a key component to improve their community's quality of life and the return on their investments.

LAWA has not sufficiently recognized this and should become a better community partner in order to help control terrorism and other criminal threats at and around LAWA properties.

For law enforcement and government to create efficient and more successful results, a true community partnership is essential. Our Senior Lead Officers who have traditionally been our educators for crime and nuisance issues are not in the community like residents, businesses and LAWA 24/7. Senior Leads also have numerous other assignments making it important to acknowledge and involve more community stakeholder's participation.

Additionally, LAPD does not have the proper resources necessary nor should they be the sole provider to create that partnership for an entity as large and self sufficient as LAWA.

Another obstacle to these successes is that law enforcement typically tries to sell rather than market public safety education. Marketing would engage more stakeholders and improves the ability from just knowing about issues to an elevated understanding of issues. Similar to what is done in Israel.

While programs such as iWatch have good bullet points, most participants tend to forget or fail to pass on important information to others once instructors are gone.

Whether it is one's investment property, their own well being or that of other community stakeholders, it is just as essential to re-enforce the safety from their boundaries going outward as well as from within a given perimeter.

To date LAX has been far too focused on re-enforcing within their perimeter and insufficiently looking outward. Minimal to no partnership of the businesses and other community members has been created. This lack of partnership from LAX may needlessly increase the risk of some criminal behavior and allow the opportunity for it to move closer to or enter LAX property.

An example is the manner with which some cameras have been installed on the exterior clearly shows the lack of identity of perimeter control and boundaries. Even with new tracking software in development, none currently developed would have much value with the manner those cameras have been installed.

I have talked to numerous business and community members who have told me there has been no effort to identify and make use of existing cameras. Installing new resources without identifying and coordinating those that exist is a waste of government resources. Doing so might have allowed others with higher value field of views to be put into place at a lower cost.

Not doing so is a poor risk management model.

Another asset not sufficiently used is that some of the best and most organized Neighborhood Watch Groups and communications in the city exist around LAX. This could and should be a great resource immediately available with minimal expense. Numerous businesses on the perimeter have also told me there is not sufficient communications as to threats or other issues at or around LAX.

All of these stakeholders in many cases would be much more able to identify abnormal behavior than even local law enforcement. It could also be done in a much more rapid manner at a far lower cost.

An LAX or Federally funded component for community stakeholder training and coordination should be immediately required whether or not any LAX improvements are agreed upon.

To enhance the value of funding spent on such a program, this could be identified and implemented as a national model.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. Portions of this comment present personal opinions about public safety that are unsupported by facts, and therefore, do not constitute substantial evidence under CEQA. Contrary to the statement by the commentor, LAWA takes public safety and security very seriously, including terrorism and other criminal threats at LAX. As indicated on page 4-1022 in Section 4.11.2 of the SPAS Draft EIR, LAWAPD engages in criminal enforcement, traffic control, ground transportation regulations and airfield safety enforcement, and specialized units that deal with cargo theft and emergency response. LAWAPD is also involved with intelligence and planning to limit the possibility of any major disruption, including terrorism, to airport operations and passenger safety. LAWAPD's Chief of Police reports to the Deputy Executive Director for Homeland Security and Law Enforcement who reports directly to LAWA's Executive Director. Currently, LAWAPD has a staff of approximately 450 police officers with an additional 650 civilian employees, including civilian traffic and security officers. LAWAPD is not the sole provider of law enforcement services at LAX. As noted in the SPAS Draft EIR, LAWAPD shares law enforcement responsibilities with LAPD. The suggestion that LAX- or federally-funded community stakeholder training and coordination should be required is noted. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-1051

Comment:

Reference: Notice of Preparation of Draft EIR for the Proposed Interim Taxiways Safety Improvement Project (ITSIP) No. EIR-10-019-AD dtd June 4, 2010

ARSAC, the Alliance for a Regional Solution to Airport Congestion, understands that this project consists of several taxiway relocations between the north complex runways 24L and 24R which are to reduce the possibility of collision from an incursion.

LAWA has acknowledged that this was never studied in the Master Plan EIR and that this is a fully stand-alone project and is being proposed in the interest of a more rapid path to runway safety improvement. In concept we support this effort but have identified the following issues which should be fully addressed in the draft project EIR.

1. Specify and evaluate the locations where processing of removed taxiway materials are collected, stored, and processed along with the environmental controls to prevent toxic fugitive dust.
2. Specify truck routes for construction purposes as well as parking locations for construction workers.
3. Noise impact evaluations should take topography into consideration. What traffic levels are assumed and what flight mix? NOP Attachment 1 from 2009 is a start, but what is projected when the airport is more fully utilized?
4. Ensure that the assessment will evaluate how (and/or whether) mid-runway takeoffs will impact noise and air quality issues as well as safety.
5. Ensure that the project is evaluated in the context of both what taxiways (and taxilanes) will exist at the start of this project as well as projects currently proposed and those authorized by the Alternative D Master Plan. Examples include the taxilanes between the new TBIT and Midfield Concourse, Midfield taxiway R (and S not yet authorized).
6. Please confirm that all construction mitigation and control systems used for the South Airfield Improvement Project are utilized for this project.

Specific comments to the CEQA Check List:

1. I.D What additional lighting will be added for construction transportation north of 24R? Can this be significant?

2. III.D What controls will stop the distribution of contaminated ground particles during construction?
3. III.E Are any sewer lines or other water system pipes impacted during construction? What smells and contamination is anticipated from this?
4. VI.A Item iii is very general about aquifers and sand compactness. Is there a map of the ground water in this area near the north runway complex? Of special interest is the eastern half.
5. XII.A Include noise from construction vehicle traffic.

We look forward to continuing to work with you. We have attached an appendix of safety related information to aid in your understanding of this complex issue.

Response:

The comment pertains to the NOP for the LAX Interim Taxiways Safety Improvement Project and requests detailed project-level information, including construction-related information, specific to that project. That project is no longer being advanced on its own and preparation of a project-level EIR is no longer occurring. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00131 Commins, Sharon Mar Vista Community Council 10/10/2012

SPAS-PC00131-1

Comment:

At its regular monthly meeting October 9, 2012, the Mar Vista Community Council unanimously passed the following motion regarding alternatives presented in the LAX SPAS DEIR:

The Mar Vista Community Council encourages the Los Angeles World Airport (LAWA) to adopt the plan in their LAX SPAS DEIR which ensures the most rapid completion of LAX modernization. Alternative 2 which requires no relocation of the North Runway and Alternative 9 which is a Consolidated Rental Car Facility in Manchester Square supported by some form of rail mass transit which allows for connection into the Westchester business district should be the preferred alternatives. Such a plan, according to DEIR evaluations, addresses the necessary airfield operational efficiency and safety concerns, presents the least intrusive impacts on local communities, and, at the same time, provides the lowest construction cost and construction risks.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR and see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that Alternatives 2 and 9 would present the least intrusive impact on local communities and provide the lowest construction cost and construction risk.

SPAS-PC00132	**Paz, Sergio**	**Los Angeles International Airport Area Advisory Committee**	**10/9/2012**

SPAS-PC00132-1

Comment:

The Los Angeles International Airport Area Advisory Committee (LAXAAC), a committee of residents of the communities surrounding Los Angeles International Airport (LAX), is writing with comments relating to the recent Draft Environmental Impact Report (DEIR) or the proposed Specific Plan Amendment Study at LAX (the SPAS).

Our initial concern with the DEIR is its massive size and complexity with the number of proposed alternatives discussed, coupled with the failure of LAWA to designate a preferred alternative, particularly in light of the extremely limited time allowed for the public to review these documents. You have indicated that LAWA may yet select a preferred alternative, which would be unfair in that it effectively would give the public even less time to evaluate that alternative thoroughly. We ask that when LAWA decides upon a proposed alternative, that the public be given additional time to address that proposal.

Response:

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3, and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. Subsequent to publication of the SPAS Draft EIR, LAWA staff recommended an alternative that couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. The environmental impacts and recommended mitigation measures associated with the LAWA Staff-Recommended Alternative are identified in Chapter 2 of this Final EIR.

Regarding public review of the preferred alternative, this Final EIR presents the LAWA Staff-Recommended Alternative, and this recommendation will be considered by the decision-makers when they deliberate, in a public process with public input, on whether to approve a particular SPAS alternative.

SPAS-PC00132-2

Comment:

Preferred Alternatives 7 and 9:

Our committee favors a combination of Alternatives 7 and 9, which we believe would modernize the airport and improve both airfield operations and ground transportation without unduly impacting the surrounding communities.

Response:

The commentor's support for Alternatives 7 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00132-3

Comment:

Alternative 7 proposes a 100 foot southward movement for Runway 6R/24L, increasing runway separation from 700 to 800 feet, and adding a center-line taxiway. We believe that the center-line taxiway would enhance safety on the North Airfield, because recent experience on the South Airfield and at other airports with added center-line taxiways suggests that incursions will be reduced.

Data available on a Federal Aviation Administration (FAA) website confirm that there was a significant reduction in the number of incursions on the South Airfield after the addition of the center-line taxiway. A comparison between the five-year periods between 2003-2007 and 2008-August 2012 before and after the south center-line taxiway shows that the incursion average on the South Airfield was reduced significantly while the incursions on the North Airfield stayed about the same. (See http://www.asias.faa.gov/portal/page/portal/asias_pages/asias_home/datainfo). Other data on the FAA website show that incursion severity has diminished since the center-line taxiway was installed. These data are consistent with that from other major airports in the country. The incursions on the North Airfield generally have been somewhat more severe than on the South Airfield after the center-line taxiway but less severe than they were on the South Airfield prior to the taxiway. Accordingly, we believe that the inclusion of a center-line taxiway on the North Airfield could significantly reduce the frequency of incursions.

We believe that less than optimal taxiway positions may have played a role in the incursions that have occurred on the North Airfield. We support the lengthening of Runway 24-L towards the east to a minimum length of 11,500 feet from the current 10,286 feet included in Alternative 7 because it would measurably improve North and South Airfield safety. The 2010 North Runway Safety Study (NASS) conducted by an academic panel under the auspices of the North Airfield Safety Advisory Committee noted on page 143 that incursion or collision risk could he minimized by balancing operations between the North and South Airfield complexes. The imbalance occurs because the heavy Groups IV and V aircraft that depart from the North terminals currently must taxi counter-flow on the North all the way around to the South complex to depart, and vice versa for landing. The NASS recognized that the net result of this imbalance is a quadrupling of the incursion risk with this traffic. This means more opportunities for incidents on the North and South complexes, additional fuel cost and time for the departing aircraft and additional pollution for the local environment from aircraft exhaust.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00132-4

Comment:

In addition, we note that the DEIR fails to explore all other safety measures that could be taken to reduce incursions. Therefore, please address the following items in the final EIR to determine whether they would be adequate to address any remaining perceived safety issues:

- Improved communications between tower and cockpit,
- Fully staffed tower and TRACON offices,
- Most modern and efficient equipment installed in the tower,
- GPS ground-tracking system installed,
- More space between aircraft, and
- Adherence to the LAX preferential runway noise abatement plan.

Response:

The content of this comment is essentially the same as comment SPAS-PC00096-5; please refer to Response to Comment SPAS-PC00096-5.

SPAS-PC00132-5

Comment:

We propose the combination of Alternative 7 with Alternative 9 because we believe that the Consolidated Rental Car Center (CONRAC) project in Alternative 7 combined with the Automated People Mover (APM) from Alternative 9, would take rental car shuttles off the road, improve traffic, and provide a great convenience to the traveling public.

Response:

The commentor's support for Alternatives 7 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. As indicated on page 1-17 of the SPAS Draft EIR, components of Alternatives 1, 2, 5, 6, 7, 8, and 9 are interchangeable such that airfield and terminal improvements from one alternative could be implemented in association with the ground access improvements proposed under another alternative. Alternative 9 includes a CONRAC in Manchester Square as well as an APM. Alternative 7 focuses on airfield improvements which, in turn, affect terminal improvements. Alternative 7 does not include any ground access improvements, including a CONRAC.

SPAS-PC00132-6

Comment:

We favor the Alternative 9 proposal of an Intermodal Transportation Facility (ITF) to be constructed between 96th and 98th Streets and between Vicksburg Avenue and Airport Boulevard. The ITF would include space for passenger parking and a remote passenger pick-up drop off to provide drivers the option of not entering the CTA.

The construction of a CONRAC with an APM to transport rental car passengers between it and the CTA would significantly improve passenger convenience and reduce traffic congestion in the vicinity of the airport as well as in the CTA. Instead of congesting several streets around the airport with rental vehicles, passengers would go to one facility to obtain or return their rental cars, where there would be more than 8200 spaces for vehicles. Departing passengers could drop off rental cars and take the APM directly from the CONRAC into the airport, while arriving passengers who need a rental vehicle could take the APM directly to the CONRAC. Combined with the CONRAC and the ITF, the APM likely would significantly reduce the number of private vehicles accessing the CTA.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

SPAS-PC00132-7

Comment:

The APM, which would be located on a new elevated tramway, would be superior to the bus system proposed in Alternative 8. Under Alternative 8, rental car shuttles would arrive in the CTA from the CONRAC via the elevated bus way (4.12.1 at p. 4-1093). This system has the potential to severely

impact traffic between Manchester Square and the CTA, along the 98th Street corridor, as well as in the CTA, where it would merge with mixed-flow traffic on the upper level roadway.

Response:

The commentor's support for a ground transportation alternative that would include an APM (i.e., Alternative 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. As described and depicted in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 2, 3, 8, and 9 each include direct dedicated connectivity between the CTA and Manchester Square. Alternative 8 assumes dedicated LAWA-operated shuttle operations would connect facilities at or adjacent to Manchester Square, including the CONRAC facility, parking, and Metro passengers, to the CTA via an elevated busway. This elevated busway would ensure LAWA shuttles traveling from Manchester Square to the CTA via the 98th Street corridor would not operate on the surface streets and therefore would not negatively impact off-airport traffic. These shuttles would merge with mixed-flow traffic along the inbound portion of the realigned Sky Way entrance roadway to the CTA. They would continue to operate in mixed-flow traffic within the CTA and on off-airport streets until they reach the ITF, at which point they would reenter the elevated busway en route to Manchester Square. This route, depicted by the dashed red line labeled as Transit Access (Mixed Flow), is illustrated in Figure 2-8 of the SPAS Draft EIR.

The buses proposed by LAWA to operate on the evaluated busway are non-articulated buses similar to the existing LAX shuttles. While the total number of LAX shuttles accessing the CTA would increase under this proposal, the total number of commercial vehicles accessing the CTA would effectively decrease. This is because buses serving new facilities outside of the CTA, including the ITF and CONRAC, as well as some of the other commercial modes and about 5 percent of the private vehicles currently accessing the CTA would no longer access the CTA when the elevated busway is in place. Instead, the passengers would be dropped off or picked up at the ITF or the ground transportation facilities in Manchester Square, and passengers would be consolidated into groups and boarded onto LAWA-operated buses that would be used to transport passengers into the CTA. These buses would have higher capacities and operate with higher average passenger loads than would the commercial vehicles that would otherwise access the CTA. Consequently, the use of the consolidated busing operation would result in a net decrease in the number of commercial vehicles accessing the CTA.

Alternative 9 assume an elevated Automated People Mover (APM) system, with stops at the ITF and in the airport's CTA, would replace the elevated busway connection and LAWA busing operations as described above, thereby eliminating those buses associated with the elevated busway in Alternative 8 from the traffic flow.

The impacts to traffic within the CTA associated with the dedicated busway in Alternative 8 and the APM system in Alternative 9 are addressed in Section 4.12.1 of the SPAS Draft EIR. As indicated in that section, none of the SPAS alternatives would severely impact traffic within the CTA. However, as indicated in the summary of impacts provided in Section 4.12.1.9.5 of the SPAS Draft EIR, and in Table 4.12.1-43, alternatives with a dedicated busway (i.e., Alternatives 1, 2, and 8) would affect more roadway links (three roadway links) than would Alternative 9 with an APM (one roadway link).

The impacts to off-airport transportation associated with the Alternatives 8 and 9 are addressed in Section 4.12.2 of the SPAS Draft EIR. The dedicated busway under Alternative 8 would result in a small difference in the trip generation estimates between Alternatives 8 and 9 (approximately 350 or fewer trips per hour). As noted above, the westbound route of the busway would not operate on surface streets; therefore, there would be no impacts along the 98th Street Corridor in this direction of travel. As indicated in Section 4.12.2, there are two intersections along the portion of the eastbound route of the dedicated busway that would be in mixed flow traffic outside of the CTA: Intersection 38 (Sepulveda and Century Boulevards) and Intersection 143 (Vicksburg Avenue and 96th Street). Impacts of Alternatives 8 and 9 compared to Baseline (2010) conditions are summarized in Table 4.12.2-13 of the SPAS Draft EIR. As indicated in that table, neither alternative would have a significant impact on either of these two intersections under this scenario. Impacts in the Future (2025) scenario are summarized in Table 4.12.2-19 of the SPAS Draft EIR. As indicated in that table, both alternatives would have a

significant impact on Intersections 38 and 143 in the p.m. peak, which would be fully mitigated by Mitigation Measures MM-ST (SPAS)-15 and MM-ST (SPAS)-32, respectively.

SPAS-PC00132-8

Comment:

We expect that the APM in Alternative 9 would prove to be less cumbersome for travelers than would the elevated bus way proposed in Alternative 8, for the simple reason that stepping onto an APM with luggage is easier than getting onto a bus with luggage. Passengers with baggage and children would find the APM more convenient also because they would have fewer steps to walk when they arrived at their terminal than they would have with the bus system. The elevated tramway also would be far more passenger friendly in other respects, as it would be faster and more efficient, with less complicated routing and higher capacity. Train systems have been effectively used in other cities such as New York, San Francisco, and Atlanta, but no major airport currently uses a dedicated bus way.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

It should be noted that the APM systems proposed as a part of Alternatives 3 and 9 have been developed at a program level of planning. Should one of these alternatives with an APM be approved, further design and analysis would be undertaken to establish the capacities, alignments, easements, and technological considerations to best serve the passenger needs of the airport. The dedicated busway would end and buses would mix with other vehicles to circulate around the CTA, with stops at each terminal within the CTA.

SPAS-PC00132-9

Comment:

We are concerned, however, about the numerous details missing from the DEIR regarding the APM in Alternative 9. For example, we think it imperative that the APM move around the CTA in a continuous loop, and not dead-end at Terminal 7, as it appears to do in Figure 2.9 (2.3.1.9.4 at p. 2-43). If it were to dead-end at Terminal 7, arriving passengers at any terminal would have to travel back through all the other terminals on the APM to go to the CONRAC. This would be especially inconvenient for passengers who are arriving at Terminals 5 through 7, and would defeat the purposes of saving time and improving convenience for passengers. Given that the APM would not be the exclusive means to access the CTA, it will need to be more convenient than private vehicles or the traveling public will not use it. Please explain how it would operate.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS alternatives were designed and discussed at a programmatic level, and specific design components will be formulated and discussed in future project-level review. Please see Response to Comment SPAS-PC00130-764 regarding the programmatic level of planning associated with the APM. As noted therein, the design and station locations of the APM line(s) within the CTA would be determined and addressed at the project level, should an alternative that includes an APM be approved.

The comment does not suggest or provide any evidence that a non-continuous track would result in significant environmental impacts. As discussed in Section 4.12.1 of the SPAS Draft EIR, including Table 4.12.1-15 which presents the passenger mode splits used to estimate traffic for each alternative in 2025, the APM in Alternative 9 is likely to account for a significant portion of passenger traffic coming to LAX. The SPAS Draft EIR made reasonable assumptions in deriving these estimates, as described in Section 4.12.1 of the SPAS Draft EIR.

SPAS-PC00132-10

Comment:

We also are concerned about the apparent lack of participation in this process by the Los Angeles Metropolitan Transportation Authority (Metro). Collaboration between Metro and LAWA on any link between a new light-rail extension and the CTA is essential. Currently, Metro is considering several options for extending the Green Line into LAX, in addition to Alternatives 8 and 9, such as extending an elevated Green Line into the CTA or bringing the Green Line into the CTA underground. Why are these proposals, which might offer significant advantages in terms of the volume of passengers carried to the airport, not addressed in the DEIR? Further, LAWA has made only vague references in the SPAS public hearings to the Metro processes on the Green Line and Crenshaw Line. Because Metro would need to use public funds unrelated to the airport for any construction of a light rail line outside airport boundaries, cooperation between LAWA and Metro is mandatory. Please explain how LAWA would work with Metro in this regard.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding coordination efforts between LAWA and Metro to provide transit options to LAX, including the relationship between the SPAS alternatives and SPAS Draft EIR to transit connection options being considered by Metro.

SPAS-PC00132-11

Comment:

Alternatives 2 and 4

We prefer Alternative 7 over Alternative 2 because Alternative 7 allows for the inclusion of a center-line taxiway, as discussed above. We would not otherwise oppose Alternative 2, which has been designated the "environmentally superior alternative" (1.5 at p. 1-103), if it were to be combined with Alternative 9. We support the airfield improvements in Alternative 2, which does not relocate Runway6L/24R or Runway 6R/24L, but lengthens Runway 6R/ 24L, and modifies and improves taxiways. The DEIR shows that larger aircraft (Groups V and VI) can be acceptably handled by these modifications to the airfield with no additional runway spacing (see Table 4.7 2-8, at p. 4-514-515). The NASS unanimously concluded that the North Runway Complex is extremely safe, even at projected fleet mix and traffic levels (4.7.2. at p. 4-505). Alternative 2 would also be an affordable option, in that, among other things, it would have the least impact on road traffic noise (4.10.2.6.1 at p. 4-942) and would not require modifications to Lincoln Boulevard or the Argo Drainage Channel that would be required under other options.

Response:

The commentor's support for Alternative 7 over Alternative 2, as well as support for the combination of Alternatives 2 and 9, is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. Regarding enhancements to airfield safety and efficiency under Alternatives 2 and 7, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. Please also see Responses to Comments SPAS-PC00130-3 and SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Please see Response to Comment SPAS-PC00183-2 regarding road traffic noise impacts associated with

Alternative 2. The commentor correctly notes that there would be no modifications to Lincoln Boulevard or the Argo Drainage Channel under Alternative 2. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) However, Chapter 8 of the Preliminary LAX SPAS Report provides estimated costs and an approximation of funding sources for the SPAS alternatives and demonstrates how each alternative would be funded.

SPAS-PC00132-12

Comment:

Alternative 4 would accomplish less than Alternative 2, and for that reason is less desirable. Alternative 4, the option that represents what would happen if all non-yellow light improvements identified in the Alt. D Master Plan were implemented, proposes the same extension of Runway 6R/24L and Taxiway E as Alternative 2, coupled with a CONRAC and new parking lot. However, it would not meet design standards for ADG V and VI aircraft or reduce the need for FAA waivers, and thus does not accomplish as many of LAWA's goals as either Alternatives 7 or 2.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00132-13

Comment:

Alternatives 1, 5 and 6 (moving the runway north):

We oppose these alternatives because of their proposals to move Runway 6L/24R north (Alternative 1: 260 feet north, Alternative 5: 350 feet north, Alternative 6: 100 feet north). It already has been demonstrated that further runway separation is unnecessary for safety (see the NASS, 4.7.2. at p. 4-505). In negating the safety rationale for revisiting the separation distance of Runways 24-L and 24-R, the academic panel also negated any legitimate argument that the communities surrounding LAX must suffer the adverse impacts of runway movement due to safety concerns.

Response:

The content of this comment is identical to comment SPAS-PC00096-8; please refer to Response to Comment SPAS-PC00096-8.

SPAS-PC00132-14

Comment:

Given that the DEIR predicts an increase in the size of the noise contour over surrounding communities from these runway movements (4.10.1.6.1 at p. 4-829 (Alt. 1); 4.10.1.6.5. at p. 4-881-2 (Alt. 5); 4.10.1.6.6 at p. 4-897 (Alt. 6)), we oppose them because it appears that the primary reason to expand LAX in these ways would be to increase the capacity of the airport.

Response:

The content of the comment is similar to comment SPAS-PC00096-9; please refer to Response to Comment SPAS- PC00096-9.

SPAS-PC00132-15

Comment:

Please explain how the impacts associated with the change of uses within the Runway Protection Zones (RPZ) can be considered "less than significant" (1, p. 1-77) when it is clear that Westchester businesses not currently located within an RPZ would be located within it and may need to be destroyed (see, for example, 4.7.2, p. 4-516). This includes much of the Westchester Central Business District along Sepulveda Boulevard south of La Tijera Boulevard. LAWA appears to assume that the airport would have to purchase very little of the existing Westchester business district even through much of it would fall into the RPZ because it assumes that pilots will land mid-runway on Runway 24R. However, there is no guarantee that pilots will land mid-runway or that the FAA will agree that telling them to do so is an adequate protection for the businesses that will be within the RPZ. It is our understanding that the FAA will no longer "grandfather" existing structures, but instead will insist that they be cleared not only from the Runway Safety Area (RSA) but also from the RPZ. The DEIR recognizes these as incompatible uses under FAA design recommendations (4.7.2. at p. 4-522), and recognizes that FAA may require that these structures be removed.

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00130-253; please refer to Response to Comment SPAS-PC00130-253.

SPAS-PC00132-16

Comment:

In addition, LAWA and the City of Los Angeles also are likely to incur a substantial financial burden under any of these three alternatives. We expect that the cost estimates in the DEIR are vastly understated. Do the cost estimates included in the DEIR for this alternative include the cost of purchasing the very profitable properties that likely would need to be purchased at great expense to LAWA and Los Angeles? How was the market value determined for this analysis?

Response:

The economic and social effects of a project are not significant effects on the environment, and thus are not required to be discussed in the SPAS Draft EIR. (State CEQA Guidelines Section 15131(a).) Nevertheless, the costs and funding sources of the alternatives are discussed in Section 8 of the Preliminary LAX SPAS Report. Please see Response to Comment SPAS-AL00007-28 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District. As noted in this response, no acquisition is proposed within the Westchester Business District.

SPAS-PC00132-17

Comment:

In addition, moving the runway north would require very expensive modifications to the Argo Drainage Channel, the Manchester Tunnel and Lincoln Boulevard. In addition, sewer lines may have to be moved. Where does the DEIR analyze these impacts of each of these alternatives?

Response:

This content of this comment is similar to Comment SPAS-PC00096-13; please refer to Response to Comment SPAS-PC00096-13.

SPAS-PC00132-18

Comment:

We do not see an adequate discussion in the DEIR of the following questions:

- What businesses in the Westchester Business District would need to be relocated, and what buildings demolished?

Response:

Please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931 regarding potential impacts on businesses in the Westchester Business District.

SPAS-PC00132-19

Comment:

- What would be the cost of such demolition/relocation? Realistic costs for all proposals should be included that take into account negotiations and potential litigation and include realistic time schedules to accommodate these procedures.

Response:

This content of this comment is similar to Comment SPAS-PC00096-14; please refer to Response to Comment SPAS-PC00096-14.

SPAS-PC00132-20

Comment:

- What would be the loss to the City of Los Angeles from the loss of this tax base and purchasing capability of dislocated businesses and residences?

Response:

SPAS-PC00132-23

Comment:

- Under each alternative, what would be the costs for relocating/realigning/reinforcing Lincoln and Sepulveda Boulevards, including the Sepulveda Tunnel? Because these endeavors would involve other agencies (e.g., the California Department of Transportation) what would be a realistic time schedule to achieve them?

Response:

This content of this comment is similar to Comment SPAS-PC00096-19; please refer to Response to Comment SPAS-PC00096-19.

SPAS-PC00132-24

Comment:

- What would be the scheduling of the implementation of each proposal and how could the costs be expected to increase during the implementation?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding phasing. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements. As noted in that response, CEQA does not require an analysis of cost or project funding. (CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, rough-order-of-magnitude cost estimates were prepared for all of the components of all of the SPAS alternatives evaluated in the SPAS Draft EIR (see Chapter 8 and Appendix G of the Preliminary LAX SPAS Report). The methodology for considering escalation of costs in the cost estimates is described in Section 8.5 of the Preliminary LAX SPAS Report.

SPAS-PC00132-25

Comment:

- Who would pay for the costs associated with the various proposals for reconfiguration?

Response:

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00132-26

Comment:

Alternative 3 (moving the runway south 340 feet):

We oppose Alternative 3 because it unnecessarily proposes to move Run 6R/24L 340 feet south, at significant expense, including demolition of three terminals and extensive central terminal construction, because, as discussed above, the separation of the North runways by this amount of distance is simply unnecessary for either airfield safety or efficiency. The DEIR states that Alternative 3 will increase runway separation from 700 to 1040 feet. These changes would not affect the existing abilities relative to simultaneous arrivals and departures (4.7.2.6.7 at p. 4-563), and in fact, this runway movement may adversely impact operations on the south runway (p. 4-533 fn 406).

Just as with the three Alternatives proposing to move the runway north, the DEIR does not have an adequate cost analysis for the displacement of the newly included businesses that would be located within the Alternative 3 RPZ.

Response:

The content of this comment is similar to comment SPAS-PC00096-21; please refer to Response to Comment SPAS-PC00096-21.

SPAS-PC00132-27

Comment:

The DEIR's discussion of each of the alternative proposals is incomplete because the DEIR does not calculate the unavoidable environmental impacts for each of the alternatives from construction activities, which it attributes to the conceptual nature of the projects (see 4.2.2.1 at p. 4-86). This is another reason why we should be given an additional opportunity to comment upon the environmental impacts of whatever becomes the LAWA staff's preferred alternative. In addition, we expect LAWA would take all precautions with the selected alternative for some offset of such construction impacts by requiring the operating directives mandated for other recent construction projects to mitigate air pollution, noise, dust and disturbance for neighboring communities. Methods and procedures to ensure strict enforcement with these directives must be included in the final EIR.

Response:

The SPAS Draft EIR discloses construction impacts of the alternatives at a program-level of detail. For example, page 4-86 of the SPAS Draft EIR, cited by the commentor, explains the methodology used to develop program-level estimates of construction air pollutant emissions. It is infeasible to further quantify construction impacts because specific construction schedules and phasing programs for individual projects components have not been developed. Should a SPAS alternative be selected for implementation, project-level CEQA documents would present detailed design and construction plans and disclose detailed project-specific construction impacts and mitigation measures. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

Also, please see Topical Response TR-SPAS-LR-1 regarding the fact that the SPAS Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines and the subsequent preparation of a project-level CEQA documents, which address in greater detail construction-related impacts, is appropriate and consistent with CEQA requirements.

Finally, LAX Master Plan commitments and mitigation measures for construction impacts applicable to the SPAS alternatives are delineated throughout Chapter 4 of the SPAS Draft EIR, including, but not limited to, Section 4.2 for air quality and dust and Section 4.10.3 for construction noise. The monitoring and enforcement of those commitments and measures would be detailed in the Mitigation Monitoring and Reporting Program (MMRP) that would be adopted by the Board of Airport Commissioners (BOAC) if they approve one of the SPAS alternatives.

SPAS-PC00132-28

Comment:

We also are very concerned that the expressed Project Objectives for the SPAS (Exec. Summary Section 1.2.1) do not include the goal of regionalization of Southern California air traffic, which we had understood to be a goal of the current mayor of Los Angeles. Please explain why regionalization was not included as a Project Objective. We firmly believe that only an aggressive regional approach to air transportation will mitigate the safety concerns, noise, congestion and air pollution currently impacting the communities surrounding LAX. Only if the air traffic burden can be spread throughout the Southern California region, will we continue to see the economic benefits of a vibrant transportation system without unduly impacting one portion of the Southern California community. Accordingly, we believe that regionalization should have been included in the list of Project Objectives, and the DEIR should have included a discussion of how each alternative will help to accomplish that objective.

Finally, we understand the need to modernize LAX. Given that funding sources are limited, it makes sense for LAWA to invest in infrastructure that will enhance the travel experience, such as improving the

tipper roadway, the signage, the elevators, and restrooms. And, to the extent that creating jobs is an objective of any of these projects, such modernization projects will accomplish that.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California, and the reasons that regionalization was not included as a project objective for SPAS.

SPAS-PC00132-29

Comment:

Because we believe that the airport should be modernized, but not expanded, we do not think that LAWA should undertake any alternative that would be prohibitively expensive. We believe it would make more sense to devote funds to developing facilities elsewhere that can relieve some of the burden of regional air transportation from this portion of Southern California. Given the possibilities of a major earthquake near LAX or a terrorist attack on what is admittedly Southern California's prime target, the economy of this region needs to have other airport facilities.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport and Palmdale Regional Airport. As also described therein, there are six major airports, not just LAX, serving the Southern California region.

SPAS-PC00132-30

Comment:

We hope that LAWA, the Board of Airport Commissioners and the City Council all recognize that these Alternatives are in fact all piecemeal or "Band-aid" solutions that in the long term will result in Los Angeles having the magnificent airport that we all desire. If Los Angeles is truly to have a world-class airport, the city must realize that LAX is not the location for it, because LAX is so constrained geographically. Los Angeles must start to develop an airport where there is space for such an airport, and also build mass transit from downtown directly to that site.

Please let us know if you have any questions regarding our position on these matters.

Response:

The content of this comment is similar to that of comment SPAS-PC00096-24; please see Response to Comment SPAS-PC00096-24.

SPAS-PC00133 Melton, Audrey Iredale Mineral Cosmetics, Ltd. 10/10/2012

SPAS-PC00133-1

Comment:

As a long time resident of Westchester, I fully support "Alternative 2" (modernization with NO runway movement) and "Alternative 9" addressing transportation.

We all want a world class airport, but we object to moving any runway that would grossly impact our community with noise, pollution, and the loss of any more of our business district.

Please take into account any plan that would disrupt the lives of people and property values in one of the best communities in the city of Los Angeles. Be a good neighbor.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration in Sections 4.10.1, 4.10.2, 4.10.3, and 4.10.4 respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

Relative to transit noise and vibration, as indicated in Section 4.10.4 of the SPAS Draft EIR Alternatives 1, 2, and 8 would result in significant but mitigable transit noise impacts at noise-sensitive receptors (hotels) associated with the elevated/dedicated busway system. Transit noise impacts under Alternative 3 related to the two APMs would be less than significant with implementation of mitigation already required under the LAX Master Plan. Under Alternative 9, transit noise impacts related to

operation of the APM operations would be less than significant. Alternative 4 does not propose an elevated/dedicated busway system or APM system; as such, this alternative would not result in any transit-related noise impacts. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not have transit noise impacts, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Transit-related ground-borne vibration would be less than significant for Alternatives 1, 2, 3, 8, and 9. Alternatives 4, 5, 6, and 7 do not propose an elevated/dedicated busway system or APM system and would not result in any transit-related vibration impacts.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives in Section 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. In addition, please see Response to Comment SPAS-PC00189-4 regarding impacts to property values.

SPAS-PC00135-1

Comment:

I sent in some comments a few days ago, and I have some specific questions to add. I also neglected to complete my address which is written below.

1. What is the reason that LAWA wants to move the North runway? If it is safety, exactly what difference will it make?

Response:

LAWA is considering several options for improvements to the north airfield, some of which include relocation of the north runway -- Runway 6L/24R. Specifically, SPAS Alternatives 1, 5, and 6 propose moving the subject runway northward by either 260 feet, 350 feet, or 100 feet, respectively. Alternatives 3 and 7 proposing moving the adjacent runway -- Runway 6R/24L southward by either 340 feet or 100 feet, respectively, while Alternatives 2 and 4 would not relocate either runway. The reasons why LAWA wants to make improvements to the north airfield are described in Section 2.2 of the SPAS Draft EIR, which provides an overview of the problems associated with the current outdated design of the airfield and describes the objectives LAWA seeks in improving the airfield. Section 4.7.2 of the SPAS Draft EIR addresses the safety considerations associated with each alternative, and Table 4.7.2-16 summarizes the differences in safety and efficiency enhancements to the north airfield operations between the alternatives.

SPAS-PC00135-2

Comment:

2. What is the advantage of having a taxiway between the runways?

Response:

As specified in Section 4.7.2.6 of the Draft EIR, a centerfield taxiway, coupled with increased runway separation, would reduce the potential for a runway collision or incursion and enhance safety, particularly as related to future operations involving a greater number of large aircraft. A centerfield taxiway also provides more time and options for Federal Aviation Administration (FAA) air traffic controllers to manage aircraft exiting the outboard runway; more time and distance for the pilot of an arriving aircraft to exit the outboard runway, slow down and hold before crossing the inboard runway; and reduces the potential for incursions and other hazards.

SPAS-PC00135-3

Comment:

3. Are the number of A380s limited because of current north runway configuration, and how are south runways used for A380s?

Response:

The number of A380 operations is not restricted due to the north airfield runway configuration. However, as described in Section 2.2 of the SPAS Draft EIR, the north airfield is not fully designed for the largest aircraft types currently in service (Aircraft Design Group (ADG) VI). While the number of large aircraft is not limited, the north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase aircraft delay. As discussed in Section 4.7.2 of the SPAS Draft EIR, because the north airfield does not meet the Federal Aviation Administration's (FAA) separation standards for ADG VI aircraft, restrictions limiting simultaneous takeoff and landing, as well as taxiing, are in place in order to ensure an acceptable level of safety while these aircraft operate. As

such, the north airfield does not operate in an efficient manner during ADG VI operations. Although the south airfield does not meet the FAA's standards for ADG VI aircraft and has its own set of restrictions, the A380 currently operates safely on the south airfield, but not in an efficient manner due to those restrictions.

SPAS-PC00135-4

Comment:

4. Exactly what will be the difference in noise to residents on the approach for landings and takeoffs if the North Runway is moved 100, 260 or 350 ft? I live in the Osage area--what difference will it make to me?

Response:

A discussion of project impacts resulting from aircraft noise under Alternative 1 (relocate Runway 6L/24R 260 feet north), Alternative 5 (relocate Runway 6L/24R 350 feet north), and Alternative 6 (relocate Runway 6L/24R 100 feet north) as well at Alternatives 2, 3, 4, and 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR.

Regarding noise levels at the commentor's property (located at 5422 West 82nd Street in the community of Westchester), as analyzed in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR, under all of the alternatives the referenced property would not be newly exposed to high noise levels within the 65 CNEL noise contour nor experience an increased probability of nighttime awakening. Therefore, impacts at the commentor's property would be less than significant.

SPAS-PC00136 Bergelson, Gordon None Provided 10/9/2012

SPAS-PC00136-1

Comment:

I endorse the motion was passed at the monthly meeting of the CD11 Transportation Advisory Committee on 10/8/2012 by a vote of 7-0-0:

MOTION-Support of LAX SPAS DEIR Alternatives 2 and 9
The CD11 Transportation Advisory Committee encourages the Los Angeles World Airport (LAWA) to adopt the plan in their LAX SPAS DEIR which ensures the most rapid completion of LAX modernization. Alternative 2 which requires no relocation of the North Runway and Alternative 9 which is a Consolidated Rental Car Facility in Manchester Square supported by some form of rail mass transit which allows for connection into the Westchester business district should be the preferred alternatives. Such a plan, according to DEIR evaluations, addresses the necessary airfield operational efficiency and safety concerns, presents the least intrusive impacts on local communities, and, at the same time, provides the lowest construction cost and construction risks.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that

Alternatives 2 and 9 would present the least intrusive impact on local communities and provide the lowest construction cost and construction risk.

SPAS-PC00137 Mayeron, Candace None Provided 10/9/2012

SPAS-PC00137-1

Comment:

Please add my name to those protesting moving or adding runways on the north side.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00138 Wayne, Alan B None Provided 10/9/2012

SPAS-PC00138-1

Comment:

There is no question that Los Angeles International Airport (LAX) is one of the top two or three economic drivers for the City, the County, and the Southern California region. But that position continues to be undermined by a small, short-sighted, vocal group of airport neighbors who have managed to hold hostage the airport's plans to upgrade the facility's operational efficiency, safety, and competitiveness.

Simply, it is time to put an end to these roadblocks---hurdles that hub airports across the U.S. have either not experienced or solved to essentially eclipse LAX in constructing state-of-the-art airports for the 21st century. Seattle, San Francisco, Denver, Dallas/Ft. Worth, Phoenix, Las Vegas, and Vancouver, B.C. are cases in point and are overshadowing LAX.

While the modernization of the Bradley International Terminal is a long overdue move to begin the comeback of LAX, much more must be done. Reconfiguring the 1960s era out-of-date north airfield complex to effectively and safely handle the next generation of large aircraft (A380, Boeing 787, Boeing 747-800), addressing the aging domestic terminal (circa 1961) where some 80 per cent of the traffic is handled, improving ground access, and passenger processing, and constructing a single car rental facility are uppermost.

I retired in late 2006 as Regional Director of Governmental and Public Affairs for United Airlines after some 27 years based at LAX, and I should point out that these submitted comments only reflect my personal viewpoint as an interested observer.. I am not privy to United's position on the LAX Specific Plan Study (SPAS) Draft Environmental Impact Report (EIR) or the other carriers and am not involved with any of them and have not discussed it with them. However, I have continued to follow industry developments and serve as a member of the Board of Directors of the Aero Club of Southern California and the Flight Path Learning Center and Museum at LAX.

But I can offer a historical perspective. In the 2003/2004 timeframe United and many international carriers supported the Alternative D Master Plan advanced by then Mayor Jim Hahn. As the largest carrier at LAX, United recognized the benefits of the plan that had many forward-thinking elements aimed at modernizing LAX, including a remote passenger check-in facility and a central terminal processing facility. The City Council passed the plan, 12-3 in December 2004, thanks to a coalition

composed of business, labor, airlines and related vendors and led by the Los Angeles Chamber of Commerce and the L. A. County Federation of Labor.

Six months later Councilman Antonio Villaraigosa, one of the three "noe" votes, defeated Mayor Hahn in the mayoral race. In subsequent months key elements of the plan were shelved and various accommodations were reached with the neighborhood dissidents. But the important elements approved by the Council in Alternative D remain on the table, ripening if you will, and dealing with surface transportation improvements, new terminal construction, and the separation of the north runways... and awaiting approval. That process is underway as the alternative actions are reviewed to solve the problems at LAX against the backdrop of not only making it competitive, but also responding to the tremendous need for quality jobs to be injected into the local economy.

As L.A. Chamber president Gary Toebben has stated, enough is enough. This process has gone on for some 20 years and LAX has fallen behind and the constraints have resulted in an airport that trails other hub facilities, particularly those in the West.

It is time to fix LAX.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00139 Redner, Jim theRednerGroup 10/9/2012

SPAS-PC00139-1

Comment:

We have reviewed the nine alternatives currently being suggested for LAX. Based on where we lives (85th Place, between Georgetown and McConnell), across Manchester from the golf course.

As it is, the flights coming in and out are fairly loud and depending on the direction of the wind, we can smell jet fuel. The idea that runways may move up to 350/300 ft closer to where we live is very troubling. The movement will negatively impact our lives with unwanted and potentially harmful pollution (noise and air). If this movement were to occur, it will have undesired repercussions.

With that in mind, we support Alternative 2 and Alternative 9. The improvement of transportation in and out of LAX would help elevate current congestion. Alternative 9 would improve the airport, helping to make it a top destination which it is current not.

Response:

The commentor's support for Alternative 2 and Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With

implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Regarding human health, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, and off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

SPAS-PC00140-1

Comment:

I"m a resident living in Playa Del Rey, for the past 18 years, I am totally against any plans calling for a move of the runway NORTH BY 300ft.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00140-2

Comment:

I waited 10 years for the LAX project to "sound proof " our homes. A total rip off of taxpayers money, the sound of airplanes taking off has not improved our quality of life the nose is constant, our skylights leak, due to poor workmanship, which the LAX authorities continue to ignore.

Response:

Please refer to pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR, for a description of the Aircraft Noise Mitigation Program (ANMP) established to provide soundproofing to eligible properties within the noise impact area (i.e., exposed to 65 or higher noise levels), pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). As described on page 4-666 of the SPAS Draft EIR, priority for soundproofing is typically given to those homes within the noise impact area that are experiencing the highest noise levels.

Regarding leaking skylights, and other purported deficiencies, these are addressed by LAWA's Residential Soundproofing Division (for properties in the City of Los Angeles). LAWA's sound insulation contracts provide homeowners with a one year warranty on installation and a ten year warranty on most of the materials installed. If a homeowner contacts the Residential Soundproofing Division with a complaint about a defect in either the material or the installation, staff verifies if that complaint is covered under the warranties, and if so, the homeowner is directed to the appropriate party. Homeowners are informed of these warranties when they enroll in the program, and copies of the warranties, with contact information, are given to the homeowners at the time the work is completed. When a complaint is outside of the warranty period, the homeowner is provided with information on how to correct the issue. LAWA is aware, however, that homeowners in condominium complexes often mistake problems resulting from lack of regular maintenance with issues resulting from soundproofing installation. These inquiries continue to be addressed by LAWA staff on a case by case basis.

Regarding constant noise, to ensure that interior noise levels have been reduced to 45 CNEL or less after soundproofing (in conformance with Title 21), post-construction noise tests are conducted on a random sampling of homes to verify the efficacy of sound insulation. To date, all post-testing has confirmed that interior noise levels meet this requirement.

SPAS-PC00142-1

Comment:

I have attended one of the public meetings and will be greatly impacted by which Alternative is chosen. I fully support Alternatives and 9.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00143 Davison, Mike None Provided 10/9/2012

SPAS-PC00143-1

Comment:

I support SPAS Alternatives 2 and 9, although with some reservations. I am very much opposed to moving runway 24R north. The 2010 NASA study affirmed that the north airfield is already safe. Taxiway improvements and runway status lights will further improve safety and efficiency.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-68 regarding conclusions of the NASS relative to north airfield safety.

SPAS-PC00143-2

Comment:

Proponents of moving the runway say the north airfield must "shut down" when an A380 lands. Since it is never said for how long, I must conclude that "shut down" is an exaggeration. In any case, because only five A380s are landing at LAX today, and because Gina Maria Lindsey said (at last month's World Route Development Strategy Summit in Abu Dhabi) that "few airlines are using the A380 for its full capacity," it seems ill-advised to spend billions to move a runway to accommodate five below-capacity planes a day.

Response:

As indicated in Section 2.2 of the SPAS Draft EIR and described more fully in Section 4.7.2.3 of the SPAS Draft EIR, the existing outdated design of the LAX airfield does not meet FAA design standards for Aircraft Design Group (ADG) VI aircraft, such as the Airbus A380; consequently, existing operations of the A380 at LAX are subject to a number of special operating procedures and requirements through waivers and modifications of standards. While the north airfield is not "shut down" when an A380 lands,

it does create a number constraints and inefficiencies in maintaining airfield operations. That is one of the airfield problems that the SPAS is attempting to address, as discussed in the project objectives presented in Section 2.2.

A passenger forecast activity forecast was prepared to evaluate the passenger and aircraft activity that may occur at LAX from the Baseline Year 2009 through the Plan Year 2025. For additional information on the forecast, see Section 1 in Appendix F-1 of the Preliminary LAX SPAS Report. The assumed numbers of ADG VI aircraft (which includes the Airbus 380) are included in Tables 8 and 12 of Appendix F-1. As indicated in Table 12, it is projected that the number of daily operations of ADG VI aircraft at LAX will increase to 39 for future (2025) activity levels.

SPAS-PC00143-3

Comment:

In addition, moving runway 24R north would require rerouting and burying Lincoln Boulevard, covering the Argo trench, and likely major rerouting of sewer lines and other infrastructure. Besides being prohibitively expensive certainly not worth it for five planes a day out of what, 800 or so? -- this work would snarl traffic for years. Traffic around LAX is already bad due in part to the lack of north-south streets in the area; it's also bad because Ontario Airport is underutilized, forcing passengers and freight originating closer to Ontario to travel across town to LAX.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. Please see Section 4.12.2 and Appendix K2 of the SPAS Draft EIR for a discussion of off-airport traffic. Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. Please see Topical Response TR-SPAS-REG-1 concerning LA/Ontario International Airport.

Lastly, please note that this comment presents personal opinions about traffic impacts that are unsupported by facts or evidence.

SPAS-PC00143-4

Comment:

I also firmly believe that either the Metro Green Line or an automated people mover must be brought into the CTA. NOT A BUSWAY! Rail transportation into the CTA is an absolute, non-negotiable requirement to make LAX a world-class airport. The current proliferation of buses in the CTA is bad enough; having the largest buses terminate instead at the proposed Intermodal Transportation Facility would make the CTA more drivable.

Response:

The commentor's support for an APM into the CTA (i.e., Alternative 9) or the extension of the Metro Green Line into the CTA is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of the these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Also, please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including the Airport Metro Connector Project, which is evaluating options for extending transit to the airport.

Under Alternatives 1, 2, and 8, consolidated buses would connect passengers between the CTA and the Intermodal Transportation Facility (ITF), as discussed on page 4-1091 (Alternatives 1 and 2) and on page 4-1092 (Alternative 8) in Section 4.12.1.6.1 of the SPAS Draft EIR, which would reduce the number of commercial vehicles accessing the CTA.

SPAS-PC00143-5

Comment:

One aspect of Alternative 2 that I am opposed to is the construction of Terminal 0 east of Terminal 1. SPAS section 4.12.01, page 57, states, "While it is presently assumed that all Terminal 0 passengers will be processed at Terminal 1 or 1.5, changes in security processing or other processing requirements may necessitate those functions be incorporated into Terminal 0." Entering Terminal 1.5 and then walking all the way back to Terminal 0 is not my idea of a world-class airport! If passenger processing is subsequently moved - or shoehorned -- into Terminal 0, then I foresee major traffic backups on the modified Sky Way entrance.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

As it relates to the on-airport transportation analyses, and as a program-level document, the SPAS Draft EIR assumed that Terminal 0 passenger processing would take place at the adjacent Terminals 1 and 1.5, as discussed on page 4-1099 in Section 4.12.1.7.1 of the SPAS Draft EIR.

The potential hosting of passenger processing at Terminal 0 itself would be analyzed in the project-specific Terminal 0 development analyses and CEQA document, should a SPAS alternative including Terminal 0 be selected to move forward.

SPAS-PC00143-6

Comment:

I am opposed to expanding LAX, already the sixth busiest in the world, especially moving runway 24R north. Rather, LAX needs to be modernized with new taxiways and runway lights, rail transportation into the CTA, a consolidated rental car facility at Manchester Square, and renovation of terminals and other facilities that are, as Gina Marie Lindsey was quoted in the 6/14/12 New York Times, "falling apart." In addition, better use needs to be made of Ontario Airport, which will reduce congestion and pollution not only near LAX but across the Los Angeles Basin.

Response:

The commentor opposition to expanding LAX is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

As indicated in Section 2.3 of the SPAS Draft EIR, Alternatives 1, 2, 3, 5, 6, and 7 include taxiway improvements, which would include taxiway lighting. As discussed in Topical Response TR-SPAS-T-1, all of the SPAS alternatives, except for Alternative 4, include ground transportation improvements that would be integrated with the future Metro Crenshaw/LAX Transit Corridor and Station, which would enhance the use of public transit to and from LAX and, in turn, reduce airport-related vehicle trips. Additionally, those alternatives, again with the exception of Alternative 4, include the development of an elevated/dedicated busway or APM system to help reduce airport-related traffic impacts in and near the CTA. Alternatives 3, 4, 8, and 9 include development of a proposed CONRAC, which would include a single consolidated shuttle system to replace the number of individual rental car company shuttles that currently operate at the airport. This is also intended and designed to reduce local impacts from airport-related traffic. Regarding the use of LA/Ontario International Airport, please see Topical Response TR-SPAS-REG-1.

SPAS-PC00144 Smith, Garrett None Provided 10/9/2012

SPAS-PC00144-1

Comment:

Our family and our community has always worked to be understanding good neighbors of LAWA and expected the same respect in return. We support your efforts to make our airport a world class gateway for our guests. Without objection we supported the new Tom Bradley terminal. We are very proud of the progress and look forward to its grand opening.

While it's impossible for me to have reviewed and comprehend the 11,000 plus pages of the draft EIR especially with the limited review and comment period, I will make my best effort to comment on a few observations and concerns.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. To clarify, the text of the SPAS Draft EIR is approximately 1,800 pages in length, not 11,000 plus pages as suggested by the commentor. Printed appendices total approximately 3,000 pages, much of which consists of model output data sheets. Appendix K2-6, which includes intersection level of service worksheets, is provided in electronic format only and is approximately 3,000 pages in length. Please see Response to Comment SPAS-AL00007-59 regarding the length of the public review period for the SPAS Draft EIR. Please also see Responses to Comments SPAS-PC00144-2 through SPAS-PC00144-5 below.

SPAS-PC00144-2

Comment:

A world class airport starts with getting passengers in and out. A transportation system designed to connect passengers with terminals, Metro facilities, consolidated Rental Car Facility, hotels and trains. Transportation is step one. Affordability of a transportation solution is not even a question, it must be done first. This is why I encourage LAWA to adapt Alternative 9 as the first phase of modernization of LAX.

I support the modernization of terminals 1, 2 and 3 even building terminal zero at Park One if necessary. What has taken LAWA so long to remodel these terminals? This is a no brainer. These projects would create more jobs, permanent jobs with living wages and would not have a negative impact on our community. Without question I am in favor of any CTA improvement. Let's get started immediately.

Response:

The commentor's support for Alternatives 9 and for CTA improvements (i.e., terminal components Alternatives 1, 2, 5, 6, and 7) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements.

SPAS-PC00144-3

Comment:

We are 100% in support of safety especially when it comes to our airport. Nothing in this EIR will make us any safer. Out of 11,000 pages I could not find the NASA study, although I was told it was there. The

NASA study, which we spent millions of dollars to conduct, clearly said NO MEASURABLE improvement of safety would be increased by moving the runway north. Runway safety lights should be adequate for pilots to avoid intrusions and near misses.

Response:

The North Airfield Safety Study (NASS) completed by NASA Ames is summarized in Section 4.7.2 of the SPAS Draft EIR (see pages 4-505 and 4-506), is referenced in Section 5.3.1 of the Preliminary LAX SPAS Report (see page 5-76), and is provided in its entirety as Appendix H-6 of the Preliminary LAX SPAS Report.

Please see Response to Comment SPAS-PC00130-168 relative to the development and conclusions of the NASS, and the opinion of the academic panel.

Runway status lights are being installed at LAX; however, there are many other aspects of airfield safety beyond those addressed by such a system. Section 4.7.2 of the SPAS Draft EIR addresses airfield safety.

SPAS-PC00144-4

Comment:

Moving the north runway even one foot north is unacceptable. Now can moving the noise, pollution, vibration, air traffic, light and glare of airport operations be beneficial to our community. The community of Westchester/Playa del Rey cannot give up any more of our business district to LAX, it is unacceptable and unnecessary. Moving the north runway to accommodate any Airbus or other large plane is completely intolerable and to expensive especially since the south runways are perfectly capable to handle these landings and takeoffs. There is only one acceptable Alternative and that is number 2.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District.

As identified in Section 1.2.1 of the SPAS Draft EIR, an objective of the SPAS effort is to "provide north airfield improvements that support the safe and efficient movement of aircraft at LAX". This section also identifies that one of the problems associated with the outdated airfield is that "the primary north airfield departure runway (6R/24L) is too short for certain larger aircraft (e.g., fully-loaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield, resulting in less efficient operations and disproportionate environmental impacts." As discussed and depicted in Section 2.3.1 of the SPAS Draft EIR, each of the SPAS airfield alternatives (Alternatives 1 through 7) includes an extension to Runway 6R/24L to help balance long-haul departures between the north and south airfields. Please also refer to Response to Comment PC00130-511 for additional discussion regarding airfield balance.

SPAS-PC00144-5

Comment:

If any northerly movement of the runway is approved, then any negative impacts must be mitigated including traffic, sound proofing, pollution, vibration, light and glare for our Westchester, Playa del Rey, Inglewood, south Los Angeles communities. There should be NO additional negative impact on our neighbors and business district No loss of income to individuals and small businesses like myself who's customer base is in the Downtown Westchester Business District. Not one more decibel, not one more molecule of pollution and not one more inch of our community.

I strongly encourage you to get busy modernizing our airport, get busy connecting LAX with a great transportation system and leave the north runway alone.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Table 1-6 in Chapter 1 of the SPAS Draft EIR presents the existing LAX Master Plan commitments and mitigation measures, as well as proposed SPAS-specific mitigation measures, that would reduce or avoid environmental impacts, including traffic, noise, air quality, and light and glare impacts. Pursuant to Public Resources Code Section 21081.6(a), LAWA would adopt a mitigation monitoring and reporting program (MMRP) in connection with the approval of any of the SPAS alternatives. The MMRP would define what agency is responsible for each adopted mitigation measure and commitment, when that measure or commitment would be implemented, and what criteria would be used to determine whether the measure or commitment is being implemented and is effective. The MMRP is a means to ensure compliance with mitigation measures and commitments during project implementation.

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the Runway Protection Zone (RPZ), please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester Business District, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

Please see Topical Response TR-SPAS-T-1 regarding transit into LAX.

SPAS-PC00145 Marcellus, Terry A None Provided 10/10/2012

SPAS-PC00145-1

Comment:

I was in attendance at the Westchester High School auditorium townhall meeting. I and my wife Janis live at 8829 Stanmoor Dr., L.A. 90045 and we totally support Alternative 2 (no runway move but improve taxiways and terminal) combined with Alternative 9 (include a ConRAC and and mass transit access to LAX - no bus). We believe that ARSAC's solutions totally reflect our community's position and aspirations. The mayor's office, Councilman Rosendahl, Maxine Waters and many business organizations support Alternatives 2 & 9 as well. We strongly implore LAWA and the FAA to work with us in implementing the two aforementioned alternatives in the DEIR. Thank you for your cooperation and understanding.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00146 Edwards, Demetra L Wood, Smith, Henning & Berman LLP 10/9/2012

SPAS-PC00146-1

Comment:

We have reviewed the nine alternatives currently being suggested for LAX. Based on where we live (6851 W. 85th Place, between Georgetown and McConnell and approximately one block from Manchester), we are extremely concerned with the alternatives suggested for expansion of LAX toward our neighborhood.

Specifically, as it is, the flights coming in and out are quite loud and depending on the direction of the wind, we can smell jet fuel. The idea that runways may move up to 350/300 feet closer to where we live is very troubling both from an environmental standpoint and health standpoint. The movement will negatively impact our lives with a nuisance, particularly unwanted and potentially harmful pollution (noise and air). If this movement were to occur, it will have undesired repercussions and ramifications for the citizens of Westchester.

Response:

The content of this comment is similar to comment SPAS-PC00139-1; please refer to Response to Comment SPAS-PC00139-1.

SPAS-PC00146-2

Comment:

With that in mind, we support Alternative 2 and Alternative 9. The improvement of transportation in and out of LAX would help elevate current congestion. In particular, Alternative 9 would improve the airport, helping to make it a top destination which it is currently not.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Comment:

Thank you for your consideration. Please feel free to contact me should you have any questions or wish to further discuss the concerns of the community.

Response:

The comment is noted.

SPAS-PC00147 Hench, Cyndi Neighborhood Council of Westchester Playa 10/10/2012

SPAS-PC00147-1

Comment:

The Neighborhood Council of Westchester/Playa supports a modern and revitalized LAX. After considering the Specific Plan Amendment Study Draft Environmental Impact Report ("SPAS" or "Study") that details the possible options for improvements at LAX we are excited to support a combination of Alternative 2 and Alternative 9 for the following reasons:

- Combining Alternative 2 and 9 fulfills SPAS goal to have airfield, terminal and transportation improvements.
- Alternatives 2 and 9 are the most affordable design options to ensure that LAX capacity needs are met to protect the economy and tourism.
- Independent evaluators have shown these alternatives to allow for safe operation of all aircraft at LAX.
- The analysis presented in the Study shows that Alternative 2 is superior to all others in airport operational efficiency.
- The analysis also shows that Alternatives 2 is clearly the environmentally superior alternative to the others when air quality and environmental impacts are considered.
- These alternatives will bring $10.5 billion dollars in investment to LAX and the City of Los Angeles.
- The combination of Alternative 2 and 9 provides permanent long-term job opportunities by creating a state-of-the-art passenger facility and transportation system that requires ongoing maintenance and support thus strengthening the Southern California economy.
- Funding for these upgrades will make this the largest project in Los Angeles history. Knowing that funding sources are limited, we encourage LAWA to invest in the infrastructure that will improve the passenger experience and address the transportation issues that surround LAX.

As the first line of welcome to travelers to Los Angeles, the Neighborhood Council of Westchester/Playa is excited to see improvements made to LAX that will modernize and revitalize the nation's #1 origination-destination and third busiest airport in the country. We believe that these alternatives will invest in Los Angeles' economy and build an airport that we can be proud of - that maintains and increases safety, efficiency, and community.

SPAS-PC00148 Morrison, Nancy-Gene None Provided 10/10/2012

SPAS-PC00148-1

Comment:

Safety

My major concerns are safety issues.

How will LAX/LAWA maintain safety for the community surrounding and using LAX?

How will agencies communicate safety information and be notified of malfunctions?

How will the public be informed of malfunctions and safety of using the Sepulveda tunnel when the sign reads, "Danger fire in tunnel Do not enter"?

Who is responsible for inaccurate information and protecting public safety?

On Monday, August 27, 2012 at approximately 1:30 PM, due to a malfunctioning sign on the Sepulveda Tunnel south bound, the sign on the tunnel read "Danger fire in tunnel Do not enter". I phoned 911 as traffic roared through the tunnel and was connected in the following order to:

Los Angeles Police Department
Los Angeles Fire Department
LAX Fire Department-who wanted to know where the Fire was in the Tunnel
LAX Police Department- who were aware of the malfunctioning sign.

LAX Fire Department was never notified of the malfunctioning sign, the agency to be the first responder to any fire at LAX. LAX PD, told me the sign was malfunctioning and that no agency involved was able to turn the sign off. There was no presence of LAX PD, that it was all right to go through the tunnel in spite of the sign.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS Draft EIR addresses safety impacts of the SPAS project in Section 4.7.2 and addresses impacts to fire protection and law enforcement in Sections 4.11.1 and 4.11.2, respectively. The questions in the comment regarding the potential for malfunctions in the signage for the Sepulveda tunnel do not relate to the SPAS project and are beyond the scope of the SPAS EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00148-2

Comment:

What will you do to improve communication between your own airport agencies and protect the public by giving accurate information out?

LAX is located in an active geological area on the Pacific "Rim of Fire" on and close to known earthquake faults.

How will LAX/LAWA respond to an earthquake effecting use and safety at LAX?

Response:

LAWA maintains a comprehensive and effective public safety and communication program, and continually seeks ways to improve it. In 2011, LAWA completed a $14 million emergency response center at LAX to improve coordination and communication in responding to emergencies at LAX. Additionally, LAWA appointed in August 2012 a Director of Emergency Preparedness, Operations and Emergency Response to further develop and coordinate emergency preparedness and response plans at all LAWA airports.

Regarding earthquake risks at LAX, the 2010 Revised NOP and Initial Study for the SPAS Draft EIR explained why these risks for the SPAS alternatives are less than significant. Please also see Response to Comment SPAS-PC00130-878 for a discussion of the seismic-related hazards at LAX.

LAWA's existing emergency response plans include earthquakes. Additionally, the City of Los Angeles Emergency Management Department provides for emergency response plans on a citywide basis.1

1. http://emergency.lacity.org/index.htm.

SPAS-PC00148-3

Comment:

What are the plans for switching operations to Ontario and Palmdale, both of which are operated by LAWA?

It is unwise to "put all your eggs in one basket", i.e. only using LAX for this densely populated large metropolitan area. A regional plan is need for emergencies.

Response:

Please see Topical Response TR-SPAS-REG-1 regarding the status of LA/Ontario International Airport and Palmdale Regional Airport, as well as regionalism of air travel demand within Southern California. As described therein, there are six major airports, not just LAX, serving the region.

SPAS-PC00148-4

Comment:

Why is there NO earthquake preparedness information readily seen by travelers at LAX?

Where are travelers to go if an earthquake occurs while at LAX?

What if any earthquake preparedness do you have for the traveling public?

In the new Denver Colorado airport, tornado shelter information signs are readily seen frequently through out the airport. I believe earthquakes are more frequent, often very small, at LAX than tornados in Denver Colorado.

Response:

The comment, which raises issues about the dissemination of public preparedness information at LAX, is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, please see Response to Comment SPAS-PC00148-2 regarding earthquakes and emergency preparedness/response planning at LAX.

SPAS-PC00148-5

Comment:

There is excellent train service, well marked within the airports at Washington Dulles, Denver and San Francisco. Train service is needed to LAX and between terminals within LAX.

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. As discussed therein, an Automated People Mover (APM) is a part of Alternatives 3 and 9 to provide "train service" to and within LAX. The SPAS alternatives recognize, at a program level, the need for multiple APM station stops within the Central Terminal Area (CTA) to limit passenger walking distance. Details on the final number and locations of APM stations with the CTA would be analyzed during detailed engineering and project-specific CEQA review should a SPAS alternative be selected for implementation.

SPAS-PC00148-6

Comment:

I join with the Neighborhood Council of Westchester/Playa in urging the adoption of

Alternative 2, plus Alternative 9 with a realistic train service plan that includes all the terminals, No centerline taxiway.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00149 Davis, Christina LAX Coastal Area Chamber of Commerce 10/10/2012

SPAS-PC00149-1

Comment:

The LAX Coastal Area Chamber of Commerce has completed its review of the Draft Environmental Impact Report ("DEIR") for the Specific Plan Amendment Study ("SPAS") process and finds that it supports the vast majority of the referenced projects including the completion of the Bradley West Project, the Midfield Satellite Concourse, the new Airport Response Coordination Center, the "New Face" of the Central Terminal Area Improvements/Enhancements, the Network Power Station Upgrade, a new centralized Public Safety Facility, the Consolidated Rental Car Facility (CONRAC), Automated People Mover, parking lot rehabilitation and more. Cumulatively these "landside" projects are the ones that address the aging infrastructure of LAX and give us a facility that will compete for travelers over the next thirty years. These projects are also the most labor intensive and will create the most immediate jobs to jumpstart our economy.

In the past, the LAX Coastal Area Chamber of Commerce actively supported Alternative D, which was adopted by the Los Angeles City Council subject to the "SPAS" process, "Alt D" would have brought us three new terminals and reduced environmental impacts on the community. We strongly supported the new West Satellite Concourse to ensure that the new Group VI aircraft including the A380 and newest 747 would not fly over Los Angeles in preference for competing destinations. We believe strongly in all aspects of the proposals to renovate our terminals and improve the passenger experience at LAX which J.D. Power found "falls way short of meeting customer expectations ranking 68 of 76 global airports in overall airport satisfaction." We were next to last in major US airports in 2010. Indeed, we applaud LAWA's recent focus where it counts: $4 Billion spent on modernization of the passenger experience at the renovated Bradley International Terminal to treat our overseas visitors to a world class experience when they arrive.

However, there is one single project we cannot support - the reconfiguration and relocation of the north airfield runways both because the proposals having nothing to do with economic competitiveness and there is no factual basis for moving the north runways on the basis of safety either today or at any time between now and 2028.

The question must be where and when is it best to invest finite airport dollars to most effectively ensure that LAX is competitive in the 21st century? As business people we must prioritize our spending on capital improvements and so must our airport. It no more makes sense to focus our time and resources on runway configuration than it does to put a cast on your arm when it was your leg that was broken. The "landside" projects which the Chamber supports directly address LAX' deficiencies as identified by J.D. Power. But, not once in the sixty plus page report by J.D. Power did it ever even mention runway configuration as a factor in improving LAX' position at the bottom of airports worldwide.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00149-2

Comment:

Why are Runways Even on the Drawing Board?
At the outset of these comments we feel compelled to put into perspective how we have come to be here today. The general public and policy makers alike were both told that there was a compelling safety reason that necessitated reconfiguring the North runways at LAX. Dissatisfied with the "highly suspect"1 peer reviews that were produced many in the same weekend, the LA City Council took the unprecedented step of delaying this DEIR for two years so that we could get a true unbiased and thorough study done to determine whether safety was truly an issue. Without a safety need, runways would not move. The NASA Study definitively concluded there was simply no safety reason for moving the runways.

It is a universally accepted fact that it is impossible to move these runways further North and make them longer without having an unavoidable environmental impact on the communities to the North - most significantly in the form of increased noise and as a consequence of growth, traffic.

Yet, a Coalition has been formed to ignore the facts and press forward anyway. But without safety as a reason for moving the runway, no policy maker can reasonably conclude that is makes good public policy to subject its population to severe environmental impacts.

Amazingly, of the 1800+ pages of the DEIR only 6 pages are given to summarizing what are described as seven independent assessments. Of these, the only actual comprehensive study done over a period of two years and at an expense of two million dollars and at the express behest of the Los Angeles City Council is given nothing more than a summary (inaccurate at that) and a total of two paragraphs and 16 lines of text.

For the policy maker reviewing this document, this should be a giant red flag as it amounts to a massive and intentional failure to disclose relevant information critical to the core reason that the policy maker is being asked to consider alternative with substantial impacts many of which cannot be mitigated. And to the extent the policy maker reading this is a member of the Los Angeles City Council, the DEIR flies right in the face of what the City Council asked for in demanding the NASA Study take place; to wit, the complete NASA Study and it's Addendum are nowhere to be found in the DEIR.

Ironically, scant days before the findings of the NASA Study were released, most of the key players now pushing for the runways to move North (including the Los Angeles Area Chamber of Commerce, Los Angeles Economic Development Corporation (LAEDC), Central City Association (CCA) and Valley Industry and Commerce Association (VICA)) released a joint communique to the press2 insisting that this study was the one we should all accept as the dispositive final word on the subject. We call on all the signatories to the February 17, 2010 communique to honor their word. They said that the NASA Study "should be the final study that LAWA and the City of Los Angeles conducts to ascertain how to maximize passenger safety at the LAX North Airfield" and that we should all "embrace the results of the study." We agree.

We also call on Mayor Villaraigosa to stand by the statements in his letter dated February 19, 2010 after the NASA Study came out.3 He wrote that:

"Barring other findings that would indicate safety issues, we are not moving the runway."

There have been no "other findings." As the Coalition members above suggested, the NASA Study was the final study. There has been NO STUDY which has contradicted the NASA Study findings that the North runways are safe since it's completion in February 2010 - in fact there have been no further safety studies at all. As Mayor Villaraigosa added:

"the report concludes definitively that the north runways are 'extremely safe under the current configuration' and that is very good news for the millions of travelers who use LAX every year."

Since there is no present safety rationale, the LAX Coastal Area Chamber of Commerce logically declines to support any runway reconfiguration proposal until such time as there is a simple proven need to move the runways. That day has not yet arrived.

1 Los Angeles City Council Resolution number 07-1782 Adopted on June 20, 2007 (attached as Exhibit C).
2 See attached Exhibit "A".
3 See attached Exhibit "B".

Response:

The commentor presents no evidence that the SPAS Draft EIR's summary of the NASS is inaccurate.

SPAS-PC00149-3

CRITICAL PROBLEMS WITH THE DEIR

I) The Proposals in the DEIR Violate the Settlement Agreement
II) There is No Justification for Moving Any Runway Before 2028 at the Earliest
III) NASA Study Addendum Not Even Referenced
IV) NASA Study is the Only Comprehensive Safety Study
V) Failure to Comply with City Council Motion
VI) Other DEIR Deficiencies (Traffic Mitigation/ARGO Ditch/Scoping relocation of Lincoln/
VII) Support for the Consolidated Rental Car Facility (CONRAC)

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00149-4 through SPAS-PC00149-17 below.

SPAS-PC00149-4

Comment:

I. The Proposals in the DEIR Violate the Settlement Agreement

We share the view of Los Angeles County Supervisor Don Knabe who observed that the proposals for study " ... goes against the spirit of the settlement agreement."

Likewise, the Los Angeles City Council has stated that expanding LAX for reasons other than safety

"...would be a clear violation of the 2005 Stipulated Settlement Agreement between LAWA and its neighbors."4

More specifically, we note that the SPAS Study was supposed to provide that Alternative Projects "...provide a comparable level of mitigation to that described for the Yellow Light Projects..."5 Indeed, the Stipulated Settlement also expressly requires "minimizing environmental impacts on the surrounding communities"6 as part of its terms.

During the public outreach process, LAWA itself told the public that the LAX Specific Plan Amendment Study called for by the Settlement Agreement requires that:

"Potential environmental impacts that could result from replacement of the Yellow Light projects with the Alternative Projects, and potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects in the LAX Master Plan Program EIR."7

In summary, LAWA has said one thing while doing another. LAWA has represented to the public that the only allowable alternatives which can even be considered are those which would have no more impact that the Yellow Light Projects. By contrast, LAWA has treated the SPAS process as though it calls for an completely unconstrained blank sheet or de novo review. Most egregiously this now includes the addition of a proposal for runway separation far in excess of the south movement and extension of 24L approved by the Master Plan. We submit that the all of the proposals to move Runway 24R both north and west violate these express provisions of the Stipulated Settlement and therefore exceed the scope of what should properly be considered by the NOP and the DEIR. Their inclusion renders the document fatally flawed.

4 Los Angeles City Council Resolution number 07-1782 Adopted on June 20, 2007. Attached hereto as Exhibit "C".
5 Stipulated Settlement Section V.D.3. @ p.9
6 Stipulated Settlement Section V.C. @ p.9
7 See http://www.laxmasterplan.org/pdf/N_Airfield_-_Land_Use_112206.pdf p.6 PowerPoint slide attached as Exhibit "D". (Emphasis in original)

Response:

The SPAS Draft EIR includes and analyzes a broad range of airfield improvement alternatives, all of which include numerous LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS mitigation measures to minimize impacts on surrounding communities. Table 1-6 in the SPAS Draft EIR lists those commitments and measures for each alternative, which are described in greater detail in Chapter 4 of the document.

With regard to commentor's indication that "all of the proposals to move Runway 24R both north and west violate these express provisions of the Stipulated Settlement" relative to what was otherwise approved in the LAX Master Plan, to move Runway 6R/24L 340 feet south, comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. However, it should be noted that SPAS Alternatives 1, 5 and 6, all of which move Runway 6L/24R both north and west would, in general, result in less air quality and noise impacts than would occur under Alternative 3, which would move Runway 6R/24L 340 feet south. These differences in impacts are evident in SPAS Draft EIR Tables 4.2-10 through 4.2-15 for air quality and Tables 4.10.1-55 and 4.10.1-56 for aircraft noise. For other environmental topics, the environmental impacts of Alternatives 1, 5, and 6 are generally comparable to those of Alternative 3. Additionally, the westerly shift in Runway 6L/24R proposed under Alternatives 1, 5, and 6 would move the existing RPZ out from existing residences located east of the runway. As such, alternatives which move Runway 6L/24R to the north and west would result in similar or less impacts and essentially a better level of mitigation than would otherwise occur under the LAX Master Plan.

In response to the comment that "LAWA has represented to the public that the only allowable alternatives which can even be considered are those which would have no more impact that the Yellow Light Projects. By contrast, LAWA has treated the SPAS process as though it calls for an completely unconstrained blank sheet or de novo review"; the comment provides no evidence of any statement by LAWA consistent with that alleged in the comment. Again, comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA.

SPAS-PC00149-5

Comment:

II. There is no Safety8 Justification for Moving any Runway Before 2028 at the Earliest

The NASA safety study9 concludes with this sentence:

"All things considered, the Panel cannot construct a compelling argument for reconfiguring the North Airfield on safety grounds alone." P .164

"After much analysis, the AP [Academic Panel] unanimously concluded that the existing North Airfield will be extremely safe even under traffic levels projected for 2020, estimating that:

...at 2020 traffic levels, fatal runway collisions on the existing North Airfield would occur on average approximately once every 200 years." Study P157

...according to the current FAA Terminal Area Forecast (TAF) projections LAX will not reach the level of daily operations projected in the LAWA year 2020 demand scenario until the year 2028.10

It is important to note that these findings were based on the projected flight mix at LAX which will be reached in 2028. There is no study which addresses runway safety at a date later than this or at any increased utilization of LAX in the future. Therefore, the conclusion that the north runways need not be reconfigured can only be said to apply up to that date.

Despite these clear and unequivocal findings, the DEIR misleads the reader with respect to both the relative significance of the "independent assessments" completed to date and the conclusions of the most important one of these - the NASA Study. It purports to summarize the findings of the two years of research, simulations and innumerable meetings with stakeholders as directed by the City Council Resolution to a grand total of five bullet points. As a result there are those who have either failed to actually review the source materials or who choose to recklessly cherry pick facts out of context to say moving the runway makes us 55% safer11 and that if we don't do something "there will be blood on our hands." What the 55% advocates didn't tell you when using this percentage number is that the chances are so small to begin with that the number is statistically irrelevant!12

The NASA Study Addendum directly addressed the notion of percentage improvements by saying that:

"As noted earlier, we believe that this "fact" is not informative, and neither does FAA. We never suggested that a centerline taxiway would have no safety benefits: we assume that the 40% reduction in relevant incursions observed at LAX-South would also occur on LAX-North. The issue is: what is the baseline level of risk that would be reduced by 40%?"13

"The AP [academic panel] estimates that, at 2020 traffic levels, fatal runway collisions would occur on the North Airfield at an expected rate of one every 200 years, and that such fatal collisions would cause approximately one death for every 150 million LAX passengers."

Cutting in half the risk means simply that the chances of a fatal runway collision drop from once every 200 years to once every 300 years. Odds are we may not even be using planes at all 200 or 300 years from now! "That number [1/150,000,000] is small compared to the risks that citizens face every day."

"We would summarize our conclusions about mortality risk in the baseline case [i.e no change in runway configuration] as follows:
- The runway-collision risk to LAX air travelers would be extremely low in absolute terms, even at 2020 traffic levels.
- The risk would be very low relative to the other mortality risks that face residents of Los Angeles."

What are the other mortality risks we face every day? The risk of dying on the north runways at LAX is so small it wouldn't even make a dot on the attached chart prepared by the National Safety Council.14 By comparison, it is already 700 times more likely you'll die from being stuck by lightning than because of an accident at LAX. And the odds are 150,000 times more likely someone will die by committing suicide than to die in a runway accident at LAX.

By comparison, the odds are:

1 in 126 of dying by poisoning.
1 in 6609 of being shot to death
1 in 29,196 of dying from a cataclysmic storm
1 in 79,842 of dying from a bee sting!
1 in 97,807 of dying in an earthquake
1 in 111,779 of being executed
1 in 134,000 of being struck by lightning

1 in 150,000,000 chance of dying on the runway at LAX even if we don't move the runways at all.

As the NASA Study concludes:

"The statistic "one in 150 million" is obviously small in absolute terms. It is also extremely small relative to other accident risks that Los Angeles residents and others face: for example, an American baby born today has approximately a 1 in 100 chance of eventually dying in an automobile accident."

8 As a side note, as business organizations it would be unfair to ignore the data provided in the study showing that there is a $5.7 million dollar annual projected savings to the airlines stemming from a 17 second average reduction in taxi times. (Final Report, p.122) But of course at $500 million and up it would take a hundred years to recoup the investment.

This isn't to say that the day will not come when we need to improve the operational efficiency of LAX, but based on the addendum to the NASA Study, we will not even reach the number of flights they assumed until 2028! And, looking at capacity, the study noted that:

"It is noteworthy that, in 2000, when daily operations at LAX were only about 5% below the level projected for 2020, the airport fared quite well."

Furthermore, the DEIR unequivocally states that "Based on the activity level selected for the analysis, none of the alternatives is expected to result in significant operating efficiency gains." Appendix F-2, p.107

9 The entire NASA Study and its Addendum answering and rebutting questions raised by the FAA letter dated April 2, 2010 are attached hereto as Exhibits "E" and "F".
10 Addendum to Final Report, May 15, 2010, p.13.
11 The study uses alternately refers to the risk reduction as 50% and 55% in its findings. The NASA Study concluded that "Compared to the Baseline case, the risk of a fatal runway collision would drop approximately 50% if the existing North Airfield were replaced by the 340' North configuration with a centerline taxiway." p.110.
12 We note also that according to the NASA Study, 40% improvement comes from moving only 100 feet - and that creates just as many jobs. Comparing a runway movement of only 100 feet to 340 feet, the NASA Study found a statistical reduction of 0.5 lives per decade:
"Thus, instead of five lives lost per decade, the estimated number would drop to an average of 2.5. (Compared to 100' North, deaths per decade would drop from three to 2.5.)" p.110.
13 Addendum to Final Report, May 15, 2010, Paragraph 7, p.19.
14 Attached as Exhibit "G".

Response:

As indicated on page 4-505 of the SPAS Draft EIR, the academic panel's review of the technical work completed for the NASS had several main conclusions including, but not limited to: the LAX north airfield is extremely safe under the current configuration for the projected 2020 activity forecast; and, certain improvements to, and reconfiguration of, the north airfield would substantially increase airfield safety (i.e., reduce the risk of a fatal runway collision). The academic panel also concluded that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield (i.e., given that the baseline level of risk is so low, reducing the risk of a fatal runway collision by a substantial level is of "limited practical importance"). The academic panel's opinion, which represents a subjective value judgment on the importance of reducing the risk of a fatal runway collision, is not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation.

Similar to the academic panel's use of statistics and presenting the reduced risk of a fatal runway collision afforded by certain airfield improvement in terms of the existing baseline level of risk, the commentor presents several statistics of the odds of a fatality from events other than a runway collision. That information is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00149-6

Comment:

III. NASA Study Addendum Not Even Referenced

The DEIR also presents an FAA letter written without any simulation or empirical study but then completely omitted reference to the Addendum to the NASA Study that addressed and completely debunked the FAA and other comments. This again misleads the reader of the DEIR by omitting information which impacts the ability of the policy maker to evaluate the choices presented.

In addition to directly refuting claims raised, new and important information presented in the Addendum focused also on the myth that the centerline taxiway built for the south runways at LAX was inherently safer than not having one as on the north. The Addendum noted the following:

- Air Traffic Controllers "judged the existing north configuration without a centerline taxiway as about equally safe as the south airfield with such a taxiway."15

- The south airfield still has more incursions than the north even with the centerline taxiway and additional runway separation! "Indeed, since the centerline taxiway was opened on June 24, 2008, the LAX incursion pattern [was 12 south and 6 north]."

In fact since the Addendum came out, the statistics taken from the DEIR itself show that since the south airfield was reconfigured, for calendar years 2009, 2010 and 2011 combined there have been 25 incursions on the south runways and 11 on the north. In the last three years of data there has been not one single incursion on runway 24R - which is the very runway it is proposed be moved and lengthened. And none of the north runway incursions have been graded as categories A or B meaning that they were all minor incidents that did not rise to a significant safety risk.16

The Addendum put it this way:

"We do not mean to be critical, but the critique suffers an inconsistency. It cannot depict the new LAX South airfield as a paragon of safety and yet claim that the North-which appears just as safe as the South now-poses an unacceptable risk to LAX passengers. If LAX North is really "not good enough," then it follows that neither is LAX South." p.9

It went on to the following conclusions:

"...we would suggest that it is time to stop describing LAX as a high-risk airport. Both the North and South airfields more than "hold their own" against other major US airports."

"If the FAA critique had presented valid criticisms of our analysis, then we would have hastened to make full corrections: never would concerns about "saving face" have meant anything to us compared to the imperative of saving lives. But we were charged with the task of estimating the absolute level of risk for the LAX North Airfield, and were encouraged by all parties to do nothing but tell the truth. This we have done, and this we will continue to do."

15 "It is also instructive to consider the responses of air traffic controllers who took part in the NASA-Ames simulation. The controllers were asked to compare the LAX-North baseline configuration with the new South Airfield with its centerline taxiway. On a scale from 1 to 7, in which 1 meant "LAX North much safer" and 7 meant "LAX South much safer," the controllers gave an average response of 4.2. In short, they judged the existing north configuration without a centerline taxiway as about equally safe as the south airfield with such a taxiway." Addendum p.9.
16 Appendix G2 Safety c p.19.

Response:

The subject Addendum is included within the Final LAX North Airfield Safety Study (NASS) Report of May 11, 2010, which is cited in Footnote 398 on page 4-505 of the SPAS Draft EIR and is provided in its entirety as Appendix H-6 of the Preliminary LAX SPAS Report. While the Addendum includes the

academic panel's responses to the FAA comments, it did not change the conclusions of the Preliminary NASS Report. Those final conclusions of the NASS are presented in the SPAS Draft EIR.

Regarding the comment about the LAX incursions summary presented in Table 4.7.2-7 of the SPAS Draft EIR, it is important to note that, as described in the text immediately below the table (page 4-510), that Categories A and B incursions represent the most serious kinds of incursions, whereas Categories C and D incursions are low-risk surface incidents with ample time and/or distance to avoid a collision. The 36 incursions noted in the comment as occurring in the calendar years 2009, 2010, and 2011 were all Categories C and D incursions. The commentor is correct in noting that none of the north runway incursions during that period have been graded as Categories A or B; however, that is also the case relative to the south runway incursions. Between 2001 and 2007, there were five serious incursions (Categories A or B) on the south airfield, but subsequent to completion of the south airfield improvements, which included the addition of a centerfield parallel taxiway, there have been no serious incursions on the south runways.

SPAS-PC00149-7

Comment:

IV. NASA Study is the Only Comprehensive Safety Study

The NASA Study was so important in comparison to all the other "independent assessments" that preceded it that the Los Angeles City Council voted unanimously to halt the EIR process in its tracks for two entire years so that we would have the benefit of its findings before choosing to move forward with any north runway reconfiguration.

But, the DEIR misleads the reader by suggesting that there were "seven independent assessments" and presents them in merely six pages with the clear implication that they should all be given equal weight by the policy maker assessing the risks affecting the alternatives presented. Of these seven, only one - the NASA Study - was an actual complete study worthy of use to evaluate the alternatives. Mayor Villaraigosa who wrote that:

"I would like to thank the academic panel and NASA-Ames for conducting the most comprehensive airfield safety study ever done for Los Angeles International Airport (LAX). By dedicating approximately 21 months to extensive computer simulation and analysis, these experts have carefully considered all aspects of runway safety on the north Airfield in an unprecedented level of detail." 2/19/10 Statement on Release of North Airfield Safety Study.

Historical perspective is in order to understand that the NASA Study came to fruition because the prior five "independent assessments" as they are referred to by the DEIR were considered,

"highly suspect peer review studies. The studies, conducted in a cursory manner by airline insiders, came to no clear conclusions, and strayed from safety issues to focus on "operational efficiency," which many consider to be code for 'expansion.' LAWA's efforts have convinced practically none of the airport neighbors, who consider the studies to be biased, skewed, focused on the wrong issues, and therefore inconclusive. Additionally, it is concluded in the Motion that objective and thorough analysis, conducted by an independent agency that has credibility with airport neighbors and their elected officials, is imperative."

That language is taken from the Los Angeles City Council's own resolution calling for an "objective and thorough analysis, conducted by an independent agency."

In 2008, the Board of Airport Commissioners voted to move forward with a DEIR for the North Runways. In an unprecedented act, the City Council put the EIR on hold requesting that: "...BOAC direct that the study be conducted, completed and reviewed before the release of the Notice of Preparation (NOP) for the LAX Master Plan Restudy; and that the study's findings be incorporated into the NOP and environmental documents."17

By comparison, of the first five "independent assessments" preceding the NASA Study most of them were done on the same weekend in May of 2007 when industry insiders gathered to produce a few

quickly slapped together papers without any simulation or oversight whatever. These papers were so completely discredited that the City Council directed BOAC to do a real study of the same type done before deciding on configuration of LAX' South Runways - run by NASA and involving real pilots, air traffic controllers and using the state of the art NASA Ames FutureFlight simulation facility to evaluate each proposed design.

The bottom line is the NASA Study represents the gold standard and the DEIR fails to either adequately disclose its findings or provide accurate context for the reader to understand its relative significance to the other "independent assessments" which it is lumped in with even though it is the only actual study completed by any group on the subject.

17 Los Angeles City Council Resolution number 07-1782 Adopted on June 20, 2007.

Response:

The City Council action of June 2007 was to support Councilman Rosendahl's motion to: (1) request the LAWA Board of Airport Commissioners (BOAC) hire an independent firm or organization to conduct a comprehensive and objective study and analysis of north airfield safety issues; (2) request that the BOAC direct the study to be conducted, completed, and reviewed before the release of the Notice of Preparation (NOP) for the LAX Master Plan Restudy; (3) request that the BOAC direct the study to examine certain issues related to airfield safety; and, (4) request that the BOAC form a North Runway Safety Advisory Committee. The LAWA BOAC subsequently considered and agreed to all those requests, and the North Airfield Safety Study (NASS) was completed accordingly.

The project addressed in the SPAS Draft EIR is the SPAS, including the range of alternatives addressed therein. (See Section 1.2 of the SPAS Draft EIR.) The NASS does not address the SPAS project; its purpose was to "inform decision makers on the scope and severity of operation safety problems of the north airfield and a range of potential solutions." (See Section 4.7.2 of the SPAS Draft EIR for additional discussion of the NASS.) Note also that the NASS represents a subjective value judgment on the importance of reducing the risk of a fatal runway collision, which is not shared by the FAA, the federal agency responsible for the safety of civil aviation.

The results of the NASS and five other safety studies related to the north airfield are summarized in Section 4.7.2 of the SPAS Draft EIR, with citations to the complete reports provided as footnotes in that section, and copies of the six study reports provided as Appendices H-1 through H-6 of the Preliminary LAX SPAS Report. These studies provide the public and decision-makers with extensive information to review and consider relative to airfield safety on the north airfield. All six studies were prepared by highly qualified entities and individuals with substantial expertise related to the subject matter. In addition to the six professors who comprised the academic panel for the NASS, the individuals with direct involvement in the other safety studies included professional airline pilots, current and former managers of major international airports, professional airport planners, and aviation safety program managers, planners, and specialists. The individuals with lead involvement in the studies each have decades of experience in commercial aviation, safety, and airport planning.

The ultimate determination of whether to select one of the SPAS alternatives and the rationale for such a determination is left to the decision-makers. This comment will be provided to them for their review prior to making a decision.

SPAS-PC00149-8

Comment:

V. Failure to Comply with City Council Motion

We object to the NOP on the grounds that LAWA has failed to comply with the mandate of the Los Angeles City Council when it created the North Runway Safety Advisory Committee; to wit, "the study's findings be incorporated into the NOP and environmental documents." The conclusions of that study are critical to the policy makers having a true understanding of the need or lack thereof of reconfiguring the north airfield. Put simply, failure to include this critical document as explicitly required by the Los Angeles City Council resolution renders the document defective on its face.

Response:

LAWA issued the original Notice of Preparation (NOP) for the SPAS Draft EIR in March 2008 and, following completion of the LAX North Airfield Safety Study (NASS) in spring 2010, issued a Revised NOP in October 2010. The LAX NASS is specifically noted on page 4 of the NOP. The NASS is also referenced and summarized on page 4-505 in Section 4.7.2 of the SPAS Draft EIR and provided in its entirety as Appendix H-6 of the Preliminary LAX SPAS Report.

SPAS-PC00149-9

Comment:

VI) Other DEIR Deficiencies

Scoping/Timing: The DEIR fails to adequately disclose the timing and sequencing of the various construction projects anticipated at LAX.18 Admitting that the proposal simply lacks sufficient specificity is not an excuse under CEQA. As such environmental impacts during construction cannot be adequately reviewed and may materially understate the cumulative impact of multiple projects proceeding concurrently.

18 The DEIR admits to the deficiency; to wit: "There is not sufficient information at this conceptual level of planning to estimate the construction schedules, construction traffic trip generation, or trip distribution associated with the various development projects, including the SPAS alternatives. Notwithstanding, it is considered unlikely that the nature, location, and timing of the various construction projects would coincide such that traffic volumes on the nearby arterial roadways and highways would double or triple, thereby resulting in significant construction traffic noise impacts. Even using very conservative assumptions regarding construction-related traffic generation and distribution for a recent major development project at LAX (i.e., the Bradley West Project), the traffic volumes on nearby arterial roadways and freeways did not double or triple. It would be speculative at this conceptual level of planning to estimate the nature, timing, and construction traffic characteristics of major improvements projects particular to each of the SPAS alternatives along with the nature, timing, and construction traffic characteristics of other development projects that may occur between now and 2025, such that a specific combination of projects would result in a doubling or tripling of traffic on specific roadways in the airport vicinity. Regarding increases in road traffic noise associated with regional growth anticipated to occur by 2025, please see the discussion under the heading of Road Traffic Noise above.
DEIR p.1-94.

Response:

As indicated on page 2-57 of the SPAS Draft EIR, the nine SPAS alternatives were formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for any of the alternatives. Chapter 4 of the SPAS Draft EIR discloses construction impacts of the alternatives at a program-level of detail. Should a SPAS alternative be selected for implementation, project-level CEQA documents would present detailed design and construction plans and disclose detailed project-specific construction impacts and mitigation measures?

Deferring project-level detailed descriptions of construction plans and impacts to second-tier CEQA documents is not a "deficiency" in a program-level EIR such as the SPAS Draft EIR. Rather, under CEQA, it is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) Please also see Topical Response TR-SPAS-LR-1 regarding the fact that the SPAS Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines and the subsequent preparation of project-level CEQA documents, which address in greater detail construction-related impacts, is appropriate and consistent with CEQA requirements.

Lastly, the statement that cumulative impacts of the SPAS alternatives may be understated if multiple projects proceed concurrently is speculative, and not supported by facts or evidence indicating such concurrent construction is reasonably foreseeable.

SPAS-PC00149-10

Comment:

We also disagree with the premise that it would require a doubling or tripling of traffic to constitute a "threshold of significance."19

19 "...construction-related traffic would not result in a doubling or tripling of traffic volumes on nearby roadways, as would be needed to occur in order to exceed the threshold of significance; therefore, these impacts would be less than significant."
DEIR p.4-964.

Response:

The commentor provides no basis for why the LAX Coastal Area Chamber of Commerce disagrees with the subject statement from Section 4.10.3, Construction Traffic and Equipment Noise analysis, of the SPAS Draft EIR and, moreover, provides no evidence for how or why the statement is inaccurate.

The statement in Footnote 609 on page 4-964 of the SPAS Draft EIR indicating that a doubling or tripling of traffic volumes on nearby roadways would be needed to occur in order to exceed the noise threshold of significance is based on: (1) the significance threshold in Section 4.10.3.4 of the SPAS Draft EIR; and (2) scientific principles of noise generation, including traffic noise, and of the attenuation of sound over distance. As stated on page 4-952 of the SPAS Draft EIR, a significant construction traffic noise impact would occur if implementation of a SPAS alternative would result in the "ambient noise level measured at the property line of affected uses to increase by 3 dBA or more in CNEL." This thresholds is considered very conservative because "humans find a change in sound level of 3 dB is just noticeable…" (SPAS Draft EIR page 4-780).

As stated on page 4-945 of the SPAS Draft EIR, "Acoustic energy is additive in nature. For example the sound energy of two identical vehicles is twice as great as that for one vehicle, and so on; however, the relationship for sound pressure level (SPL), measured in decibels, is logarithmic, not arithmetic. For example, when the energy is doubled, the SPL increases by 3 dB. Therefore, while the energy is doubled when the volume of traffic is doubled, the SPL would increase from, say, 60 to 63 dBA." Based on this well-known and well-established scientific principle of sound generation, a minimum of at least a doubling the existing daily (24-hour) traffic volumes along a roadway would be required to result in an increase of 3 dBA or more in CNEL along that roadway. This 3 dB increase reflects the doubling of traffic volumes alone and does not take into account intervening ground conditions or structures/topography between the noise source (road) and the noise receptor (homes or other sensitive uses). Should the ground surface between the source and the receptor be characterized as "soft," such as in the case of being vegetated, an additional 1.5 dB of noise reduction per doubling of distance from the receptor would occur.1 If there is natural topography, a structure or a noise wall/barrier in the intervening area between the noise source and receptor, additional noise reduction would occur. For example a noise wall that breaks the line-of-sight between the noise source and the receptor provides approximately 5 dB of noise reduction.2 The 3 dB increase noted above also does not account for the likelihood that a doubling of traffic on a roadway would result in a reduction in average speeds on the roadway. A reduction in average speeds would be accompanied by a reduction in vehicle noise levels. As noted above, a doubling of traffic would result in a 3 dBA increase in roadway noise. A tripling of traffic would result in a 4.77 dB increase in roadway noise. In light of the above, the statement that a doubling or tripling of traffic volumes on nearby roadways would be needed to occur in order to exceed the threshold of significance related to construction traffic noise is reasonable and appropriate and is supported by substantial evidence.

SPAS-PC00149-11

Comment:

Additionally, the timing of projects designed to increase passenger capacity of LAX (runway movement) are not provided relative to the construction of those projects that would by design handle the anticipated extra passengers commensurate with the increased capacity. Put simply, any project increasing capacity should be delayed until all mitigation projects are first completed. Landside projects must be finished first.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Phasing of SPAS projects would be determined based on a number of factors, including operational needs, facility requirements, construction sequencing, financing, and other factors. Runway improvements would not increase the capacity of the airport but, rather, would improve safety and operational efficiency. Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield. Please also see Response to Comment SPAS-AL00007-4.

SPAS-PC00149-12

Comment:

Property Condemnation: The DEIR is silent on this issue. It is our understanding that without certain waivers by the FAA relating to the Runway Protection Zone (RPZ) and other property setbacks, that there may be a substantial impact on the Westchester business district including the potential for inverse condemnation proceedings.

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-AL00007-26; please refer to Response to Comment SPAS-AL00007-26.

SPAS-PC00149-13

Comment:

Aircraft Noise: "Significant and unavoidable." Every single proposal has this label and no wonder given that more than 14,000 individuals and over 4000 homes will be directly impacted by noise in excess of 65 CNEL - reducing property values for their owners and quality of life for those who live in the community.20

20 DEIR p.1-84.

Response:

A discussion of project impacts resulting from aircraft noise under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR.

The numbers referenced by the commentor appear to be from Table 1-17 on page 1-84 of the SPAS Draft EIR. This table is referring to the change in the 65 CNEL contour area and the corresponding population and dwelling units within this area compared to 2009 baseline conditions and 2025 No Additional Improvement Conditions (i.e., Alternative 4). Under Alternatives 1 through 7, there would be an increase of between 12,861 and 14,404 residents and between 4,315 and 4,603 dwelling units within the 65 CNEL or higher noise contours compared to 2009 baseline conditions. However, when compared to 2025 No Additional Improvement, there would be between 1,543 and 365 residents under Alternatives 1, 2, 3, 5, 6, and 7 no longer exposed to noise levels of 65 CNEL or higher due to the

movement of the contour away from more densely populated areas, as further described in Response to Comment SPAS-PC00149-2.

The population and dwelling units that would be impacted by exposure to high noise levels (either through new exposure to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours) are presented in Table 1-16 on page 1-83 of the SPAS Draft EIR. As shown on this table, the population that would be newly exposed to noise levels of 65 CNEL would range from 13,259 to 14,691 residents and between 4,809 to 5,151 dwelling units. The population and dwelling units that would be experience a noise increase of 1.5 CNEL or higher within the 65 CNEL or higher contours would range from 12,705 to 19,482 residents and between 4,879 to 7,325 dwelling units.

Regarding property value impacts, CEQA does not require property value impacts or other purely social or economic impacts to be analyzed in an EIR (CEQA Guidelines Section 15064(e)).

Please see Response to Comment SPAS-PC00189-4 for further discussion about impacts on property values. CEQA does not require that impacts on quality of life be assessed, and interpretation of effects on quality of life would likely be subjective and highly variable. The SPAS Draft EIR does however evaluate physical impacts on the environment associated with over 20 topical issues and how such impacts affect residents in surrounding communities.

SPAS-PC00149-14

Comment:

Traffic Mitigation: The entire DEIR is deficient in failing to provide alternatives for mitigation of substantial traffic impacts described in the report. It is no surprise that traffic on the West side of Los Angeles is generally speaking a disaster. Many of the major intersections in a radius of several miles surrounding LAX are already significantly degraded. While the DEIR discloses that no mater which proposal is adopted, more than 40 major intersections will suffer significant impact relative to future conditions "with no feasible mitigation available."21

21 DEIR p.1-49.

Response:

The commentor claims that the SPAS Draft EIR is deficient because it does not provide alternatives for mitigation of traffic impacts, but does not specify any additional mitigation measures or alternatives. As described in Section 4.12.2.7 of the SPAS Draft EIR, specific mitigation measures are identified to address the significant traffic impacts under each alternative. The commentor correctly states that each of the alternatives would result in significant and unavoidable traffic impacts at numerous locations following mitigation when compared to the Future (2025) Without Alternative conditions. As described on page 4-1199 of the SPAS Draft EIR, the Future (2025) Without Alternative conditions hold airport-related traffic at 2010 baseline levels and do not include traffic associated with the natural growth at LAX; the effect of that growth is analyzed together with the effects of the physical changes proposed under each alternative.

SPAS-PC00149-15

Comment:

ARGO Drainage Channel: The DEIR fundamentally fails to address or analyze the impact of relocating runway 24R northward on this significant storm water collector system. Plans currently call for the community to have the benefit of soccer fields and a recreation park as part of the Northside sanitation project which is directly fed by this system. No analysis is presented nor contact made with the United States Corps of Engineers who have oversight of this project.22

22 DEIR pp.44 and 98.

Response:

The SPAS Draft EIR acknowledges that the Argo Drainage Channel would be converted to a concrete box culvert under Alternatives 1, 5, and 6, and evaluates the impacts to hydrology and water quality associated with the conversion in Section 4.8 of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-169 regarding the function of the system following construction of the box culvert. As indicated in that response, following construction of the box culvert, the system would function as it does currently. Flows would enter the culvert at the eastern end of the airport, and would be conveyed through the culvert to an existing concrete box drain and ultimately through the Argo outfall to the Santa Monica Bay. If it were implemented, the Bureau of Sanitation Stormwater Infiltration and Treatment Facility would divert flows from the Argo Drainage Channel into an underground rainwater storage tank. Flows could be diverted from the channel even if it were converted to a box culvert. Future uses within LAX Northside would not be affected.

The U.S. Army Corps of Engineers (USACOE) does not have oversight over the Argo Drainage Channel, although USACOE has regulatory authority over jurisdictional areas (i.e., waters of the U.S.) associated with the channel and mitigation for impacts. The commentor's footnote citation to the SPAS Draft EIR as the basis for their statement is unverifiable, as there are no such pages (i.e., "pp. 44 and 98.") within the subject document. Please see Responses to Comments SPAS-PC00130-201 and SPAS-PC00130-258 regarding USACOE jurisdiction.

SPAS-PC00149-16

Comment:

Relocation of Lincoln Boulevard: Again the DEIR provides inadequate information for the evaluation of the impact of the runway on the location of Lincoln Blvd. and also for the environmental impacts caused during construction of this heavily used north/south commuter artery in forcing the relocation of traffic onto alternative routes in the local community.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00149-17

Comment:

CONCLUSION

We would remind the reader that it was the FAA itself who in 2005 proclaimed that it "considers the airport safe to use today."23 Since then two million dollars and two years were spent on a comprehensive study looking out into the future on 2028 and finding that:

"All things considered, the Panel cannot construct a compelling argument for reconfiguring the North Airfield on safety grounds alone."

As such, the LAX Coastal Area Chamber of Commerce cannot endorse any proposed plan for the realignment or extension of runways on the north airfield at LAX and expresses it's substantial concern that the Draft Environmental Impact Report presented in compliance with CEQA requirements fails to meet the standards set forth therein as a matter of law.

23 FAA Record of Decision for LAX Master Plan Improvements, May 20, 2005, p.41

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please refer to Response to Comment PC00130-168 regarding the North Airfield Safety Study (NASS) and the opinion of the academic panel involved in that study. The opinion of the academic panel is not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation. Additional discussion of the NASS and several other safety studies completed for the north airfield is provided in Section 4.7.2 of the SPAS Draft EIR.

The reconfiguration of the north airfield is not based solely on safety, although safety is an important consideration. As described in Section 1.2.1 of the SPAS Draft EIR, SPAS is also designed to provide north airfield improvements that support efficiency. For example, the current north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase aircraft delay. (See page 1-10 of the SPAS Draft EIR.)

SPAS-PC00150 Marcellus, Terry None Provided 10/10/2012

SPAS-PC00150-1

Comment:

The undersigned has already commented on the SPAS Report and the Draft Environmental Impact Report in the media and as a speaker at the September 27, 2012 Town Hall sponsored by the Neighborhood Council of Westchester Playa. Those comments were in large part to express support for Alternative 2 of the DEIR which would improve airfield efficiency but which would not move the northernmost runway, would not expand outward the perimeter fence of LAX, would not dig up Sepulveda Boulevard, and would not reroute and tunnel Lincoln Boulevard.

As a life-long resident of Westchester, my views are informed by my extensive knowledge of both the history of LAX and the communities adjacent to it. I view it as sheer political and financial folly to even consider a multi-billion dollar runway project that will achieve no significant benefits in either airfield efficiency or safety.

These comments on the DEIR however are not based on my local knowledge or community affiliations. Rather they are written from the perspective of nearly 40 years as an attorney at law and member of the California Bar Association with experience in CEQA/NEPA compliance and infrastructure development.

Knowing to a certainty that protracted litigation will result from a decision to expand LAX and reroute and tunnel Lincoln Blvd., at this time I offer comments on just two issues.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00150-2 through SPAS-PC00150-4 below.

SPAS-PC00150-2

Comment:

WITHIN ITS FIRST FEW PAGES THE DEIR VIOLATES THE TERMS OF THE SETTLEMENT AGREEMENT AND SHOWS ITSELF TO BE A BAIT AND SWITCH ON THE PLAINTIFFS IN THE LITIGATION AND THE PUBLIC.

Article V, section C of the Settlement Agreement, a binding legal document which was the genesis of the DEIR and the SPAS Report, states:

Upon the completion of the initial phase, LAWA will prepare a proposed LAX Specific Plan Amendment Study and prepare all necessary environmental documents. LAWA will make a good faith effort to complete the LAX Specific Plan Amendment Study Process within 24 months of the commencement date of this second phase. The LAX Specific Plan Amendment Study will, consistent with previous local and federal approvals, identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 million annual

passengers while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA. (Emphasis added).

"Creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA." These words constitute the heart and soul of the Settlement Agreement. Without this specific assurance there would have been no settlement. They are the words relied upon by the community as six years, not 24 months passed, and as doubts grew that the SPAS report would indeed enhance safety and security or minimize environmental impacts on the surrounding communities.

Achieving a regional solution to air traffic in Southern California is the key to equalizing both the benefits and the burdens airports bring to communities. It is vitally important for our region in the event of a natural or man-made disaster impacted LAX. And on 28-lined legal paper, in clear words, it is what LAWA agreed in Court to do.

How did LAWA comply with these terms of the Settlement Agreement? What did LAWA do to fulfill its promise?

In the draft EIR, in clear contempt for the Settlement Agreement and the process which brought it about, LAWA declares its "Project Goal" 3 to be the following:

"Maintain LAX's Position as the Premier International Gateway in Supporting and Advancing the Economic Growth and Vitality of the Los Angeles Region."

What a remarkable transformation of priorities and goals. From a solemn commitment to regionalization of air traffic and constrained growth at LAX, to hucksters hype of a growth agenda at LAX. From a serious recognition of a region's transportation needs, to a chamber of commerce promo.

CEQA/NEPA documents must be consistent with their purpose and need and with the project described. The goal of the entire SPAS effort was to fulfill the requirements of the Settlement Agreement. LAWA has failed to do so. Nowhere in the DEIR or SPAS Report is there discussion of the region's overall air traffic circumstances. There is no discussion of the potential of LAWA-owned Palmdale airport, auspicious located at the hub of future rail transportation lines. There is no discussion of the potential and the reality of Ontario airport which has actually lost a major portion of its traffic in the six years LAWA has spent preparing the SPAS Report and DEIR.

Of the three major areas studied by SPAS, ground transportation, terminal modernization and airfield reconfiguration, the failure of the SPAS document to follow its court-ordered mandate calls into question most directly those airfield changes which would require expanding the fence line of LAX and rerouting Lincoln Blvd. The need to provide public transit to the airport and to modernize the terminals is a reality.

At page 1-2 of the DEIR, LAWA devotes two sentences to the Stipulated Settlement, the document which is the foundation of the entire SPAS effort. While LAWA can devote page after page to a self service discussion of LAX as an economic engine, it introduces the Stipulated Settlement with the back of its hand and an attitude that it is of little current significance. The Court may feel otherwise.

LAWA needs to avoid additional litigation by eliminating the SPAS alternatives that would move the northern runway, concentrate its efforts on ground transportation and terminal modernization thereby creating thousands of long term jobs, and follow the Court order to encourage growth at other airports, particularly those owned by LAWA.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. However, there is no conflict between regionalization of air travel demand and, at the same time, maintaining LAX's position as the premiere

international gateway for the region, as called for in Project Objective 3. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As also described therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The Topical Response also discusses the status of LA/Ontario and Palmdale airports.

SPAS-PC00150-3

Comment:

THE DEIR FAILS TO ACCURATELY STATE THE ENVIRONMENTAL IMPACT OF MOVING THE NORTHERN RUNWAY, EXPANDING THE PERIMETER FENCE OF LAX, DIGGING UP SEPULVEDA BLVD AND REROUTING LINCOLN BLVD.

For many reasons moving the northern runway, expanding the LAX fence outwards, digging up Sepulveda Blvd., and rerouting and tunneling Lincoln Blvd will be a massive public works project. The DEIR consistently fails to recognize or intentionally minimizes the environmental impact both during and after construction of such a project. Each of the major elements of such a project would have significant environmental impacts. Taken together the elements constitute a program that would have environmental impacts far greater than those recognized in the DEIR.

Major project elements include:

- Moving runway 24R/6L. Years ago when LAWA moved the southernmost runway it had a construction cost in excess of half a billion dollars. It uncovered an old runway of which LAWA had no record or knowledge. The proposed move of runway 24R/6L would be between twice as far up to six times as far as the southern runway move.
- Conversion of the Argo Drainage Channel to a box culvert. The Argo Drainage Channel is under the control of the Army Corp of Engineers, and is one of the most important flood control facilities in the region. Taken alone, this project would merit study of the most rigorous level.
- Expanding the perimeter fence of LAX. The last time the perimeter fence of LAX was expanded outwards the communities of Westchester and Playa del Rey lost over 4,000 homes and a significant portion of its business district.
- Excavation of Sepulveda Blvd. and rerouting Lincoln Blvd. The intersection of Sepulveda and Lincoln is one of the busiest and most important intersections in the county of Los Angeles. For LAX traffic, it is the last intersection before which travelers from the north enter the airport. For non-LAX regional traffic it is the only major link between the South Bay and the Westside of Los Angeles. At a time when LAWA has been consistently unaware and surprised about what it finds under its own property which it has owned and operated for decades, this project element will take LAWA far outside its own campus and into an area crisscrossed with crisscrossed with major sewer outfall, oil and gas, fiber optic, and wet and dry utility structures.

The DEIR consistently conceals or uses minimizing language to describe the environmental impact of the Lincoln Blvd. program. In many portions of the DEIR reference is made to the runway move without even mentioning these major project elements.

Just as the DEIR ignores, downplays, and minimizes the terms of the Stipulated Settlement, so also the DEIR ignores, downplays and minimizes the environmental impact both during and after construction of the runway move and Lincoln Blvd. realignment.

DEIR tactics used to minimize the environmental impact of the runway move and Lincoln Blvd. realignment include:

- Simply omitting the fact that the Argo Drainage Channel work, the perimeter fence expansion and the Lincoln and Sepulveda work are necessary in order to move the runway.
- Referring to these very large projects with minimizing language such as mere "modifications".
- Referring to these very large projects as "improvements", a description that is highly debatable and not the job of staff to determine.

Examples of the use of these deceptive tactics are many.

- The realignment of Lincoln is treated as if it were a mere curb-and-gutter job where work can be done in non-peak hours and traffic can be managed by single lane closures. In fact more than a mile of Lincoln Blvd. will be altered and the heavily used intersection of Lincoln and Sepulveda will be completely dug up.
- The extensive work on Sepulveda Blvd. is barely mentioned. In fact Sepulveda Blvd. has for decades been the route under which oil from the Baldwin Hills oilfields is transported to the refineries in the South Bay.
- The heavy impact both during and after construction in terms of noise, vibration, visual impairment, air pollution, and light and glare in the areas immediately adjacent to the airport is obscured by using statistics for the region as a whole. Unbelievably, LAWA makes the assertion that the impact of noise will be reduced by the project.

Response:

The commenter does not provide factual support of substantial evidence for the assertion that the environmental assessment and conclusions reached in the SPAS Draft EIR are inaccurate. Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. The environmental impacts of relocating runways within the north airfield, including related projects such as constructing a box culvert in the Argo Drainage Channel and relocating Lincoln Boulevard, are addressed throughout the SPAS Draft EIR. Contrary to the statement by the commentor, the SPAS alternatives would not involve "digging up Sepulveda Boulevard" or "extensive work on Sepulveda Boulevard." As noted in the topical response, the realignment of Lincoln Boulevard would start northwest of the intersection of Lincoln Boulevard and Sepulveda Boulevard. The intersection of Lincoln Boulevard and Sepulveda Boulevard itself would remain in its current configuration; a minor modification to the right turn movement from southbound Sepulveda Boulevard to westbound Lincoln Boulevard may be required. As further noted in the topical response, the SPAS Draft EIR is a programmatic document. Project-level impacts associated with implementation of individual components, including Lincoln Boulevard, will be assessed in future CEQA documents, if Alternatives 1, 5, or 6 are selected for implementation. Specific construction-related impacts to Sepulveda Boulevard would be determined during project-level planning and design.

Please see Response to Comment SPAS-PC00130-904 regarding the abandoned runway that was excavated during construction of the South Airfield Improvement Project.

The SPAS Draft EIR does not omit information about the Argo Drainage Channel. For instance, page 1-14 of the SPAS Draft EIR states that a defining characteristic of the various alternatives is the extent to which the Argo Drainage Channel would have to be modified. Moreover, the Argo Drainage Channel is not under control of the U.S. Army Corps of Engineers (USACOE), although USACOE has regulatory authority over jurisdictional areas associated with the Argo Drainage Channel and mitigation for impacts. Please see Response to Comment SPAS-PC00130-201. Please also see Topical Response TR-SPAS-LR-1 regarding the need for individual SPAS components to undergo project-level environmental analysis prior to implementation.

Please see Topical Response TR-SPAS-LR-1 regarding relocation of the perimeter fence associated with the realignment of Lincoln Boulevard. As noted in the topical response, relocation of the perimeter fence would occur entirely within airport property and would not affect any homes or businesses.

Any impacts associated with noise, transportation, aesthetics, air pollution, and other environmental categories, are discussed throughout the SPAS Draft EIR. Again, commenter does not provide any evidence or facts supporting the contention that the findings are erroneous or were deceptive or intentionally mischaracterized. Please see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities.

SPAS-PC00150-4

Comment:

On the first page of the DEIR it is pointed out that it is a Program Level Environmental Impact Report prepared pursuant to the California Environmental Quality Act. As a result, before a single shovel of dirt

can be tossed (by electeds in hard hats undoubtedly), a full program level Environmental Impact Statement under the National Environmental Protection Act must be prepared and a Record of Decision from the federal government must be obtained.

Approval of these two program level documents is just the opening act to the effort required and the battles that await preparation of a project level EIR/EIS for the runway move, the expansion of the perimeter fence and the realignment and tunneling of Lincoln Blvd. LAWA will then be dealing directly and in infinite detail with such agencies as Caltrans, the Army Corp of Engineers, the Los Angeles Department of Transportation and many, many others. And at the end of this trail lies the Los Angeles Superior Court. Years of expense and uncertainty for both LAWA and the citizens of Los Angeles County lie ahead.

Future passenger traffic at LAX is highly uncertain in view of modest growth and the recent passenger friendly improvements completed at other airports in California. The fate of New Large Aircraft such as the A-380 is questionable at best in view of the clearly emerging preference of airlines for using (and filling) smaller two engine aircraft. Amid these uncertainties, the need to improve ground transportation to LAX and the monetary value of modernizing Terminals 1, 2 and 3 is perfectly clear.

LAWA has one great advantage as it considers moving runway 24R/6L northward. It owns outright the property between the current airfield and Westchester Parkway. That land is not going away. No one else can develop it in conflict with LAWA's future use of the property. It will be as available 20 years from now as it is today.

Money is not hanging off of the rose bushes in the garden next to the Administration Building. LAWA is already engaged in a spending program in excess of $3 billion. At some point the airlines will resist ever higher landing fees at an airport disfavored by the traveling public.

LAWA can safely meet today's air travel demand with its current airfield. LAWA should withdraw from consideration the DEIR alternatives that would move the northern runway. LAWA has received great praise and no community opposition for solving problems at the Tom Bradley International Terminal and the Central Utility Plant. LAWA should continue working to solve today's problems today, and deal with tomorrow's problems tomorrow because tomorrow's problems may never occur.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS Draft EIR acknowledges that, depending on the outcome of the SPAS process, FAA would have to complete environmental review of SPAS pursuant to NEPA and issue a Record of Decision (see page 2-75 of Section 2.4.1 of the SPAS Draft EIR). Furthermore, on page 2-74, the SPAS Draft EIR notes that, depending on the outcome of the SPAS process, additional project-level CEQA review may be required for implementation of the improvements associated with the selected SPAS alternative. Other actions and permits anticipated to be required for the project are identified in Section 2.4 of the SPAS Draft EIR, including actions by the U.S. Army Corps of Engineers, Caltrans, and other agencies.

Regarding passenger traffic forecasts, the assumptions in the SPAS Draft EIR are based on a passenger activity forecast and design day flight schedule (DDFS) that was prepared by experts in the field. Development of the LAX Passenger Forecast and DDFS is documented in Appendix F-1 of the Preliminary LAX SPAS Report. Page 1 of Appendix F-1 acknowledges the uncertainty in the forecast, stating that "[b]ecause future conditions are by definition unknown, future activity results may be different from those predicted in the forecast results. Development of DDFSs carries the further uncertainty of airlines responses to changes in operating costs and demand. Therefore, the 2025 DDFS developed from the LAX Passenger Forecast represents a range of possible, but not necessarily actual, future aircraft activity levels." These uncertainties are further spelled out in Section 2.1 of Appendix F-1. The methodology for developing the future fleet mix assumed in the LAX Passenger Forecast and DDFS is explained on page 23 in Section 4.2 of Appendix F-1. Please also see Response to Comment SPAS-PC00130-643 regarding the fleet mix assumptions.

Please see Response to Comment SPAS-PC00096-2 regarding funding for the SPAS improvements.

LAWA is in agreement with the comment that "LAWA can safely meet today's air travel demand with its current airfield." The SPAS Draft EIR does not indicate that current air travel demand cannot be met safely with the current airfield. In fact, page 4-485 of the SPAS Draft EIR states that "[a]viation today is one of the safest forms of public transportation, particularly in the U.S." However, the SPAS Draft EIR identifies a number of safety issues related to the current design of the north airfield, and evaluates the extent to which safety objectives would be met under each alternative. Please also see Response to Comment SPAS-PC00149-2 regarding safety associated with the north airfield as well as a summary of the project objectives other than safety associated with the north airfield improvements.

SPAS-PC00151-2

Comment:

As a 30-year resident of Westchester Playa del Rey, I support a modern and revitalized LAX. After considering the Specific Plan Amendment Study Draft Environmental Impact Report ("SPAS" or "Study") that details the possible options for improvements at LAX we are excited to support a combination of Alternative 2 and Alternative 9 for the following reasons:

- Combining Alternative 2 and 9 fulfills SPAS goal to have airfield, terminal and transportation improvements.
- Alternatives 2 and 9 are the most affordable design options to ensure that LAX capacity needs are met to protect the economy and tourism.
- Independent evaluators have shown these alternatives to allow for safe operation of all aircraft at LAX.
- The analysis presented in the Study shows that Alternative 2 is superior to all others in airport operational efficiency.
- The analysis also shows that Alternatives 2 is clearly the environmentally superior alternative to the others when air quality and environmental impacts are considered.
- These alternatives will bring $10.5 billion dollars in investment to LAX and the City of Los Angeles.
- The combination of Alternative 2 and 9 provides permanent long-term job opportunities by creating a state-of-the-art passenger facility and transportation system that requires ongoing maintenance and support thus strengthening the Southern California economy.
- Funding for these upgrades will make this the largest project in Los Angeles history.

Knowing that funding sources are limited, we encourage LAWA to invest in the infrastructure that will improve the passenger experience and address the transportation issues that surround LAX. As the first line of welcome to travelers to Los Angeles, I am excited to see improvements made to LAX that will modernize and revitalize the nation's #1 origination-destination and third busiest airport in country. We believe that these alternatives will invest in Los Angeles' economy and build an airport that we can be proud of - that maintains and increases safety, efficiency, and community.

SPAS-PC00151-4

Comment:

Sadly but truly it can be said that one need go no further than Page 1-1 to discern key failings of the Report. Paragraph One, Sentence One of the Report presages LAWA's failure to understanding its place in the city, the county, the region and the world. The sentence reads:

"This Specific Plan Amendment Study (SPAS) Report identifies potential amendments to the LAX Specific Plan that plan for the modernization and improvement of Los Angeles International Airport (LAX) in a manner that is designed for a practical capacity of 78.9 million annual passengers while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by Los Angeles World Airports (LAWA)."

This white paper will assess whether the Lincoln Blvd. realignment and tunnel project is consistent with LAWA's mandate to "minimize environmental impacts on the surrounding community," but with respect to "enhancing safety and security," LAWA's documents fail to give a full and complete disclosure of the finding by the distinguished NASA safety panel that LAX is a safe airport in its current airfield configuration.

Similarly, neither the SPAS Report nor the DEIR include a discussion of what LAWA has done to "encourage airlines to go to other airports in the region, particularly those owned and operated by ... LAWA," i.e. Ontario. One would have to google "Free Ontario Airport" to understand LAX's failings at that facility. Indeed, after years of failure to create a viable airport in Palmdale, the SPAS Report and DEIR fail to recognize and discuss its very strategic and advantageous location to the ever-growing rail network in Southern California. Within the next few years the Palmdale Airport will be at the hub of Metrolink commuter rail service, the Desert Express high speed rail line servicing Las Vegas, and the California High Speed Rail running into the California Central Valley. Ontario Airport is similarly well-placed with the Foothill Light Rail Line having a planned station at the airport.

PROGRAM LEVEL VS PROJECT LEVEL EIR ANALYSIS
RE: THE LINCOLN BLVD. TUNNEL PROJECT

INTRODUCTION AND SUMMARY

The SPAS Report and DEIR recently released by LAWA purports to be a Program Level EIR, not a Project Level EIR, despite the fact that numerous specific projects are identified including an automated people mover, consolidated rental car facility, movement of taxiways and runways on the airfield and modernization of terminals.

This white paper is written to examine one of the projects specifically identified in the documents in the context of the Program versus Project Level EIR debate. It is being written to assist members of the community and the community's legal team to locate and understand detail relevant to the issue which is buried within thousands of pages of technical writing.

The specific project considered herein is the realignment of Lincoln Boulevard to accommodate the move northward of the outboard runway of LAX. This project will in effect swing Lincoln Boulevard, California State Route 1, on a wider arc around the airfield, bringing it much closer to homes, businesses, churches, schools and other sensitive uses in the Westchester community. It will also require that Lincoln be depressed below grade into a tunnel of a length which will depend on the extent of the runway move.

This white paper does not undertake to study all aspects of the runway move. A similar white paper could be written about the implications of converting the Argo Trench to a box culvert or the elimination of the old tunnel which still exists under the north airfield.

Three of the alternatives proposed by LAWA would involve extending the perimeter fence of LAX hundreds of feet into the community and realigning and tunneling Lincoln Boulevard, California State Route 1. All would involve realigning and tunneling Lincoln Blvd.

Alt 1 relocates runway 6L/24R, the outboard runway of the north airfield, 260 feet to the north; Alt 5 relocates this runway 350 feet to the north; and Alt 6 relocates this runway 100 feet to the north. Each of these alternatives require that 6080 feet of Lincoln Blvd. be realigned and each would require that it be depressed into a tunnel. In the case Alt 1, the tunnel would be 252 linear feet; Alt 5 would require a 765 foot tunnel; and Alt 6 would require a 540 foot tunnel.

In contrast to Alts 1, 5 and 6, Alternative 2 would not require moving the LAX perimeter fence or realigning and tunneling Lincoln Blvd.

The subject of Program Level versus Project Level EIRs is dealt with the California's CEQA Guidelines. Under the regulations stated therein, a Program Level EIR may be used to adopt a general plan for the conceptual planning of a district or area. It is designed to provide some level of analysis of "future and unspecified development" (CEQA Guideline 15146(b).

In summary, this white paper demonstrates that the realignment and tunneling of Lincoln Blvd. is a specific, tangible, identified project, not a "future and unspecified" project. A high level of technical analysis has been performed on the project, far more than the "conceptual planning" sanctioned by the Guidelines for a Program Level EIR.

The DEIR and SPAS Report analyze the Lincoln Blvd. project in significant detail including its alignment, linear length tunneling and sloping, and its cost. Doing so reveals that a "project", not a "program" is being proposed. Having opened the door of technical analysis, LAWA is obligated to perform the analysis completely and accurately. LAWA cannot escape the effects of faulty, incomplete, misleading and inaccurate analysis by claiming only a "program level" analysis is required.

Simply stated, LAWA cannot have its cake and eat it too. It cannot disclose innocuous or general details and conceal specific details which reveal serious flaws. It cannot calculate and state the costs of a project without including all of the costs. And it cannot identify some of the impacts of the project without revealing all of the impacts.

One does not need to be a civil engineer to discern that if LAWA is able to calculate the exact length of the tunnel required for the realigned Lincoln Blvd., then it must know Lincoln's proposed path including how much closer it will be to residences, businesses, schools, churches and other sensitive uses. It must also know how deep below surface level the tunnel must be placed including the extensive web of oil and gas pipelines, outfall sewers, water, electrical, fiber optic and other subsurface facilities which will have to be identified, located, and relocated as a result of the project. None of these factors are addressed in the DEIR or SPAS Report.

Having clearly revealed that it has taken the Lincoln Boulevard realignment project past conceptual planning and into preliminary engineering, LAWA must be forced by either community outcry or by court decree to treat the outward expansion of the LAX perimeter fence and the realignment and tunneling of Lincoln Boulevard as a project which can only be entitled by means of a project level EIR.

During the scoping phase of the SPAS process, numerous comments were offered asking that the subsurface structures below Lincoln and Sepulveda boulevards be studied. The failure to do so, or the failure to disclose the result of doing so, constitutes a fatal flaw in the DEIR.

A word about the real-world context of this program versus project level debate: Gina Marie Lindsay and other advocates for moving the runway are openly and repeatedly refusing to defer the issue of the movement of the runway to a later time when more is known about LAX's passenger levels and the success or failure of the New Large Aircraft which the runway move is designed to accommodate. They are declaring that no other projects at LAX can be planned or implemented until the location of the runway is established. Clearly, this statement reveals that a program level EIR is simply not what LAWA needs at this time. At this time LAWA needs and should produce a Project Level EIR to move the runways. If LAWA has determined that the runway move and the attendant realignment and tunneling of Lincoln Blvd. is the lynchpin for all other LAWA projects, then it should withdraw the Program Level EIR, isolate the runway/Lincoln Blvd. project, study it thoroughly and circulate a project level DEIR for it.

SPAS-PC00152-1

Comment:

My neighbors of 89th Street and Stanmore would like for LAX to adopt a combination of Alternatives 2 and 9 and NOT move the north runway further north into our neighborhoods.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00152-2

Comment:

Why is there an assumption that the airport has to allow those new Airbus mega-jetliners landing and taking off even closer to our homes. Your plan to move the runway north and allow bigger planes to use them, will create a more unbearable situation for the residents of Westchester and Playa Del Rey.

If you bring the runway closer to Westchester/Playa Del Rey there will be a tremendous amount of noise pollution thrust upon these communities. Moreover, with this extension northward of the runway toward Westchester/Playa Del Rey, this northernmost runway will be able to accommodate those GIANT Airbus airplanes which make even more noise than regular airplanes.

Thus, by adopting any Alternative that moves the runway north, you will make the family oriented communities of Westchester and Playa Del Rey unbearable due to the foreseeable excessive runway noise.

Another concern is that if you move the runway further north there will be irreparable damage done to Neilson Park. Neilson Park is a family focus in our Westchester/Playa communities. Our children play soccer and baseball there all week long. It's one of our community's many gems. As it stands the planes descend over the edge of the park. Moving the runway north ANY NUMBER OF FEET will have devastating effects on our park. Rather than descending on the southern edge of the park, as currently is the case, planes will, with a northward move of the runway, now be flying at a low altitude directly OVERHEAD. This will have devastating effects for this park as it will not only be intimidating to have planes descend directly overhead but also be deafening for the children and the adults having the jets descend so close to our children and families. The park will be ruined and parents won't let their kids play there for health reasons. The Westchester/Playa Del Rey Little League Baseball and AYSO Youth Soccer programs will be decimated all because of your decision to move the runway further north. Please don't do it.

Please make the right choice and be the good neighbor that you've promised to be and do not move any runways north closer to our communities of Westchester and Playa Del Rey. Don't further encroach on our communities and make them less livable than they already. Take care of the communities, Westchester and Playa Del Rey, which have taken care of LAX.

Response:

A discussion of project impacts resulting from aircraft noise under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As analyzed therein, under Alternatives 1 through 7, some areas within Westchester and Playa del Rey (including areas near 89th Street and Stanmoor Drive) would be newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours.

Regarding the commentor's statement "why is there an assumption that the airport has to allow those new Airbus mega-jetliners landing and taking off even closer to our homes," note that LAWA does not have control over which aircraft operate at LAX. The make and model of aircraft operating at LAX are dictated by the aircraft operators.

To an extent, through LAWA's Aircraft Noise Abatement Program and updates to elements of the Aircraft Noise Abatement Program under LAX Master Plan Commitment N-1 and LAX Master Plan Mitigation Measure MM-N-4, as well as LAWA's Preferential Runway Use policy (SPAS Draft EIR Section 4.10.1.5), LAWA is able to implement some mitigation controls over aircraft activity, but not over which aircraft are being operated.

It is assumed that the commentor is referring to the Airbus A380 with the statements "Airbus mega-jetliners" and "giant Airbus airplanes." The commentor's statement that the Airbus A380s "make even more noise than regular airplanes" is incorrect. According to Airbus Industries and as reflected in the parameters of the Integrated Noise Model (INM) used for the SPAS Draft EIR aircraft noise modeling, the Airbus A380 produces "half the noise energy when taking off" and "three to four times less noise energy when landing" when compared to a Boeing 747-400.1 Through enhanced engine acoustic

treatment and optimized wing design, the Airbus A380 has been recognized by the airport and airline industry for its quietness, both inside and outside the aircraft, when compared to similar wide-body aircraft.

As of today, and as simulated under the SPAS Draft EIR aircraft noise modeling for future conditions, when operating on the north airfield, an Airbus A380 only uses Runway 6L/24R (the runway the closest to the communities of Westchester and Playa Del Rey) for landing and never for taking off, because Runway 6L/24R does not provide enough departure length for the Airbus A380. In general terms, an aircraft is louder during takeoff than it is during landing. Three SPAS alternatives include the northerly relocation of Runway 6L/24R: Alternative 1 (260 feet north), Alternative 5 (350 feet north) and Alternative 6 (100 feet north). Under these three SPAS alternatives, the take-off length of the relocated Runway 6L/24R would remain the same as the current runway take-off length, precluding an A380 from taking off on this runway. Please refer to Response to Comment SPAS-AL00008-30 regarding the numbers of arrivals and departures modeled under the SPAS Draft EIR aircraft noise analyses. It should be noted that airport-related noise impacts in the Playa del Rey area are primarily from aircraft that are departing from, or approaching (under "east flow" conditions when aircraft arrive from the west and land towards the east), the north airfield. Such aircraft are typically several hundred feet up in the air when passing by Playa del Rey.

Please see Responses to Comments SPAS-PC00130-794 and SPAS-PC00130-469 regarding air quality and noise impacts on Nielson Park.

SPAS-PC00153 Acherman, Robert ARSAC 10/10/2012

SPAS-PC00153-1

Comment:

ARSAC STATEMENT ON LAX SPECIFIC PLAN AMENDMENT STUDY
DRAFTENVIRONMENTAL IMPACT REPORT

ARSAC, the Alliance for a Regional Solution to Airport Congestion, reaffirms its opposition to moving the north runway, 24 Right, closer to the communities of Westchester/Playa del Rey.

"Moving Runway 24 Right closer to homes and businesses is unsafe, unnecessary, unacceptable and probably illegal under the Stipulated Settlement Agreement" said Denny Schneider, President of ARSAC. "We will vigorously fight efforts to move the runway to the north, especially when there are better alternatives available to increase safety, security and passenger convenience that would not require destroying homes and businesses in Westchester/Playa del Rey. Furthermore, any movement of the runway to the north will permanently alter flight patterns over Southern California, newly exposing millions of residents to aircraft noise, pollution and safety issues who have not been impacted by LAX operations in the past. If necessary, we will go back to court to protect our communities and to force LAX to reconsider other runway configurations which do not move aircraft closer to Westchester/Playa del Rey."

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS alternatives that would move Runway 6L/24R northward are not "illegal under the Stipulated Settlement Agreement." The Stipulated Settlement requires LAWA to, among other things, study potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address,

consistent with a practical capacity of LAX at 78.9 MAP. The Stipulated Settlement does not preclude study of configurations that include northward runway movements. LAWA has carefully considered a wide range of alternative designs during the SPAS process, as documented in Chapter 5 of the Preliminary LAX SPAS Report. The SPAS process and preparation of the SPAS Draft EIR have been conducted in accordance with the Stipulated Settlement, as described in Section 1.1.2 of the SPAS Draft EIR and reflected throughout the main text and appendices of the Preliminary LAX SPAS Report.

Please see Responses to Comments SPAS-PC00130-736, 800, 814, 815, 816, 843, 848, 849, and 969 which address alternatives suggested by ARSAC.

As noted in Response to Comment SPAS-PC00130-931, no acquisition of residences or businesses is proposed within Westchester or Playa del Rey. Please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield and the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities. The statement by the commentor that "any movement of the runway to the north will…newly expose millions of residents to aircraft noise…" is not accurate. As discussed in Response to Comment SPAS-PC00149-2, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward (Alternatives 1, 5, and 6) than would occur in moving 6R/24L southward (Alternatives 3 and 7) or not moving either runway (Alternatives 2 and 4), and the total residential population newly exposed to 65 CNEL would be lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to >65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) or do not move the runways (Alternatives 2 and 4). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower with alternatives that move Runway 6L/24R northward--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas north of the airport. That is, although more homes to the north of the airport would be impacted by noise with a northward move of Runway 6L/24R, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in an overall decrease in the numbers of homes and people exposed to aircraft noise impacts.

Regarding air quality, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-PC00153-2

Comment:

Schneider continued, "We all want an airport that we can proud of, but it does not mean that LAX adjacent communities have to be sacrificed for the greater good. When the north runway was built in the late 1960's, thousands of Westchester/Playa del Rey residents lost their homes. In addition, many businesses were dislocated from the Westchester Central Business District along Sepulveda Boulevard. It took more than 25 years for the business district to recover from the decimation of the community by LAX expansion. LAX officials promised then that future airport expansion would occur in Palmdale. LAX officials have reneged on their promises. We will hold them to their promises this time."

ARSAC supports a safe, secure and convenient LAX which does not expand into the surrounding communities. ARSAC also strongly backs expanding capacity at Palmdale and Ontario airports to meet Southern California's air capacity needs.

Response:

The commentor's opposition to expanding LAX is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Regarding expansion into surrounding communities, Section 2.3.1.11 of the SPAS Draft EIR delineates the properties proposed to be acquired in conjunction with each of the SPAS alternatives. Those properties are located east of the airport and primarily involve existing airport-related uses. Regarding the role of LA/Ontario International Airport, Palmdale Regional Airport, and other airports in the region for meeting future air travel demands in Southern California, please see Topical Response TR-SPAS-REG-1.

SPAS-PC00153-3

Comment:

As a part of the EIR process, ARSAC submitted several runway, taxiway, terminal and ground access concepts that can transform LAX into a world-class airport without expanding into the surrounding communities. These concepts can be seen on ARSAC's website at www.regionalsolution.org. "We strongly encourage LAX officials and expansion proponents to study and champion our ideas to avoid costly and time-consuming litigation." Schneider concluded.

Response:

The concepts suggested by ARSAC are addressed in the responses to comments contained in comment letter SPAS-PC00130; see in particular Responses to Comments SPAS-PC00130-736, -800, -814, -815, -816, -843, -848, -849, -969, -1022, and -1033.

SPAS-PC00153-4

Comment:

ARSAC is a grass roots organization formed in 1995. ARSAC's mission is to establish a powerful, unified voice of elected officials and business and community leaders to promote a regional solution to the future commercial aviation demands of the entire Southern California region.

*This statement is one day ahead of the anticipated LAWA release of the DEIR and SPAS costing report on Friday, July 27. We have not seen the draft EIR.

Response:

The information concerning the mission of ARSAC is noted. The comment that the press release was published one day prior to the release of the SPAS Draft EIR is also noted. The comment will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

The SPAS Draft EIR was released on July 27, 2012. Electronic and hard copies of the SPAS Draft EIR and Preliminary LAX SPAS Report were provided to ARSAC on this release date.

SPAS-PC00153-5

Comment:

"Moving Runway 24 Right closer to homes and businesses is unsafe, unnecessary, unacceptable and probably illegal under the Stipulated Settlement Agreement" said Denny Schneider, President of ARSAC. "We will vigorously fight efforts to move the runway to the north, especially when there are

better alternatives available to increase safety, security and passenger convenience that would not require destroying homes and businesses in Westchester/Playa del Rey. Furthermore, any movement of the runway to the north will permanently alter flight patterns over Southern California, newly exposing millions of residents to aircraft noise, pollution and safety issues who have not been impacted by LAX operations in the past. If necessary, we will go back to court to protect our communities and to force LAX to reconsider other runway configurations which do not move aircraft closer to Westchester/Playa del Rey."

Schneider continued, "We all want an airport that we can proud of, but it does not mean that LAX adjacent communities have to be sacrificed for the greater good. When the north runway was built in the late 1960's, thousands of Westchester/Playa del Rey residents lost their homes. In addition, many businesses were dislocated from the Westchester Central Business District along Sepulveda Boulevard. It took more than 25 years for the business district to recover from the decimation of the community by LAX expansion. LAX officials promised then that future airport expansion would occur in Palmdale. LAX officials have reneged on their promises. We will hold them to their promises this time.

ARSAC supports a safe, secure and convenient LAX which does not expand into the surrounding communities. ARSAC also strongly backs expanding capacity at Palmdale and Ontario airports to meet Southern California's air capacity needs. As a part of the EIR process, ARSAC submitted several runway, taxiway, terminal and ground access concepts that can transform LAX into a world-class airport without expanding into the surrounding communities. These concepts can be seen on ARSAC's website at www.reqionalsolution.org. "We strongly encourage LAX officials and expansion proponents to study and champion our ideas to avoid costly and time-consuming litigation." Schneider concluded.

ARSAC is a grass roots organization formed in 1995. ARSAC's mission is to establish a powerful, unified voice of elected officials and business and community leaders to promote a regional solution to the future commercial aviation demands of the entire Southern California region.

*This statement is one day ahead of the anticipated LAWA release of the DEIR and SPAS costing report on Friday, July 27. We have not seen the draft EIR.

Response:

The content of this comment is essentially the same as comments SPAS-PC00153-1 through SPAS-PC00153-4 above; please refer to Responses to Comments SPAS-PC00153-1 through SPAS-PC00153-4 above.

SPAS-PC00154 Clarke, Darrell Sierra Club Angeles Chapter 10/10/2012

SPAS-PC00154-1

Comment:

The Sierra Club Angeles Chapter Transportation Committee is submitting the following comments on the Specific Plan Amendment Study Draft EIR, primarily about ground access to LAX. Good mass transit access to LAX is critical to its future functionality and will require close planning coordination between Los Angeles World Airports and Metro.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX, including coordination efforts between LAWA and Metro.

SPAS-PC00154-2

Comment:

Automated People Mover

* Considering that LAX is one of the busiest airports in the U.S. and sees itself competing on passenger amenities with other major U.S. airport hubs, it is absurd to consider the 1970s-era concept of buses looping the Central Terminal Area as competitive with the Automated People Mover (APM) systems installed at most other major airports. California's second-busiest, SFO, is a close model of an APM with stations at each of its three domestic terminals as well as two international terminals, BART, and the rental car facility.

* An APM should have at least two stations (not one) on each side plus the international terminal -if not a station for each terminal, like the current buses do.

Response:

SPAS Alternatives 3 and 9 include an APM system into the CTA. The commentor's suggestions regarding the number and locations of APM stations is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Should a SPAS alternative including an APM be selected for implementation, the number and locations of APM stations would be determined during detailed engineering and project-specific CEQA review. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00154-3

Comment:

* No discussion at the planning level has been made of vertical and horizontal circulation within the airport terminals via pedways and horizontal escalators to connect travelers and their luggage from the mass transit stations into the airport terminals.

Response:

Detailed information related to project-specific terminal improvements, including vertical and horizontal passenger circulation via pedestrian walkways and escalators, or the conveyance of passenger luggage from transit stations, would be developed during detailed engineering and project-specific CEQA review should a SPAS alternative be selected for implementation. Such details would be evaluated in a project-level EIR for the appropriate terminal or transit improvement project. Projects such as the Automated People Mover (APM) system described on page 8 in Section 5.1 in Appendix E2-2 of the Preliminary LAX SPAS Report suggest dedicated pedestrian walkways may be constructed to connect APM stations in the CTA to individual unit terminals, as well as a connection between the future Metro Crenshaw/LAX and Green Line Station to an adjacent APM station.

SPAS-PC00154-4

Comment:

* Routing of an APM should include interface with a potential future Metro rail branch line up the I-405 or Lincoln corridor. A station in the Lot C area would save people arriving on this coastal route from going out of their way to Aviation Boulevard and retracing to LAX.

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including interface with the future transit station at Aviation and Century Boulevards associated with the Crenshaw/LAX Transit Corridor, which parallels the I-405 corridor in the vicinity of LAX. Metro is not currently planning a rail line on the Lincoln corridor. However, the passenger conveyance systems in Alternatives 1, 2, 8 and 9 include a stop at the proposed Intermodal Transportation Facility (ITF) along 98th Street, while Alternative 3 includes a stop at the proposed Consolidated Rent-A-Car facility also along 98th Street. These stops could serve as a connection point between the airport conveyance system and a future Metro rail line serving the Lincoln corridor.

SPAS-PC00154-5

Comment:

* Operating costs of an APM must be compared with operating costs of the bus / BRT proposals, not just capital costs, for a complete financial analysis.

Response:

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. CEQA does not require an analysis of project-related construction or operating costs. (CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.)

SPAS-PC00154-6

Comment:

* The costs and benefits of operations/infrastructure sharing between agencies similar to airline operation code-sharing between airlines is precedent for funding ground transportation like APM or LRT.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). As identified in the SPAS Draft EIR, several alternatives include development of an APM system to assist with ground transportation. (See Section 2.3 of the SPAS Draft EIR.) The funding for such development is discussed in Chapter 8 of the Preliminary LAX SPAS Report. LAWA does not have unlimited discretion to spend all funds assumed for the construction of the alternatives, as some funds are encumbered by federal agencies. For example, funds dispersed pursuant to the Airport Improvement Program and Passenger Facility Charge are limited to certain types of uses identified by the FAA. Therefore, the ability of LAWA to fund certain projects is subject to LAWA's ability to use airport revenue to the extent permissible under federal law and policies, or to develop other state or federal funding sources. Please see Response to Comment SPAS-PC00130-429 for a discussion of the types of funds assumed in the Preliminary LAX SPAS Report.

SPAS-PC00154-7

Comment:

Traffic Measurement

* Current mode share (drive, transit, etc.) of both LAX passengers and employees should be documented and compared with similar major airports.

Response:

As stated in Section 4.12.2 of the SPAS Draft EIR, the current (2010) mode share for the airport was developed based on current and historic data in the Los Angeles International Airport 2006 Air Passenger Survey on the mode of access to LAX.

From a CEQA perspective, it is not necessary to break down baseline traffic into individual types of vehicles (i.e., mode share). As discussed under State CEQA Guidelines Section 15125(a), "the description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives." The mode share for on airport baseline traffic operations is nevertheless provided in Table 4.12.1-5. The mode share for off-airport traffic is included in the baseline conditions described in Section 4.12.2.3 and discussed on page 4-1200. As described in Sections 4.12.1.3.12 and 4.12.2.2.2 the traffic models were calibrated and validated

against existing traffic conditions. The comment is requesting a comparison of LAX current mode share with similar major airports is noted; however, such a comparison would not provide meaningful information to the public and decision-makers relative to selecting one of the SPAS alternatives for approval, nor is this information required by CEQA. The trip generation and passenger travel mode shares of major airports are particular not only to the air passenger characteristics of each airport (i.e., major airports with comparable numbers of million annual passengers [MAP] can have very different vehicle trip generation depending on the split of connecting flights versus origin and destination flights; transport mode choices can vary substantially depending on relative proportions of business travelers versus pleasure travelers, etc.), but, more importantly, are strongly influenced by local and regional traffic conditions as well as the transit characteristics specific to each airport's local setting. For example, both LAX and JFK International Airport are major airports, but have very different public transit facilities in the local area. In short, such a comparison is not relevant to the analysis presented in the SPAS Draft EIR.

SPAS-PC00154-8

Comment:

* How is traffic in the Central Terminal Area loop measured? The stated LOS "B" sounds like an average of light times with jammed times, not a true measure of peak periods.

Response:

As discussed in Section 4.12.1.1 of the SPAS Draft EIR, traffic operations within the Central Terminal Area (CTA) roadway were evaluated based on three types of facilities: curbsides, roadways, and intersections. Terminal area curbsides are evaluated based on a curbside utilization factor which is a measure of the curbside demand in linear feet divided by the available curb length. The utilization factor provides an indication of the amount of double and triple parking that would result for a given space demand, and the Level of Service (LOS) associated with a given utilization rate recognizes that drivers do not park vehicles uniformly along the curbside.

The commentor is referred to Section 4.12.1.2 which provides a detailed discussion for the on-airport transportation analysis methodology. As indicated on page 4-1050 in Section 4.12.1.2.3 of the SPAS Draft EIR, CTA intersection LOS were estimated using the Critical Movement Analysis (CMA) planning level methodology as defined in Transportation Research Board Circular 212, in accordance with LADOT Traffic Studies Policies and Procedures guidelines, and the L.A. CEQA Thresholds Guide. The intersection at the exit point in the CTA adjacent to Terminal 8 on the lower level is a five legged intersection with Center Way and World Way South. The Circular 212 method does not provide for the analysis of five legged intersections; therefore, the LOS for this intersection was determined using Synchro 7 which calculates the LOS at the intersections by measuring the control delay at each leg of the intersection, then calculates the volume to capacity ratio and corresponding LOS.

CTA roadway LOS values for key roadway links within the CTA were prepared by calculating the ratio of roadway volume to capacity. The model used to evaluate curbside performance includes a tool for evaluating the throughput performance of the roadway lanes adjacent to the curbside. For this analysis, vehicle congestion created by stopped vehicles at the adjacent curbside is accounted for when evaluating the impacts on the roadway's throughput capacity.

A detailed description of how traffic conditions on each of the three facilities (curbsides, roadways, and intersections) were evaluated is provided in Section 4.12.1.3.13 on page 4-1074 of the SPAS Draft EIR. The analyses of the CTA departures and arrivals level roadways were conducted for each level's peak hour activity. As stated on page 4-1078 of the SPAS Draft EIR, individual terminals may experience spikes in arriving passenger traffic during other periods of the day which do not coincide with either the arrivals, departures or overall airport peak periods. Spikes at individual terminals not coinciding with peak hours could result in lower LOS values; however, these time periods were not included in this analysis.

SPAS-PC00154-9

Comment:

* There are a number of simple low-cost fixes to improve pedestrian and vehicle movements that should also be explored.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The commentor states that "there are a number of simple low-cost fixes to improve pedestrian and vehicle movements that should also be explored." However, the commentor did not identify these low-cost improvements.

As discussed in Section 1.2.1 on page 1-11 of the SPAS Draft EIR, one of the objectives of the SPAS improvements is to improve traffic flows and pedestrian movements inside the Central Terminal Area (CTA).

SPAS-PC00155 Dillard, Joyce None Provided 10/10/2012

SPAS-PC00155-1

Comment:

In Biological Resources 5.5.3 you mention that Ballona is mitigated to a "level less than significant by an extensive restoration program."

With that, do you refer to the US Army Corps of Engineers and the California Department of Fish and Game Joint Draft EIS/EIR for Ballona Wetlands Restoration Project?

Your use of the word "were" means past tense.

What are the impacts of the different alternatives on this current Draft EIS/EIR?

Response:

Section 5.5.3 of the SPAS Draft EIR identifies existing biological resources in the cumulative impacts study area, including the Ballona Wetlands, which is no longer a part of the Playa Vista project, as well as degraded wetlands in the Playa Vista Planning Area. The reference to an extensive habitat restoration program refers to wetlands restoration associated with the Playa Vista project, which has been completed.

The SPAS Draft EIR does not address cumulative impacts associated with the proposed Ballona Wetlands Restoration Project, which will be the subject of environmental review by the U.S. Army Corps of Engineers (USACOE) and California Department of Fish and Game (CDFG). A public scoping meeting for the Ballona Wetlands Restoration Project Draft EIS/EIR was held on August 16, 2012.1 The SPAS Draft EIR was released on July 27, 2012, prior to the public scoping meeting for the Ballona Wetlands Restoration Project. The Ballona Wetlands Restoration Project is at a preliminary conceptual stage and, as such, the scope of the project has not been finalized and the Draft EIS/EIR has not yet been prepared. The Ballona Wetlands Restoration Project Draft EIS/EIR will evaluate cumulative impacts on biological resources, including cumulative impacts associated with the LAX SPAS project, if any. It is anticipated that future construction of the proposed Ballona Wetlands Restoration Project would result in beneficial impacts to aquatic resources in the vicinity of LAX, and thus would not alter the cumulative impacts analysis presented in Section 5.5.3 of the SPAS Draft EIR.

As stated in Section 5.5.3 of the SPAS Draft EIR, cumulative impacts to aquatic features subject to the jurisdiction of the USACOE and CDFG associated with Alternatives 1, 5, and 6 are considered significant. This finding of significance is based upon the historic loss of jurisdictional aquatic features in the LAX vicinity, including at Playa Vista. With implementation of mitigation described in Section 4.3 of the SPAS Draft EIR (MM-BIO (SPAS)-13), the contribution of SPAS Alternatives 1, 5, and 6 to this significant cumulative impact would not be cumulatively considerable. The other SPAS alternatives would not have any contribution to cumulative impacts on jurisdictional aquatic features.

1. California Department of Fish and Game, Ballona Wetlands Restoration Project Under Way With Public Input, Available: http://cdfgnews.wordpress.com/2012/08/01/ballona-wetlands-restoration-project-under-way-with-public-input/, accessed October 21, 2012.

SPAS-PC00155-2

Comment:

The El Segundo butterfly may be affected by the proposal for the use of 600,000 cubic feet of off-shore beach sand at Dockweiler State Beach for City of Malibu's Beach Replenishment Program.

How would this affect your alternatives?

Response:

The proposal for the use of 600,000 cubic feet of off-shore beach sand at Dockweiler State Beach for the City of Malibu's Beach Replenishment Program would not reasonably be expected to affect the restored dune habitat for El Segundo blue butterfly at the Dockweiler Beach habitat restoration area, as the sand would be dredged off-shore and would not affect the immediate nearshore and upland portions of the beach. The proposed Dockweiler Beach sand source is located approximately 0.5 mile offshore, outside the surf zone, at a depth of 40 - 45 feet. An alternative onshore sand source in Ventura County is also under consideration.1 It should be noted that the proposal to utilize off-shore beach sand at Dockweiler State Beach is preliminary, as the proposal was brought before the City of Los Angeles Department of Recreation and Parks Facility Repair and Maintenance Commission Task Force on October 3, 2012.2 Any environmental review that may have been conducted for the proposal has not yet been publicly released.

As the proposal to dredge sand off-shore of Dockweiler State Beach is not expected to affect El Segundo blue butterfly or its dune habitat, it is not relevant to the cumulative analysis of the SPAS alternatives.

SPAS-PC00155-3

Comment:

For the Hydrology issues, how does mitigation for the TMDLs Total Daily Maximum Load pollutants in the watersheds affect the Proposition O capital project?

Storm drain improvements will reduce TMDLs by what amount.

How is the Operations and Maintenance budget being addressed for this?

How will the alternatives affect Beneficial Uses of the Basin Plan?

What is the testing and analysis timeline for water quality?

Response:

The primary goal of the City of Los Angeles Bureau of Sanitation (BOS) Stormwater Infiltration and Treatment Facility project, consistent with all Proposition O projects undertaken by the City, is to reduce pollutants in urban runoff to help meet the City's TMDL obligations, in this case, those for Santa Monica Bay. Mitigation of water quality impacts associated with the SPAS alternatives would not affect the proposed BOS facility, although the goals would be complementary. By implementing Mitigation Measure MM-HWQ (SPAS)-1, set forth in Section 4.8.7 of the SPAS Draft EIR, LAWA would revise and update the Conceptual Drainage Plan (CDP) to address the selected alternative. Based on the updated CDP, LAWA would implement all identified BMPs to prevent a net increase in pollutant discharges to surface waters resulting from the overall LAX Master Plan improvements including if/as modified by the selected SPAS alternative. By preventing an increase in pollutant loads, the SPAS activities would not contribute any new load of pollutants covered by the TMDLs. Implementation of the BOS Stormwater Infiltration and Treatment Facility project would similarly reduce existing pollutant loads from urban runoff. That project, while on airport property, is independent of SPAS as indicated on page 5-22 of the SPAS Draft EIR.

Operations and maintenance of all LAWA facilities and activities at LAX are funded by airport revenues. This includes the operation and maintenance of all BMPs.

The Beneficial Uses of any water body in the Los Angeles Region are established in the Basin Plan, together with appropriate numerical and narrative water quality objectives to protect the Beneficial Uses. The Regional Water Quality Control Board uses a number of implementation measures to help maintain receiving water quality at or below the objectives. When waters consistently exceed any objective, the Regional Board adopts a TMDL to identify additional specific actions that must be implemented to achieve the objectives. By implementing the identified water quality improvements in the CDP, and implementing its SWPPP, LAWA's actions would meet its obligations under the TMDLs.

There are a number of testing and analysis programs in the area carried out by several agencies in response to Municipal Stormwater Permit and TMDL requirements. LAWA specifically has monitoring requirements identified in its SWPPP that it routinely implements.1

1. City of Los Angeles, Los Angeles World Airports, Los Angeles International Airport Storm Water Pollution Prevention Plan, September 2011.

SPAS-PC00156 Cope, Danna None Provided 10/10/2012

SPAS-PC00156-1

Comment:

Below are some additional comments on the document:

The DEIR fails to address the stipulations of the agreement following the lawsuit. Under these stipulations, LAWA agreed to accomplish several projects, such as:

- Green Light Projects, e.g., the Consolidated Car Rental Facility (even the location is still undecided)

- Establishing eight new Flyaway Bus lines (only two new Flyaway lines have been established)

I fervently hope that the next lawsuit (if one is necessary due to LAWA ignoring or inadequately addressing concerns raised about the DEIR) will result in court orders, not a stipulated agreement which LAWA has chosen to ignore.

Response:

LAWA has not "chosen to ignore" the Stipulated Settlement's terms related to a CONRAC and the FlyAway program. However, comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. Please see Response to Comment SPAS-PC00130-443 regarding the fact that LAWA had been independently advancing the planning and consideration of a CONRAC at LAX; however, the formulation of concept options for overall ground transportation system improvements at LAX, as part of SPAS, provided the basis for further evaluation of the need for, and location of, a CONRAC at LAX.

Please see Response to Comment SPAS-PC00130-957 regarding LAWA's FlyAway program and progress towards establishing additional new stations.

SPAS-PC00156-2

Comment:

It is truly regretible that LAWA does not realize and seize the opportunity it has right now to build Ontario (and/or Palmdale) into an airport that could handle air traffic without having a hugely detrimental effect on established residential communities so close to runways.

The DEIR does mention expanding other airports (especially those owned by LAWA), but postpones such development until LAX reaches 75 MAP. By that time, the opportunities that now exist at other sites will have evaporated, and we would all be stuck with a woefully inadequate and unsafe airport (LAX) which would clog the surface traffic for miles while it tries to handle far too much of the greater LA basin's air traffic. The stipulated agreement stated that LAWA should focus on regionalization, but did not give LAWA an extended time to do so.

Thank you.

Response:

Please see Topical Response TR-SPAS-REG-1 regarding the role of LA/Ontario International Airport, Palmdale Regional Airport, and other airports in the region for meeting future air travel demands in Southern California. The comment provides no facts or evidence supporting the assertion that expansion opportunities that now exist at other airports will no longer exist when LAX reaches its practical capacity.

SPAS-PC00157 Huth, Hans None Provided 10/10/2012

SPAS-PC00157-1

Comment:

Thank you for this opportunity to submit comments on the Specific Plan Amendment Study Draft Environmental Impact Report (SPAS DEIR). Please note that the DEIR is over 12,000 pages long, for which the public has been given less than three months to review. At three months, a comprehensive review would require reviewing over 4000 pages per month. On this note, I would appreciate the review period for the DEIR being extended to next year, so that adjacent communities have a fair opportunity to consider the full impact of the proposed alternatives.

Response:

The commentor's request for an extension of the public comment period for the SPAS Draft EIR is noted. LAWA provided a 75-day review period for the SPAS Draft EIR which ended on October 10, 2012. Section 21091(a) of the Public Resources Code requires that the review period for a Draft EIR

that is submitted to the State Clearinghouse for review shall be at least 45 days. (See also State CEQA Guidelines Section 15105.) The review period for the SPAS Draft EIR provided an additional 30 days for public comment beyond the requirements of CEQA.

It should be noted that the text of the SPAS Draft EIR is approximately 1,800 pages in length. Printed appendices total approximately 3,000 pages, much of which consists of model output data sheets. Appendix K2-6, which includes intersection level of service worksheets, is provided in electronic format only and is approximately 3,000 pages in length.

SPAS-PC00157-2

Comment:

In the interim, I will focus my comments on Chapter 4.2 focused on expected Air Quality Impacts, particularly in regards to PM10, PM2.5 and lead for which the area in question is designated in non-attainment of federal air quality standards, I have many concerns, but will focus on three important points:

(1) Baseline data is not inclusive of the LAX Air Quality and Source Apportionment Study:

As noted in the DEIR chapter 4.2.1.2, the scope of the analysis associated with construction activities requires that the consultant obtain background concentration data from the SCAQMD and estimate future concentrations with construction of each alternative. However, the chapter includes no reference to the LAX Air Quality and Source Apportionment Study, due for release on January 31, 2013. As per LAWA's own comments regarding the Source Apportionment Study:

"It is important to note that this study is focused solely on identifying and properly allocating airport and other emissions affecting the neighborhoods around LAX. However, the results of this study and its documented methodology may be used to guide the approach of future studies attempting to analyze health impacts in surrounding communities."

In light of LAWA's comments, the Apportionment Study and its associated data should be an essential component of a DEIR, especially given its scope of leveraging "future studies attempting to analyze health impacts in surrounding communities." This is critical for evaluating baseline conditions. However, the DEIR completely ignores this study. Instead, the DEIR considers regional air quality monitoring data which, in some cases, is not even in the same municipality. To make this point clear, please note that in section 4.2.3.3, the DEIR is using baseline data for PM 2.5 from an air quality monitoring station located at 3648 North Long Beach Boulevard, in North Long Beach. This is no where near the area that will be impacted by the proposed alternatives. On these grounds, modeling associated with the DEIR is based on an incomplete dataset in that it ignores the Source Apportionment Study, and the potential to use locally available data for PM2.5.

Please note that LAWA acknowledges that the Source Apportionment Study is expected to be released on January 31, 2013. As such, why is the DEIR publication and comment period being rushed in advance of the Source Apportionment Study publication? Why would LAWA ignore this important decade-long study? Couldn't LAWA and its consultant mine this study for the data needed to more accurately predict baseline conditions and model impacts from proposed alternatives, particularly for PM2.5?

Response:

Please refer to Response to Comment SPAS-PC00130-36 regarding the LAX Air Quality and Source Apportionment Study and its ties to LAX construction projects.

SPAS-PC00157-3

Comment:

(2) Fugitive dust from proposed construction staging sites not adequately modeled:

Chapter 2, Section 2.3.1.12 discusses Construction Staging Areas. As noted:

Figure 2-15 represent areas that are, or will be, generally vacant, are located outside of aircraft operation, and are generally suitable for the placement of construction trailers/offices, storage of construction materials, and staging of construction activities. They are considered to be equally available to all of the alternatives.

Seven potential construction staging areas have been identified. Of these, areas "C" and "D" are located directly adjacent to residences within the community of Westchester. In this context, Section 4.2.2.1 notes that:

Fugitive dust emissions resulting from excavation, dirt transfer operations, wind erosion of storage pile, and particle entrainment from vehicle travel on paved and unpaved roadways were quantified as part of the construction emissions inventories.

However, the inventory analysis is flawed in the context of LAWA's existing practices. Specifically, note the following assumption in the DEIR:

An additional source of PM10 and PM2.5 emissions associated with construction activities is fugitive dust. Fugitive dust includes resuspended road dust from both off-and on-road vehicles, as well as dust from grading, loading, and unloading activities.

Watering, as required under LAWA construction contracts and also being one of the main dust suppression measures recognized in SCAQMD Rule 403, was assumed to reduce fugitive dust emissions by 50 percent.

Please note that LAWA is currently using area "C", directly adjacent to Westchester residents as an LAWA site for storing construction material stockpiles and fill dirt without any kind of dust suppression measures. Local residents have witnessed and voiced concerns about these activities to LAWA for years, and yet the activity has recently increased with no mitigation.

As evidence, I have included a photo (collected August 11, 2012) summarizing the activities exercised by LAWA on Area "C". Please take note of the homes and Catholic Middle School (Visitation) plainly visible in the background. Note that there are no dust suppression technologies in place, nor have any been witnessed by the local community over the past three years. Additional photos are included in the following section.

In this context, baseline characterizations for PM 2.5 and PM10, and/or predicted impacts from the associated alternatives should model stockpiling of fill dirt as an unmitigated activity, rather than one that considers dust suppression measures. In addition, the DEIR must include a discussion of what impact moving the existing tons of fill dirt will have if the associated site will be used for other construction-staging activities associated with the proposed alternatives.

Response:

The content of this comment is similar to comment SPAS-PC00130-109; please refer to Response to Comment SPAS-PC00130-109.

SPAS-PC00157-4

Comment:

(3) Assumptions regarding adherence to historical agreements must be revisited in any modeling.

As noted in section 4.2.5 summarizing LAX Master Plan Community Benefits Agreement; X.L., Rock-Crushing Operations and Construction Materials Stockpiles:

This provision requires LAWA to locate rock-crushing operations and construction material stockpiles for all construction related to the LAX Master Plan in areas away from LAX-adjacent residents to reduce impacts form emissions of fugitive dust. This requirement would be included in specifications for any SPAS alternative requiring on-site construction.

However, the activities currently taking place in Area C demonstrate that LAWA is not abiding by this community agreement. As such, any assumptions that LAWA will adhere to this or any other community agreements as a foundation for any modeling of predicted impacts is questionable. The violation of trust is demonstrated by the following photos collected in Area C, directly adjacent to the Westchester community:

In this context, predicted impacts to adjacent communities from ongoing unmitigated activities must reflect what is being witnessed rather than rely on idealistic assumptions that LAWA will begin adhering to historical agreements. Specifically, DEIR modeling must consider that Area C will in fact be used for storage of construction-related fill materials as is currently taking place.

Response:

Comments on activities currently taking place in Area C are not comments on the adequacy of the SPAS Draft EIR or on impacts that would result from the SPAS project. The content of this comment is similar to comment SPAS-PC00130-109; please refer to Response to Comment SPAS-PC00130-109.

SPAS-PC00157-5

Comment:

In closing, I am concerned that the air-quality section of the DEIR is based on incomplete information and idealistic assumptions not based on observed facts. Air Quality modeling associated with DEIR must be revisited in the context of locally and readily available data (i.e. LAX Air Quality and Source Apportionment Study), and must reflect current practices by LAWA rather than assume idealistic adherence to historical community agreements which are being broken. Given that the foundation of the modeling is in question, a revised DEIR is necessary to accurately assess the impacts of the associated alternatives on air quality, particularly PM10, PM2.5 and lead for which the area is already federally designated as impaired.

Response:

Please refer to Response to Comment SPAS-PC00130-109 for a discussion of LAWA's mitigation monitoring as it pertains to construction. Please refer to Response to Comment SPAS-PC00130-36 for a discussion of the LAX Air Quality and Source Apportionment Study.

The air quality impact analysis presented in the SPAS Draft EIR complies with the requirements of CEQA, identifies significant air quality impacts associated with each alternative, and presents the air quality impact results in formats that allow the lead agency to compare the differences between alternatives. No revision to the analysis is warranted.

SPAS-PC00157-6

Comment:

Please take note of the DEIR section that discusses fine particulate matter:

PM10 and PM2.5 can accumulate in the respiratory system and are associated with a variety of negative health effects. Exposure to particulate matter can aggravate existing respiratory conditions, increase respiratory symptoms and disease, decrease long term lung function, and possibly cause premature death. The segments of the population that are most sensitive to the negative effects of particulate matter in the air are elderly, individuals with cardiopulmonary disease, and children. Aside from adverse health effects, particulate matter in the air causes a reduction of visibility and damage to paints and building materials.

As you know, there are elderly families that have lived in Westchester for over a generation. These families purchased their homes and built their lives in Westchester decades before any proposed expansion of LAX. In this context, I would hope that LAWA take into consideration a complete and accurate evaluation of expected air quality impacts on their health and well being rather than rush an incomplete DEIR. LAWA should be just concerned about accurately predicting air quality impacts on the health of residents in adjacent communities as much as it is concerned about airport safety and traffic.

As it now stands, the rushed nature of the DEIR suggests otherwise, and yet lives are in the balance on both sides of the equation.

Response:

The air quality impact analysis of particulate matter (PM10 and PM2.5) follows the methodology for construction described in Section 4.2.2.1 of the SPAS Draft EIR and is consistent with South Coast Air Quality Management District methods for assessing air quality impacts for CEQA documents. As indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), PM10, and PM2.5 would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

The human health risk associated with toxic air contaminants released during construction and operation of the SPAS alternatives are identified in Section 4.7.1 of the SPAS Draft EIR. As indicated in that section, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). The health impacts of pollutants on the elderly are discussed in Section 4.2.1.1 of the SPAS Draft EIR. Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. The primary health impact for acrolein is as an irritant for the eyes and nasal passages. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

SPAS-PC00158 Branham, Tammy Dollar Thrifty Automotive Group, Inc. 10/10/2012

SPAS-PC00158-1

Comment:

DTG Operations, Inc. has reviewed the above study and we would like to comment on options that include a consolidated facility on Lot C. The rental car industry worked with staff at LAWA and a team of consultants to develop a consolidated rental car facility at Lot C. Due to height restrictions, we were not able to find a solution that worked on that property.

The Manchester Square option would allow for a multiple level facility that is not restricted by the height limitations at Lot C. We urge you to only consider a consolidated rental car facility at Manchester Square, or another parcel of land that would allow for multiple levels.

Lot C does not meet the current needs of the rental car industry and would not meet the future needs. Manchester Square meets the current needs and allows for future growth. If we are going to build a consolidated facility that improves the rental car experience for our mutual customers, we cannot do it on Lot C.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00159 Ouellet, James V None Provided 10/10/2012

SPAS-PC00159-1

Comment:

After reviewing what I could of the Specific Plan Amendment Study and Draft Environmental Impact Report, I have some questions which are listed below.

1. In making its long-term forecast of airfield safety, please state whether LAWA is making the assumption that no new technology that would improve on ASDE-X and Runway Status Lights will ever be introduced to improve airfield safety? The SPAS-DEIR makes no mention of the possibility that a new technology could come along to further improve airfield safety. LAWA certainly includes a forecast of lower automobile emissions (owing to improving technology) when it discusses 2025 air quality.

Response:

The SPAS Draft EIR analysis of airfield safety takes into account the existing and proposed FAA/LAWA safety measures that are described on pages 4-501 and 4-502. While LAWA will continue to consult and coordinate with the FAA regarding any future advancements in airfield safety technology that could be implemented at LAX, the SPAS airfield safety analysis did not assume or take credit for such future possibilities, as that would be speculative. The SPAS Draft EIR air quality analysis took into account lower vehicle emissions rates for future year emissions based on the fact that those state and federally mandated reductions in emissions are a matter of law and are already incorporated into the EMFAC vehicle emissions factors developed by the California Air Resources Board for the specific purpose of modeling future year conditions.

SPAS-PC00159-2

Comment:

2. Page 4-502 (3rd bullet) says that LAWA and FAA agreed to expanded, improved Runway Status Lights. Then in May, 2011 FAA balked due to budget constraints. Then "Based on discussions between LAWA and the FAA in December 2011, the FAA is re-evaluating the scope and budget with the goal of initiating the implementation in 2012. In order for the safety benefit of this technology to be fully realized, an airfield geometry designed to accommodate modern aircraft is needed."

Is this saying FAA is refusing to provide funding for safety upgrades unless LAX redesigns the North Airfield to fully comply with FAA design standards for ADG V and ADG VI aircraft? The sentence quoted above sounds as if the FAA is trying to force LAWA to undertake a redesign the North Airfield before FAA will release funds for RWSL. Is that a correct interpretation of the sentence? Are LAWA and the FAA cooperating in this delay in order to force adoption of Alternatives 1, 5 or 6? State what progress has been made in fully implementing Runway Status Lights on the North Airfield since this paragraph was written.

Response:

As described in the subject discussion on page 4-502 of the SPAS Draft EIR, LAWA and the FAA entered into a Memorandum of Agreement for a full implementation (Phase 2) of runway status light system technology at LAX and although the Phase 2 system has been designed, implementation of the system was delayed by the FAA due to budgetary constraints; however, the installation of Phase 2 is

expected to occur in 2013. Implementation of the Phase 2 system is not dependent upon or awaiting the selection of any of the SPAS alternatives.

SPAS-PC00159-3

Comment:

3. Identify which North Airfield safety studies were done: 1) before the installation of ASDE-X and Runway Status Lights, 2) which were done after and 3) which took into consideration improved safety benefits of runway status lights and ASDE-X.

Response:

As indicated on pages 4-501 and 4-502 of the SPAS Draft EIR, the existing ASDE-X and Runway Status Light systems at LAX went into operation in 2009. As indicated on pages 4-502 through 4-505, the majority of north airfield safety studies were completed on 2007, with the exception of the North Airfield Safety Study (NASS), which acknowledges both ASDE-X and Runway Status Lights.

SPAS-PC00159-4

Comment:

4. The SPAS-DEIR summary of the various North Airfield safety studies unfairly lumps them together, for example, by saying that all agree that North Airfield safety would be improved by moving Runway 24R further north. For each study, please identify: 1) the total cost of the study, 2) the man-hours involved in actually studying North Airfield safety in each study, 3) whether the study attempted to the quantify the likely risk of disastrous runway crash and loss of life versus merely evaluating North Airfield compliance with FAA standards, 4) Whether the study addressed the issue of the whether the cost of moving Runway 24R north is worth the benefit in improved safety.

Response:

The content of this comment is similar to comment SPAS-PC00130-250; please refer to Response to Comment SPAS-PC00130-250.

SPAS-PC00159-5

Comment:

5. Page 4-505 describes the FAA criticism of the North Airfield Safety Study (NASS) performed by the Academic Panel in cooperation with NASA. It is shameful that the SPAS-DEIR does not even mention that the Academic Panel studied the FAA critique and issued a lengthy and detailed response.

Please amend the SPAS-DEIR to include a fair description of the Academic Panel's response to the criticisms brought against their report. The following quotes taken from the Academic Panels response should be included in any LAWA document that describes the FAA critique and the Panel's response:

"After reviewing the FAA critique of our study, we see no reason to amend our estimates. We disagree with the assessment that our work suffered from 'several critical flaws in the study's assumptions, methodology and conclusions.' We continue to believe that our analysis was logical, accurate, and conservative." "If the FAA critique had presented valid criticisms of our analysis, then we would have hastened to make full corrections: never would concerns about 'saving face' have meant anything to us compared to the imperative of saving lives." (Italics in the original.)

Response:

The content of this comment is similar to comment SPAS-PC00130-728; please refer to Response to Comment SPAS-PC00130-728.

SPAS-PC00159-6

Comment:

6. Table 4.7.2-9 (p. 4-516) lists 10 off-airport commercial parcels in the RPZ at the west end of the outboard runway, 24R. Google satellite views show zero structures in that area. Please list those structures and GPS coordinates of each.

Response:

The commentor may be referring to the 10 commercial parcels identified for the Departure RPZ on Runway 24R in Table 4.7.2-9 of the SPAS Draft EIR. The locations of those 10 parcels are shown in Figure 4.7.2-7. The structures that occupy those parcels, which are all located along Sepulveda Boulevard south of Westchester Parkway, include, but are not limited to, the Parking Spot, the Paradise office building, and miscellaneous commercial retail shops along the east side of Sepulveda Boulevard. Given that the comment references "in the RPZ at the west end of the outboard runway" the commentor may be thinking of the RPZ for Runway 6L, also shown in Figure 4.7.2-7, which is absent of any notable structures.

SPAS-PC00159-7

Comment:

7. Table 4.2-13: LAWA computes into its 2025 forecast a decrease in pollution
produced by on-road vehicles - people coming to the airport in cars. Those changes will be almost entirely due to new vehicle fuel economy rules passed by Congress, not by any changes at LAX. Why it appropriate to calculate those changes into forecasts of total pollutant counts? In effect, LAX will generate more pollution by increased air traffic but gives itself a "freebie" reduction in car-generated pollution.

Response:

The air emissions summarized in Table 4.2-13 of the SPAS Draft EIR were developed following standard CEQA methodology - the future project conditions are compared to baseline conditions (i.e., the conditions that exist at the time the Notice of Preparation was issued). This approach is consistent with the California Code of Regulations, Title 14, Chapter 3 (Guidelines for Implementation of the California Environmental Quality Act), Section 15126.2(a).

The model used to estimate emissions from cars and trucks, the USEPA and CARB-approved EMFAC model, takes into account the effect on emissions of regulations that have been adopted and are being implemented.

In addition to the standard comparison of air quality impacts relative to the existing (baseline) conditions, an additional comparison is included for informational purposes in Section 4.2.6 of the SPAS Draft EIR, as summarized in Table 4.2-14. This second approach compares conditions for a given alternative to those for Alternative 4, which is essentially a no project alternative relative to airfield improvements (i.e., the majority of emissions associated with the SPAS alternatives are from aircraft; hence, a delineation of, and comparison to, emissions estimated to occur in the future if no airfield improvements were implemented provides a meaningful indication of how airfield emissions would either increase or decrease due to changes in aircraft operations under each alternative that proposes airfield improvements). This approach eliminates the time difference (i.e., 2009 versus 2025) since all comparisons are made relative to a future no project condition, thus the emissions factors for all sources are the same. The differences shown in Table 4.2-14 indicate a given alternative's increase or decrease in 2025 emissions compared to doing nothing by 2025.

SPAS-PC00159-8

Comment:

8. Emissions due to construction are reported in peak emissions (in lbs/day) or peak concentration. Nothing in the Main document mentions total emissions, which would vary considerably, depending on which alternative is pursued. Please provide ROM estimates of total construction emissions for Alternatives 1-7 in a single table.

Response:

The total construction emissions, in tons, for each pollutant under each alternative are presented in Appendix C, Attachment 1, Table 1 of the SPAS Draft EIR.

SPAS-PC00159-9

Comment:

9. Page 4-451 which discusses human health impacts of the various alternatives,
says this: "In addition, Alternative 2 would have lower aircraft emissions than Alternatives 1, 3, 4, 5, 6, and 7." In contrast, page 4-130 says this: "In comparison to the other alternatives, Alternative 1 peak daily aircraft emissions for all criteria pollutants (CO, VOC, NOx, SO2, PM10, and PM2.5) would be lower than aircraft emissions under Alternatives 2, 3,4, and 7. Alternative 1 aircraft emissions would be the same or greater than aircraft emissions under Alternatives 5 and 6."

Which is it? Are emissions higher lower under Alt 1 or under Alt 2?

Response:

The aircraft emissions from Alternative 1 would be higher than aircraft emissions from Alternative 2 when viewed over the long term (months or years) but lower when viewed from a peak daily basis. This situation arises because aircraft fly in various types of weather conditions, and the weather on a given day affects the aircraft delays in the air and on the ground.

Most of the time, aircraft fly under visual flight rules (VFR) in and out of LAX, which has the best (lowest) impact on delays. Therefore, annual average emission calculations were made using VFR weather conditions. When emissions are averaged over a year or more, the emissions from Alternative 2 would typically be lower than those from Alternative 1. Since the discussion on page 4-451 of the SPAS Draft EIR was summarizing impacts related to long-term cancer risk, the evaluation correctly described Alternative 2 as having lower aircraft emissions than the other build alternatives because the impacts were based on long-term exposure.

On the other hand, the criteria pollutant impact analysis in Section 4.2.6 of the SPAS Draft EIR is discussing peak daily emissions from aircraft since the South Coast Air Quality Management District (SCAQMD) thresholds of significance for operational emissions are for peak daily activity and emissions. The airport does operate under Instrument Flight Rule (IFR) weather conditions occasionally, and these conditions produce the highest delays and emissions. Under these conditions, Alternative 1 would handle aircraft better than Alternative 2, meaning less ground delay and less emissions. Therefore, when describing aircraft emissions for peak daily impacts on page 4-130, the discussion correctly identifies Alternative 1 as having lower peak daily emissions.

Finally, the emissions from aircraft for each alternative under VFR and IFR conditions are presented in Appendix C, Attachment 2 of the SPAS Draft EIR. Aircraft IFR emissions are included in Tables 1 through 20, and aircraft VFR emissions are included in Tables 21 through 40.

SPAS-PC00159-10

Comment:

10. Table 4.2-13 (pp. 4-122 to 4-125) reports "Incremental Project Operational

Emissions Compared to Baseline (2009) Conditions" Does Table 4.2-13 report the predicted TOTAL aircraft emissions in 2025? Or does Table 4.2-13 report the amount of predicted emissions that would be added to the 2009 baseline conditions?

Response:

The aircraft emissions summarized in Table 4.2-13 of the SPAS Draft EIR represent the incremental emissions above the 2009 baseline for each alternative in 2025. Total aircraft emissions for each alternative in 2025 are presented in Appendix C, Attachment 2 of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00159-9 for a discussion of the conditions assumed for those emissions.

SPAS-PC00159-11

Comment:

11. Noise: Please identify the variables used to calculate current and predicted
CNEL. For each variable, identify the value or range of values that was used in the calculations of CNEL. Do the calculations of CNEL include variables for the topography of the land, such as the hill at the west end of Playa del Rey and the sort of "valley" at the north end of Pershing Drive?

Response:

The aircraft noise analyses were conducted using the Federal Aviation Administration's Integrated Noise Model (INM). In order for the INM to generate CNEL aircraft noise exposure contours, the following inputs to the model are required: runway layout geometry; average annual weather (e.g., temperature); aircraft operations by time of day and aircraft type; runway use information by aircraft type; location and use of flight tracks; and aircraft arrival and departure profiles.

Regarding temperature and humidity, the FAA's INM takes into account the actual atmospheric absorption adjustment based on average airport temperature and relative humidity to incorporate the fact that the propagation of sound is affected by meteorological conditions. In a simple term, air absorbs sound. The INM uses the temperature to calculate aircraft performance (INM Users Guide 2007). The absorption of sound varies with temperature, humidity, and the frequency of the sound. For example, an aircraft climbs more efficiently and faster in cool weather than in hot weather. The INM also includes an option to match atmospheric sound propagation to aircraft performance in the form of a noise-power-distance (NPD) curve based on local standard temperature and humidity. As indicated in Section 3.1.1.3 of Appendix J-1-1 of the SPAS Draft EIR, for the LAX elevation (125 feet above sea level), the average annual temperature (63 degrees Fahrenheit) and the average annual humidity (72 percent) at LAX in 2009 were used.

Terrain elevation data obtained from the United States Geological Survey (USGS) were also included in the INM noise analyses. Information regarding aircraft noise analysis methodology was provided in Section 4.10.1.2 of the SPAS Draft EIR; however, as noted in the SPAS Draft EIR "more detailed information is provided in Appendix J1-1" of the SPAS Draft EIR (see Appendix J-1-1, Sections 2.3 and 3.1.1.3).

SPAS-PC00159-12

Comment:

12. Define how LAWA calculated the mix of ADG VI aircraft in its 2025 forecast.

Do LAWA's calculations of the 2025 aircraft group mix assume that sales forecasts of ADG VI aircraft such as the Airbus A380 and Boeing 747-8 are accurate? So far, sales of both are far below their manufacturers' projections. If it weren't for a single airline (Dubai-based Emirates, which flies to LAX once daily in a Boeing 777) that has ordered 90 A380s, the A380 would be a financial disaster. Are LAWA's predictions of ADG VI aircraft based on sales to date? On manufacturer forecasts? On declining sales and possible early phasing out of ADG VI aircraft? Currently, only Qantas, Korean Air, Singapore and Air France fly A380s into LAX. Which airlines, if any, have notified LAWA they intend to begin flying the A380 to LAX?

Response:

The commentor is inquiring about how the mix of Aircraft Design Group (ADG) VI aircraft was derived and refers to various uncertainties in terms of accurateness and realization of Airbus 380 and Boeing 747-800 sales forecasts. Parts of the comment appear to be of subjective nature with no supporting data being provided: "sales of both are far below their manufacturers' projections" and "If it were not for a single airline (…) that has ordered 90 A380s, the A380 would be a financial disaster." These parts of the comment are noted.

As discussed in Section 4.1 in Appendix F-1 of the Preliminary LAX SPAS Report, aircraft manufacturers' orders, manufacturing schedules and anticipated delivery dates were reviewed to assess future aircraft availability. Although the technical team reviewed manufacturers' information, the inclusion of ADG VI aircraft in the 2025 Design Day Flight Schedule (DDFS) did not depend on current sales (at the time the analysis took place, starting in summer 2010) or on sales forecasts by Airbus or Boeing to particular airlines or in general. In addition, the assumed number of ADG VI aircraft in the 2025 DDFS was not based on aircraft manufacturers' sales forecasts or an assumption suggested by the commentor of "declining sales and possible early phasing out of ADG VI aircraft."

As presented in Section 4 in Appendix F-1 of the Preliminary LAX SPAS Report, the 2025 DDFS was developed to represent a generalized flight schedule, independent from airline-specific characteristics. As such, the 2025 DDFS does not include air carrier identifiers. The technical team assumed ADG VI aircraft solely based on the following factors: forecasted passenger demand by market; ability of the destination or origin airport to handle ADG VI aircraft; numbers of seats per aircraft; and resulting passenger load factors. See the section entitled "Scheduled-Passenger Fleet Mix" in Section 4.2 in Appendix F-1 of the Preliminary LAX SPAS Report regarding the development of the 2025 DDFS fleet mix.

SPAS-PC00160 Dial, Karen Drollinger Properties 10/5/2012

SPAS-PC00160-1

Comment:

On behalf Drollinger Properties I have reviewed the Draft Environmental Impact Report and have included my comments herein.

As property and business owners in the Westchester/Playa del Rey community for over 65 years Drollinger Properties has a long standing relationship with the airport and this community. Drollinger Properties owns and operates properties which support more than 60 businesses and over 1,000 daily workers, as well as our own offices. No single private entity will be affected more by a northward expansion of LAX than Drollinger Properties. Drollinger Properties and related entities objects to the approval of the proposed project or projects included in the Draft Environmental Impact Report for the reasons stated below. Drollinger Properties also includes by reference the objections raised in the comment letter submitted by the Alliance for Regional Solutions to Airport Congestion.

Drollinger Properties is committed to the preservation of the Westchester Business District which contains the vast majority of the company's assets and the preservation of the broader Westchester/Playa del Rey community which supports the business district.

Drollinger Properties has been instrumental in the formation of the Westchester Business Improvement District and the Westchester Street Improvement Association which have transformed the area which was nearly destroyed by the expansion of LAX in the 1970's.

Drollinger Properties has invested millions of dollars into Westchester/Playa del Rey both in private investment in business and properties and in charitable donations to our local community and educational institutions.

It would be safe to say that Drollinger Properties will be a strong advocate for that which promotes a better quality of life for the people and businesses of Westchester and Playa del Rey.

The modernization of LAX is long overdue and Drollinger Properties supports the efforts of LAWA to upgrade the terminals, create a more efficient ground transportation system and to improve airplane safety at the airport without moving north.

The Draft EIR has modeled nine alternatives for the community to review and LAWA has indicated that a preferred alternative could be a combination of any of the nine.

In our review of the alternatives it appears to us that several of the alternatives will make the needed improvements to the terminal areas and ground transportation facilities. It seems that the relocation and configuration of the north airfield is the most contentious aspect of the alternatives.

It is our understanding that the north airfield has been deemed "safe" by the standards employed by the NASA study. The airfield could operate more efficiently with additional runway and/or taxiway modifications although it is our belief that the data does not justify the movement of the north runway for safety reasons. The Draft EIR noted that not moving the runway provided the most efficient movement of aircraft off runways to gates.

The Draft EIR presented several alternatives to the north airfield in order to address "safe and efficient" movement of aircraft.

We have reviewed the integrated alternatives in an effort to assess the environmental impacts of noise, traffic, safety and air quality on our properties. But we aren't able to choose an acceptable alternative based upon the information within the Draft EIR documents. In general we contend that the community is best served with alternatives which do not expand the perimeter of the airport to the North nor move the runways on the North airfield further North than their existing location.

Of the other alternatives it appears that alternative 2 if coupled with alternative 9 would address airfield safety issues, include efficiency features and would upgrade terminal and ground transportation facilities without moving the airfield to the North. It is critical for Drollinger Properties that the preferred alternative will provide clear and definitive plans showing how properties around the North side of the airport will be affected in terms of all environmental impacts, safety within Runway Protection Zones, waivers from the FAA and any and all requirements for private and/or public property acquisition. With the information provided we support alternatives 2 and 9.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-1051 for responses to the comment letter submitted by ARSAC, which is incorporated by reference by the commentor.

Please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District.

Regarding impacts on quality of life, CEQA does not require purely social or economic impacts to be analyzed in an EIR. (CEQA Guidelines Section 15064(e)). As required by CEQA, the SPAS Draft EIR evaluates physical impacts on the environment associated with over 20 topical issues and how such impacts have the potential to affect residents in surrounding communities.

Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Topical Response TR-SPAS-LR-1 regarding relocation of the perimeter fence associated with the realignment of Lincoln Boulevard. As noted in the topical response, relocation of the perimeter fence would occur entirely within airport property and would not affect any homes or businesses.

SPAS-PC00160-2

Comment:

Drollinger Properties is faced with years of uncertainty for its business partners and tenants if a northward movement of the north airfield is part of the approved plan for LAX. Even now we are inundated with concerns from tenants who are not willing to invest in Westchester for the fear their businesses may be required to move in the future. This is a very real cost to our business and affects the entire business district. The approval of a "program" narrows the uncertainty but until decisions are made on a "project" basis our economic future will remain in limbo. It is our contention that the "program" EIR is far too broad to have any real significance. This program EIR cannot possibly detail what is needed in a project EIR simply because no one knows the magnitude of each project within the program. We suggest that an individual project EIR be required for each element of work and that the community be allowed to comment on each project EIR.

Response:

Please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. The SPAS Draft EIR is a programmatic document. As indicated in Section 2.4 of the SPAS Draft EIR, additional project-level CEQA review is anticipated for implementation of the improvements associated with the selected SPAS alternative. Project-level CEQA documents would be subject to public review and comment. Please also see Response to Comment SPAS-PC00130-235 regarding the programmatic level of the SPAS Draft EIR. The programmatic nature of the SPAS Draft EIR is appropriate. An EIR is not required to speculate about the environmental consequences of future development that is unspecified or uncertain. (Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502.) As discussed in Response to Comment SPAS-PC00130-235, if an alternative is selected and when project details and plans are available, project-specific environmental review will be conducted. The public will have an opportunity to comment upon any such project-level review.

SPAS-PC00160-3

Comment:

Any alternative which includes the relocation of Lincoln Boulevard will have a significant impact on our business district and this is inadequately addressed in the DEIR. Traffic re-routing, utility disruptions, construction noise and dust will affect our local businesses for prolonged periods of time. We have high technology tenants who must receive continuous connectivity to broadband services and disruptions are very costly.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00160-4

Comment:

This is our outline of the prime issues that Drollinger Properties has regarding the Draft EIR.

1. The Draft EIR does not address what will happen to specific properties in each of the alternatives. Please provide a detailed assessment of what properties will remain and what properties will be demolished in each of the alternatives.

Response:

A discussion of specific properties that would be acquired or affected by the development of the SPAS project (i.e., properties where structures would be demolished) is provided in Section 2.3.1.11 and Section 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. In addition, Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5 of the SPAS Draft EIR, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components, although acquisition would be required for the ground access components with which these alternatives would be paired. Furthermore, existing facilities located on LAWA property that would be affected by the SPAS project are summarized in Table 2-3 and presented in Figure 2-10 in Section 2.3.1.10 of the SPAS Draft EIR. The impacts associated with properties that would be acquired or affected are described in Section 4.9.6 of the SPAS Draft EIR. As stated therein, impacts on acquired properties would be reduced through implementation of LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measures MM-RBR-1 and MM-RBR-2. As also described in Section 4.9.6 for those properties, relocation would be a business decision. As noted in Table 2-3 in Section 2.3.1.10 of the SPAS Draft EIR, these properties could potentially relocate elsewhere in the vicinity.

Regarding what could happen to properties that would be located within the RPZ under the SPAS alternatives, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931.

SPAS-PC00160-5

Comment:

a. For properties that will remain please describe the environmental impacts for interior and exterior noise impacts versus current conditions for each alternative.

Response:

The SPAS Draft EIR discusses noise impacts in Sections 4.9 and 4.10, including discussion of existing noise levels and proposed noise levels under the various alternatives (including discussion of interior and exterior noise levels). Sections 4.10.1.8 and 4.9.8 of the SPAS Draft EIR summarize the conclusions of these analyses for aircraft noise. Section 4.10.2.7 of the SPAS Draft EIR summarizes the conclusions related to road traffic noise, Section 4.10.3.8 of the SPAS Draft EIR summarizes the conclusions related to construction traffic and equipment noise, and Section 4.10.4.9 of the SPAS Draft EIR summarizes the conclusions related to transit noise and vibration.

SPAS-PC00160-6

Comment:

b. For properties that will remain please describe the environmental impacts for air quality compared to current conditions for each alternative.

Response:

The construction emissions associated with each alternative, including emissions from the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6, are included in the impacts analysis in Section 4.2

of the SPAS Draft EIR and in Appendix C, Attachment 1 of the SPAS Draft EIR. Specifically, peak daily construction emissions are summarized in Table 4.2-10 on pages 4-110 and 4-111, and total project emissions are listed in Appendix C, Attachment 1, Tables 1 through 10, of the SPAS Draft EIR. Note that in the Appendix C tables, the Lincoln Boulevard realignment construction emissions are included in the line item titled "Runway 24L & South Parallel Taxiways" since it would be the movement of the runway that requires realignment of Lincoln Boulevard.

The impact of construction on ambient air concentrations surrounding LAX are summarized in Tables 4.2-11 and 4.2-12 on pages 4-115 through 4-117 of the SPAS Draft EIR. Detailed concentration results for each receptor and pollutant for each alternative are included in Appendix C, Attachment 1, Tables 11 through 66.

SPAS-PC00160-7

Comment:

c. For properties that will be demolished please provide a plan for business relocation in the event of property condemnation.

Response:

As described in Response to Comment SPAS-PC00160-4, impacts associated with properties that would be acquired under the SPAS project would be reduced through implementation of LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measures MM-RBR-1 and MM-RBR-2. This LAX Master Plan mitigation measure and the two LAX Master Plan commitments are described on pages 4-687 through 4-689 of the SPAS Draft EIR, and include a Draft Relocation Plan (available at: http://ourlax.org/publications.aspx) and phasing to accommodate airport-dependent businesses. As also described in Section 4.9.6 of the SPAS Draft EIR, for those affected properties on LAWA-owned property, relocation would be a business decision. As noted in Table 2-3 in Section 2.3.1.10 of the SPAS Draft EIR, these uses could potentially relocate elsewhere in the vicinity.

Regarding properties that could potentially be impacted within the RPZ, as stated in Response to Comment SPAS-AL00007-26, in the event that acquisition is required, implementation of LAX Master Plan Commitment RBR-1 would serve to reduce impacts. Future project-specific CEQA documents, if any, would identify specific properties proposed for acquisition.

SPAS-PC00160-8

Comment:

d. For properties that will be demolished please provide a detailed analysis of what uses and restrictions will apply to the affected properties after the expansion for each alternative and what will the airport do with any properties it condemns?

Response:

As described in Chapter 2 and Section 4.9.6 of the SPAS Draft EIR and in Response to Comment SPAS-PC00160-4, under each of the SPAS alternatives some properties, occupied primarily by airport-related uses, would be acquired. Table 2-3 of the SPAS Draft EIR identifies other airport uses and non-airport tenants located on airport property, such as the urgent care facility, Travelodge Hotel, Burger King Restaurant, and Denny's Restaurant, that would also be removed with implementation of the SPAS alternatives. These properties would be demolished and replaced with SPAS-related improvements such as airfield, terminal, ground access, and parking facilities proposed under the respective alternatives. Land use impacts associated with acquisition and relocation are described in Section 4.9.6 of the SPAS Draft EIR for each SPAS alternative under the heading "Acquisition and Relocation." As stated in Section 4.9.6, since these properties are located within the boundaries of the LAX Plan and LAX Specific Plan, they would be required to comply with the applicable provisions and restrictions of these plans. The acquired areas and sites of businesses affected by the SPAS alternatives would be subject to LAX Master Plan Commitment LU-2, Establishment of a Landscape Maintenance Program for Parcels Acquired Due to Airport Expansion, which would require that,

following demolition, these areas would be fenced, landscaped, and maintained if there are delays in development for airport purposes.

SPAS-PC00160-9

Comment:

2. Please provide detailed analysis of the potential safety considerations for properties that are currently or will be in the Runway Protection Zone in each of the alternatives.

Response:

The requested information is provided throughout Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00160-10

Comment:

3. Please provide detailed analysis for utility service impacts, disruptions and capacities for each of the alternatives. Specifically, the area in and around the intersections of Lincoln Blvd. and Sepulveda and Westchester Parkway and Sepulveda Westway.

Response:

As explained on page 4-3 of the EIR, the SPAS Draft EIR is a programmatic document. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project. Project-level impacts associated with implementation of individual components would be assessed in future CEQA documents, including impacts associated with utilities. It should be noted that the portion of Lincoln Boulevard that would be relocated under Alternative 1, 5, and 6 is north of the intersection of Lincoln Boulevard and Sepulveda Boulevard. None of the SPAS alternatives is anticipated to result in any impacts or alterations to this intersection or to the intersection of Westchester Parkway and Sepulveda Westway.

SPAS-PC00160-11

Comment:

4. Please show which of the alternatives best minimizes, avoids or reduces the environmental impacts to surrounding communities. Please outline this analysis for each of the alternatives and each of the surrounding communities.

Response:

The information requested in the comment is included in the impact analyses presented throughout Chapter 4 of the SPAS Draft EIR, as well as in Chapter 5 (cumulative impacts), and is summarized in Chapter 1 of the SPAS Draft EIR.

SPAS-PC00160-12

Comment:

5. Please provide a landscape improvement and maintenance plan for all parcels acquired due to airport expansion for each alternative.

Response:

Please refer to Response to Comment SPAS-PC00160-4 for a discussion of parcels that would be acquired or otherwise affected (e.g., require demolition) under the SPAS alternatives.

A landscape maintenance and improvement plan would be implemented under LAX Master Plan Commitment LU-2, which is incorporated as a component of the LAX Street Frontage and Landscape

Development Plan Update. The LAX Street Frontage and Landscape Development Plan Update is described on pages 4-11 through 4-13 in Section 4.1 and on page 4-694 in Section 4.9 of the SPAS Draft EIR and requires that, following demolition, acquired parcels and affected parcels located on LAWA property would be fenced, landscaped, and maintained if there are delays in development for airport purposes.

Regarding properties that could potentially be impacted within the RPZ, in the event that acquisition is required, implementation of LAX Master Plan Commitment LU-2 would also apply to these parcels. This Master Plan commitment requires that land acquired and cleared for airport development be fenced, landscaped, and maintained regularly until the properties are developed for airport purposes. Project-specific information on landscape improvement and maintenance would be developed during project-specific CEQA review should an alternative calling for property acquisition be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) Please also see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00160-13

Comment:

6. What aircraft noise mitigation measures will be employed on which properties for each of the alternatives?

Response:

Aircraft noise mitigation measures are discussed in Section 4.9.3.3, Section 4.9.5, and Section 4.10.1.5 of the SPAS Draft EIR. Please also see Response to Comment SPAS-PC00008-1 regarding current programs to address existing aircraft noise levels.

SPAS-PC00160-14

Comment:

7. Please outline how the Alternative proposal's level of mitigation is comparable to that described in the LAX Master Plan Program EIR as described on page 1-9 paragraph number 3.

Response:

Section V.D.3 of the Stipulated Settlement requires LAWA to focus SPAS on "Potential environmental impacts that could result from replacement of the Yellow Light projects with the Alternative Projects, and potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects in the LAX Master Plan Program EIR." The SPAS Draft EIR identifies a comprehensive set of applicable LAX Master Plan commitments and mitigation measures, as well as SPAS-specific mitigation measures, that would reduce or eliminate significant impacts associated with the SPAS alternatives. The fact that the level of mitigation associated with the SPAS alternatives is comparable to that described in the LAX Master Plan Final EIR can be determined by comparing the significant unavoidable impacts associated with each. The significant unavoidable impacts of the LAX Master Plan are identified in Section 6.2 of the LAX Master Plan Final EIR.1 The significant, unavoidable impacts of the SPAS alternatives are identified in Section 7.1 of the SPAS Draft EIR. As indicated in these sections, both Alternative D, (i.e., the previously-approved LAX Master Plan), and the SPAS alternatives would have the following significant unavoidable impacts: Air Quality, Human Health Risk Assessment, Land Use as related to aircraft noise, Aircraft Noise, Construction Equipment Noise, and Off-Airport Transportation. In addition to these impacts, the SPAS alternatives would have significant unavoidable impacts related to Greenhouse Gases and On-Airport Transportation. The LAX Master Plan did not identify significant unavoidable impacts relative to Greenhouse Gases as this topic was not addressed in the LAX Master Plan EIR. The LAX Master Plan did not identify a significant unavoidable impacts to On-Airport Transportation as the CTA would be closed to traffic under the approved LAX Master Plan (i.e., Alternative D). This comparison demonstrates that the SPAS Draft EIR provides a level of mitigation comparable to that described in the LAX Master Plan Final EIR.

No further response is required because the comment does not raise any significant new environmental issues or address the adequacy of the environmental analysis in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

1. City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004.

SPAS-PC00160-15

Comment:

8. The effects of Lincoln Blvd. tunneling or re-alignment has not been adequately analyzed or explored. What are the effects on surrounding traffic patterns with a modification of Lincoln Boulevard, particularly Sepulveda Boulevard?

Response:

As stated on page 2-55 in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 5, and 6 would require the realignment of Lincoln Boulevard between Sepulveda Boulevard and the Lincoln Boulevard/Westchester Parkway interchange. As part of the realignment, approximately 540 feet of roadway would be covered and below grade under Alternative 1, approximately 765 feet under Alternative 5, and approximately 252 feet under Alternative 6. This improvement is not expected to affect the overall north/south through traffic capacity on Lincoln Boulevard nor on Sepulveda Boulevard. This improvement would result in a localized traffic redistribution surrounding the intersection of Lincoln Boulevard and Westchester Parkway. Motorists traveling northbound on Lincoln Boulevard wanting to transition to Westchester Parkway would no longer use McConnell Avenue but would use a new leg farther east at the existing T-intersection of La Tijera Boulevard/Westchester Parkway. Traffic westbound on Westchester Parkway seeking to transition to northbound Lincoln Boulevard would no longer use McConnell Avenue and instead, would travel farther west, making a right turn onto Loyola Boulevard and then make a left turn from La Tijera Boulevard or Loyola Boulevard onto Lincoln Boulevard northbound. This localized traffic redistribution is not expected to result in significant impacts on the Lincoln Boulevard corridor nor Sepulveda Boulevard corridor operations.

Traffic-related impacts associated with construction activities were addressed in Section 4.12.2.6.3 of the SPAS Draft EIR. The SPAS Draft EIR includes a number of LAX Master Plan commitments and mitigation measures specifically designed to reduce such impacts; however, at this time, it would be speculative to conclude that all construction-related traffic impacts would be reduced to a level that is less than significant.

SPAS-PC00160-16

Comment:

9. Any re-alignment of Lincoln Boulevard will have significant impacts on the community during construction. Please outline those impacts and the mitigation methods in terms of traffic, noise, air pollution, temporary and permanent drainage.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00160-17

Comment:

10. Any re-alignment of Lincoln Boulevard could also affect other utilities. Please outline the impacts on other utilities, water, power, cable, telephone etc and provide mitigation solutions,

Response:

Please see Topical Response TR-SPAS-LR-1 regarding utility impacts associated with the relocation of Lincoln Boulevard under Alternatives 1, 5, and 6.

SPAS-PC00160-18

Comment:

11. There are currently major drainage issues in Westchester as even mild rain events result in flooding every year. Any changes to drainage facilities on the northside of the airport should be studied and analyzed for the 100 year storm event. If drainage facilities are modified all facilities should be upgraded for the 100 year storm event.

Response:

As stated on page 4-607 in Section 4.8 of the SPAS Draft EIR, previous hydrologic analysis of the conveyance system within the Argo sub-basin of the Santa Monica Bay Watershed indicates that flooding does not occur within the airport area as a result of the LADPW 50-year design storm under baseline conditions. The 50-year storm event is the maximum storm event used to design major drainage facilities in the City per the Bureau of Engineering Storm Drain Design Manual. As shown in Table 4.8-5 of the SPAS Draft EIR, there would be no increase or minimal (2 percent) increase in impervious area within the portion of the airport tributary to Santa Monica Bay, which includes the Argo Drain tributary area, and these facilities are expected to continue to be adequate to convey the 50-year storm event. Improvements associated with SPAS are not anticipated to result in any flooding within Westchester. Because the Argo Drainage Channel is expected to convey the 50-year storm event even with SPAS improvements, there would not be any new hydraulic limitation to conveying flows from the Westchester area into the channel that would result in increased flooding potential within Westchester. Please see Response to Comment SPAS-PC00130-169 regarding the design capacity of the proposed Argo Drainage Channel with implementation of Alternatives 1, 5, and 6. Please also see Response to Comment SPAS-PC00130-85 for a discussion of why a 10-year storm event is the standard applicable to LAX.

SPAS-PC00160-19

Comment:

12. The West Maintenance Facility should be included in this draft EIR as a cumulative impact part of LAWA's project. Please provide an impact analysis that includes environmental impacts of the West Maintenance Facility as part of this EIR as it relates to construction and ongoing noise, air pollution and traffic impacts. This facility could have a major impact on our community and should be included.

Response:

Please see Response to Comment SPAS-PC00130-15 regarding the West Aircraft Maintenance Area project.

SPAS-PC00160-20

Comment:

13. We would like a detailed timeline as part of the final EIR which outlines the timing for all improvements included in the approved plan.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements.

SPAS-PC00160-21

Comment:

14. General impacts on the community and businesses such as routing of equipment, noise, times of operation, temporary closures, etc. in addition to staging area A?

Response:

Detailed construction plans requested by the commentor are not available. As indicated on page 2-57 of the SPAS Draft EIR, the nine SPAS alternatives were formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for any of the alternatives. Chapter 4 of the SPAS Draft EIR does disclose construction impacts of the alternatives at a program level of detail. Should a SPAS alternative be selected for implementation, project-level CEQA documents would present detailed design and construction plans and disclose detailed project-specific construction impacts and mitigation measures? It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

Please also see Topical Response TR-SPAS-LR-1 regarding the fact that the SPAS Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines and the subsequent preparation of a project-level CEQA documents, which address in greater detail construction-related impacts, is appropriate and consistent with CEQA requirements.

SPAS-PC00160-22

Comment:

We have reviewed the comments submitted by the Alliance for a Regional Solution to Airport Congestion (ARSAC). In addition to the comments included herein we want to make it clear that Drollinger Properties supports, agrees and hereby incorporates the comments from ARSAC in its comments to the SPAS Draft EIR.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. ARSAC's comments package on the LAX SPAS Draft EIR is designated in this Final EIR as SPAS-PC00130. Responses to comments by ARSAC on the SPAS Draft EIR are provided in Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-1051.

SPAS-PC00160-23

Comment:

Drollinger Properties is vested in Westchester unlike any other private property owner. Again, we have invested millions of dollars in our community over a period of 65 years. We support the efforts of LAWA in upgrading LAX. We support the upgrades to the terminal areas and we support the efforts of LAWA to improve ground transportation in and around the airport. As property owners and members of the Westchester BID we support an attractive "gateway" to LAX and to the City of Los Angeles. We support the efforts of LAWA to improve the safety of airport operations and to increase the efficient movement of aircraft around the airfields.

We support Alternative 9 and we support Alternative 2. We cannot support any alternative that moves the North airfield to the North.

Please consider these our comments to the SPAS DRAFT EIR.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00161 Zifkin, Walter None Provided 10/2/2012

SPAS-PC00161-1

Comment:

My name is Walter Zifkin, and I was privileged to serve as a member of the Board of Airport Commissioners for seven years - from 2004 to 2011. I was originally appointed by Mayor James Hahn and re-appointed by Mayor Antonio Villaraigosa. My tenure on the Board spanned two mayors, three commission presidents and three airport directors.

The common thread shared by all who were involved with Los Angeles International Airport during those seven years was the commitment to modernize our aging airport. I joined the Commission in the midst of the City Council's consideration of the LAX Master Plan. Following its adoption in 2004, and the settlement of the lawsuit early in 2006, we began work on the so-called green-lighted projects which kicked off the modernization efforts.

Today we are witnessing unprecedented construction, thousands of jobs and millions of dollars infused daily into our economy. Next year, we will see the grand opening of the new Bradley West, which will re-shape the Tom Bradley International Terminal and change the way we serve our international passengers. This work is vital to improving the way our passengers experience this airport and this City. However, we stand at the threshold of all that yet needs to be accomplished. We are at one of the most critical times in this massive endeavor - deciding whether the modernization of LAX should continue to full completion, or whether we stop now and find satisfaction with a partial fix.

I believe that a partial fix is simply not enough. How can we truly believe we have modernized LAX without addressing key improvements to its North Airfield? How can we proclaim "mission accomplished" without forging ahead with a Consolidated Rental Car Facility? How can we claim victory before we find a way to connect the airport to public transportation? Obviously, we can't. That is why this Specific Plan Amendment Study is so important.

I know firsthand there remain contentious issues. I lived it for seven years - I heard the testimony, read the reports, met with stakeholders. But I remain completely convinced that our North Airfield must be reconfigured to accommodate today's aircraft fleet. It's vital we separate the runways and construct a centerline taxiway. We cannot continue with an airfield which was not designed and built for Group 5 and Group 6 aircraft. Air Traffic Control modifications have been stretched to accommodate this new generation of aircraft. How can we find it acceptable to shut down all North Airfield operations when an A380 aircraft is in operation? LAX must have a 21st century airfield.

The North Airfield is not as safe as it could or should be. During my time on the commission, we reviewed several safety studies and heard from experts relative to the condition of the North Airfield. While the conclusions varied, each of the studies indicated that a reconfigured North Airfield would result in a safer airport. Most noteworthy, the FAA and the airline pilots have consistently and strongly recommended the two northern runways be separated by at least 350 additional feet and that a centerline taxiway be added between them.

I have carefully reviewed each of the alternatives considered in the Draft EIR document. Recognizing that a reconfigured North Airfield can result in a safer airport while improving operational efficiency, I believe that only Alternative 5 contained in the Draft EIR can achieve these objectives. None of the other alternatives present a separation of runways at the level requested by the FAA (i.e. 350 feet).

Alternative 5, however, demonstrates a significant improvement to the existing condition and would enable the construction of a much-needed centerline taxiway.

This is probably one of the most important times in the history of this airport. Like the 1961 opening of the central terminal area or the 1984 renovation, we are faced with a decision which will shape the way the aviation industry views LAX for the next generation. Will airlines choose LAX for new routes using newer and cleaner aircraft, or will we continue to be eclipsed by competing airports eager for the business? Will we truly transform LAX to a 21st century facility or simply remain satisfied with a memory of its former glory? In addition to the safety issues discussed above, the answers to these questions will have a substantial impact on industries and jobs that are dependent on having a safer, vibrant and attractive airport. We must continue to improve the airport so that it continues to be a major economic engine for our city.

I urge, therefore, that you choose the appropriate option of Alternative 5 so that the North Airfield can be reconfigured for safety and operational improvements. For the decision makers, it will take courage to do what is right and the vision that we act today not just for us, but for future generations of the citizens of Los Angeles. I urge the Board of Airport Commissioners and the City Council to take the courageous and responsible action.

Response:

The commentor's support for Alternative 5 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. It should be noted that Alternative 1 provides for a centerline taxiway. Please see Response to Comment SPAS-PC00130-168 regarding conclusions of the NASS relative to north airfield safety.

SPAS-PC00162 Lund, Ph.D., P.E., Russell A — None Provided — 10/8/2012

SPAS-PC00162-1

Comment:

Thank you for taking the time to address our community at September 27's NCWP town hall meeting. You had little time to cover a great deal of information, and I think you used your time effectively. I was also impressed by the unanimity of views expressed by community organizations and political representatives. I agree with them that important improvements must be made at LAX. As outlined in part below, I am convinced that moving the north runway is NOT a cost effective or efficient approach to improve LAX and the flying experience for Los Angeles residents. The best information available does NOT support moving the runways for reasons of safety.

I was particularly struck by the comments of Mr. Voss of the LAX Coastal Area Chamber of Commerce. As I understood him, he was involved with determining the objectives for the LAX NASS. He described the researchers selected as experts who would provide the "gold standard" report on north runway safety. Nevertheless, the DEIR seems to denigrate the findings of these blue ribbon experts. The LAWA report seems instead to favor disagreements such as those expressed by the FAA, without emphasizing the fact that the NASS response to the FAA "review" largely debunks their criticisms. It is unfortunate that the important NASS response is largely relegated to the end of an appendix and is not given the prominence it deserves.

Response:

With regard to the commentor's opposition to moving the north runway, the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. With regard to the comment's reference to comments from Mr.

Voss of the LAX Coastal Area Chamber of Commerce, please refer to the responses to comment letter SPAS-PC00149, particularly Responses to Comments SPAS-PC00149-2, -5, -6, -7, and -8.

SPAS-PC00162-2

Comment:

If flight safety is of paramount concern, LAWA could - in short order and at relatively little cost - reduce the risk of aircraft incursions on the north runways by simply eliminating exits along the length of north runway 6L/24R, thereby requiring all landing aircraft to cross runway 6R/24L at the far end of the runway. Although this would increase taxi time for some operations, many airports have taxi distances and times far longer than those presently at LAX, and this increase would only marginally increase total gate-to-gate times (of course, any alternative that involves moving the runways farther from the terminals may also increase taxi time). Taxi time is a very minor issue when compared to capital project costs, quality of life in the neighborhoods north of LAX, and even the misleading safety arguments. If large equipment (e.g. the A-380) needs more space, simply use the south runways for these few flights.

That this option was not included in the current set of Alternatives can only be viewed as part of the ongoing LAWA strategy to push one plan down the throats of Los Angeles residents, and its absence effectively constrained the work performed by the NASS (who nevertheless found that safety concerns do NOT support moving the north runways). Time and time again LAWA has proposed airport expansion through relocation of the north runways (only to have that proposal rejected), with the apparent hope that one day the heretofore strong opposition will be caught napping.

Response:

The runway design alternative to eliminate all runway exits along Runway 6L/24R except for the ones at far ends of the runway is infeasible due to the operational problems, environmental impacts, and safety issues that it would pose. Additionally, it would not respond to the project objectives related to improving the north airfield. Therefore, it was not evaluated in detail in the SPAS Draft EIR.

Under this runway design alternative, all arriving aircraft on Runway 6L/24R would be required to taxi to the end of the runway before crossing Runway 6R/24L, which is the primary departure runway in the north airfield. The implication in this concept is that arriving aircraft on Runway 6L/24R could taxi across Runway 6R/24L more safely at the end of the runway because any departing aircraft would probably be well up in the air by the time it gets to that taxiway crossing point (i.e., the taxiing arriving aircraft could cross beneath the departing aircraft). One of the many problems associated with such a concept is that no aircraft is allowed to taxi across an active runway, that is a runway where an aircraft arrival operation or an aircraft departure operation is occurring, for the entirety of the subject operation. In other words, for a departure operation, the air traffic control tower will hold all nearby aircraft from even starting to cross the departure runway until the departing aircraft has cleared the end of the runway on takeoff. There cannot be any objects, including taxiing and holding aircraft, within the FAA designated Object Free Zone (OFZ), which extends 2,600 feet past the end of the runway, as shown in Figure 4.7.2-2 of the SPAS Draft EIR. Should an aircraft taxi across a departure runway while an aircraft departure operation is occurring, thereby entering the runway in front of a departing aircraft, it would be classified as a Category A or Category B runway incursion, which are the most serious/hazardous incursion types, even if taxiing aircraft end up passing beneath the departing aircraft.

Runway approaches are always designed so that aircraft land about one thousand feet down the runway. The navigation aids (especially the glide slope) and the runway markings are designed around the one thousand foot target. A single taxiway exit at the very end would require aircraft to remain on the runway until they reach that exit. Given that the normal landing distance needed for aircraft does not put them at the very end of the runway, additional taxi distance would be required to reach the end of the runway. Although most larger ADG V and VI aircraft would finish their landing closer to the runway end, some additional taxiing on the runway would still be required. The majority of aircraft at LAX are typically smaller ADG III type aircraft (i.e., Boeing 737 or Airbus A320) and their required landing distance is much shorter; hence, having one exit taxiway at the very end would require substantially more taxiing time and distance. All of the extra taxiing on the runway would increase runway occupancy time (otherwise known as ROT) which would require increasing "in-trail" distances between aircraft on the approach to avoid "go-arounds." It should be noted that due to safety issues

and concerns, it is not practical for aircraft to "land long" or taxi faster in an effort to get to the end of the runway in a shorter amount of time.

Regarding the commentor's suggestion that if larger aircraft need more operating space than what is currently available on the north airfield, they should simply use the south runways, such an approach is contrary to the project objective to improve airfield balance. There is currently a disproportionate amount of large aircraft departures occurring on the south airfield, at which LAWA seeks to improve the north airfield to reduce taxiing between the north and south runway complexes.

In light of the types of operational problems described above, the suggested alternative would fail to respond to the project objectives described in Section 2.2 of the SPAS Draft EIR relative to providing north airfield improvements that support the safe and efficient movement of aircraft at LAX. Additionally, the operational problems associated with this alternative would not support other project objectives. For example, it would not maintain LAX's position as the premier international gateway in supporting and advancing the economic growth and vitality of the Los Angeles region (i.e., ongoing airfield congestion and delays and airspace delays and rerouting of arriving flights could hamper LAX's ability to accommodate international flights), would not enhance safety at LAX, and would not support an improvement program that is efficient, sustainable, feasible, and fiscally responsible.

SPAS-PC00162-3

Comment:

Usefulness of LAX is limited by ground transportation. Users of LAX (air travelers and freight from the southland) must reach the airport by car, truck, or bus. The nearby freeway and road infrastructure is overloaded. LAWA should focus its expansion desires on the regional airports (including Palmdale), not on shoehorning more people into the constrained area of LAX. It is reprehensible that flight safety is being used to try and "justify" the misguided goals of LAWA.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports a regional approach to accommodating air travel demands in Southern California. The Topical Response also discusses Palmdale Regional Airport.

The SPAS alternatives provide potential modernizations and improvements designed for a practical capacity of 78.9 MAP. 78.9 MAP is a conservative growth assumption consistent with the Southern California Association of Governments 2012 Regional Transportation Plan/Sustainable Communities Strategy. (See footnote 670 on page 4-1048 of the SPAS Draft EIR.) Therefore, based upon the SCAG RTP/SCS, growth in airport use would naturally grow to 78.9 MAP, with or without any improvements. The SPAS alternatives are designed to provide improvements that will accommodate this increase in passengers, not to promote further growth. Additionally, as provided in Section 1.1.2 of the SPAS Draft EIR, the SPAS amendments are designed to create conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA.

SPAS-PC00162-4

Comment:

Meanwhile, improvements to transportation local to the airport can and should be implemented. Furthermore, our terminals show their age, and are woefully inadequate to handle passenger loads. I notice this particularly in Terminals 1 and 3 (despite recent improvements made to the Terminal 1 arrival/bag claim area).

Of the options offered in the SPAS DEIR, I endorse Alternative 2 as being the closest to the approach described above.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00165-1

Comment:

I currently have three residences; my main residence is in The Netherlands with two more in the US and UK. Naturally I often compare airports to my main hub of Schiphol. And let me say that LAX is terrible--worse than Heathrow. I support any improvements done to the airport not only for passengers but for economic concerns as well. The airport is vital for the city's economy. However the only modification I would make to the plan is the light rail station. Why not build an underground station similar to Schiphol? As I currently understand the plan there will be bus transfers to the airport but this is cumbersome especially when travellers have more than one piece of luggage. An underground station would speed trips and prove extremely convenient whilst providing a real alternative to driving to the airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. As indicated in the topical response, an underground alignment and station for a future Metro rail extension into the CTA are under consideration by Metro as part of the Metro Airport Connector Project.

SPAS-PC00166 Toledo, Luis O None Provided 9/5/2012

SPAS-PC00166-1

Comment:

I think the LAX SPAS Open House/Public Meeting Board information is deceptive when it answers "no" to the question will "more" people be affected by noise with the northfield expansion....especially when they then provide a representation that moves the noise line north for EVERY proposal. Even if it was accurate that you aren't affecting "more" people...you are affecting the "same" people in a worse way. In other words the people that were already affected by noise will now be MORE affected by it. As someone that just bought a home in Playa Del Rey and already deals with noise at all times of the day and night I think this is unacceptable.

Response:

The commentor states that they find the "LAX SPAS Open House/Public Meeting Board information deceptive when it answer 'no' to the question will 'more' people be affected by noise with the northfield expansion…" This misstates what was said in the referenced presentation, available at: http://www.lawa.org/uploadedFiles/SPAS/PDF/20120824_LAWA_SPAS_Boards.pdf. The language from board 5.1 states "Will moving the north airfield runway result in more people being impacted by aircraft noise *compared to future conditions with no movement of the airfield*?" (Emphasis added.) The board further responds to this question as follows: "No. Any increase in the number of people that would be impacted by aircraft noise will be due to natural growth in aircraft activity projected to occur by 2025. The SPAS noise analyses indicates that reconfiguring the north airfield would actually impact

fewer people than leaving the runways in their current locations. This is due to the relationship between the noise contours and the affected land uses and residential densities in the LAX region."

The discussion from the presentation above is correct and consistent with the analysis provided in the SPAS Draft EIR (see Table 4.10.1-55 and discussion under "Cumulative Contribution - Changes from 2025 'No Additional Improvements' Conditions"). As summarized on the top of page 1-84 of the SPAS Draft EIR "[t]he density of the population is not constant across the area exposed to noise above 65 CNEL or higher; consequently, while the area of exposure may be similar among alternatives, the numbers of persons, dwellings or non-residential noise-sensitive facilities varies among the alternatives." Similar discussion was also provided in Section 4.10.1.6.8 of the SPAS Draft EIR.

The comment also states that "you are affecting the 'same' people in a worse way." The aircraft noise analysis included in Sections 4.9 and 4.10.1 of the SPAS Draft EIR addresses impacts of increased noise levels at existing locations (see thresholds of significance in Section 4.10.1.4.1). Please see Response to Comment SPAS-PC00149-2 regarding aircraft noise impacts that would result from the relocation of Runway 6L/24R northward under Alternatives 1, 5, and 6 compared to Alternatives 2, 3, 4, and 7.

A discussion of aircraft noise impacts in Playa del Rey under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As analyzed therein, under Alternatives 1 through 7, some areas within Playa del Rey and surrounding communities would be newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours.

SPAS-PC00166-2

Comment:

I sent an application for soundproofing to the appropriate department and was told that this plan has expired...so LAWA isn't even helping current residents with the lower noise problem now...so how can we expect cooperation in the future?

Response:

LAWA'S Residential Soundproofing Program has a record of Mr. Toledo contacting LAWA on June 29, 2012. Mr. Toledo's request was logged into LAWA's database. However, Mr. Toledo's request came in after the deadline of June 1, 2010 (see discussion of the LAWA's Residential Soundproofing Program below). The Los Angeles County Assessor's Office website indicates that the commentor's recent purchase occurred on or about March 7, 2012. LAWA's records show that previous owners of the said property have been contacted by LAWA to participate in LAWA's Residential Soundproofing Program but the previous owners never followed through. It should be noted that based on the 4th Quarter of 2011 Quarterly Noise Report and its associated noise contour map (available at http://www.lawa.org/welcome_lax.aspx?id=1090), Mr. Toledo's property is located outside the 65 CNEL contour.

LAWA's Residential Soundproofing Program began in 1997 with implementation of the first soundproofing project in Playa del Rey and Westchester in the City of Los Angeles. At that time, LAWA opened a community office on Sepulveda Boulevard, which remained open to the public until September 2009. After an extensive outreach effort to contact all eligible homeowners, a final deadline for participation in the original program was issued for June 1, 2010. Since the start of the program, LAWA has soundproofed over 7,300 residential dwelling units near LAX.

As discussed on page 4-664 of the SPAS Draft EIR, "LAX shall continue to implement its ANMP, with assistance of the affected jurisdictions, and shall update the entire ANMP from time to time to ensure that it reasonably represents the mitigation and funding programs that are in place, being implemented, or proposed for future implementation.

However, as acknowledged in Section 4.10.1.8 of the SPAS Draft EIR, because these programs will take time to implement "…significant noise impacts would be experienced in the area after implementation of the selected SPAS alternative but before the mitigation measures are fully

implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time."

SPAS-PC00166-3

Comment:

I also think that it's NOT true that in the future the noise level will increase anyway because of more planes....the frequency of the noise might increase but NOT the individual noise level (unless the traffic is directed further north as in all these expansion plans). I think there is a lot of information that downplays how this will affect the residents in Playa Del Rey. As someone who deals with this noise on a daily basis I want to have the whole commission out on our street and do some "fly overs" based on current traffic patterns and then based on the "new" proposed flight patterns...and let's see them argue that there isn't a problem with the northfield expansion!!

Response:

As shown in Table 1-4 on page 1-48 of the SPAS Draft EIR, impacts related to aircraft noise are classified as "significant unavoidable impacts" under SPAS Alternatives 1 through 7. Under the heading of "Aircraft Noise Exposure" on page 1-82, the SPAS Draft EIR discusses the fact that, under Alternatives 1 through 7, residential and non-residential noise-sensitive facilities would be newly exposed to noise levels of 65 CNEL or higher, or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. From a CEQA perspective, these impacts would be significant. In addition, as discussed under the heading of "Aircraft Noise" on page 1-84 of the SPAS Draft EIR and presented in Table 1-17 on page 1-84, it was determined that the area of exposure is similar under each alternative. However, within each area of exposure, residential density (number of persons and dwelling units) as well as the concentration of non-residential sensitive facilities varies among the alternatives.

Refer to Tables 1-18, 1-19, and 1-20, on pages 1-85 and 1-86 of the SPAS Draft EIR for additional results in terms of aircraft noise impacts as well as Section 4.10.1 of the SPAS Draft EIR.

Regarding the statement that "there is a lot of information that downplays how this will affect the residents in Playa Del Rey," each alternative analyzed in the SPAS Draft EIR was fully assessed through the process regardless of which area or community would potentially be impacted.

SPAS-PC00167 Turner, Jordann None Provided 9/7/2012

SPAS-PC00167-1

Comment:

movement of runway north 100 feet in conjunction with runway improvements and extentions

Response:

The commentor's support for moving Runway 6L/24R 100 feet north (i.e., Alternative 6) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00168 Turner, Jordann None Provided 9/7/2012

SPAS-PC00168-1

Comment:

First comment was sent in error as it was not complete. My main comment is follows. The changes to the specific plan should include moving the runway 100 feet north to accomodate a center taxiway. Also include related runway and taxiway extensions as well as the rapid transit options to the airport as contemplated in various alternatives. Two questions: how are the alternatives that include runway shifts north evaluated with the Northside Plan ? How is Metro's airport access study handled during the LAWA's study to do the same? Hopefully they are not redundant.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. An update to the LAX Northside plan is currently underway and a Draft EIR is being prepared. The Draft EIR for the LAX Northside Plan Update will take into account, as appropriate, the SPAS study as well as any concurrent LAWA and non-LAWA projects.

Please see Topical Response TR-SPAS-T-1 regarding the relationship of SPAS to the Airport Metro Connector Project and collaboration between LAWA and Metro regarding transit issues related to LAX.

SPAS-PC00170-1

Comment:

Please do everything you can to reduce noise in our community. Install sound walls if it would help. This is my only concern. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their considerations prior to any action on the SPAS project.

Please refer to pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR for a discussion of the LAWA Aircraft Noise Mitigation Program (ANMP). Section 4-10.1.7 of the SPAS Draft EIR discussed in details the aircraft noise abatement techniques in general and specific measures analyzed under each SPAS alternative. Relative to the commentor's suggestion to install noise walls, airport-related noise impacts in the Playa del Rey area are primarily from aircraft that are departing from, or approaching (under "east flow" conditions when aircraft arrive from the west and land towards the east), the north airfield. Such aircraft are typically several hundred feet up in the air when passing by Playa del Rey. Noise attenuation (reduction) associated with noise walls comes from the ability to interrupt (block) the noise path between source and receptor. As such, it is anticipated that the placement of noise walls between the airport and Playa del Rey would not reduce aircraft noise levels. Additionally, placement of noise walls may result in visual impacts to the local area. Therefore, the suggestion to install noise walls in this area is rejected because there is no evidence it would reduce significant environmental impacts and would likely have additional adverse impacts.

SPAS-PC00172 Stacey, Pamela None Provided 9/26/2012

SPAS-PC00172-1

Comment:

My name is Pamela Stacey and i have lived in Playa del Rey for the past 27 years and love my community. I am here to advocate for the adoption of Alternative 2 combined with transportation features of Alternative 9. I oppose and will work to obstruct adoption of any other plan most especially any plan to move the north runway. Concerning the expansion people often ask us--What did you expect when you moved near the airport? We all did our homework. We expected an improvement in technology and proper management and governance. For the most part as evidenced by how many of us have stayed so long the airport has been a decent neighbor. Only Alternative 2 allows that to continue. Everybody in our neighborhoods wants to see LAX revitalized and improved --we too use the airport and know its low ranking--but we want it to be done to 21st century standards which include green technology the promotion of clean air and minimal vehicle traffic. Other plans risk turning LAX into a lumbering over-sized over-capitalized small-brained dinosaur. The people of Southern California and travelers to LAX deserve better. Most important to me only Alternative 2 states that there will be minimal or no increase in pollution. Moving the runway north will spew more toxins over more homes that are even now relatively compromised. It doesn't improve safety or air traffic to move the north runway. It does harm people. In only the two blocks where I live there are six cases of cancer. In only two blocks. I know the complications legitimate ones to proving cause and effect with cancer clusters. But you all know including our elected officials Council Members and LAWA power brokers that increased noise and air pollution put people at greater risk of cancer and other problems. There comes a time when common sense has to rule while science weighs in. That time is now. That decision has to be Alternative 2. Thank you. Pamela Stacey.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The commentor's statement that Alternative 2 will have minimal or no increase in pollution is incorrect. Related to air quality impacts, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Related to health concerns, As indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, and off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration in Sections 4.10.1, 4.10.2, 4.10.3, and 4.10.4 respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant.

However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

SPAS-PC00173 Vaughn, Vicki None Provided 9/28/2012

SPAS-PC00173-1

Comment:

The options presented in recent community meetings of pushing the north runway further north by 50 "" 350 feet are not acceptable. THE CURRENT CONFIGURATION OF THE NORTH RUNWAYS ARE SAFE ACCORDING TO THE 2010 NASA "" AMES STUDY RELEASED IN FEBRUARY 2010. It is unbelievable that the Los Angeles city council could ignore the report of 'rocket scientists' in terms of safety at our airport. I'm not into accusing anyone of unethical dealings but the mere fact that these options are still on the table tells me that someone is going to benefit enormously and it won't be the local residents!

Response:

As indicated in Section 4.7.2 of the SPAS Draft EIR, the LAX North Airfield Safety Study (NASS) was initiated at the request of City of Los Angeles elected officials. The North Runway Safety Advisory Committee, composed of LAX stakeholders, was formed to oversee the study, including selection of academic panel members to be involved in the study. The panel consisted of six professors from various universities and various disciplines in Science and Engineering, but who had in common a longstanding interest in issues about aviation safety and efficiency. As indicated on page 4-505 of the SPAS Draft EIR, the academic panel's review of the technical work completed for the NASS had several main conclusions including, but not limited to: the LAX north airfield is extremely safe under the current configuration for the projected 2020 activity forecast; and, certain improvements to, and reconfiguration of, the north airfield would substantially increase airfield safety (i.e., reduce the risk of a fatal runway collision). The academic panel also concluded that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield (i.e., given that the baseline level of risk is so low, reducing the risk of a fatal runway collision by a substantial level is of "limited practical importance"). The academic panel's opinion, which represents a subjective value judgment on the importance of reducing the risk of a fatal runway collision, is not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation.

SPAS-PC00173-2

Comment:

We'll be left with sleepless nights from the noise increased air pollution and increased traffic.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of

these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-PC00173-3

Comment:

The mellow-dramatic act by Mr. Rothenberg at a recent meeting was ridiculous and highlights the fact that the committee whom he represented could care less about the residents of the area. His only concern was that one air conditioning unit on a business building might have to be moved. Never did he mention the degradation in the quality of life that the local neighborhood would suffer with the proposed changes to push further north. Just because the airport OWNS the land does not mean that it is OK for LAX to impose its presence on the neighborhoods. THERE IS LEGAL PRECEDENCE IN THE CITY OF LOS ANGELES THAT DEMANDS COMPENSATION OF HOMEOWNERS WHO SUFFER PROPERTY VALUE DEPRECIATION DUE TO NEARBY DEVELOPMENT AND EMINENT DOMAIN TAKINGS (West Hills Property Owners circa 1990) I don't know all the details which homes will be taken because of eminent domain but those of us who are left and are exposed to increased noise/pollution/traffic should be compensated for the loss in property value. I recently moved to the Westchester area thinking that the threat of pushing the airport runways further north was over because of the NASA report. While house hunting a local relator pointed out to me that homes south of Manchester around Emerson were 50-100k cheaper than north of Manchester. I bought north of Manchester and paid the extra amount expecting a quieter existence. My property value will drop $100k or more because of someone else's greediness (it is well documented that this is NOT being done for safety reasons.) IT WILL MATTER IN TERMS OF THE VALUE OF MY HOUSE. Back in the early '90s I lived in an area of Los Angeles called West Hills located in the western edge of the San Fernando valley. A developer came in the city approved their plans they created 50 foot high hills behind many homeowners who had a "view" Pushing the runways further north will cause me to LOSE ALL OF THE EQUITY IN MY HOUSE. How do you plan to compensate me and my neighbors?

Response:

A discussion of property acquisition that would occur under the SPAS alternatives is provided in Section 2.3.1.11 and Section 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. In addition, Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components, although acquisition would be required for the ground access components with which these alternatives would be paired. As indicated in these figures and tables, no residential acquisition is proposed.

Regarding the displacement of homes and businesses within the RPZ for alternatives proposing moving runways north, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. One of the objectives of the SPAS alternatives, as presented on page 2-2 of the SPAS Draft EIR, is for LAWA to seek airfield improvements that minimize or eliminate the extent that RPZs overlay residential areas. As shown in Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR, Alternatives 1, 5, and 6 would result in residences no longer being located within the RPZ.

Regarding the assumption that eminent domain would be used to acquire property affected by the RPZ, the City of Los Angeles would use the most appropriate and practical measures available (e.g., voluntary acquisition, leasing, and/or public condemnation) to implement the project. However, at this early point in the planning process, it is not possible to predict which, if any, properties would be acquired through eminent domain.

Regarding property value impacts, CEQA does not require property value impacts or other purely social or economic impacts to be analyzed in an EIR (State CEQA Guidelines Section 15064(e).) Please see Response to Comment SPAS-PC00189-4 for further discussion about impacts on property values.

Regarding effects associated with air quality, noise, and traffic, these issues have been evaluated in Section 4.2, 4.9, 4.10, and 4.12 of the LAX SPAS Draft EIR.

SPAS-PC00173-4

Comment:

THE REDUCTION IN AIRPORT NOISE LEVELS FROM THE MOST EXTREME PLAN (PUSH 350' NORTH) IS ERRONESOULY BEING APPLIED TO THE WESTCHESTER/PLAYA AREAS. THAT REFERS TO EL SEGUNDO BECAUSE THE SOUTHERN RUNWAYS WILL HAVE FEWER INTERNATIONAL FLIGHTS. NOISE LEVEL WILL BE INCREASED FOR RESIDENTS NORTH OF THE AIRPORT.

Response:

The commenter states that "THE REDUCTION IN AIRPORT NOISE LEVELS FROM THE MOST EXTREME PLAN (PUSH 350` NORTH) IS ERRONESOULY BEING APPLIED TO THE WESTCHESTER/PLAYA AREAS…" In comparison to baseline (2009) conditions, the SPAS Draft EIR concludes that Alternative 1 would result in significant impacts "located principally along the approach to the north and south airfield." (See page 4-837 of the SPAS Draft EIR.) The commentor is referred to Sections 4.9 and 4.10.1 of the SPAS Draft EIR for additional discussion of aircraft noise analysis associated with the SPAS alternatives. Please also see Response to Comment SPAS-AL00007-22 regarding impacts under Alternative 5 (which would relocate Runway 6L/24R 350 feet north) compared to Alternatives 1, 2, 3, 4, 6, and 7.

SPAS-PC00173-5

Comment:

Currently my house is violently shaken EVERY TIME that a 747 long haul jet takes off from the north runway. The vibrations are so strong that my closet doors on the north side of the house rattle! I asked one of your "engineers" at the meeting at the Proud Bird about where sensors were placed when the study was done concerning the noise because I can't believe I'm outside of the 65 decibel area. Turns out it was mathematically calculated without taking into account the terrain of my house. My house sits up on a small knoll exposed to the sound waves as they travel across Westchester park. I'm 100 feet (my best guess) outside the area that had windows replaced by the airport. I've had to replace the windows myself. However it does NOTHING to abate the vibrations of those 747s. I'm at the corner of 85th and Holy Cross Pl 90045 Plus unless and until you force airlines to not use their reverse thrusters on their 757s and 737s and just use the turn out further down the runway there will be no peace. I just can't imagine THAT noise 350' closer to my house as well. Thank you for your consideration.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Note that the comment primarily addresses existing conditions and does not address or comment on the noise analysis conducted in the SPAS Draft EIR, which addresses noise impacts of the SPAS alternatives.

The aircraft noise analysis is provided in Section 4.10.1 of the SPAS Draft EIR. This analysis was based in part on a number of variables including topography. The SPAS Draft EIR aircraft noise analysis was undertaken using the FAA's Integrated Noise Model (INM), the standard model used for aircraft noise analysis in the United States. The noise analysis incorporated digital topographic data from the U.S. Geological Survey. Thus, the results of the noise modeling reflected the effects of topographic variations in the study area at LAX region. Appendix J1-1 of the SPAS Draft EIR further describes the INM and the input data and assumptions used for modeling current noise (2009) and forecast noise (2025) for all SPAS alternatives.

The commentor also discusses concerns regarding the use of reverse thrusters under existing conditions. As stated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1, 2, 3, 5, 6, and 7 include improving the locations of high-speed exit taxiways from the outboard runway. The improvements of the high-speed exit taxiways from the runway would allow the aircraft to exit the runway at greater

speeds, with reduced reverse thrust that directs aircraft away from noise-sensitive uses. Please see Response to Comment SPAS-PC00038-3 regarding vibration impacts associated with aircraft operations.

SPAS-PC00174 Barry, Bill None Provided 9/28/2012

SPAS-PC00174-1

Comment:

This family is strongly opposed to Alternatives 1 5 or 6. I cannot believe that our local state and federal agencies would even consider much less decide to move a pollutant source closer to a densely populated residential area with schools parks and playgrounds. "Fine" particulates and the other toxic emissions from jet engines even new generation engines are a known problem. What can you be thinking of? You even recognize that the pollution is a concern because Alternate 5 has an "SU" labelwhich I understand to mean that the pollution issues are significant and NOT CAPABLE OF BEING MITIGATED. Please adopt alternative 2 which leaves the North runway where it is.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Note that the SPAS Draft EIR determined that operational air quality particulate matter impacts for all alternatives would be significant and unavoidable (SU), as shown in Section 1.4, Table 1-7 of the SPAS Draft EIR. All of the alternatives, including Alternative 2, would result in operational air quality impacts that exceed the significance thresholds.

SPAS-PC00175 Haythorn, Joseph D None Provided 9/30/2012

SPAS-PC00175-1

Comment:

From the outset of the process to explore development of the facility at LAX it appears that LAWA has been acting in a duplicitous manner toward the citizens of Westchester and Playa del Rey. Inglewood has been treated in similar way. The idea that the if LAWA were to pursue moving the runway an additional group of houses condominiums apartments schools and businesses would need to be condemned. Any remaining outside the condemned area would surely bring actions for diminished value. The violation of the consent decree from the last condemnation would serve as the basis of the action but even without that the property owners would be successful in stopping the development resulting in no activity or at worst delaying any construction for years and ultimately receiving compensation forcing the costs of the project far beyond LAWA"TMs predictions.

Response:

A discussion of property acquisition that would occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14. As indicated therein, no acquisition is required due to the movement of the runway and associated realignment of Lincoln Boulevard. As summarized in Table 4.9-5 in Section 4.9.6 of the SPAS Draft EIR, no acquisition of residential uses is proposed and under Alternatives 1, 2, 3, 8, and 9 two charter schools within Manchester Square would be acquired.

Regarding the potential for changes in the RPZ to have an impact on homes, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. One of the objectives of the SPAS, as presented on page 2-2 of the SPAS Draft EIR, is for LAWA to seek airfield improvements that minimize or eliminate the extent that RPZs overlay residential areas. As shown in Table 4.7.2-16 in Section 4.7.2

of the SPAS Draft EIR, Alternatives 1, 5, and 6 would result in residences no longer being located within the RPZ.

Regarding concerns related to reduction of property values, please see Response to Comment SPAS-PC00189-4. Comments related to potential future lawsuits are speculative, and in any event are not relevant to assessment of the SPAS alternatives' physical environmental impacts.

SPAS-PC00175-2

Comment:

The recent charade of the Northside development project meetings and "negotiations" are a further indication that LAWA is either not serious about the alternatives which involve or intending to lull the neighbors into a false sense of security. Neither reflects well as to whether LAWA is a trustworthy party in this project. As LAWA proves again inept and it is difficult to understand whether the entire process of proposing alternatives is a sham.

Response:

The content of this comment is similar to comment SPAS-PC00108-2; please refer to Response to Comment SPAS-PC00108-2.

SPAS-PC00175-3

Comment:

Community partners have demonstrated that the safety claims are so exaggerated they may be dismissed.

Response:

Section 4.7.2 of the SPAS Draft EIR summarizes the results of seven independent assessments of north airfield safety. The commentor provides no substantial evidence in support of its statement regarding safety claims, or any specificity, analysis, or other evidence of the assessments being inadequate or inaccurate as claimed to be demonstrated by "community partners."

SPAS-PC00175-4

Comment:

The statement that noise would not be worse if the runways are moved may be technically true but the noise would be closer to the residences schools and businesses so louder there. To actually claim otherwise again demonstrates that LAWA is not dealing seriously. So I am left to speculate as to whether LAWA is lying or inept. In either case my only alternative at this point is to seek counsel unless LAWA begins to address this business honestly with a clear understanding of the consequences of their actions.

Response:

The commentor appears to be referring to the reduction in the population and dwelling units that would be exposed to 65 CNEL or higher noise levels under Alternatives 1, 2, 3, 5, 6, and 7 compared to 2025 "No Additional Improvements" Conditions. as shown in Table 1-17 of the SPAS Draft EIR, which would occur because some more densely populated areas would be removed from the 65 CNEL noise contour, as further described in Response to Comment SPAS-PC00166-1.

Aircraft noise impacts under Alternatives 1 through 7 were provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR in comparison to Baseline (2009) Conditions. As analyzed therein, aircraft noise impacts would be significant for Alternatives 1 through 7 for those noise-sensitive uses newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours, outdoor noise levels of 75 CNEL or higher, and single event aircraft noise levels which result in classroom disruption. LAX Master Plan commitments and mitigation measures that would address these impacts are identified in Sections 4.9.7 and 4.10.1.8 of the SPAS Draft EIR, and include

LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1. As concluded in Sections 4.9.7, 4.9.8, and 4.10.1.8 of the SPAS Draft EIR, interim impacts, prior to implementation of these LAX Master Plan mitigation measures and LAX Master Plan Commitment N-1, would be significant and unavoidable. In addition, impacts on parks and certain residential uses with outside private habitable areas newly exposed to noise levels of 75 CNEL or higher would be significant and unavoidable.

SPAS-PC00175-5

Comment:

I still believe that the best alternative has not been considered to close the interior parking and access roads construct two or three north-south terminals with access by passengers from a subterranean mall as at the airports in Atlanta or Denver. Passengers would enter the facility east of the airport at Manchester Square or the area now with derelict warehouses between the two points.

Response:

The comment is identical to comment SPAS-PC00108-4; please see Response to Comment SPAS-PC00108-4.

SPAS-PC00175-6

Comment:

Otherwise I agree with the Neighborhood Council of Westchester Playa that alternatives 2 and 9 appear to be the only reasonable ones. The other would receive such opposition as to block all construction. If LAWA is actually intent on ignoring their prior consent agreements there is really no reason to bother negotiating. I further agree with the Neighborhood Council of Westchester Playa that we do support intelligent development of LAX it is a shame any development is relegated to the abilities of the existing management of LAWA.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. The comment regarding LAWA's compliance with "prior consent agreements" requires legal conclusions that are beyond the scope of what is required by CEQA.

SPAS-PC00176 — Montealegre, Andrew — None Provided — 9/30/2012

SPAS-PC00176-1

Comment:

Two ideas for accessing LAX: 1) create a transfer station where people transfer from their cars to a pod-type self-driving car; 2) run the train to the Theme Bldg and create walkways from there to all the terminals. See my website drawings: www.accesslax.blogspot.com

Response:

The basic concept of having people park their cars at an off-airport facility and take an alternative mode of transportation into the CTA is the same as proposed in Alternatives 1, 2, and 8, which propose the ITF linked to the CTA with by an elevated/dedicated busway, and in Alternatives 3 and 9, where an APM system would transport people to the CTA from the GTC, ITC, or ITF. The comment suggesting

the use of a "pod-type self-driving car" is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not indicate any environmental advantages of a "pod-type self-driving car" relative to the alternatives evaluated in the SPAS Draft EIR, nor is there any evidence that such vehicles are technologically feasible. For these reasons, the commentor's suggested alternative was not evaluated in detail in the SPAS Draft EIR.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00177 Harrell, Erica None Provided 10/2/2012

SPAS-PC00177-1

Comment:

Alternative 2 seems to be the best option for those of us who live south of Manchester west of Sepulveda. If any other proposals go through do you plan to purchase any properties in this area?

Response:

Please refer to Response to Comment SPAS-PC00160-4 for a discussion of parcels that would be acquired under the SPAS alternatives. As shown in Figure 2-11 in Section 2.3.1.11 of the LAX SPAS Draft EIR, no areas are proposed for acquisition or purchase south of Manchester Avenue and west of Sepulveda Boulevard.

As implied by this and the following comment, the commentor may also be requesting the purchase of properties due to increased aircraft noise exposure. As described on pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR, incompatible uses (including residential) located within the 65 CNEL or higher noise levels are eligible for sound insulation. LAWA's current practice is to provide sound insulation to residential uses rather than purchase incompatible properties, with the exception of a separate voluntary residential acquisition and relocation program currently underway for the Manchester Square and Belford areas.

SPAS-PC00177-2

Comment:

I can assure you the airport noise is really a nuisance already here. With all of these alternative what would the sound impact be on those in my area? If alternative 2 is passed are there any incentives that could be done for the neighbors in this area? Specifically we have these horrible power poles on86th that do not even power our neighborhood. Having more trees would be nice around this area as well. Are there any neighborhood incentives planned with any of these proposals? If so what are they? Thank you!

Response:

Please see Response to Comment SPAS-PC00008-1 regarding current measures underway to address existing aircraft noise levels.

A discussion of aircraft noise impacts in Westchester, including the area south of Manchester Avenue and west of Sepulveda Boulevard (and east of the Westchester Municipal Golf Course), under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR.

Regarding noise levels at the commentor's property (located at 6527 West 86th Place in the community of Westchester), as analyzed in Sections 4.9.6 and 4.10.1.6 of the Draft EIR, under all of the alternatives the referenced property would not be newly exposed to high noise levels within the 65 CNEL noise contour. Therefore, impacts at the commentor's property would be less than significant.

Regarding the incentives proposed by the commentor, the SPAS project does not include the removal of power poles or the planting of trees for this area of Westchester. However, along the southern boundary of the area referenced by the commentor, south of 88th Place and 88th Street and east of Emerson Avenue, is LAX Northside which serves as an airport buffer zone (comprised of compatible development and landscape) between airfield operations and the Westchester community. This area is subject to use restrictions, height restrictions, setback requirements, and landscape requirements (including a 30-foot landscaped buffer setback along 88th Street between Sepulveda Westway and Liberator Avenue).

SPAS-PC00178 Mitchell, Michael None Provided 10/3/2012

SPAS-PC00178-1

Comment:

The city is broke the state is broke to think you have the money to do any of this is a scam to take city money that we do not have and the bond market is a bubble. This is a scam and the design of the international terminal should be the end of the new work on the airport the rest will not work any way the one mile loop works great if you move off this area everyone will go to other airports for it will be torture to come to lax and get out of it. the truth is spas is made to make money from a plan 15 years ago that is out of date will not work and a sin if you do. when the mayor leaves next year the secret that the city is really broke will come out the bond market will crash and the city will not be able to sell the lax bonds. It will go bankrupt and have to be sold to the highest bidder especially if you spend all this needless money for spas.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements, including bonds. As noted in that response, no general tax dollars would be used to pay for any of the proposed on-airport improvements.

SPAS-PC00179 Smith, Chris None Provided 10/3/2012

SPAS-PC00179-1

Comment:

It was very difficult to find this space on your website. I am in favor of all efforts to modernize LAX. It is evident that it has been allowed to go for far too long with making the improvements necessary to keep it a world class airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). It is unclear as to what the commentor is referring regarding his difficulty finding "this space" on LAWA's SPAS website. If the commentor is referring to the location on the website where comments could be provided, the home page of the website contained a prominently-placed section in the top right-hand corner of the page with a headline reading: "Tell us what you think. Once you have reviewed the study information, submit a comment on the Draft Environmental Impact Report by using the form below."

SPAS-PC00179-2

Comment:

That said I also think that LAWA needs to speak in a more neutral fashion about the safety studies that have been commissioned and completed - there is no sense of balance in how you portray the findings.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00180 Wiles, Jim None Provided 10/4/2012

SPAS-PC00180-1

Comment:

The only alternatives that make sense for LAX and the surrounding community are alternatives 2 & 9. I have lived in Westchester for over 30 years. Please desist from ruining this great community. If you choose an alternative that moves the runway north there will be many more years of litigation. Do the right thing.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00181 Allen, Marilyn M None Provided 10/4/2012

SPAS-PC00181-1

Comment:

I am a life long resident of the LAX area. We do not need LAX to be expanded... we need it to be modernized... tearing up streets and moving the runway are not necessary... alternatives 2 and 9 are the only way to go...if I could I would vote for them. thank you

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00182 Lund, Julie None Provided 10/8/2012

SPAS-PC00182-1

Comment:

I do understand that improvements need to be made to the airport but as a Westchester neighbor and a airport employee I do not want the north runway moved. The best options in my view are either option 2 or 9.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00183 Peterson, Linda None Provided 10/8/2012

SPAS-PC00183-1

Comment:

As homeowners near LAX and frequent users of the airport we are disappointed that the expressed Project Objectives for the SPAS do not include the goal of regionalizing Southern California air traffic. Regionalization should have been one of the enumerated Project Objectives and the DEIR should have discussed how much each alternative would help to accomplish that objective. It is short-sighted of the City to put all of its eggs into the LAX basket. In addition although LAX brings economic benefits to all of Southern California the burdens of the airport are unfairly shouldered by the communities surrounding it. It is time to take a serious regional approach to air transportation to mitigate the safety concerns noise congestion and air pollution currently impacting those who live work and travel the roads near LAX.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. The topical response explains why regionalization was not included as a project objective.

SPAS-PC00183-2

Comment:

As to the specific alternatives included in the SPAS we favor a combination of Alternatives 2 and 9 which we believe would modernize the airport and improve the airfield and ground transportation without unduly harming nearby communities. Not only is Alternative 2 the "environmentally superior alternative" (page 1-103) it appears to be the most affordable option and the one that could be accomplished with the least delay. Many of the other alternatives in the SPAS are prohibitively expensive and there is no indication of how they will be funded. We support the airfield improvements in Alternative 2 which does not relocate the north runways but instead lengthens the left runway and improves taxiways. Alternative 2 is preferable given that these modifications to the airfield would mean that the larger Group 5 and 6 aircraft could be acceptably handled with no additional runway separation (pages 4-514-515). The expert safety study conducted by the North Airfield Safety Advisory Committee considered the "gold standard" when it was commissioned unanimously concluded that the North

Runway Complex is extremely safe even with future projected traffic levels. In addition Alternative 2 would have the least impact on road traffic (page 4-942). Alternative 2 would not require the very expensive modifications to Lincoln Boulevard or the Argo Drainage Channel that would be required under the options that would move the runway so the modernization in Alternative 2 should not take as long or be as expensive as the alternatives that would move the runways. We support Alternative 9 as well because we believe that the Consolidated Rental Car center project in Alternative 2 combined with the automated people mover from Alternative 9 would improve traffic by taking rental car shuttles off the road.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. It should be noted that Alternative 2 does not include a CONRAC; however, a CONRAC is a feature of Alternative 9.

Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost alternative (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report). The comment that many of the SPAS alternatives are prohibitively expensive is a personal opinion unsupported by facts or evidence. Regarding the statement that there is no indication of how the SPAS alternatives will be funded, as indicated in Table 8-1 of Chapter 8 of the Preliminary LAX SPAS Report, the total escalated costs associated with each SPAS alternative match the approximate amount of funding from various sources that is anticipated to be available for the alternatives. Please also see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. The comment that Alternative 2 "could be accomplished with the least delay" and "should not take as along" as other alternatives is noted. Because of the programmatic nature of the SPAS Draft EIR, the relative construction time for each alternative is not currently known. As indicated on page 2-57 of the SPAS Draft EIR, the nine SPAS alternatives were formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for any of the alternatives. In conjunction with the preparation of more detailed design and engineering plans for airfield improvements, it is anticipated that several potential options for construction approaches and phasing will be explored.

Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Please also see Responses to Comments SPAS-PC00130-3 and SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Page 4-942 of the SPAS Draft EIR does not indicate that Alternative 2 would have the least impact on road traffic. The analysis on page 4-942 addresses impacts from road traffic noise, not road traffic. The conclusions on page 4-942 state that road traffic noise impacts associated with Alternative 2 would be less than significant. They do not state that road traffic noise impacts would be lower under Alternative 2 than under the other alternatives. Comparisons of road traffic noise impact associated with the SPAS alternatives are provided in Tables 4.10.2.3 and 4.10.2-4 of the SPAS Draft EIR. As indicated in the tables, road traffic noise impacts would vary at each receptor point. There is no alternative that would have the lowest road traffic noise impacts at all of the receptor points. Off-airport transportation impacts are addressed in Section 4.12.2 of the SPAS Draft EIR. A summary of off-airport traffic impacts associated with the SPAS alternatives is provided in Table 4.12.2-26 of the SPAS Draft EIR. As indicated in the table, similar to the results associated with road traffic noise, no single alternative would have the lowest road traffic impacts associated with all scenarios and types of facilities evaluated.

SPAS-PC00183-3

Comment:

The people mover in Alternative 9 would be easier for travelers than would the elevated bus way proposed in Alternative 8 simply because stepping onto a tram with luggage is more convenient than climbing into a bus with luggage. However the drawings of the people mover suggest that it dead-ends at Terminal 7 which would be a bad design. Why not have a circular design that does not end at any one terminal but instead goes to them all?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The busway in Alternatives 1, 2, and 8, and the APM under Alternative 9 have been developed at a program level of planning for SPAS. The levels of the bus platforms in the busway system have not yet been defined. Additionally, the final APM system, including the number and placement of stations within the CTA, has not yet been defined. The SPAS Draft EIR is a programmatic document, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. Nonetheless, the APM would be fully compliant with the requirements of the Americans with Disabilities Act and all other applicable laws. No further response is required because the comment, which reflects the commentor's opinion without factual support of substantial evidence, does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00183-4

Comment:

We oppose the three alternatives that propose to move the right runway north (Alternative 1: 260 feet north Alternative 5: 350 feet north Alternative 6: 100 feet north). The NASA study demonstrated that further runway separation is unnecessary for safety (page 4-505). In removing the safety rationale for further separating the north runways that study also destroyed any legitimate argument that the communities near LAX must be required to bear all the adverse effects of runway movement so the airport will be safe. The airport is safe now.

Response:

The content of this comment is similar to comment SPAS-PC00096-8; please refer to Response to Comment SPAS-PC00096-8.

SPAS-PC00183-5

Comment:

The DEIR predicts increases in the size of the noise contour over nearby communities from these runway movements (page 4-829 (Alt. 1); page 4-881-2 (Alt. 5); page 4-897 (Alt. 6)) which would negatively affect the quality of life in the communities near the airport.

Response:

The information referenced by the commentor refers to the change in the 65 CNEL noise contour area. As shown in Tables 4.10.1-8, 4.10.1-15, 4.10.1-22, 4.10.1-29, 4.10.1-34, 4.10.1-41, 4.10.1-48, under Alternatives 1 through 7 the area currently exposed to noise levels of 65 CNEL or higher would increase compared to 2009 baseline conditions.

However impacts were determined based on noise-sensitive uses that would be newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours, outdoor noise levels of 75 CNEL or higher, and single event aircraft noise levels which result in classroom disruption. As analyzed in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR, under Alternatives 1 through 7, some areas within Playa del Rey would be newly exposed to noise levels of 65

CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours, and single event aircraft noise levels which results in classroom disruption. As concluded in Sections 4.9.7, 4.9.8, and 4.10.1.8 of the SPAS Draft EIR, interim impacts prior to implementation of LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1, would be significant and unavoidable.

CEQA does not require that impacts on quality of life be assessed, and interpretation of effects on quality of life would likely be subjective and highly variable. The SPAS Draft EIR does however evaluate physical impacts on the environment associated with over 20 topical issues and how such impacts affect residents in surrounding communities.

SPAS-PC00183-6

Comment:

It appears that the primary reason to expand LAX in these ways would be to increase the capacity of the airport. Although LAWA needs to modernize we do not favor expansion.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Consistent with the requirements of the Stipulated Settlement, the SPAS identifies and evaluates potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 MAP. Please see Response to Comment SPAS-PC00130-328 regarding the fact that the airfield improvements proposed under the SPAS alternatives are intended and designed to address the problems associated with the current outdated design of the airfield. Airfield capacity is not identified as a problem and none of the airfield improvements are proposed to increase the capacity of the airport.

SPAS-PC00183-7

Comment:

We do not understand how it can be as the DEIR states that the impacts of these runway movements to businesses within the Runway Protection Zones (RPZ) under these three alternatives can be considered "less than significant" (page 1-77). It is clear that businesses which we rely upon in the Westchester business district not currently located within an RPZ would be located within it and may need to be destroyed (for example page 4-516). LAWA appears to assume that it would have to purchase very little of the existing Westchester business district even though much of it would fall into the RPZ because it is assumed that pilots will land mid-runway on the right runway. However where is the guarantee that all pilots will land mid-runway or that the FAA will agree that telling them to do so is sufficient protection for the businesses within the RPZ? If the FAA insists that these businesses be removed not only from the Runway Safety Area but also from the RPZ then the airport will again need to destroy significant parts of Westchester which currently provide both jobs and services to local residents and furnish significant tax dollars to the City. Even assuming that these businesses would not have to be moved it is not at all clear that these businesses should remain in the RPZ. Please explain how these nearby businesses would be safe if they remain in the RPZ.

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00130-253; please refer to Response to Comment SPAS-PC00130-253.

SPAS-PC00183-8

Comment:

We also oppose Alternative 3 because it unnecessarily proposes to move the left runway 340 feet south at what would necessarily be an extraordinary expense including demolition of three terminals and

extensive central terminal construction because again the separation of the north runways by this amount of distance is not necessary for either airfield safety or efficiency. Alternative 7 which proposes a 100 foot southward movement for the left runway does not seem as expensive as Alternative 3. However given that Alternative 2 is the "environmentally superior" alternative and accomplishes the project objectives there is no reason for the additional costs that Alternative 7 would be likely to entail.

Response:

The commentor's support for Alternative 2 and opposition of Alternative 3 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives.

SPAS-PC00183-9

Comment:

As frequent travelers through LAX we appreciate the need to modernize it. However we believe the travelling public would appreciate things like on-airport mass transit better signage repairs to roadways more efficient baggage screening better elevators and modernized restrooms more than moving the north runway.

Response:

The comment is noted and is hereby part of the Final EIR, and will forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Regarding improvements related to on-airport mass transit, please see Topical Response TR-SPAS-T-1.

Regarding improvements related to better signage, repairs to roadways, improved baggage screening, better elevators, and modernized restrooms, such improvements pertain to ongoing projects at LAX that are separate from the program-level improvements analyzed in the SPAS Draft EIR. Ongoing maintenance and miscellaneous improvements were considered in the cumulative impacts analyses provided in Chapter 5 of the SPAS Draft EIR, including improvements to lighting (as part of the "New Face" of the CTA Improvements/Enhancements Project), roadways (such as the CTA Second Level Roadway Expansion Joint and Deck Repairs project), baggage screening (various terminal-related projects), and elevators and escalators. Please see pages 5-17 through 5-22 of the SPAS Draft EIR for a description of the ongoing and planned airfield-, terminal-, and infrastructure/security-related improvements at LAX. Additionally, LAWA provides information on ongoing projects on their website under "Projects and Reports": http://www.lawa.org/welcomeLAX.aspx.

SPAS-PC00183-10

Comment:

Further it is time the City recognizes that regardless of what it does at LAX it will not give LA a first-rate airport. Because of its geographic constraints LAX is simply not the location for a world-class airport. The best alternative is to develop an airport where there is open space for such an airport as other cities such as Denver and Houston have done and at the same time build a mass transportation system that actually goes into that airport.

Response:

The content of this comment is similar to that of comment SPAS-PC00096-24; please see Response to Comment SPAS-PC00096-24.

SPAS-PC00184 White, Eugene None Provided 10/8/2012

SPAS-PC00184-1

Comment:

As homeowners near LAX and frequent users of the airport we are disappointed that the expressed Project Objectives for the SPAS do not include the goal of regionalizing Southern California air traffic. Regionalization should have been one of the enumerated Project Objectives and the DEIR should have discussed how much each alternative would help to accomplish that objective. It is short-sighted of the City to put all of its eggs into the LAX basket. In addition although LAX brings economic benefits to all of Southern California the burdens of the airport are unfairly shouldered by the communities surrounding it. It is time to take a serious regional approach to air transportation to mitigate the safety concerns noise congestion and air pollution currently impacting those who live work and travel the roads near LAX. As to the specific alternatives included in the SPAS we favor a combination of Alternatives 2 and 9 which we believe would modernize the airport and improve the airfield and ground transportation without unduly harming nearby communities. Not only is Alternative 2 the "environmentally superior alternative" (page 1-103) it appears to be the most affordable option and the one that could be accomplished with the least delay. Many of the other alternatives in the SPAS are prohibitively expensive and there is no indication of how they will be funded. We support the airfield improvements in Alternative 2 which does not relocate the north runways but instead lengthens the left runway and improves taxiways. Alternative 2 is preferable given that these modifications to the airfield would mean that the larger Group 5 and 6 aircraft could be acceptably handled with no additional runway separation (pages 4-514-515). The expert safety study conducted by the North Airfield Safety Advisory Committee considered the "gold standard" when it was commissioned unanimously concluded that the North Runway Complex is extremely safe even with future projected traffic levels. In addition Alternative 2 would have the least impact on road traffic (page 4-942). Alternative 2 would not require the very expensive modifications to Lincoln Boulevard or the Argo Drainage Channel that would be required under the options that would move the runway so the modernization in Alternative 2 should not take as long or be as expensive as the alternatives that would move the runways. We support Alternative 9 as well because we believe that the Consolidated Rental Car center project in Alternative 2 combined with the automated people mover from Alternative 9 would improve traffic by taking rental car shuttles off the road. The people mover in Alternative 9 would be easier for travelers than would the elevated bus way proposed in Alternative 8 simply because stepping onto a tram with luggage is more convenient than climbing into a bus with luggage. However the drawings of the people mover suggest that it dead-ends at Terminal 7 which would be a bad design. Why not have a circular design that does not end at any one terminal but instead goes to them all? We oppose the three alternatives that propose to move the right runway north (Alternative 1: 260 feet north Alternative 5: 350 feet north Alternative 6: 100 feet north). The NASA study demonstrated that further runway separation is unnecessary for safety (page 4-505). In removing the safety rationale for further separating the north runways that study also destroyed any legitimate argument that the communities near LAX must be required to bear all the adverse effects of runway movement so the airport will be safe. The airport is safe now. The DEIR predicts increases in the size of the noise contour over nearby communities from these runway movements (page 4-829 (Alt. 1); page 4-881-2 (Alt. 5); page 4-897 (Alt. 6)) which would negatively affect the quality of life in the communities near the airport. It appears that the primary reason to expand LAX in these ways would be to increase the capacity of the airport. Although LAWA needs to modernize we do not favor expansion. We do not understand how it can be as the DEIR states that the impacts of these runway movements to businesses within the Runway Protection Zones (RPZ) under these three alternatives can be considered "less than significant" (page 1-77). SPAS-PC00185-1

Comment:

I support the Consolidated Rental Car facility with a people mover to access it. Same people mover to Metro as well if green line does not go to the terminal area. All vehicle parking lots hotels should be accessed by people mover. Any remaining hotels or vehicle lots should have a central pickup accessed from the people mover. In other words the only vehicles allowed in the horseshoe would be passenger vehicles.

Response:

The comment does not indicate any environmental advantages of the suggested alternative relative to the alternatives evaluated in the SPAS Draft EIR. The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00186 Lund, Russell — None Provided — 10/9/2012

SPAS-PC00186-1

Comment:

I mailed a letter with comments yesterday thinking that two days would be enough to meet the Oct 10 deadline. I failed to recognize that yesterday was a USPS holiday so my letter would not be picked up

until today. To make sure my comments are timely I'm submitting them in this format as well -- I am not trying to stuff the ballot box. Thanks... Mr. Alvarez: Thank you for taking the time to address our community at September 27"™s NCWP town hall meeting. You had little time to cover a great deal of information and I think you used your time effectively. I was also impressed by the unanimity of views expressed by community organizations and political representatives. I agree with them that important improvements must be made at LAX. As outlined in part below I am convinced that moving the north runway is NOT a cost effective or efficient approach to improve LAX and the flying experience for Los Angeles residents. The best information available does NOT support moving the runways for reasons of safety. I was particularly struck by the comments of Mr. Voss of the LAX Coastal Area Chamber of Commerce. As I understood him he was involved with determining the objectives for the LAX NASS. He described the researchers selected as experts who would provide the "gold standard" report on north runway safety. Nevertheless the DEIR seems to denigrate the findings of these blue ribbon experts. The LAWA report seems instead to favor disagreements such as those expressed by the FAA without emphasizing the fact that the NASS response to the FAA "review" largely debunks their criticisms. It is unfortunate that the important NASS response is largely relegated to the end of an appendix and is not given the prominence it deserves. If flight safety is of paramount concern LAWA could "" in short order and at relatively little cost "" reduce the risk of aircraft incursions on the north runways by simply eliminating exits along the length of north runway 6L/24R thereby requiring all landing aircraft to cross runway 6R/24L at the far end of the runway. Although this would increase taxi time for some operations many airports have taxi distances and times far longer than those presently at LAX and this increase would only marginally increase total gate-to-gate times (of course any alternative that involves moving the runways farther from the terminals may also increase taxi time). Taxi time is a very minor issue when compared to capital project costs quality of life in the neighborhoods north of LAX and even the misleading safety arguments. If large equipment (e.g. the A-380) needs more space simply use the south runways for these few flights. That this option was not included in the current set of Alternatives can only be viewed as part of the ongoing LAWA strategy to push one plan down the throats of Los Angeles residents and its absence effectively constrained the work performed by the NASS (who nevertheless found that safety concerns do NOT support moving the north runways). Time and time again LAWA has proposed airport expansion through relocation of the north runways (only to have that proposal rejected) with the apparent hope that one day the heretofore strong opposition will be caught napping. Usefulness of LAX is limited by ground transportation. Users of LAX (air travelers and freight from the southland) must reach the airport by car truck or bus. The nearby freeway and road infrastructure is overloaded. LAWA should focus its expansion desires on the regional airports (including Palmdale) not on shoehorning more people into the constrained area of LAX. It is reprehensible that flight safety is being used to try and "justify" the misguided goals of LAWA. Meanwhile improvements to transportation local to the airport can and should be implemented. Furthermore our terminals show their age and are woefully inadequate to handle passenger loads. I notice this particularly in Terminals 1 and 3 (despite recent improvements made to the Terminal 1 arrival/bag claim area). Of the options offered in the SPAS DEIR I endorse Alternative 2 as being the closest to the approach described above.

After careful review of the plans to extend the runway at LAX I think #2 or #9 is the best choice for our community in Playa Del Rey

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00188 Redner, James None Provided 10/9/2012

SPAS-PC00188-1

Comment:

To Whom It May Concern We have reviewed the nine alternatives currently being suggested for LAX. Based on where we lives (85th Place between Georgetown and McConnell) across Manchester from the golf course. As it is the flights coming in and out are fairly loud and depending on the direction of the wind we can smell jet fuel. The idea that runways may move up to 350/300 ft closer to where we live is very troubling. The movement will negatively impact our lives with unwanted and potentially harmful pollution (noise and air). If this movement were to occur it will have undesired repercussions. With that in mind we support Alternative 2 and Alternative 9. The improvement of transportation in and out of LAX would help elevate current congestion. Alternative 9 would improve the airport helping to make it a top destination which it is current not.

Response:

The content of this comment is similar to comment SPAS-PC00139-1; please refer to Response to Comment SPAS-PC00139-1.

SPAS-PC00189 Wallace, Erin None Provided 10/9/2012

SPAS-PC00189-1

Comment:

I am a resident and homeowner in Playa del Rey. I have lived here for three years and in the surrounding area for my entire life. I am very disappointed by the push to move the north runways 350 feet closer to my neighborhood. The following issues illustrate the fault with this plan: 1. The "safety" issues in the report which I have read cover-to-cover are either unimportant or minimal (when compared to both other airports and the south runways). This is expressed in the report and in several analyses done of the report. 2. Air Force One takes off from the north runways. I assume the President of the United States would not do so if it was unsafe. 3. Most of the air traffic at LAX comes in and out of the south runways which since recently renovated should continue to provide excellent service. 4. Many of the industrial flights that come through LAX are transporting products through hangars and warehouses on the south side of the airport.

Response:

The commentor's opinion regarding the relative unimportance of safety issues discussed in the SPAS Draft EIR is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Regarding the commentor's second point, neither the FAA or LAWA would allow unsafe runway conditions anywhere at LAX for any flight. As described in Section 2.2 of the SPAS Draft EIR, one of the project objectives of SPAS is to enhance the safety and efficiency of the north airfield. Regarding the third point, improvements made to the south airfield as part of the South Airfield Improvement Project have improved the safety and efficiency of the south airfield; however, current and anticipated aircraft activity for LAX as a whole warrants improvements on the north airfield as well. Regarding the fourth point, it is true that the majority of air

cargo operations at LAX occur on the south side of the airport; however, that does not alleviate the need to make improvements to the north airfield given the amount of non-cargo aircraft activity that occur in that area of the airport.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00189-2

Comment:

5. There are many schools parks and residences close to the airport that already experience noise and air pollution that need not be furthered by decreasing the distance between them and the airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, as a result of the increase in the number of aircraft operations forecasted in the future, all of the airfield Alternatives (1 through 7) would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Please also see Response to Comment SPAS-PC00130-794 regarding noise and air quality impacts of the SPAS alternatives on parks and recreational uses, including Nielson Park, Westchester Golf Course, Westchester Recreation Center (i.e., Westchester Park), and Del Rey Lagoon.

SPAS-PC00189-3

Comment:

6. The illustration of the plan shows the runway starting on Lincoln Boulevard. Are we to assume that this important street will now be a dead end? 7. Westchester Parkway has been a place for recreation for many years. Many people use it for running walking their dogs and riding their bicycles. This relocation will make it less likely to be used for such purposes.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. As indicated in that topical response, under Alternatives 1, 5, and 6, Lincoln Boulevard would be relocated to the north in order to move the roadway out of the footprint of the runway. With the relocation, Lincoln Boulevard would continue to provide access from Sepulveda Boulevard to Westchester, as it does today. Although the portion of Lincoln Boulevard in the vicinity of LAX is identified as a part of the backbone bikeway network in the 2010 Bicycle Plan, and the street segment has been identified for a future bicycle lane, there is currently no existing bicycle path or bicycle lane along this portion of Lincoln Boulevard, nor has funding for a future bicycle path or lane been identified.1 Nevertheless, the realigned Lincoln Boulevard would continue to include sidewalks that could be used for recreational activities, such as running, dog walking, and bicycle riding.

1. City of Los Angeles, Department of City Planning, 2010 Bicycle Plan: A Component of the City of Los Angeles Transportation Element, March 1, 2011, Available: http://planning.lacity.org/cwd/gnlpln/transelt/NewBikePlan/Txt/LA%20CITY%20BICYCLE%20PLAN.pdf, accessed December 17, 2012.

SPAS-PC00189-4

Comment:

8. This will most certainly decrease property values in my neighborhood. This will mean that my neighbors and I will experience further hardships than those already placed on us by this dreadful economy.

Response:

Regarding concerns about property values, it should be noted that, per Section 15131(a) of the State CEQA Guidelines, "economic or social effects of a project shall not be treated as significant effects on

the environment." This section of the guidelines further states that "intermediate economic or social changes need not be analyzed in any greater detail than necessary" to identify a physical change caused by the economic or social changes. As outlined in Section 15002(a) of the State CEQA Guidelines, the basic purposes of CEQA are to inform decision-makers and the public about the potential significant environmental effect of proposed activities; to identify means to reduce, avoid, or mitigate environmental damage; and to disclose reasons why the decision-makers approved a project if significant environmental effects are involved. Although considerations other than environmental impacts have a role in the action taken by the decision-makers, the purpose of an EIR is to focus on environmental effects. Accordingly, CEQA does not require an analysis of project impacts on property values.

SPAS-PC00189-5

Comment:

For years we have been adding lanes to our freeways in an attempt to decrease traffic and we have done nothing but increase it. While traffic through our airports can help our community as a whole through tourism and consumerism it also increases pollution and decreases property values in the surrounding areas. Does it really make sense to spend taxpayer dollars on this project when it could potentially cause decreased revenues in both property taxes and sales taxes? Is this project the best use of taxpayer dollars? Please look at the big picture and see that this will do more harm than good to this community. Thank you Erin Wallace CPA Playa del Rey Resident and Homeowner

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

As indicated in Section 4.2 of the SPAS Draft EIR, operation of the airport, including emissions from vehicles, would result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Regarding property value impacts, CEQA does not require property value impacts, sales tax revenue impacts, or other purely social or economic impacts to be analyzed in an EIR (State CEQA Guidelines Section 15064(e)). Please see Response to Comment SPAS-PC00189-4 for further discussion about impacts on property values. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. As noted in that response, no general tax dollars would be used to pay for any of the proposed on-airport improvements.

SPAS-PC00190 Worf, Homer None Provided 10/9/2012

Comment:

Moving ahead..how far ahead ? In 20 to 30 years we might have other than petroleum powered jets.. Fortunately LAX IS A huge property..Should be build in any plans now.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00192 Melton, Greg None Provided 10/10/2012

SPAS-PC00192-1

Comment:

As a long time resident of Westchester I fully support "Alternative 2" (modernization with NO runway movement) and "Alternative 9" addressing transportation. We all want a world class airport but we object to moving any runway that would grossly impact our community with noise pollution and the loss of any more of our business district. Please take into account any plan that would disrupt the lives of people and property values in one of the best communities in the city of Los Angeles. Be a good neighbor.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration in Sections 4.10.1, 4.10.2, 4.10.3, and 4.10.4 respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

Relative to transit noise and vibration, as indicated in Section 4.10.4 of the SPAS Draft EIR Alternatives 1, 2, and 8 would result in significant but mitigable transit noise impacts at noise-sensitive receptors (hotels) associated with the elevated/dedicated busway system. Transit noise impacts under Alternative 3 related to the two APMs would be less than significant with implementation of mitigation already required under the LAX Master Plan. Under Alternative 9, transit noise impacts related to operation of the APM operations would be less than significant. Alternative 4 does not propose an elevated/dedicated busway system or APM system; as such, this alternative would not result in any transit-related noise impacts. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not have transit noise impacts, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Transit-related ground-borne vibration would be less than significant for Alternatives 1, 2, 3, 8, and 9. Alternatives 4, 5, 6, and 7 do not propose an elevated/dedicated busway system or APM system and would not result in any transit-related vibration impacts.

As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. In addition, please see Response to Comment SPAS-PC00189-4 regarding impacts to property values.

SPAS-PC00193 Kokelaar, Linda None Provided 10/10/2012

SPAS-PC00193-1

Comment:

I support a combination of Alternatives 2 and 9. Improvements are needed on the ground in the terminals and on the air field. I oppose moving the runways further north. The current configuration of the runways is safe. The quality of life for the residents in the surrounding communities is equally important and must be preserved. LAX has already disrupted the lives of thousands with previous expansions. More existing homes do not need to be destroyed.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of North Airfield Safety Study (NASS) relative to the safety enhancements associated with reconfiguration of the north airfield.

CEQA does not require that impacts on "quality of life" be assessed since it is a subjective social impact. Purely economic and social impacts are not required to be evaluated under CEQA. (State CEQA Guidelines Section 15064(e).) The SPAS Draft EIR does however evaluate physical impacts on

the environment associated with over 20 topical issues and how such impacts have the potential to affect residents in surrounding communities.

As indicated in Tables 2-4 and 4.9-5 of the SPAS Draft EIR, no residential acquisition is proposed under any of the SPAS alternatives.

SPAS-PC00194 The Allen Family None Provided 10/10/2012

Comment:

Our family purchased our home in Westchester in 1947. As long time residents we have witnessed many and various changes in our community over the years. In recent decades however LAX issues have become foremost to the residents of Weschester and the surrounding communities. We are writing to express our support of the LAWA draft EIR Alternatives 2 and 9. We are opposed to all the other Alternatives. Thank you for the opportunity to express our opinion on this extremely important issue. The Allen Family

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00195 Gat, Jonathan None Provided 8/25/2012

SPAS-PC00195-1

Comment:

My name is Jonathon Gat. I live in West LA. I'm a business person. I use the airport, a business person, I use the airport about once a month and about one in every four trips is an international trip. The airport is old in many ways, it needs to be modernized. The safety needs to be enhanced which means realigning the runways. I am very much for the idea of a consolidated car rental facility. I think that works well in other cities where it has been tried. And in general we have to get this airport out of the sixties it was designed for the 707 and they're not around anymore. So thank you for this opportunity.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00196 Livers, Gregory None Provided 8/25/2012

SPAS-PC00196-1

Comment:

Hello my name is Gregory Livers and I'm a homeowner here in the Westchester LAX area and I'm here today to discuss with you about the importance of MTA connecting the airport as soon as possible. We need this service as soon as possible in order to deal with our economy. I just came back from places like New York, Chicago where they have infrastructure, where unemployment is low due to that because they move people. In order for us to be a first class city we have to be able to move people as they do in New York, Chicago, in San Francisco. What we fail to do it here and with all this MTA expansion right now with connecting Culver City the priority should the airport, LAX, especially with the expansion of Tom Bradley going on right now. That is the first entrance of people to our city and we need to move them as soon as they get here. The time of LA being landlocked is over with. The days of Firestone, the days of Exxon-Mobil are behind us. We now have to immediately get involved with mass transit and move people for our economy's sake so that people can be able to afford good jobs and be able to have access and be able to use what they are able to receive from working but not have to pay enormous traffic costs in the car repairs, cars the way that LA actually was set up to be if you don't have a car in Los Angeles you are landlocked. This is not a major city to be landlocked without a vehicle. In order to produce and have for our children to have opportunities we have to have a better transit system, one that we can all be proud of. Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00197 Saifi, Sean Central Coast Shuttle Services 8/29/2012

SPAS-PC00197-1

Comment:

Hi, good afternoon, my name is Sean Saifi, I am a representative of Central Coast Shuttle Services. We're a local transportation company located in Santa Maria Airport. First off I wanted to commend you guys leave you guys open meeting trying to have everybody involved we do really appreciate that especially us small business owners and I would like to propose this, to just leave it the way it is. If anything I'm ok with alternative route 4 because of the car rental situation but I would really like to leave it the way it is. Couple of reasons why is, first off I think it's public or private you know we're all trying here to serve the public, what's in their best interest and I have dealt with a lot of customers in the past and you know for them to even get to the bus is a long distance sign is even a difficult task sometimes to convey to foreign customers or to even domestic customers it is a little bit hard to pass that message along and it's just it's hardly a huge inconvenience just to move everybody outside the line. And I think it is a very efficient system that we have right now at LAX and I am actually proud to say that we come from LAX when we compare to DFW, compare to JFK which is a nightmare and any most other airports, even Denver where they have the long train system set up it's just really inconvenient that this whole another cost of fuel, buses, massport and the construction so I really would like to leave it the way it is. I think you guys did a great job the way it circles is really efficient and I just want to thank you for that. Have good day.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00198 Mitchell, Michael Mickey's Space Ship Shuttle 8/29/2012

SPAS-PC00198-1

Comment:

I'm Michael Mitchel with Mickey's Space Ship Shuttle I represent eight companies that drop 35 miles out as their first stop out from LAX Airport and we are scheduled bus services. We think that you should leave the CTA the way it is, the way Clifton Moore designed it, it's perfect now. If you get a million and a half people on a Christmas the weekend to take them to the transportation intermodal facility it'd be ridiculous so we'd rather you wouldn't do it at all to build that. But if you do build it please let us stay in the CTA because we drop 35 miles out of town for a first stop. Also you're building it where airplanes could hit it and get air damage from the people out there. But to load them and take them all the way out there it's ridiculous, we think and we are going to get a lawyer if we have to, the companies I talked to this morning so we will sue the airport if you force us to go out there. At least let us stay inside because we go 35 miles for our first stop. It's totally wrong to take people, it will be a fiasco to take a million people out there and try to load with all our companies. Now we pay loop fees, we're not a concession, we've been doing it 22 years, we've done millions of people and our companies are well respected and we feel it's discriminating if you try to push us out of the way and give it all to a Fortune 500 company. We want you to support local LA companies and we feel you've discriminated us already, you've taken the courtesy phones away and pushing Super Shuttle to the inside which is owned out of France and Mr. Biar is actually on the commissioners. He actually worked for the bank that owns Viola so we think he should be recused from the commission. But we think we should leave the loop, the CTA, the way it is right now.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00199 Schuelein, Steve None Provided 10/11/2012

SPAS-PC00199-1

Comment:

Reports of LAX expansion plans are frightening. It is ill-conceived to move the runways further north for dubious gains at the expense of established area neighborhoods. This insanity must be stopped.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00200 Schneider, Barry None Provided 10/10/2012

SPAS-PC00200-1

Comment:

About twelve years ago, realizing a lifelong dream to retire near the ocean, my wife and I bought what was basically a tear down house in Playa del Rey, about one block from the airport owned land, affectionately known in the neighborhood as "the dead lands". As I started to lovingly remodel this drab old house inch by inch, I realized that we had very noisy neighbors who obviously had plenty of money, because in a few years they had bought up the property even closer to our home. It was tolerable at first because we installed what was touted as sound proof windows. But our wealthy neighbors bought up even more property closer to our home and the partying increased to all hours of the day and night seven days a week without let-up. No amount of sound proofing, complaining, telling them that our health was affected, would quiet them. They had the money and, it seemed, the law on their side.

It appears our lifelong dream has turned into a lifelong nightmare. Our noisy neighbors only continue to get noisier even later into the night; not even the early AM hours allow any respite. They just love to party and have their way pushing us to near insanity with the constant wall of noise. We have learned to live with our windows closed, doors sealed up, and the beautiful scent of the ocean drifting out of our reach. Watching television is a joke - we have to tape everything so we can stop the picture and sound until our neighbors decide to quiet down enough for us to enjoy even the simplest of pleasures.

Response:

Although the comment indicates that LAWA has purchased property in Playa del Rey within the past twelve years, no property acquisition in areas north of the airport has occurred in that time period. Moreover, airport operations have not materially changed within that timeframe (see Table 3 of Appendix F-1 of the Preliminary LAX SPAS Report). As discussed on page 4-796, footnote 570, of the SPAS Draft EIR, "the commercial aircraft fleet now operating in the United States is generally much quieter than the earlier aircraft fleets…the 65 CNEL contours for LAX under current and future conditions are generally smaller than the 65 CNEL [contours] for LAX from two decades ago."

A discussion of aircraft noise impacts in Playa del Rey under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As analyzed therein, under Alternatives 1 through 7, some areas within Playa del Rey would be newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. As concluded in Sections 4.9.7, 4.9.8, and 4.10.1.8 of the SPAS Draft EIR, interim impacts prior to implementation of LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1, would be significant and unavoidable.

Although the commentor's property (located at 7520 Earldom in Playa del Rey) is within the 65 CNEL noise contour and has received soundproofing, noise exposure at the commentor's property could increase by 1.5 CNEL or higher within the 65 CNEL contour under Alternatives 1, 2, 4, 5, 6, and 7 as analyzed in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. In conformance with Title 21 requirements, interior noise levels must be 45 CNEL or less. As stated in LAX Master Plan Mitigation Measure MM-LU-1, LAWA would continue post-insulation noise monitoring to help ensure achievement of interior noise levels at or below 45 CNEL. Currently, LAWA conducts post-construction noise tests on a random sample of homes to verify the efficacy of the soundproofing installation. To date, all testing has confirmed that interior noise levels have been reduced to 45 CNEL through soundproofing, as required.

Please see Response to Comment SPAS-PC00008-1 regarding current measure underway to address existing aircraft noise levels.

SPAS-PC00200-2

Comment:

Frankly, Mr. Alvarez, I don't think our neighbors will ever move and sometimes I wish they would just buy my lovely hand-built house and let me live my life in peace elsewhere. But I do love it here, and perhaps if my neighbors would just stop getting closer and closer to us, carrying on in whatever fashion they want, we will learn to live with them, and maybe they will learn to live with us in a more respectable and sympathetic manner.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00201 Sambrano, Diane None Provided 10/10/2012

SPAS-PC00201-1

Comment:

The Draft Environment Impact Report for the Los Angeles International Airport Specific Plan Amendment Study fails to address many of the concerns that the community surrounding the airport has expressed in the past with regard to health impacts. The DEIR does not discuss what the airport will do to mitigate or minimize health impact for the long term increase of pollutants or what the residents can expect that their health issues may be with those increases. If in fact, the general population does not purchase new low-emission-automobiles or for some reason the better-mileage-vehicles after time do not maintain as low emissions as anticipated, will the airport decrease Its increase in direct proportion ? Or will LAWA staff blame automobiles for the air pollution it hoped the vehicles would reduce so it could increase the Toxic Air Contaminants released by the increased air traffic!?

Response:

LAWA has committed to a long list of mitigation measures for air quality and human health risk, which are discussed in Section 4.2.5 of the SPAS Draft EIR, and referenced in the Mitigation Measures subsection in both Sections 4.2 (Air Quality) and 4.7.1 (Human Health Risk Assessment). These measures include mitigation for construction and operational impacts. The construction mitigation measures are summarized under the LAX Master Plan Mitigation Measure MM-AQ-2 (Construction-Related Mitigation Measures), and include at least 17 specific mitigation actions listed in Tables 4.2-7 and 4.2-8 (pages 4-104 and 4-105) of the SPAS Draft EIR. The operational mitigation measures are summarized under LAX Master Plan Mitigation Measures MM-AQ-3 (Transportation-Related Mitigation Measures) and MM-AQ-4 (Operations-Related Mitigation Measures). Table 4.2-9 (pages 4-106 and 4-107) lists at least 15 mitigation actions for transportation-related impacts that encourage transit use, improve roadways, reduce parking emissions, promote clean vehicle use, and conserve energy, in addition to the expansion of the LAX FlyAway service. LAWA continues to encourage and assist tenants in the conversion of ground support equipment (GSE) to alternative fuels or electric power, as noted on page 4-107 of the SPAS Draft EIR. Finally, LAWA has committed to a number of operational and construction mitigation measures through the Community Benefits Agreement, also noted in Section 4.2.5 of the SPAS Draft EIR.

The impact analyses for human health risk and air quality are based on the assumption that these mitigation measures are required to be implemented for any of the SPAS alternatives. Therefore, the human health risk impacts identified in Section 4.7.1.6 and air quality impacts identified in Section 4.2.6 assume these measures will be implemented.

The types of health impacts typically associated with exposure to criteria air pollutants are described in Section 4.2.1.1 of the SPAS Draft EIR. Descriptions of potential health impacts associated with exposure to toxic air contaminants are part of the toxicity profiles listed in Appendix G1, Attachment 1 of the SPAS Draft EIR.

The analysis of air quality impacts as well as human health risk was conducted following guidance and methodology developed by the South Coast Air Quality Management District (SCAQMD), the California Office of Environmental Health Hazard Assessment (OEHHA), and the California Air Resources Board (CARB). The ground vehicles (cars and trucks) analyzed in the SPAS Draft EIR were those that began or ended a trip at LAX. In addition, the GSE that were analyzed service the aircraft at LAX and will continue to do so under the selected SPAS alternative. Therefore, it is appropriate to incorporate the impact of existing regulations on future emissions from these vehicles and equipment when determining air quality and health risk impacts since they are airport emission sources that will be associated with future airport activity under the selected SPAS alternative. The evaluation approach is valid and appropriate (please see Response to Comment SPAS-PC00159-7), and this change does result in lower overall emissions and impacts for several pollutants when comparing future conditions to existing baseline conditions.

The air quality impact analysis presented in Section 4.2.6 also looks at future emissions for each alternative compared to the future emissions for Alternative 4, which would have the fewest improvements of the alternatives considered. Please see Response to Comment SPAS-PC00159-7, regarding the usefulness of this analysis.

SPAS-PC00201-2

Comment:

The airport long term impact study relies on non-airport operations to reduce impact created by the increase by the airport! A classic "someone else did it" response fails to accept responsibility for airport action. The focus on mitigation appears to be on the short-term-construction contaminants crossing the fence-line rather than on the long term falling and drifting contaminants from the aircraft emissions. While construction issues are important operational issues seem to be discounted.

Response:

Please see Response to Comment SPAS-PC00201-1 regarding mitigation measures and the appropriateness of the air quality impacts analysis in the SPAS Draft EIR.

SPAS-PC00201-3

Comment:

The Exposure assessment states that "pathways other than inhalation were not assessed in this HHRA". Therefore any exposure to settled contaminants, not directly inhaled, as on the skin, ground, sidewalk or the cumulative effect of small particulates that we all know do not simply disappear, but will or may be absorbed or even later may be inhaled when the area where the contaminants landed are disturbed, is not even evaluated!! Does no one remember the smoking ---cancer long term effect? This non-assessment fails to mitigate and does not provide solutions for the non-inhalation methods of exposure! Where is the evaluation of skin exposure, we often see the black fail-out on surfaces in our neighborhood?! - page 4-433

Response:

As stated in Section 2.2.2 of Appendix G1 of the SPAS Draft EIR, "Other exposure pathways -- including deposition of TAC onto soils and subsequent exposure via incidental ingestion of this soil, uptake from soil into homegrown vegetables, and other indirect pathways -- were addressed quantitatively in the programmatic HHRA developed for the LAX Master Plan EIR (see LAX Master Plan Final EIR Technical Report 14a and Technical Report S-9a). No pathway other than inhalation was found to be an important contributor to exposure and thus to risk/hazard. Based on this previous analysis, pathways other than inhalation were not assessed in this HHRA." Specifically, the analysis of soil deposition in the LAX Master Plan Final EIR Technical Report 14a was very conservative; it

assumed that all toxic air contaminants deposited on the soil would stay in the soil indefinitely and not be removed by rain, wind, and other mechanical methods of removal that the airport uses to keep areas clean. Even with this assumption, the analysis suggested that the estimated contributions of TAC from LAX emissions would make no measurable difference in expected background concentrations. As such, further evaluation of these non-inhalation pathways was deemed unnecessary.

With respect to the "black fall out," it is assumed that the commentor is referring to "deposition," (i.e., the gravitational fallout of material (both solid and liquid) from the atmosphere). Commonly, this material, called particulate matter, consists of dust and soot that can form deposits or cause discoloration on outdoor surfaces (i.e., building materials, motor vehicles, small water bodies, etc.). Please see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. As indicated in Response to Comment SPAS-PC00043-2, to date, the research results indicate that aircraft do not contribute substantially to deposition.

SPAS-PC00201-4

Comment:

The assessment "assumes that exposure concentrations of TAC are constant" yet everyone ever exposed to smog knows that there are times of higher concentration and lesser concentration. Temperature, and lack-of-wind do cause a much different impact on the human body and the reaction not seen in an "average period". Over time these high intensity exposures cause distressing hours not displayed in the "averaging". Pollen exposure and asthma attacks would be an example of the variant body response to irritants. While a bad asthma attack might kill someone occasionally, I guess "its okay" as long as they patient can usually breathe!

Response:

The full statement that the commentor is referring to is from page 4-433 of the SPAS Draft EIR, which states "Assessment of chronic non-cancer health hazard impacts due to release of TAC associated with the SPAS alternatives assumes that exposure concentrations of TAC are constant over a 70-year period for residential receptors." Therefore, the statement in the SPAS Draft EIR refers to long-term impacts not short-term "high intensity" impacts, such as asthma attacks and allergies, as discussed in the comment.

Short-term impacts are addressed under the modeling for acute non-cancer health hazards presented in Section 4.7.1.6.3 of the SPAS Draft EIR. As discussed in the section starting on page 4-435, exposure concentrations used to evaluate acute impacts are estimated maximum 1-hour TAC concentrations in air - which represent the highest predicted concentrations of TAC - not the 70-year average.

Air quality modeling was used to develop exposure concentrations used in the HHRA. Estimations of TAC emissions took into account multiple factors including varying on-airport meteorological data such as temperature, wind speed, wind direction, atmospheric stability, and mixing height parameters based on several years of meteorological (weather) data collected at LAX. Please refer to Section 4.2 of the SPAS Draft EIR for details on the air quality modeling.

With regards to the commentor's assertion regarding asthma, health risk assessment cannot be used to link individual illnesses to past chemical exposures, nor can health risk assessments and epidemiological studies prove that a specific toxic substance caused an individual's illness 1. In particular, it would not be possible to link health risks estimated by risk assessment to observed health effects for an airport through epidemiological studies because of the typical lack of exposure information about the study population. This population may have lived in the area for many years or just a few weeks. They may have had exposure to chemicals from other sources, such as work or emissions from other sources (e.g., automobile exhaust). They may have engaged in behavior such as smoking, drinking, overeating, or other lifestyle habits that increased their risk of adverse health effect. They may have been exposed to short-term high concentrations of background (non-airport related) urban air pollutants due to meteorological conditions. Further, health effects may be unrelated to chemical exposure at all. For example, people may have exercise-induced asthma, or asthma that is triggered by allergens, molds, or other environmental agents. Thus, simple observations of adverse effects provide little information on health effects due to exposure to airport emissions.

Although subject to a number of uncertainties common to epidemiological studies, such studies have been performed at other airports in large metropolitan areas to help determine whether individuals living near airports have a greater incidence of disease than populations living in other areas. For example, the Illinois Department of Public Health examined actual cancer incidence observed in communities near Chicago's O'Hare and Midway airports between 1987 and 1997.2 Results of the study showed no elevation in cancer incidence for all cancers combined among whites, non-whites, males, and females living near the airports. Trend analysis did not indicate a higher cancer burden for populations near the airports as compared to populations living farther away. A study conducted by the Washington State Department of Health provided an examination of actual cancer cases near Washington State's SeaTac airport.3 Results of the study indicated that incidence of cancer was not statistically significantly higher for the SeaTac area.

One of the limitations to airport epidemiological studies is that they treat people living adjacent to an airport as if they were similar to living farther from airports. In fact, many factors can vary between populations including time of residence, race, socioeconomic status, smoking behavior, age of housing, and so on. A significant difference in one or more of these factors between close and far populations would make studies very difficult to interpret. Moreover, airport studies to date have not been able to assess actual exposure of individuals. Distance from an airport is a crude and unreliable measure of exposure due to the influence of wind speed and direction, terrain, buildings, time spent indoors and out, time spent away from the airport at work or school, and other factors 2.

Some reports, including ones from studies conducted in the Los Angeles area, do suggest some association between some respiratory illnesses, such as asthma and allergies, and levels of some criteria pollutants and/or TAC. Some people may be more sensitive than the majority of the population to the effects of TAC. These people are considered "sensitive" receptors, and may include children, the elderly, people in poor health and/or those suffering from illness, such as chronic bronchitis. Sensitive individuals may form a subpopulation of people living in the Los Angeles basin that do suffer some health impacts due to poor air quality. Possible associations between illness and air quality, and the existence of sensitive individuals suggest that common sources of air pollutants could cause some health impacts at the concentrations in air found in the Los Angeles basin. However, concentrations of TAC in the vicinity of LAX do not appear to be greater than those in other parts of the basin, according to South Coast Air Quality Management District (SCAQMD) studies. In fact, the higher pollution levels noted from SCAQMD's fixed site monitoring were found to be in Burbank, Central Los Angeles, Inland Valley San Bernardino, Huntington Park, and West Long Beach. SCAQMD's modeling analysis found the highest risks to be in the port areas (e.g., Long Beach) and the area south of Central Los Angeles, where there is a major transportation corridor.4 These observations suggests that general air pollution due mainly to car and truck traffic, not single sources such as LAX, would have locally greater impacts on health impacts.

SPAS-PC00201-5

Comment:

If evaluations are based upon"duration of 70 years" rather than "quality of life," many will not survive the study in good health, but will continue to exist in a state of painfully impacted non-death. (Page 4-434) Clearly a study of life-span and illness during living years of those in surrounding communities should have been conducted. What were the results of the analysis of the several hundred Inglewood residents

"Chronic Health forms" which were submitted for the earlier draft EIR? (The prior "Comments noted" response does not suffice.)

Response:

The SCAQMD often uses an exposure duration of 70 years (a lifetime) to represent an upper bound of possible exposure. This duration is significantly greater than the typical assumption used in many risk assessments, where an exposure duration of 30 years is used as an upper range estimate of the time a person in the U.S. might spend at one address. A duration of 70 years makes no assumption about an individual's life span. Instead, it is used as a worst-case scenario for the number of years someone living near LAX and, therefore, maximizes estimates for total exposure. As indicated on page 28 in Appendix G1 of the SPAS Draft EIR, the 70-year period is used in the SPAS HHRA for consistency with SCAQMD guidance, which considers its use to be protective for human health effects.

As discussed in Section 4.7.1 and Appendix G1 of the SPAS Draft EIR, risk estimates based on a lifetime exposure are likely to be conservative (i.e., will error on the side of protection of public health), since many people will not live in the same location for a lifetime, and their exposure to TAC from LAX will therefore be less than estimated in the SPAS Draft EIR. Further, risk estimates were based on individuals exposed to TAC at locations where air concentrations would be highest. Since these locations were typically at or very near to the LAX fence-line, people that actually live, work, or attend school at some distance from the airport fence-line would be subject to lower air concentrations of TAC, and thus their risks would be lower. Results of the SPAS HHRA are best estimates of possible risks associated with the SPAS alternatives, using common and accepted regulatory methods. Risk estimates in the SPAS Draft EIR are not intended to, nor can they, be used to link individual illnesses or quality of life to past chemical exposures, nor can health risk assessments and epidemiological studies prove that a specific toxic substance caused an individual's illness.

In addition, the commentor presumes that cancer and non-cancer risk estimates indicate a definitive number of actual cases of disease rather than estimates of risk for health effects. In fact, the incidence of disease attributable to airport TAC emissions, as distinct from background concentrations of TAC in the South Coast Air Basin, is not known, but could range from zero to some small fraction of disease attributable to poor air quality in the basin in general. Incremental impacts from the SPAS alternatives would be less, and might even be beneficial (i.e., might reduce total TAC emissions during airport operations).

To summarize the approach and intent of the analyses, the SPAS HHRA assessed incremental changes to health impacts for people exposed to TAC resulting from construction and operations associated with each SPAS alternative. That is, the HHRA examined the difference between existing (baseline) emissions from LAX and emissions projected during future construction and operations. The difference between these two conditions is the incremental impact of alternatives. Incremental impacts are appropriate, since baseline emissions from LAX will be ongoing regardless of whether SPAS is implemented.

The HHRA identified whether the SPAS alternatives would increase health risks for people living, working, recreating, or attending school near LAX. As noted above, estimates provided are "worst case" since they are based on the assumption that people will live at the LAX fence-line for 70 years. Since no one does or will live in such a location, and since TAC concentrations decrease with distance from the fence-line, all exposures and risk will actually be less than predicted for all residents living near the airport. This approach is typical for human health risk assessments. These assessments are used to estimate the potential for health impacts resulting from a given set of exposure conditions. In order to avoid underestimating chemical exposure, the HHRA prepared for the SPAS alternatives estimated risks for the hypothetical maximally exposed individual (MEI), an individual that lives, works, or goes to school at a location with the highest predicted concentrations of TAC in air, and who has other characteristics, such as years of exposure, that result in maximum intake of TAC. In addition, toxicity criteria used in all health risk assessments are developed to be protective of groups that may be exceptionally sensitive to a chemical, such as children and the elderly. The result is a conservative estimate of potential health impacts associated with the SPAS alternatives. Please refer to Section 5 of Appendix G1 of the SPAS Draft EIR for further discussion of the uncertainties involved with the risk assessment. Thus, when risk estimates are low, as in the case for the SPAS alternatives, one can be confident that actual exposure and risk will be minimal.

With respect to the health forms from Inglewood residents, health risks estimated for an airport cannot be used to attribute health issues for individuals to TAC emissions. Epidemiological studies could, in theory, achieve this goal, but many factors make such studies difficult, if not impossible. Please see Response to Comment SPAS-PC00201-4 regarding epidemiological studies.

SPAS-PC00201-6

Comment:

The Airport concept that Aircraft Toxic Air Contaminant Pollution should be offset by others reducing their emissions is an insult.

That LAWA should be permitted to increase pollution while others are expected to reduce pollution is a concept far more consistent to the words of a bully on a playground than a public transportation agency, which should be setting an example, rather than thinking it is an island unto itself, with the right to disregard the local population's health, simply because it will feed someone's ego or increase financial reward for a few not physically impacted. "Cancer risk impacts-would be less than significant and would be beneficial" when based on the anticipated offset of reduction of motor vehicle emissions is straight from a reading of Grimm's -- here my pretty, the apple is delicious the poison inside is only a teeny tiny syringe-full! (See Page 4-446- 451).

Using the word beneficial ? really! Is that like ... well does the author of that statement want to join us for a nice little cup of..botox.... rumor has it you won't feel . . . well anything!

Response:

The emissions reductions of diesel particulate matter from trucks traveling to or from the airport, as well as from airport GSE operating at LAX, represents the major source of cancer risk reductions for all alternatives. Because these trucks and equipment are airport-related sources, it is appropriate to incorporate the impact that existing regulations will have on diesel emissions. Please also see Response to Comment SPAS-PC00201-1 regarding the appropriateness of the air quality impacts analysis in the SPAS Draft EIR.

SPAS-PC00201-7

Comment:

Really!! again Really!!! "adult+child resident receptor was not evaluated" (Page 4-456)

How does Acrolein and formaldehyde NOT IMPACT to a greater extent children who are exposed when every pediatrician and healthcare professional expresses that even the intake of sugar or other "good" consumables have lasting impacts on young developing bodies? Maybe the "must be 21 years old" alcohol laws should be repealed! Perhaps medical prescriptions "dosage" guidelines for children or those underweight should be eliminate if one size fits all. Did a healthcare professional sign off on the Formaldehyde isn't all that bad statement???

Response:

The SPAS HHRA followed current U.S. Environmental Protection Agency (USEPA) protocols for health risk assessment. These protocols no longer evaluate an adult+child receptor for inhalation exposure. However, young children and children of school age are protected by the new methods. After health risk assessment efforts for the LAX Master Plan began a number of years ago, USEPA upgraded its methodology for examining health impacts from inhalation exposure using available toxicological and physiological information. This methodology is described in detail in USEPA's Risk Assessment Guidance for Superfund (RAGS), Part F.1 As noted on pages 4-455 and 4-456 of the SPAS Draft EIR, the RAGS Part F methodology does not normalize hazard indices to body weight unlike the original and now outdated RAGS Part A methodology did.2 The SPAS HHRA assumes the same exposure pattern for adult and child residents (i.e., inhalation of TACs 24 hours per day, 350 days a year) and non-cancer hazard indices for adult and child residents are thus the same. The current evaluation in the SPAS HHRA appropriately covers possible health impacts for adults, children, and adult+child populations.

Further discussion comparing results using the RAGS Part F methodology to the RAGS Part A methodology which evaluates the adult+child receptor are provided in Section 5.5.1 of Appendix G1 of the SPAS Draft EIR. RAGS Part A methodology is still presented in the discussions of uncertainties for several reasons: 1) to maintain consistency with the LAX Master Plan EIR; 2) to enable the results of the SPAS HHRA to be compared directly with the results of the HHRAs included in previous tiered LAX Master Plan EIRs (i.e., the South Airfield Improvement Project EIR, Crossfield Taxiway Project EIR, and Bradley West Project EIR); and 3) to allow for SPAS HHRA risks and hazards to be combined with the calculated results of the other tiered LAX Master Plan EIRs in the determination of cumulative construction impacts. However, the RAGS Part A methodology is now obsolete and may be overly conservative. RAGS Part F methodology is currently used exclusively by the USEPA for calculating risks and hazards for the inhalation pathway and is universally applied within the United States, including California.

Acute and chronic reference exposure levels (RELs) developed by the State of California were used to characterize acute hazards and chronic non-cancer hazards associated with exposure to TAC. As stated in Section 2.3 of Appendix G1 of the SPAS Draft EIR, "RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature." As stated by the Office of Environmental Health Hazard Assessment (OEHHA), RELs were developed with the intention of protecting nearly all individuals - including individuals with low susceptibility for chemical injury and sensitive subpopulations (e.g., children, pregnant women, and elderly persons) from adverse health effects.3 Note that this definition does not include "hypersensitive individuals (those exhibiting idiosyncratic responses that cannot be predicted from studying health effects of the substance)."

SPAS-PC00201-8

Comment:

Now that the "Human Health Risk Assessment" portion of the study is found seriously lacking I will shift to the "Cultural Resources" section! This will be as gentle as I can muster!!!

Seriously! Really! Are you kidding? This is all you have on Cultural Historic Background? How much was spent on this Section? Clearly this contract scope was not well written or funds should be returned!

Perhaps the Consultants should have driven around the local area rather than going to Fullerton for information about which Historic significant buildings/ sites would be impacted by anything LAX related!

Response:

Please see Responses to Comments SPAS-PC00201-1 through SPAS-PC00201-7 regarding the human health risk assessment. Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. Historical resources survey methods are discussed on pages 4-337 and 4-338 of the SPAS Draft EIR. The potential impacts of the SPAS alternatives were considered as they relate to known historical resources identified in previous surveys undertaken in association with the LAX Master Plan EIS/EIR and the LAX Master Plan Supplemental Section 106 Report, discussed on pages 4-350 through 4-354 in Section 4.5 of the SPAS Draft EIR. The Section 106 Report and Supplemental Section 106 Report for the LAX Master Plan are provided in Appendix I and Appendix S-G of the LAX Master Plan Final EIS/EIR, respectively. Previously unevaluated buildings/structures within the SPAS cultural resources study area, which were not old enough to be considered for evaluation as part of the previous LAX Master Plan EIR Section

106 historical resources surveys but are now over 45 years in age, were surveyed and evaluated and are discussed on pages 4-354 through 4-358 in Section 4.5 of the SPAS Draft EIR. A pedestrian survey of the SPAS cultural resources study area was conducted in December 2011 and January 2012 to identify and evaluate potentially eligible resources within the SPAS cultural resources study area that would be impacted by the SPAS alternatives. Site-specific property research involving examination of primary and secondary materials was conducted in conjunction with the survey. Historical resources identified within the SPAS cultural resources study area are shown in Figure 4.5-1 of the SPAS Draft EIR. A written description, accompanied by representative photographs, of each of the surveyed properties evaluated in the 2011-2012 survey is provided on the California DPR Primary Record and Continuation Sheets in Appendix E1 of the SPAS Draft EIR.

SPAS-PC00201-9

Comment:

Had the Consultant firm been researchers with a background in local area history they might have wanted to clarify that the original home of the Centinela Rancho, built in 1834, received National Historic Status from the Department of the interior in 1939 rather than referencing only the then newly formed National Register status recognition of 1974. (But what's a mere 35 years ?)

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. There are no historic elements from previous ranches or ranch uses that exist today within LAX or the SPAS project area, and there would be no effect on the Centinela Adobe as a result of the SPAS Project. The historic context for the rancho period in the area now occupied by the Los Angeles International Airport is identified in the LAX Master Plan EIR Section 106 Report, and the LAX Master Plan Supplemental Section 106 Report, discussed on pages 4-350 through 4-354 in Section 4.5 of the SPAS Draft EIR. Therefore, while the information regarding the Centinela Rancho is noted, there would be no effect on this property associated with the SPAS alternatives.

SPAS-PC00201-10

Comment:

Amazingly, the entire History of the Airport itself is skeletal at best! The complete disregard for the post War years that created the commercial airline service and cargo service that have become the majority users and reason for "needed expansion" is startling to those who have watched the area change from the days of P-51's and North American pre-Rockwell. The failure to acknowledge the role played by significant contributors to aerospace and commercial air service is significant. The comments regarding the "historical setting" leave the casual reader with no awareness that a terminal even existed at the south end of "Airport Blvd."

Response:

The historical setting discussion presented in Section 4.5 of the SPAS Draft EIR on pages 4-349 and 4-350 is based in part on the Section 106 historical resources investigations undertaken in association with the LAX Master Plan EIR (i.e., the Section 106 Report and the Supplemental Section 106 Report for the LAX Master Plan), which are provided in Appendix I and Appendix S-G of the LAX Master Plan Final EIR, respectively, and included as a reference in the SPAS Draft EIR (see page 9-6 in Chapter 9, References, [i.e., the Final EIR for the LAX Master Plan Improvements, which includes all appendices and technical reports, including Appendix I and Appendix S-G]. As discussed on page 1-105 in Section 1.7 of the SPAS Draft EIR, the LAX Master Plan Final EIR, including Appendix I and Appendix S-G, are available for public review at Los Angeles World Airports, Capital Programming and Planning Division, One World Way, Los Angeles, CA 90045, and are also accessible via the internet at www.ourlax.org). The Section 106 surveys undertaken for the LAX Master Plan EIR discuss the early history of the Los Angeles Municipal Airport (1928-1945) and the post war history of the Los Angeles International Airport at length. The 2011-2012 historical resources survey completed for the SPAS Draft EIR relied in part on the more comprehensive data from the previous surveys, as stated on pages 4-337 and 4-352, but focused on historical resources with the potential to be adversely affected by the nine proposed SPAS

alternatives. These include Hangar One (1929) and the Intermediate Terminal Complex (1946) which are extant historical resources remaining from the airport's early history, and are discussed on pages 4-352 and 4-354 in Section 4.5 of the SPAS Draft EIR, and documented on DPR survey forms on pages 12 through 14 in Appendix E of the SPAS Draft EIR. Specifically, a summary of the Intermediate Terminal Complex is provided on page 4-354 of the SPAS Draft EIR, and notes that the complex included passenger terminals as well as other facilities. Additional information regarding the Intermediate Terminal Complex is provided on the DPR survey forms in Appendix E. The location of the Intermediate Terminal Complex southeast of the terminus of Airport Boulevard is clearly illustrated in Figure 4.5-1 of the SPAS Draft EIR.

SPAS-PC00201-11

Comment:

There is only a passing mention of the subterranean passenger tunnels to the satellites which are approaching the magical 50 in historical age. Has the Los Angeles Conservancy or any other preservation group been provided the opportunity to see the possibly restorable tunnels with their then futuristic art walks? The filling-in of the passenger-way tunnels, as planned by the North Runway Relocation, would be counterproductive to appreciating the innovative mid-century solution to moving so many people to the air-gates, not to mention a tragic end to what was considered a great expression of futuristic transportation art.

Response:

Section 4.5 of the SPAS Draft EIR is based in part on more comprehensive information contained in Appendix E of the SPAS Draft EIR. The existing subterranean passenger tunnel to the Terminal 3 Satellite is documented on the Department of Parks and Recreation (DPR) inventory form included in Appendix E, pages 21 through 23. As documented in Appendix E, while over 45 years of age, Terminal 3 (including the satellite, passenger tunnel, and attached mosaic mural) has undergone considerable alterations and additions and does not retain sufficient integrity or significance to merit eligibility under any of the applicable federal, state, or local criteria discussed on page 23. For the same reasons, neither the tunnel nor the mosaic qualify as historical resources under CEQA Guidelines section 15064.5.

SPAS-PC00201-12

Comment:

Within the area covered in the study of Area of Potential Effect there seems to be a major lack of recognition of buildings in close proximity with significant roles because of architectural significance or historical role. That the Academy Theatre on Manchester near Crenshaw Boulevard is mentioned yet there is no mention of the Fox Theatre on Market just north of Manchester, which is much closer to LAX, is baffling.

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. Section 4.5 of the of the SPAS Draft EIR is based in part on more comprehensive information contained in the previous Section 106 historical resources investigations undertaken in association with the LAX Master Plan EIR provided in Appendix I and Appendix S-G of the LAX Master Plan Final EIR. The National Register eligible Academy Theatre (1939) on Manchester Avenue between Crenshaw Boulevard and Western Avenue, and the Fox Theater just north of Manchester Avenue are both located outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 in Section 4.5 of the SPAS Draft EIR, and would not be impacted by the SPAS alternatives. The Academy Theatre was identified in the LAX Master Plan EIS/EIR as a National Register eligible resource, and is acknowledged as a resource within the LAX Master Plan Composite Area of Potential Effect (APE) in Table 4.5-1 of the SPAS Draft EIR. The Fox Loyola Theater at 6266 Manchester Avenue and 8600-8610 S. Sepulveda Boulevard was designated a City of Los Angeles Cultural-Historic Monument No. 259, adopted December 17, 1982. The theater was closed and the interior remodeled for a medical office building. Included in the APE for the LAX Master Plan EIS Section 106 survey, the property was not eligible for listing in the California Register or the

National Register and, therefore, was not included in the LAX Master Plan Section 106 documentation. An additional reason why certain historic or potentially historic resources more proximate to LAX than the Academy Theatre were not identified in earlier LAX Master Plan historic investigations, is that the APE was established in part to assess potential indirect impacts associated with high levels of aircraft noise, which follow a pattern that runs much farther to the east of the airport than to the north and south.

SPAS-PC00201-13

Comment:

How is it that there is no mention or inclusion of concern regarding the former IBM (designed to look like a key punch card) building now occupied by Otis Parsons College? Located just outside the acquisition area this building stands as a reminder of technological change, without the transitional computer capabilities there would still be handwritten passenger ticketing and terminal arrival/departure update boards would still be changed with individual letters kept in boxes under the gate desks. (Lincoln south of Manchester close to- oh yes the airport).

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. The former IBM building now occupied by Otis Parsons College is located outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 in the SPAS Draft EIR, and would not be impacted by the SPAS alternatives. It should be noted that the former IBM building is located approximately 1.3 miles northwest of the closest SPAS acquisition area (SPAS acquisition areas are illustrated in Figures 2-12, 2-13, and 2-14 of the SPAS Draft EIR).

SPAS-PC00201-14

Comment:

Not far away, but close in proximity also are several Loyola University buildings, the Magee Building- among the first business buildings in Inglewood, the 1924 building of Peoples Savings and Loan - the second institution in the United States to received FDIC approval, and it's 1960's newer building across the street, Dinah's Restaurant, The first Foster's Freeze (home of the first soft serve ice cream cone) and of course Pann's of Google architecture fame, all of which are closer to the impact area than the Academy Theatre.

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. The Loyola University buildings are located over one mile north of the airport off Lincoln Boulevard. Commercial buildings, banks, and restaurants are located over one mile northeast of the airport in Inglewood. The university buildings and commercial uses are located outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 of the SPAS Draft EIR, and would not be impacted by the SPAS alternatives. Similarly, Randy's Donuts at 805 West Manchester Boulevard, Dinah's Family Restaurant at 6521 Sepulveda Boulevard, Foster's Freeze at 999 S. La Brea Boulevard, and Pann's Restaurant at 6710 La Tijera Boulevard, are all located outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 of the SPAS Draft EIR, and would not be impacted by the SPAS alternatives.

SPAS-PC00201-15

Comment:

Also left off the list but closer than the Academy is the Transportation Mural which in mosaic stone (terrazzo) depicts the transition from foot traffic to flying machines as the largest art work remaining of the WPA years! Not only is this a significant and eligible work, it also is listed by that National Register that took so much discussion space!

Response:

Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the of the SPAS Draft EIR. Helen Lundeberg's historic Work Progress Administration (WPA) mural, "History of Transportation," was originally located at the southeast corner of Centinela Park at the intersection of Florence Avenue and Redondo Boulevard. It was restored in 2007 and is now located in the Grevillea Art Park (230 S. Grevillea Avenue) in Inglewood, directly across from Inglewood High School. The transportation mural is located outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 of the SPAS Draft EIR, and would not be impacted by the SPAS alternatives. As previously indicated, the reason certain resources more proximate to LAX than the Academy Theatre were not identified in earlier historic investigations is due to the pattern of aircraft noise contours and the potential for indirect noise impacts under Section 106 of the National Historic Preservation Act.

SPAS-PC00201-16

Comment:

While it appears a great deal of explanation about "Historic" was essentially cut and pasted to create pages, a serious shortcoming is the looking about the community to see what or who impacted the local area .... There is no mention of the Maddox home (largest airline of the early years - later renamed Trans World Airlines) also located closer to LAX than the Academy Theatre. How is it the home of what was the nation's greatest library collection on aviation does not even merit mention!! Does the name Howard Hughes only conjure up a movie theatre complex to the writers of the EIR?

Response:

The early history of LAX is documented in the Supplemental Section 106 Report, in Appendix S-G of LAX Master Plan Final EIR, and included as a reference in the SPAS Draft EIR (see page 9-6 in Chapter 9, References, [i.e., the Final EIR for the LAX Master Plan Improvements, which includes all appendices and technical reports, including Appendix I and Appendix S-G]. As discussed on page 1-105 in Section 1.7 of the SPAS Draft EIR, the LAX Master Plan Final EIR, including Appendix I and Appendix S-G, are available for public review at Los Angeles World Airports, Capital Programming and Planning Division, One World Way, Los Angeles, CA 90045, and are also accessible via the internet at www.ourlax.org). The "Maddox home" and the aviation collection purported to be associated with it is not located within the SPAS cultural resources study area. The comment may be in reference to LAX as "home" of Maddux Air Lines, and the aviation collection referred to may be the David D. Hatfield collection of aviation history formerly housed at Northrop University. Maddux Air Lines was founded in 1927 by John Luther "Jack" Maddux. However, the Los Angeles air strip was too small and not suitable at the time for the airline's passenger service, so Maddux chose instead Rogers Airport, and later Grand Central Air Terminal in Glendale. On November 16, 1929, Transcontinental Air Transport bought Maddux Air Lines, which became known as TAT-Maddux Air Lines, with Jack Maddux as the western head. In 1930, TAT-Maddux merged with its former competitor, Western Air Express, which became known as Transcontinental & Western Air (T&WA) and later became TWA.1 Howard Hughes became the principal stockholder of T&WA in 1939 and expanded the airline, beginning transatlantic service in 1946 using the new Lockheed Constellation aircraft.2 The only remaining building at LAX from the late 1920s and early 1930s that may once have been associated with Maddux Air Lines is Hangar One. Hangar One is discussed on pages 4-352 and 4-353 in Section 4.5 of the SPAS Draft EIR, its location is depicted in Figure 4.5-1, and a DPR form for Hangar One is included in Appendix E of the SPAS Draft EIR. Hangar One would not be impacted by the SPAS alternatives due to its distance from the proposed improvements.

The David D. Hatfield collection of aviation history was formerly housed at Northrop University. The majority of the former Northrop University campus at 1155 West Arbor Vitae Street is outside of the SPAS cultural resources study area boundary, shown in Figure 4.5-1 in the SPAS Draft EIR, and would not be impacted by the SPAS alternatives.3 The American Hall of Aviation History was established at Northrop University in 1975 to house the Hatfield collection, which brought together more than 250,000 photographs, and thousands of documents, manuals, motion pictures, maps, magazines, posters, paintings, and newspaper articles on aviation history.4 Too large to be displayed on the 3rd floor of the Northrop University Library, where it had been housed since its donation in 1967, the collection was transferred in 1975 to a vacated, 31-room, two-story engineering building at 5520 Arbor Vitae Street.5 The existing Postwar Modern building at 5520 Arbor Vitae Street (built in 1956) is situated across the

street from the former main campus of Northrop University. Original building permits for 5520 Arbor Vitae Street show that the building was originally designed as an "adult training school" and the original owner was Cal Avitron, Inc. The American Hall of Aviation History exhibits were opened to the public in 1976.6 After Northrop University closed its doors in 1992, the Hatfield Collection was acquired by the Museum of Flight in Seattle, Washington and was moved to Seattle and archived in the Museum of Flight collections.7. The 5520 Arbor Vitae Street building was surveyed in January 2012 and documented on a DPR form, which is included on pages 44 through 47 in Appendix E of the SPAS Draft EIR. The property was found not eligible for historic designation at the federal, state, or local level based upon lack of architectural and/or historic merit. The building is now owned by LAWA and leased to TSA for training. The building would be demolished under all of the SPAS alternatives except for Alternative 4 to allow for the development of parking, a GTC or parking/CONRAC proposed under these alternatives. Because the building is not eligible for historic designation at the federal, state, or local level, this demolition is not considered a significant environmental impact.

SPAS-PC00201-17

Comment:

With very little effort they should have been able to discover that the Northrop Institute of Technology is a stones-throw from the cultural resources study area and at a minimum worthy of mention.

Response:

The study area used for cultural resources investigation, as discussed in Section 4.5.2 of the SPAS Draft EIR, represents an area sufficient to determine whether the project may cause a substantial adverse change in the significance of an historical resources. (State CEQA Guidelines Section 15064.5(b).) Historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR. Northrop Aeronautical Institute was founded in 1946; after 1953, the institution was known as the Northrop Institute of Technology and, after 1971, as Northrop University. Formerly located at 1155 West Arbor Vitae Street at the northeast corner of Arbor Vitae Street and Aviation Boulevard in Inglewood, California,1 the majority of the site of the former Northrop University campus is outside of the SPAS cultural resources study area boundary shown in Figure 4.5-1 in the SPAS Draft EIR and would not be impacted by the SPAS alternatives.

The existing Postwar Modern building at 5520 Arbor Vitae Street (built in 1956) is situated across the street from the former main campus of Northrop University and once served as a classroom building for the University. Original building permits for 5520 Arbor Vitae Street show that the building was originally designed as an "adult training school" and the owner at the time of its construction in 1956 was Cal Avitron, Inc. The 5520 Arbor Vitae Street building was used as an engineering building by Northrop University. Later, the American Hall of Aviation History was located in the vacant engineering building in 1975 and exhibits were opened to the public in 1976.2 Please see Response to Comment SPAS-PC00201-16 for further discussion of this building. Because the building is not eligible for historic designation at the federal, state, or local level, this demolition is not considered a significant environmental impact.

The 5520 Arbor Vitae building was surveyed in January 2012 and documented on a DPR form which is included on pages 44 through 47 in Appendix E of the SPAS Draft EIR. The property was found not eligible for historic designation at the federal, state, or local level based upon lack of architectural and/or historic merit. The building is now owned by LAWA and leased to TSA for training. The building would be demolished under all of the SPAS alternatives except Alternative 4 to allow for the development of parking, a GTC or parking/CONRAC proposed under these alternatives. Because the building is not eligible for historic designation at the federal, state, or local level, this demolition is not considered a significant environmental impact.

SPAS-PC00201-18

Comment:

Moving on though I could go on about what was left out.....

Response:

As previously indicated, historical and archaeological resources identified within the SPAS cultural resources study area are discussed in Section 4.5 of the SPAS Draft EIR, which is based in part on the comprehensive information contained in the previous Section 106 historical resources investigations undertaken in association with the LAX Master Plan EIS/EIR (Appendix I and Appendix S-G of the LAX Master Plan Final EIR). The various resources that the commentor suggests should have been included in the SPAS Draft EIR were not because they would not be impacted by the SPAS alternatives and were, therefore, outside of the SPAS cultural resources study area. Furthermore, as previously indicated, the Academy Theatre, located well to the east of LAX, was included in the LAX Master Plan Section 106 APE, while more proximate resources to LAX were not, due to potential indirect impacts associated with aviation noise where high noise levels follow a pattern that runs much farther to the east than to the north and south.

SPAS-PC00201-19

Comment:

While today's LAX traveler's experience is less than delightful, expanding the footprint and intruding into the neighboring communities is not the best solution.

The complete disregard for the actual history of the area, health of the community that still occupy the area, and the complete lack of sincerity in interacting with the truth of impact on the "CIMBY"S who will suffer significant impacts, leaves this writer absolutely convinced that the most important factor in decisions regarding the "modernization" of LAX is not how well is serves or fits into the community. Very few genuinely believe that the concept of "destination airport" is truly a realistic desire for any resident or business in the general area. As a long term business traveler with more air travel miles than the majority of United States residents, a multitude of car-rental experiences and over 1800 hotels nights in my background, I have never encountered anyone who has chosen to go somewhere based on the joys of spending quality time on airport property. It is more likely passengers select airports for the ease in getting off the property rather leisurely spending the afternoon or evening surrounded by jet fumes and sound levels requiring mitigation.

Countless suggestions for improving the guest experience given by local residents who also are regular air travelers seem to be often pushed aside. The multitude of local community members who have made the recommendations and who have offered their expertise are in fact often the very individual's

who helped design, implement, and build the very intricate inner workings of the equipment that flies both onto runways and into outer-space. It is unfortunate that many of these very skilled engineers, chemists, physicists, geo¬thermal scientists and other aero-aware have been disregarded by those who have as their goal the bigger-is-better mindset which often leads to soon obsolescence.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. In accordance with CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments received on the SPAS Draft EIR, including all comments submitted by local community members. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations.

Please see Response to Comment SPAS-PC00130-731 for a detailed explanation of the public outreach and public participation campaign during the SPAS process. Also, please see Chapter 4 of the Preliminary LAX SPAS Report for a discussion of the community and Advisory Committee input.

SPAS-PC00201-20

Comment:

I would hope that the collection of other comments regarding the inadequacies of the EIR will focus some of those in positions to make final decisions, that the alternatives presented which impact the community to do their best to limit construction to improve within the footprint and truly make the airport better rather focus on making it bigger. Regionalization would meet the need for transportation of more passengers and cargo without destroying the LAX community.

Response:

The comment regarding making the airport better rather than bigger is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-REG-1 regarding regionalism of air travel demands in Southern California.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California.

SPAS-PC00201-21

Comment:

More than any other group of people in Los Angeles County those who live close to the airport believe in Safety. Unfortunately the concepts presented in the EIR provide limited understanding that we will be those most impacted or dead and our concerns are not just a bunch of "Nimbisms" but are based on experience, knowledge and commitment that the place we call home is safe, functional, and healthy.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202 Toebben, Gary Los Angeles Area Chamber of Commerce 10/8/2012

SPAS-PC00202-1

Comment:

The Los Angeles Area Chamber of Commerce (Chamber) is on record in full support for the complete modernization of Los Angeles International Airport (LAX), and the efforts of Los Angeles World Airports (LAWA) to provide state-of-the art facilities, including its airfield, terminals and ground transportation access modes. We believe the Specific Plan Amendment Study (SPAS) has the potential to result in a complete renovation of LAX, ensuring we haVe an airport worthy of our world class city.

We commend Mayor Antonio Villaraigosa, the Board of Airport Commissioners and the LAWA staff for the important work already begun, such as the renovated South Airfield, the construction of a new cross field taxiway, significant improvements to Terminal 6, the selection and approval of new concessionaires and Duty Free shopping opportunities and the current construction of a new Central Utility Plant. We also eagerly anticipate further capital improvements not directly related to SPAS, including more renovations to passenger terminals and the construction of the Midfield Satellite Concourse.

At the heart of the current modernization of LAX is the renovation of the Tom Bradley International Terminal. We believe Bradley West will be the finest international passenger terminal of any U.S. airport, which will further solidify the airport's current role as the premier gateway for the Asian and Australian markets.

At the same time, despite economic uncertainties and recovery from the Great Recession, LAWA has successfully recruited new air carriers and routes to its schedules. In the last two years, LAX has added direct, non-stop flights to such new destinations as Madrid, Rome, Istanbul, Dubai and Melbourne. Some of these international flights are serviced with the new generation of quieter and cleaner aircraft. The A380 and 747-8 are now daily fixtures at LAX as international carriers such as Qantas, Singapore, Korean, Cathay and Air France have included these aircraft as part of their local fleets.

As the region's largest business organization, we recognize the tremendous impact of LAX to our local economy. Last year, 61 million passengers were served at LAX and nearly two million tons of air freight and mail were handled by 22 domestic and 58 international airlines. Several recent reports published by the Los Angeles County Economic Development Corporation have well documented the value LAX provides to our region:

- LAX impacts, directly and indirectly, 294,000 jobs in Los Angeles County;
- LAX generates over $39 billion into our county's economy;
- Current construction projects generate nearly $7 billion to the local economy and employ 39,900 jobs;
- Each daily, non-stop international flight generates $623 million in economic value each year.

Simply put, LAX is one of the region's most significant job generators and it is a major driver of our continued economic recovery. Objective 3 of the SPAS Draft ER most accurately describes the airport's importance in the goal to "maintain LAX's position as the Premier International Gateway supporting and advancing economic growth and vitality of the Los Angeles Region."

This objective is one reason for the Chamber's recent efforts in forming the Coalition to Fix LAX Now, a collaboration co-chaired by this Chamber, the Los Angeles County Federation of Labor and the Los Angeles and Orange Counties Building and Trades Council. While we commend LAWA for the construction already completed and / or underway, we believe it is just the beginning towards a full restoration of LAX's identity as a premier airport. There is much work to be done, and SPAS is the road map to get us there.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-2

Comment:

The Specific Plan Amendment Study (SPAS)

The SPAS process is conducted under strict consistency with the provisions of the 2006 Stipulated Settlement Agreement. In particular, the designs and configurations that provide alternatives to the so-called yellow-lighted projects are all compliant to the practical capacity of 78.9 million annual passengers.

This restriction has therefore provided us with a short-sided analysis of actual airside and landside impacts as passenger levels continue to grow during the 21st Century - with or without SPAS approval. Had the airport been allowed to study alternatives that would more fully address the practical growth of the airport, we feel a more justified, long-range planning process would have been achieved.

The limiting boundaries upon which this study is based concerns those of us who believe in modernizing LAX as a 21st Century aviation facility. The report cannot accurately demonstrate long-range air emission improvements resulting from the increased use of the new generation of aircraft over the long term. Without the limitations to annual passenger count mandated by the Stipulated Settlement Agreement, would LAWA have provided a more long-range analysis as it searched for alternatives to challenges relative to the yellow-lighted projects?

This constrained analysis may compel some to advocate for "quick-fix" options for the North Airfield, such as Alternative 2. In the short term, Alternative 2 could be viewed as an attractive solution for alleviating some of the North Airfield's existing challenges. However, when addressing the complete and comprehensive improvement of the North Airfield, the alternative selected must include a realignment of the runways which would accommodate the construction of a centerfield taxiway.

Despite the constraints placed upon the study, we once again commend the LAWA management and staff for its thorough and exhaustive process which has resulted in this draft report. We submit the following analyses and endorsements for the alternatives defined in the DEIR.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS process, including preparation of the SPAS Draft EIR, was conducted in accordance with the requirements of the LAX Master Plan Stipulated Settlement, and all alternatives were considered in light of a practical capacity of 78.9 MAP. This passenger activity level at LAX is projected to occur by 2025, which was used as the planning and analysis horizon year for SPAS. Please see Response to Comment AL00004-7 for a discussion of why the use of a more distant horizon is not required by CEQA. To make specific planning assumptions beyond 2025 would be speculative. (See State CEQA Guidelines Sections 15144 and 15145.)

SPAS-PC00202-3

Comment:

Ground Transportation Access

Alternatives 8 and 9 outline two options for connecting the airport to three key arterial locations: (1) an Intermodal Transportation Facility, (2) a future Light Rail Station to be constructed by the Metropolitan Transportation Authority (MTA), and (3) a Consolidated Rental Car facility plus remote parking at

Manchester Square. Alternative 8 would utilize an elevated and dedicated busway connecting these remote locations to the Central Terminal Area (CTA). Alternative 9 would access the CTA by use of an Automated People Mover (APM) system.

Both alternatives, with the corresponding projects described, would greatly enhance the passenger experience and encourage travelers to access LAX via public transportation. This would reduce vehicular traffic in and around the airport alleviating congested intersections and potentially providing an improved quality of life for neighboring residents.

The Chamber of Commerce views both alternatives as acceptable, with an Automated People Mover system as optimal. However, we recognize the cost implications of such a project and whether an APM offers the most benefit when compared to other modernization projects. Significant issues must also be resolved between LAWA, the MTA, the Federal Aviation Administration (FAA) and the airlines before such a project is funded. The Chamber encourages ongoing and fruitful negotiations among the parties so that the project remains on a timeline consistent with the completion of the Light Rail Station, which is a Measure R-funded MTA project. It is, therefore, the Chamber's position that an elevated and dedicated busway would be an acceptable alternative as an immediate first step, and that the project be constructed to accommodate a future APM.

Response:

The commentor's support for a dedicated busway as a first step (i.e., Alternative 8) and an APM in the future (i.e., Alternative 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX and Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, which includes an APM.

SPAS-PC00202-4

Comment:

North Airfield Realignment

The Chamber strongly supports the realignment of LAX's North Airfield for safety and operational efficiency. Designed in the 1960s, the North Airfield was built to accommodate a fleet of aircraft that is now nearly mothballed.

Operational Efficiency is of paramount importance. We are now witnessing the arrival of yet another generation of new aircraft which cannot be accommodated on LAX's North Airfield without significant Air Traffic Control modifications. We know when an A380 lands or departs from the North Airfield, virtually all operations stop for several minutes. In fact, on a recent return trip from Paris, I was a passenger of an Air France A380 and we were delayed by nearly one hour waiting for the runway to be cleared and a gate to be assigned. This results in a poorly efficient airfield with passenger delays and the real potential of further negative air emissions. How can we settle for a modernization of LAX's aging facilities and not address our North Airfield once and for all?

The Chamber is aware of neighborhood anxiety and fear of an increased intrusion by airfield operations. However, none of the alternatives considered will result in the taking of homes. We support efforts to reduce the impact to the Westchester business community due to North Airfield realignment, particularly the runway protection zone. We are confident a solution can be achieved which alleviates the concerns of Downtown Westchester businesses without compromising North Airfield improvements. We urge LAWA to continue its dialogue with the FAA to find a solution to this challenge.

Safety is everyone's concern. There is no doubt safety will be improved as a result of runway realignment. All recent safety studies conducted relative to the North Airfield have reached that same conclusion. In fact, the most recent study released by an academic panel with modeling performed by NASA / Ames concluded that North Airfield runway separation would result in as much as 55% improvement to safety. While some make an effort to portray safety as an issue of percentages, it's more than that; it's the one thing where no margin for error can be afforded. LAWA must make every

effort to protect the safety of its passengers and the neighboring communities. It is paramount that the North Airfield realignment must proceed to reduce any possible risk to passenger safety, especially in this day and age of larger aircraft.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-5

Comment:

Alternatives 1 and 6

These options would separate the north runways by moving Runway 24R 240 feet north (Alternative 1) or 100 feet north (Alternative 6). While we see the merits to furthering these alternatives and commend LAWA for producing alternatives which address separation of runways, we are concerned that these alternatives are still inadequate to accommodate aircraft in all weather conditions and factors. Additionally, the separation of 100 or 240 feet north does not achieve the maximum level of increased safety for passengers. Therefore, the Chamber does not endorse these alternatives.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Section 4.7.2 of the SPAS Draft EIR discusses and analyzes safety issues associated with the SPAS alternatives, including runway separation distances. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-6

Comment:

Alternatives 2 and 4

These options reflect no further separation of the runways, but do modify the North Airfield with improvements to runways and reconfiguration of certain taxiways. Only Alternative 2 addresses terminal and Ground Transportation enhancements. Because these alternatives provide no additional separation to the runways and prohibit the construction of a centerfield taxiway, they do not improve operational efficiency and safety. They do not fully address terminal and Ground Transportation issues and the Chamber does not endorse these alternatives.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Section 4.7.2 of the SPAS Draft EIR discusses and analyzes safety issues associated with the SPAS alternatives, including runway separation distances. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-7

Comment:

Alternative 3

This option identifies projects in accordance with LAX's currently approved Master Plan (also known as Alternative D). While some of these projects had merit when originally designed to reflect an immediate post 9/11 security-conscious environment (e.g. the closure of the CTA to all private vehicles), many of these projects are now obsolete and should be scrapped. Additionally, the movement of Runway 24L 340 feet south would mean the demolition of Terminals 1, 2 and 3 and the elimination of the northernmost gates in the Bradley Terminal. This severe renovation of LAX was designed ten years ago and does not make sense today. Therefore, the Chamber does not endorse this alternative.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-8

Comment:

Alternative 5

This option provides the most responsible solution to the North Airfield's limitations. By relocating Runway 24R 350 feet north, LAWA can construct a new centerline taxiway. Other important runway and taxiway improvements can also be completed. The North Airfield would be fully operational in all weather conditions and the northern terminals would be enhanced. While not specifically addressing Ground Transportation issues, this alternative, combined with Alternatives 8 or 9, provides the best solution for a full modernization of LAX.

Alternative 5 will also include significant improvements to the Lincoln Boulevard / Sepulveda Boulevard intersection, Other mitigation measures to improve traffic flow at key intersections should be a component of the final EIR. These improvements will enhance the ground transportation access for passengers using LAX. It would also benefit local traffic flow for residents surrounding the airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Section 4.12.2.7.2 of the SPAS Draft EIR identifies mitigation measures proposed to address off-airport transportation impacts associated with the SPAS alternatives, including mitigation measures designed to improve key intersections in the surrounding areas. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-9

Comment:

Again, it is most unfortunate that LAWA was mandated to conduct an analysis of impacts not based on projected 21st Century passenger levels, but rather under the constraints of the Stipulated Settlement Agreement (i.e. 78.9 million annual passengers). However, there is no question that Alternative 5 provides the most promise towards full modernization. The Chamber views this alternative as the best and most responsible path towards completing LAX's long-awaited modernization and therefore fully endorses Alternative 5.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00202-10

Comment:

Conclusion

A Word Class City deserves a World Class Airport. Tourism is our region's leading industry and LAX is our front door for the traveler's experience. The approval of SPAS by the Board of Airport Commissioners, the County's Airport Land Use Commission and the City Council will clear the way for important projects to enhance passenger experience - generate thousands of more jobs and pumping billions more into our economy with no expense to the taxpayer.

The Chamber strongly supports the modernization of LAX and commends the Mayor, City Council, Board of Airport Commissioners and airport management for the significant progress already underway. But the process is far from complete and will result in a "lopsided" airport without resolving several important long-term development issues. We therefore strongly endorse Alternatives 5, 8 and 9 as reasonable and preferred options towards fully modernizing our airport.

We thank you for the opportunity to provide comments and we look forward to actively participating during the approval process once the final report is published.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Comment:

NO PEOPLE MOVER!!!
Build transit INTO airports now.
Start building transit until it becomes the #1 Way to connect our airports with the world!

Response:

The commentor attached a hand-marked plan delineating the main components of a suggested alternative concept for improvements to LAX. Based on LAWA's review of the attachment, the main components are summarized as follows:

1. Extend heavy-rail transit service to LAX via Metrolink, Amtrak, and High-Speed Rail (HSR). This would be accomplished via an underground rail tunnel system coming from the north along Aviation Boulevard and turning west at Century Boulevard to extend beneath the CTA, where the Metrolink and Amtrak would continue along beneath the north side of the CTA with stops at the CTA terminals, Tom Bradley International Terminal (TBIT), and the future Midfield Satellite Concourse (MSC). The HSR would continue along beneath the south side of the CTA with stops at the CTA, TBIT, MSC, and an LAX employee commuter station proposed in the western portion of the airport.
2. Extend light-rail transit service to LAX via an extension of the Metro Green Line along Aviation Boulevard with a western branch line along Century Boulevard extending into and around the CTA. The segments of the Green Line within the CTA, Century Boulevard, and Aviation Boulevard north of

Century Boulevard would be on an aerial (elevated) platform, while the segment south of Century Boulevard would be in an underground tunnel.
3. Convert the CTA's easternmost parking garages (Parking Structures P-1 and P-7) into a municipal bus terminal, with station connecting to the Green Line, Metrolink, and Amtrak.
4. Do not develop an Automated People Mover (APM) system at LAX.
5. Leave the north airfield and surrounding areas essentially as they are today. Under this concept, there would be minimal airfield changes and the north airfield would be used primarily for smaller aircraft. Lincoln Boulevard would not be modified at all and there would be no development in LAX Northside.
6. Extend the south runways east past Aviation Boulevard and place Aviation Boulevard within a tunnel between Century Boulevard and Imperial Highway. With these runway extensions, larger aircraft would operate primarily on the south airfield. Under this concept, uses within the runway extension area, as well in the areas extending north to Century Boulevard and between La Cienega Boulevard and the I-405 would be acquired by LAWA and demolished.

Elements of the alternative concept described above for LAX improvements are not feasible, are similar to elements already included in the SPAS alternatives, and/or do not avoid or substantially lessen significant environmental impacts that would occur under the alternatives addressed in the SPAS Draft EIR. Therefore, the alternative concept was not evaluated in detail in the SPAS Draft EIR. The reasons for this are described below, based on the same order of concept elements summarized above.

1. Heavy-Rail Transit Service to LAX: LAWA does not have any responsibility, authority, or jurisdiction to bring heavy-rail transit to LAX. Such transit services occur directly through Metrolink, Amtrak, and the California High-Speed Rail Authority. None of those agencies currently has plans or funding to extend service to or near LAX. The planned California High-Speed Rail system does not include a stop at or near LAX; however, as currently envisioned, the high-speed rail alignment would stop at Union Station in downtown Los Angeles, where passengers could board the Union Station FlyAway to reach LAX. Therefore, heavy-rail transit service to LAX is considered infeasible. Also, the construction impacts associated with development of an extensive underground tunnel network into and beneath the CTA, extending that tunnel network west beneath the airfield operations area, and development of above-ground station connections would be substantial; these impacts would far exceed construction impacts of ground transportation system improvements, such as the elevated busway or APM system, proposed under the various SPAS alternatives.
2. Light-Rail Transit Service to LAX: LAWA does not have the responsibility or authority to bring light-rail transit service into LAX, as that service is within the jurisdiction of Metro. However, with the exception of Alternative 4, all of the SPAS alternatives include improvements to enhance connections with and use of Metro light-rail transit service at LAX. This would occur primarily through the integration of SPAS-related ground transportation system improvements with Metro light-rail transit corridors and stations, such as the connectivity between the elevated busway or APM systems proposed under Alternatives 1, 2, 8, and 9 and the future Metro Crenshaw/LAX Transit Corridor and Station, or the pedestrian walkway between the Intermodal Transportation Center (ITC) and the existing Green Line Aviation Station proposed under Alternative 3. Additionally, LAWA and Metro have been coordinating, and will continue to coordinate, on the Airport Metro Connector Project described on page 5-22 of the SPAS Draft EIR to provide light-rail transit service directly into the CTA. It is anticipated that Metro's formulation and evaluation of alternative concepts for the Airport Metro Connector Project may include the types of alignments and facilities suggested by the commentor. (See Topical Response TR-SPAS-T-1 for further discussion of transit options into LAX.)
3. Municipal Bus Terminal Within CTA: Regarding the suggested conversion of existing parking facilities at the east end of the CTA to a municipal bus terminal, having a major bus facility within the CTA would adversely affect traffic conditions within the CTA, based on the size and number of buses that would likely be added to the traffic mix within the CTA. Of particular concern would be the one intersection within the CTA that is anticipated to have unavoidable significant impacts under all of the SPAS alternatives in future (2025) conditions. That intersection, World Way South and Center Way, is one of the main exit points from the CTA and the placement of a municipal bus facility immediately adjacent to it, and addition of numerous bus trips to the intersection, would exacerbate that significant impact. Also, the bus trips within the CTA could result in additional intersections being significantly impacted, that would not otherwise occur under the current range of SPAS alternatives. The worsening of traffic conditions within the CTA would be contrary to the project objective of improving traffic conditions in the CTA, as described in Section 2.2 of the SPAS Draft EIR. In addition to the adverse impacts to CTA traffic, the placement of the municipal bus center within the CTA would not, from a bus

route logistics standpoint, be as efficient as the location currently proposed by Metro, that being adjacent to the future Crenshaw/LAX Century/Aviation Station. The location proposed by Metro would enable buses to take access to and from a number of major streets in the nearby area, whereby the location within the CTA would require all buses to travel on Century Boulevard and Sepulveda Boulevard before accessing other major streets in the nearby area.

4. No APM: Although this concept suggests that all non-automobile access to and within the CTA be provided by a combination of the aforementioned heavy-rail transit and light-rail transit systems, such systems would not provide the traffic benefits of having an APM or elevated busway connect the CTA with the ITF, ITC, CONRAC, or GTC proposed under various SPAS alternatives, which would transport passengers/customers between these airport-related facilities using a dedicated route removed from the local street system. Not providing an APM would be contrary to the project objective of improving the ground access system to improve traffic conditions within the CTA.

5. No/Minimal Improvements to the North Airfield: SPAS Alternative 4 already reflects a scenario where no improvements are made to the north airfield, except for federally-mandated Runway Safety Area improvements. As described in the impacts analysis presented in Chapter 4 of the SPAS Draft EIR, implementation of this alternative would substantially reduce construction-related impacts compared to the other SPAS alternatives, but would result in greater long-term operations-related air quality and aircraft noise impacts. However, this concept would not respond to the project objective described in Section 2.2 of the SPAS Draft EIR relative to improving the north airfield to support safe and efficient movement of aircraft. Regarding the suggestion that there be no LAX Northside development, the LAX Northside project is not part of SPAS.

6. Extend Runways in South Airfield: The concept of further improving the south airfield to better accommodate large aircraft, in lieu of improving the north airfield, not only fails to address other problems associated with the north airfield, as described in Section 2.2 of the SPAS Draft, but would exacerbate the existing imbalance between the north and south airfields relative to large aircraft. As described in Section 2.2, the inability of some large heavy aircraft to depart from Runway 6R/24L due to insufficient runway length requires them to use Runway 7L/25R, which causes an imbalance in such operations between the two airfields. Although the south airfield can already accommodate large heavy aircraft and there is not a need to lengthen the runways, as suggested under this alternative concept, any degree to which additional operations of large aircraft are shifted to the south airfield under this concept (i.e., by leaving the north airfield unimproved and discouraging large aircraft operations in that area while improving the south airfield to draw such operations), would result in greater air quality and aircraft noise impacts than would otherwise occur by leaving the south airfield in its current configuration and improving the north airfield. Adverse air quality and noise impacts associated with shifting a greater number of aircraft operations from the north airfield to the south airfield would occur due to longer taxiing times and distances for aircraft (i.e., more air pollutant emissions from aircraft engines) that are gated near the north airfield but have to use the south runway and from placing a greater number of aircraft arrivals and departures over densely populated areas east of the south airfield (higher concentrations of homes and people exposed to aircraft noise impacts). Additionally, the easterly extension of the runways would shift the aircraft noise contours for the south airfield eastward, which, in turn, would increase noise impacts on highly populated areas east of the airport. Also, the extent of land area proposed for acquisition and demolition of existing uses under this concept would substantially increase construction-related impacts as well as land use impacts (i.e., loss of existing land uses).

Comment:

PUBLIC COMMENT: LOS ANGELES WORLD AIRPORTS [LAWA] SPECIFIC PLAN AMENDMENT STUDY

Alternative 2 is the "Environmentally Superior Alternative" [that achieves] "compliance with FAA Airport Design Standards, the larger aircraft are more acceptably handled by Alt. 2" without requiring additional runway spacing [=runway relocation]. Alt. 2 provides higher-speed taxiway exits for aircraft, lengthens the north runway, & "should be a no-brainer," according to Alliance for a Regional Solution to Airport Congestion [ARSAC] president Denny Schneider . . .

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Regarding enhancements to airfield safety and efficiency under Alternative 2, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. Please also see Responses to Comments SPAS-PC00130-3 and SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

SPAS-PFA00001-4

Comment:

But Schneider points out: 'NONE OF THESE OPTIONS CREATE SIGNIFICANT CAPACITY INCREASES FOR VEHICLE TRAFFIC FLOW!" UNACCEPTABLE! For years, ARSAC + other LAX neighbors have been pressing LAWA and LAC MTA to meet airport traffic demand by distributing it away from LAX, with Public Transportation & High Speed Rail. Some of these neighbors now back big commercial development plans north of LAX, hoping to make land too expensive for further runway expansion; HOW SELF-DEFEATING! Construction trades want any construction, however misguided . . . . . but it's TRANSIT CONSTRUCTION WE NEED to fix LAX & regional airports' worst problems! It's MOVING PEOPLE NOT CARS, NOT RUNWAYS; that's the focus MISSING or DONE WRONG in all 9 SPAS Alternatives:

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX. As indicated in that topical response, LAWA is working closely with Metro regarding the planning of the Airport Metro Connector Project and implementation of the Crenshaw/LAX Transit Corridor Project. In addition, all of the SPAS alternatives, with the exception of Alternative 4, include a connection to the planned Metro Aviation/Century Station that would provide improved passenger connectivity as compared to the existing service.

LAWA does not have the responsibility or authority for planning regional roadway capacity. Within the airport, the creation of significant amounts of additional roadway capacity would require building new roads within the CTA. Options for this are limited by a variety of constraints within the CTA and would require significant reconstruction of existing facilities. Instead, LAWA seeks to maximize existing capacity by employing a variety of methods which are presented in the SPAS alternatives and Draft EIR (see discussions of the SPAS alternatives in Section 2.3.1, beginning on page 2-13 under the subheading "Ground Access"). The methods intended to reduce future vehicle demand in the CTA include (1) relocating some modes which currently access the CTA to facilities such as the ITF (e.g.,

Shared Ride Vans and FlyAway buses from the arrivals level, and five percent of the passenger cars accessing the CTA on both the departures and arrives levels who would instead use the kiss-and-ride lot), (2) consolidation of the various commercial shuttles, and (3) implementing single level busing operations for specific commercial modes (i.e., rental car, hotel, and private parking operator shuttles) which would permit shuttles to both pick up and drop off passengers on a single level of the CTA.

Regarding the comment that "neighbors now back big commercial development plans north of LAX" to make land more expensive, no facts or evidence has been provided to support this assertion, and a response is not required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 14204(a)).

Comment:

Alternative 1 would move north side Runway "6L/24R" 260 feet north of its present location, add "center field" taxiways, & require significant grading changes to airport drainage channels. Aviation professionals say they don't need center taxiways- UNACCEPTABLE!
Alternative 3 would implement the changes described in LAX Master Plan D- Including "Yellow Light projects:" A. unneeded "center field" taxiways, B. demolition of existing Air Terminals 1, 2, & 3, and C. a Ground Transportation Center (GTC). plus an Automated People Mover [APM]***. UNACCEPTABLE WASTEFUL RIDICULOUS! And Mayor Villaraigosa promised NOT to build the "Yellow Light Projects"!
Alternative 4 would implement changes described In LAX Master Plan D, without the "Yellow Light projects . . . " Still UNACCEPTABLE WASTEFUL and RIDICULOUS!
Alternative 5 would move the northernmost Runway "6L/24R" a whopping 350 feet north of its present location toward Westchester . . . This is NOT ACCEPTABLE! Will Lincoln Blv. go thru the WallyPark garage?
Alternative 6 would move north Runway "6L/24R" 100 feet north . . . and is UNACCEPTABLE.
Alternative 7 would move the other north Runway "6R/24L" 100 feet south . . . also UNACCEPTABLE.
Alternative 8 addresses ground access improvements, yet favors inefficient car traffic over transit . . . this is UNACCEPTABLE; TRANSIT IS 21ST CENTURY TRANSPORTATION!
Alternative 9 concentrating rental cars [or any cars] in a single facility [CONRAC] = a traffic jam, not and improvement! Concentrating on cars & People Mover transfers curses transit riders! UNACCEPTABLE!***
"PEOPLE-MOVERS ARE A SIGN OF FAILURE!" -Gil Mallery

Quit moving runways; that's for aircraft carriers! Kill the People-Movers! AFTER 20 YEARS WASTED ON STUDYING & FOOLING AROUND, why on earth is LAWA talking People-Mover Nonsense.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The commentor does not provide any evidence that aviation professionals have opined that center taxiways are not needed. For further discussion on the operational and safety benefits of a centerfield taxiway please see page 505 in Section 4.7.2 of the SPAS Draft EIR. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PFA00001-6

Comment:

TODAY we should be riding that excess capacity in Green Line trains aerial to 3rd floor Airtel stations over Century Blvd, then straight inside LAX's inner airport loop! NOT BUILDING A NEW INCOMPATIBLE PEOPLE-MOVER SYSTEM with new equipment, new yard, new maintenance personnel . . . & time-wasting mode transfers that'll never go away. Likewise why wasn't the curse of a remote 98th Street Municipal Bus Terminal demolished long ago, giving way to excellent -one seat muni

bus rides- by taking over the eastern-most parking garage of the airport loop- to put buses IN WALKING DISTANCE OF LAX AIR GATES? Why aren't Metrolink commuter trains arriving under the International Terminal TODAY [in a tunnel station, pulled by electric locomotives from the Harbor Sub]- from Ontario & Burbank Airports? Flyaway Trains from Van Nuys? from LA Union Station?
Why aren't we planning to bring in Amtrak on the same route- from John Wayne & San Diego Airports? Trains from New Orleans, Chicago, Vancouver? Cruise ship passengers & Port employees from San Pedro & Long Beach? Planning more tunnels TODAY for High Speed rail under LAX's new Terminal for passengers to take from San Francisco Airport, Sacramento . . . shortening trip times to Asia, South America & Europe?

LAX is one of the last US airports that isn't all screwed up: Start building transit TO & INTO our airports, til TRANSIT IS THE #1 WAY to connect our airports with the world- without wasting our time, without laying waste to our airports or neighboring communities!

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. As indicated in that topical response, LAWA is working closely with Metro regarding the planning of the Metro Airport Connector Project and implementation of the Crenshaw/LAX Transit Corridor Project. In the vicinity of LAX, the Crenshaw/LAXTransit Corridor Project will also serve as an extension of the Green Line, which is currently located along the I-105 corridor and turns south just west of Aviation Boulevard. All of the SPAS alternatives, with the exception of Alternative 4, include a connection to the planned Metro Aviation/Century Station that would provide improved passenger connectivity as compared to the existing service. As part of the Metro Airport Connector Project, Metro is currently evaluating a range of options for connecting the regional rail system to LAX, including two light rail options directly into the CTA, and two airport circulator options-including an APM and a Bus Rapid Transit (BRT)-that would connect to Metro's service at the planned Aviation/Century Station. Please see Response to Comment SPAS-PFA00001-1 for reasons why the extension of heavy-rail service, such as for Metrolink and Amtrak, to LAX is considered infeasible.

It is assumed that by the SPAS horizon year (2025), Metro will relocate the current 96th Street Metro Bus Station, with is located between Vicksburg Avenue and Jenny Street, to a new bus center located adjacent to the planned Aviation/Century Station. Access to the CTA from the relocated bus center would be provided by the SPAS APM or dedicated busway. Relocation of the bus station to the CTA is not under consideration by either LAWA or Metro and is considered infeasible for a number of reasons. Specifically, relocating this station to the CTA would result in delays for the non-airport passengers who are believed to make up the majority of the passengers on these buses. The existing garages on the eastern end of the CTA do not have sufficient vertical clearance to accommodate Metro buses; accommodation of buses could only occur if a garage was demolished and reconstructed. Moreover, use of a garage for regional bus service would reduce the amount of on-airport parking. Finally, airport passengers arriving on Metro buses to the easternmost parking garage in the CTA could be required to walk in excess of 2,300 feet to reach their terminal or transfer to the airport's inter-terminal shuttle. Please also see Response to Comment SPAS-PFA00001-1 for additional reasons supporting the conclusion that relocating the municipal bus terminal to the CTA is considered infeasible.

LAWA has no responsibility or planning authority for high-speed rail. It should be noted that the planned California High-Speed Rail system does not include a stop at or near LAX. As currently envisioned and stated on page ES-1 in the California High-Speed Rail Program Revised 2012 Business Plan, Building California's Future, April 2012, the high-speed rail alignment would stop at Union. Please also see Response to Comment SPAS-PFA00001-1 for additional discussion regarding the idea of extending high-speed rail to LAX.

we should be routing the extra capacity in Green Line trains aerial to 3rd floor Airtel stations over Century Blvd., then straight inside LAX's inner airport loop!
Likewise why hasn't the curse of a remote 98th Street Municipal Bus Terminal been long ago demolished, giving way to excellent one-seat muni bus rides by taking over the eastern-most parking garage of the airport loop for transit WITHIN WALKING DISTANCE OF LAX AIR GATES? Why aren't Metrolink commuter trains arriving under the International Terminal TODAY [in a tunnel station, pulled by electric locomotives from the Harbor Sub]- from Ontario & Burbank Airports? Flyaway Trains from Van Nuys? from LA Union Station?
Why aren't we planning to bring in Amtrak on the same way- from John Wayne airport, San Diego Airport . . Ship passengers from San Pedro & Long Beach? Trains from New Orleans, Chicago? TODAY planning more tunnels for High Speed rail under LAX's new Terminal, for passengers to arrive from San Francisco Airport, Sacramento... & across the Pacific Rim?
Start building transit until it becomes the #1 Way to connect our airports with the world!

Build Transit INTO airports now; don't screw up LAX!

Alternative 1 would move north side Runway "6L/24R" 260 feet north of its present location, add "center field" taxiways, & require significant grading changes to airport drainage channels. Aviation pros say they don't need center taxiways- UNACCEPTABLE!
Alternative 3 would implement the changes described in LAX Master Plan D. Including "Yellow Light projects:" A. unneeded "center field" taxiways, B. demolition of existing Air Terminals 1, 2, & 3, and C. a Ground Transportation Center (GTC), plus Automated People Mover [APM]***.. UNACCEPTABLE; Mayor Villaraigosa promised NOT to build these!
Alternative 4 would implement changes described in LAX Master Plan D, without the "Yellow Light projects" Still UNACCEPTABLE WASTEFUL and RIDICULOUS!
Alternative 5 would move the North Runway "6L/24R" a whopping 350 feet north of its present location . . . This is UNACCEPTABLE!
Alternative 6 would move Runway "6L/24R" 100 feet north . . . and is UNACCEPTABLE..
Alternative 7 would move Runway "6R/24L" 100 feet south . . . also UNACCEPTABLE..
Alternative 8 addresses ground access improvements, but favors low capacity auto traffic over transit . . . this is UNACCEPTABLE; TRANSIT IS 21ST CENTURY TRANSPORTATION!
Alternative 9 concentrating rental cars [or any cars] in a single facility [CONRAC] = a traffic jam, not an improvement! Concentrating on cars & People Mover transfers curses transit riders! UNACCEPTABLE!***

SPAS-PH100001 Ali, Micah Compton School Board 8/25/2012

SPAS-PH100001-1

Comment:

Good morning. My name is Micah Ali and I serve as a member of the Compton Unified School District Board of Education and I'm also a member of -- the president of the Los Angeles County School Trustees Association.

All would agree that the Los Angeles International Airport is an extremely vital economic engine to this entire region. Last year, LAX generated nearly 40 billion dollars in economic output and created 300,000 jobs within our voluminous county.

So what does that mean? That means that LAX cannot operate without service workers. What does that mean? That workers must be included and must be valued as an element with respect to airport expansion. We believe that airport expansion is important because this is not just Los Angeles airport. This is the airport for our entire region.

What it also means is that we must make certain that if there are contractors who are not holding their end of the bargain, who are not being responsible stewards with respect to the public's trust, then they should not have a place at the airport.

And last but not least, we must make certain that we are very diligent in making sure that workers are treated fairly and equitable and that whether it's a tradesman or whether it's a service worker, the same level of respect is yielded, because all of us utilize this airport as a mode of transportation within our region.

Thank you.

Response:

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100002 Toebben, Gary Los Angeles Area Chamber of Commerce 8/25/2012

SPAS-PH100002-1

Comment:

My name is Gary Toebben. I'm the president of the Los Angeles Area Chamber of Commerce and the co-chair of the Fix LAX Now coalition of businesses, labor unions and individual citizens.

Our economic future depends on LAX. As the previous speaker just said, the airport pours nearly 40 billion dollars into our economy each year and generates direct and indirect employment of 300,000 jobs. When you add the current and future construction projects, LAX will generate another 15 billion dollars in economic impact.

It is not an exaggeration to say that improving LAX is the single-most important infrastructure project in our region today. Modernization is long overdue and our inaction is a source of embarrassment for Los Angeles.

The Coalition to Fix LAX Now is advocating for a full and complete modernization of LAX, which means the successful passage of the Specific Plan Amendment Study and its corresponding EIR. LAX needs three things: state-of-the-art terminals, a safe and efficient North Airfield, and appropriate ground transportation access. Only when all three areas are improved will we be able to say that we are a 21st century airport for our world-class city.

We urge the Airport Board to diligently but aggressively proceed through the SPAS EIR process. Our Coalition pledges to provide strong support and advocacy. Business and labor are unanimous in our view that now is the time to approve a full and complete modernization of LAX. Our airport is an incredible asset for Southern California and its modernization is essential to the improvement of our city.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100003 Lobera, Jose SEIU-USWW 8/25/2012

SPAS-PH100003-1

Comment:

My name is Jose Lobera and I've been working for LAX for 30 years to support my family.

My name is Jose Lobera. I've been working at LAX for 30 years to take care of my family. That includes my lovely wife and my three kids.

I am proud of working at LAX. I work hard at Aviation Safeguards, but yet it is difficult to take care of my family economically. Like all workers at LAX, I believe expansion is a good thing and it can be positive. I say that it could be positive, but I'm worried that the struggle to modernize the airport does not consider the health, safety, and the living wage of workers. That's why I am here this morning to express my support for the expansion, but only if it includes the prosperity of the LAX workers.

As long as we have irresponsible contractors at LAX that make a mockery of the living wage and the laws at LAX, there's no way that we can seriously talk about progress.

Thank you very much. The communities, the companies, the workers, and their families can progress together. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100004 Reeg, Kristin Unite Here Local 11 8/25/2012

SPAS-PH100004-1

Comment:

Hi. My name is Kristin Reeg and I'm the Director of Airports for Unite Here, Local 11. We represent -- over 3,000 of our members live very close to the airport. They work in the hotels along Century Boulevard and they also work inside the airport itself in concessions, both food and beverage and retail, and we also represent about 500 members who work behind the airport in more of a factory setting, making the food that goes on the airlines.

So our members are mostly, you know, working class. They live right in the area. They live in Lennox, they live in Hawthorne, and our union supports the expansion of the airport, making sure that we have decent jobs and more good jobs that provide benefits and provide good and decent wages for working folks in the neighborhood.

So we support the expansion. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100005 Kelly, Michael The Los Angeles Coalition for the Economy of Jobs 8/25/2012

SPAS-PH100005-1

Comment:

Good morning. Michael Kelly. I'm the Executive Director of the L.A. Coalition for the Economy and Jobs. We're a bipartisan alliance of business, labor, academia and nonprofit and are committed to working with policy makers to advance initiatives that are going to produce economic and job growth throughout this region.

We are particularly focused on this region's bigger economic assets such as the port, LAX, and our transportation network because they are going to be most directly linked to economic growth in a global marketplace.

You know, a growing economy just doesn't happen. It requires vision, collaboration, and political will. L.A.'s founders were not afraid of being ambitious, decisive, and boisterous when it came to promoting the region's image as one full of opportunity.

Because of the foundation they laid, L.A. County from 1949 to 1990 experienced a 208 percent growth in jobs, outpacing the entire United States by 58 percent. Since then, the population of L.A. County has grown by 19 percent, yet the number of jobs in the region has decreased by 9 percent. The most staggering fact is that the City of Los Angeles that actually owns the region's top economic assets mentioned above disproportionately represented the most jobs lost.

That is why we strongly support LAWA's vision to maintain and modernize LAX and to amass the economic realities of today's rising consumer demands, travel and trade units from around the world. The proposals to realign the North Airfield, build a consolidated rental car facility and an automatic people mover are all economically justified product and they will create tens of thousands of jobs, open trade and tourism, improve the air quality throughout the region, and connect all of us to family and friends throughout the world.

That's why the L.A. Coalition encourages everyone involved to demonstrate prudent leadership by moving this process forward with all deliberate speed in order to achieve the necessary competence as well as meet the expectations of L.A.'s customers and the residents most impacted by these changes.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100006 Durazo, Maria E LA County Federation at Labor, AFL-C10 8/25/2012

SPAS-PH100006-1

Comment:

Thank you. Good morning. I am secretary-treasurer of the Los Angeles Federation of Labor. We represent hundreds of thousands of men and women throughout Los Angeles County that work hard every day throughout our region.

As passengers travel through LAX, there are thousands of people who work hard to make sure that their experience is safe, that it's comfortable, and it's reliable. From flight attendants to baggage screeners, food and retail, construction workers, cabin cleaners, and customer service representatives, all of these employees deserve to have a voice on the job. They work very hard. They need the tools, the training and the working conditions. Some of them are here today, not only as employees of LAX but also as residents of the immediate area.

You know, LAX is an asset for all of us. 300,000 people raise their families through the jobs directly or indirectly related to LAX. Our airport generates 40 billion dollars. Those men and women spend their paychecks buying groceries, shopping in their stores, and reinvesting back into their local neighborhoods. Jobs at LAX are divided throughout L.A. city, all the districts, all the supervisorial. There is not a corner of our county that isn't touched by the economic vitality of the airport.

We have an opportunity here to put another incredible shot in the arm to our economic recovery that is the issue nationally. So we -- the sooner we approve and we finalize the approval process, which by the way has been going on for the past eight years, then we're going to be able to get another 8 billion dollars in projects and thousands of people back to work.

Thank you all very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100007 Cruz, Marisol Lennox School District 8/25/2012

SPAS-PH100007-1

Comment:

Yes. My name is Marisol Cruz, Lennox School Board president, but most importantly, I'm a long-life Lennox resident and I'm here to support the service worker. We need dignant jobs, benefits, salaries that justify the working class, and to increase our benefits as a community, giving us the jobs that we need to uplift our communities, our families. Given that Lennox is right at the runway of LAX and if LAWA will be expanding the runway north of LAX, it will heavily impact our community with pollution, with more traffic, and we want to make sure that we are serving the needs of the workers, the community, the students, the parents of the community that we are the labor force of LAX, like my parents, my brother and many of my neighbors.

So I want to make sure that we are providing those services, those salaries, those benefits that will really benefit our community, our parents, our students, and our teachers as a community.

Thank you so much and I have high hopes that you will provide the needs of our community. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than

significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-PH100008 Schneider, Nancy WNA-ARSAC 8/25/2012

SPAS-PH100008-1

Comment:

I want to just say that I've lived near LAX since I was five years old. I think that it is time to improve LAX grossly. I think we should start with the biggest jobs, the most permanent jobs that you have. We need to improve the passenger experience and we need to clean up the surrounding areas and get some mass transit into LAX in order to make this airport operable and, you know, a much better neighbor.

The only way you can make it a better neighbor is to get all these loose cars off the road. We approved the CONRAC, the consolidated rental car, six years ago. Where is it? Thank you.

Response:

Please see Response to Comment SPAS-PC00130-443 regarding the fact that LAWA had been independently advancing the planning and consideration of a CONRAC at LAX; however, the formulation of concept options for overall ground transportation system improvements at LAX, as part of SPAS, provided the basis for further evaluation of the need for, and location of, a CONRAC at LAX.

SPAS-PH100009 Hunter, Robbie LA/OC Building Trades Council 8/25/2012

SPAS-PH100009-1

Comment:

Robbie Hunter. I represent the Los Angeles and Orange County Building and Construction Trades Council. We represent 140,000 construction workers. We live in this community as well. We want this airport to be friendly to the neighbors. We want it to be a better environmental neighbor and we supported Measure R for a transit system in Los Angeles, not only for jobs but because we live in this city and we want a better place to live.

This modernization will improve the environmental footprint, will improve the traffic for the neighbors. The transit systems that we hope will be built here, people will be getting on transit systems to get to the airport from the neighborhoods that they live on and will have no impact in this area, and that's what we would like to see and we believe that this is the first step in this modernization.

We do believe that the airport as it exists today needs to be improved as far as being a neighbor and we believe today that this is the plan to do it. So it will provide jobs, but we have to look at the effect on the neighbors on the long term and we believe this will improve the environment.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The environmental impacts of the SPAS alternatives are addressed in Chapter 4 of the SPAS Draft EIR and summarized in Chapter 1. While some environmental conditions would improve compared to what would occur in the absence of SPAS, all of the alternatives would result in significant unavoidable impacts relative to existing conditions. These impacts are summarized in Table 1-5 of the SPAS Draft EIR.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX.

SPAS-PH100010 Mishelevich, David ARSAC 8/25/2012

SPAS-PH100010-1

Comment:

Good morning. I'd like to thank the work that the staff put together and the consulting firms to produce the Draft EIR. I am a member of the Board of ARSAC, the Alliance for a Regional Solution to Airport Congestion.

All of the alternatives have different economic impacts. In Section 8 of the main volume, it talks about the costs of the different alternatives, but it would be extremely important to have the basis for what those estimates were. The reality is that each of them has a different jobs profile and economic impact in terms of customer satisfaction.

LAX is, as I understand, the largest origins and destinations airport in the U.S., so we have more opportunities if we improve the customer satisfaction to increase the dollars that will remain in the community, as opposed to airports like Hartsfield in Atlanta or O'Hare in Chicago that are mainly transfer airports and the dollars do not stay there.

Jobs are absolutely critical and the reality is that if you build runways, you get fewer jobs and less diverse jobs for the various trades than if you improve the terminals; and it isn't an infinite load of money that we have available and I would encourage those estimates and the basis for those estimates to be made available so we can consider the alternatives in that economic light.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, please see SPAS-PC00130-77 regarding the cost estimates prepared for the SPAS alternatives and Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements.

SPAS-PH100011 Mendoza, Maria USWW 8/25/2012

SPAS-PH100011-1

Comment:

My name is Maria Mendoza. I am a resident of Los Angeles in the airport area and I have been working at LAX for 16 years.

I have two children and I work as a janitor for the company Air Serv where I work proudly and honestly; and even though I put in all this hard work, it's really tough to maintain my family. I'm here as a member of the communities that surround LAX, as a worker of LAX, and as a mother and as a working mother.

I'm here to express my support for the modernization of LAX. I think that the modernization of LAX is good for the workers if it means that we will have new jobs and new opportunities. However, the prosperity of LAX and its communities cannot move forward if you forget the workers that make this airport work without any problems.

The modernization of LAX has to include respect for workers, respect for living wage ordinances, and respect for unions. So that's why I'm here today, so that the effort to modernize LAX also includes health, safety, and prosperity for the workers who do the job.

So do what you can to police these contractors in LAX for violating the laws of the city and/or not following living wages. We can't have prosperity for everyone at LAX if you keep these contractors who are not following the laws at LAX. Yes to modernization, but no to some of these contractors that are responsible.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100012 Lopez, Joe Sheet Metal Workers 8/25/2012

SPAS-PH100012-1

Comment:

Good morning. My name is Joe Lopez. I'm with Local 105, Sheet Metal Workers, longtime resident of this area, and I support this project.

In California, we face over 10 percent unemployment and I ask that we approve this modernization of this project, if we could. It would give me a chance to go back to work after so many years of hard times. I'm not asking for handout. I'm just asking for an opportunity to give me and my family -- give me a chance to put food on the table for my two kids. So let's support this project.

I also -- since I am in the sheet metal industry, we will be modern- -- a modernization of this airport will -- we will be modernizing the roads of the surrounding areas and pollution that our local deals with. We will be modernizing all this, so thank you very much. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100013 Callahan, Edward None Provided 8/25/2012

SPAS-PH100013-1

Comment:

Hi. I'm just a homeowner in Playa del Rey and it sort of feels like we're being steamrollered by all the great powers. The unions are not our enemy. We can't fly anywhere without them, but this all seems to be about expansion and moving the north runway. That's what people are talking about and the head of the Chamber of Commerce talks about safety, that was an issue, which it's been proven that it's not. So there's some sort of steamrolling process here that's probably going to roll over the union as well as the homeowners.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100014 Freeman, Stefan None Provided 8/25/2012

SPAS-PH100014-1

Comment:

Hello everybody. Stefan Freeman.

I live in Playa del Rey as well and what I'll tell you is LAX, you know, we're your neighbors; right? And it's our responsibility as a neighbor to take care of the other neighbors around us, and for all the different labor organizations that are represented here right now, you guys do an unbelievable job. You do world-class work and I will tell you that our concern is not with you. We know that when you're in there, the work's going to get accomplished and it's going to be the best that it possibly can.

You know, our concern is really around the how and the what that's about to be done. Our concern is that LAX is going to come in there and do what they want without any sensitivity around the neighbors. Okay? And we wouldn't do that to you and all I ask is that you go back and try to figure out a way to even potentially move that runway further south. Now, it might mean more work, right, in terms of what you have to do to the terminals, but at the end of the day, that would be more work for the employees that you see here as well.

So that's what we're asking for right now is really just the how and what you're going to do and make sure that you have these employees included.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Regarding the commentor's request that "all I ask is that you go back and try to figure out a way to even potentially move that runway further south," SPAS Alternatives 3 and 7 propose the southward relocation of Runway 6R/24L and are included within the range of alternatives to be considered by the LAWA Board of Airport Commissioners.

SPAS-PH100015 Ferrer, Mirella Unite Here 8/25/2012

SPAS-PH100015-1

Comment:

Good morning. My name is Mirella Farvrer. I live at 416 West 105th, L.A. and I work for El Camacho's Cantina, LAX. I am a cook and I am backing up the project for the modernization of the airport because with this, it's going to benefit. It's going to create more work and we're going to better the economy of the city and the country.

This expansion is going to benefit everybody. Like, for example, me, that I am a worker, a middle-class worker, and this is going to benefit myself and my family and, therefore, we do not have to depend on any public service. I would like to state again that I approve of this project to 100 percent.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100016 Lemus, Teresa Unite Here 8/25/2012

SPAS-PH100016-1

Comment:

Good morning. I would like to thank all of you for being present here this morning and, God willing, I hope you put your hands to your heart and think about us, the poor people. We need work.

My name is Maria Teresa Lemus and I live in South Central Los Angeles and I've worked for Sky Chef for 13 years. I prepare the meals and the drinks that are for the airplanes. I approve of the project of the airport because this is going to benefit all of us. It's going to create more work for the -- it's going to create more work and it's going to better the economy.

I am alone and I depend on my job and, like me, there is many others. I would like to state again that I approve the modernization project to 100 percent.

Thank you for being here present and please, kindly, I request that you think about this. We need those jobs so we can continue to live in this world.

Thank you. Thank you. May God bless you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100017 Mendoza, Marlene Unite Here 11 8/25/2012

SPAS-PH100017-1

Comment:

Good morning. My name is Marlene Mendoza. I'm a proud member of Unite Here, Local 11, but I'm more proud of being a single mom and I have two children, Frankie and Valerie. My son is -- has cerebral palsy as well as dysphagia. I want to share that with you because I want you to think about what I have say.

I worked for HMS Host for 24 years and at Gladstone's at Terminal 3 and I'm very proud to serve you when you come through LAX, and I also want to say that I have a union job that gives me all the benefits that I need and I feel that no, it just can't be Marlene, Valerie, and Frankie who can have these benefits.

There are so many kids. I live in the city of Lawndale. There are so many families, so many single moms like me that deserve the rights to have these jobs. We have the right that LAX creates more jobs, and good jobs, and we also have the right to have a beautiful airport and we have the right of the modern- -- I support the modernization because of what it gives me and it gives my family, and the most

important thing that I get, even though sometimes I have to work the jobs, just -- having a job at LAX gives me more time to be with my kids and I want you to think about it because this is our future and it's our future. These are our kids.

This is our family and in order for us to create the communities, we need to have this modernization to have a better city, to have a better L.A., to have a better country. So keep that in mind that we are here. We are at the airport every single day supporting you. I say, "Hi. My name is Marlene. Welcome to Gladstone's."

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100018 Chavez, Sinia Unite Here Local 11 8/25/2012

SPAS-PH100018-1

Comment:

Good morning. My name is Sinia Chavez. I work for HMS Host as a chief supervisor of the Food Court. I've been working there in the airport for eight years, which has given me the opportunity to have a good living-wage job, which helps me to support my kids. I'm a single mom of six. And also, my older daughter is working at the airport, too, and she's getting the opportunity that -- the job is giving her by -- giving her the chance to go to a university. She's 23 years old and I support this expansion at the airport because I know it's going to give us better jobs each day, which we will have the opportunity to support our families the best we can and give my kids the opportunity to keep going to school while I work at the LAX. So I support 100 percent this project.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100019 Hinson, Stephen Sheet Metal Worker Local 105 8/25/2012

SPAS-PH100019-1

Comment:

Good morning, ladies and gentlemen. My name is Steve Hinson. I'm the Business Representative for Local 105 Sheet Metal Workers. We represent over 6,000 sheet metal workers, active and retirees, roughly about 3500 active members.

At the height of our unemployment, we were about 1100 members out of work. Now we're roughly about 600, which is still kind of high, but this expansion that we've had so far in the modernization of Tom Bradley, we've been able to put over 200 sheet metal workers to work on-site, not to mention countless members that are working off-site, project management, everything that's included within the construction.

Thousands of members -- thousands of good construction jobs have been created because of the Tom Bradley expansion. It's given our members a sense of hope, a sense of pride. It's helped them keep their houses, helped them keep their health care. It's done a great thing. This next modernization at LAX will not only enhance the community, but it will also be able to put our members back to work and, you know, I hope we can do this and get this thing passed.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100020 Morrison, Nancy-Gene None Provided 8/25/2012

SPAS-PH100020-1

Comment:

I'm Nancy-Gene Morrison. I live in Westchester and have for 30 years.

I am all for modernizing the airport. I am opposed to moving the runways and moving -- expanding LAX. I feel that it is very important that we not have all our eggs in one basket and our only major airport here being LAX. We have Ontario. There's Palmdale. Those areas need to be used and we are in an area that has geographic problems, geological problems with earthquake faults here. The ocean here is subject to tsunami and only this week we have had two major incidents at LAX where traffic has been halted on the roadways. A plane had to be unloaded the other day. There are constantly helicopters overhead.

There have been enough emergencies in this country in the last month that we cannot have everything all at LAX. We need to use other areas around. If there's any emergency in this area, there will be nothing here as far as air transportation.

I'm all for workers having jobs and being respected, but they can also have jobs in building at Palmdale and at Ontario.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport and Palmdale Regional Airport. As also described therein, there are six major airports, not just LAX, serving the Southern California region. In addition, please see Response to Comment SPAS-PC00094-2 regarding emergency response.

SPAS-PH100021 Schneider, Denny ARSAC 8/25/2012

SPAS-PH100021-1

Comment:

I'm Denny Schneider, president of ARSAC, and we want to see the airport fixed for four reasons: It's difficult and impossible to get to it, get through it, get out, and navigate among the terminals. Other than that, it's great.

The Master Plan is like a jigsaw puzzle with several key pieces that are still missing and it needs to be solved. Traffic gridlock, getting to and out of the airport, and besides that, it also short-changes the people who are traveling domestically because so far all we've done is work for the international passengers. All those other terminals need to be fixed, badly.

We know there's a lot of conflicts in the 6,000 pages that was written in the EIR and the other 6,000 in the SPAS report. We haven't had more than a month to look through all of those pages yet, but you will get lots of written comments.

We want to make sure that we do the alternative that the EIR suggests is best. That's Alternative 2. It's the lowest cost, provides the most efficient movement of aircraft on the ground, and is the best environmentally. Taxiways are moved. They make it safer so that you can move around. It extends 24R -- or 24L, I mean, to the east so that we have the runway safety area protected and it provides for balance among the airport, and it's just a good idea. Add number 9 and overall the key here is jobs, jobs, jobs, but what we need is jobs that are sustainable and that's what we really need here.

So thank you. I just want to make sure that you understand I have not talked about the local impacts because those aren't important to most of the people listening. It's what happens in the whole region.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. The commentor provides no substantiation regarding conflicts in SPAS Draft EIR and the Preliminary LAX SPAS Report.

In accordance with State CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments received on the SPAS Draft EIR during the public review period. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, Chapter 8 of the Preliminary LAX SPAS Report provides a financial analysis of each alternative. As identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Responses to Comments SPAS-PC00130-3 and SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. Response to Comment SPAS-PC00089-1 also provides an

explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative.

SPAS-PH100022 Cope, Danna None Provided 8/25/2012

SPAS-PH100022-1

Comment:

I'm Danna Cope, resident of Westchester for a long time.

Why does the Draft EIR present so many very, very expensive alternatives? Alternative 2, which does not include moving the runway north, plus the CONRAC, the consolidated rental car complex, plus train access into the airport meets the safety requirements. It does not disrupt the North Airfield and, therefore, impact our neighbors to the south, because the South Airfield would be terribly impacted. It meets environmental requirements with much less impact and it does create jobs.

Response:

The commentor's support for Alternative 2 plus the CONRAC and APM (i.e., Alternative 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Regarding enhancements to the safety of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. Please also see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. The commentor is not specific in the comment that Alternative 2 plus Alternative 9 "meets environmental requirements with much less impact." However, please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. The impacts associated with Alternatives 2 and 9 are discussed throughout the SPAS Draft EIR.

SPAS-PH100022-2

Comment:

There is a lot of modernization that needs to be done at this airport that does not involve moving the runway. Why doesn't the -- why, when development of other LAWA-owned airports is a Draft EIR goal, does LAWA want to wait until LAX meets 75 MAP? We should be immediately developing Ontario for the safety reasons that previous speakers mentioned and that would create many, many more jobs.

LAWA projects must include fair wages for all workers, including subcontractors. Is that included in the Draft EIR? Why not go right now to developing Ontario? It would increase jobs in this area incrementally -- I mean, immeasurably and we need it.

Thank you.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport.

The comment also raises employment and wage issues. These are purely economic impacts not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PH100023 Czyzyk, Joe Mercury Air Group 8/25/2012

SPAS-PH100023-1

Comment:

Good morning. My name is Joe Czyzyk and I'm chairman and CEO of Mercury Air Group and the immediate past chair of the Los Angeles Area Chamber of Commerce.

I've been a Playa del Rey resident since 1984 and my company has continuously operated among other airports and LAX since 1955. My company will not profit or benefit from any decision made on these SPAS.

I am here today to speak in support of SPAS and specifically Alternatives 1 or 5 to ensure that the North Airfield is finally configured in such a way as to accommodate the next generation of longer and wider aircraft. It's hard to believe that LAX doesn't operate as a fully functional and approved Group V airport under FAA guidelines when there are Group VI aircraft landing here today.

LAX modernization, not expansion, not what you've been hearing. People have been saying "expansion." There's no expansion contemplated in Alternative 1 or 5. It's important to point out that even if the North Runway is moved 350 feet, which is Alternative 5, it stays within LAX's existing fence line. I repeat, it is not an expansion; just modernization. If there is an expansion, it's only for safety and jobs.

I have lived in this community for nearly 30 years. I don't want to see our community hurt by this airport, but at the same time I don't want to see the airport's future hurt by a lack of action on undertaking a complete modernization, including the North Airfield. The airport provides growing and massive economic support to the City of Los Angeles and its surrounding communities, including my community of Playa del Rey and Westchester. Inaction will cause us to have a dangerous-to-use, noncompliant airport.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As indicated on pages 1-10 and 1-11 in Chapter 1 of the SPAS Draft EIR, one of the objectives of the SPAS project is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. The existing problems associated with the outdated airfield design at LAX are described therein. A summary of the safety and efficiency enhancements to the north airfield operations under the SPAS alternatives, including Alternatives 1 and 5, is provided in Table 4.7.2-16 on pages 4-569 and 4-570 of the SPAS Draft EIR.

SPAS-PH100024 Lestz, Patricia None Provided 8/25/2012

SPAS-PH100024-1

Comment:

Hi. I live in Playa del Rey. My name is Patricia Lestz and I've only lived been there for seven years, so obviously the airport was here when I moved here. I was not aware -- I lived in Los Angeles for 30-some-odd years. I was not aware of really what was happening in Playa del Rey.

The first thing that I want to say is that I think that anyone who was involved in whatever we want to call it, you know, expansion, modernization, et cetera, that whether it's a subcontractor or a contractor, that they ought to pay them a living wage. That I think is number one. That's the most important thing. We should not live in a city where that is not the case.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100024-2

Comment:

Number two, I think that all of these things on the wall should show the economic impact. Money is certainly not easy to come by, especially in this state and in the city and yes, we need the jobs, but we also need to know how we're going to compensate the businesses that are affected outside of the airport, the homeowners that are affected -- and obviously I'm concerned about that. I mean, all of our values have already dropped. How much more is it going to drop with runways being closer to us?

So those are the points that I want to make. I think that, once again, the economic impact of everything that is in this community -- is it going to affect Otis? Is it going to affect Loyola? We have to think about those things because those are the things that really make us special as a community.

Thank you.

Response:

Regarding the need for an economic impact analysis, per Section 15131(a) of the State CEQA Guidelines, "economic or social effects of a project shall not be treated as significant effects on the environment." This section of the guidelines further states that "intermediate economic or social changes need not be analyzed in any greater detail than necessary" to identify a physical change caused by the economic or social changes. As outlined in Section 15002(a) of the State CEQA Guidelines, the basic purposes of CEQA are to inform decision-makers and the public about the potential significant environmental effects of proposed activities; to identify means to reduce, avoid, or mitigate environmental damage; and to disclose reasons why the decision-makers approved a project if significant environmental effects are involved. Although considerations other than environmental impacts have a role in the action taken by the decision-makers, the purpose of an EIR is to focus on environmental effects. Please also see Response to Comment SPAS-PC00189-4 regarding property values.

It is not clear in the overall context of the comment what the commentor is referring to other than potential economic effects on Otis College of Art and Design and Loyola Marymount University. As shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Tables 2-4 and 2-5 of the SPAS Draft EIR, no acquisition of Otis College of Art or Design or Loyola Marymount University is proposed under the SPAS alternatives. However, potential physical impacts of the proposed SPAS alternatives on surrounding land uses, including Otis College of Art and Design and Loyola Marymount University, were analyzed in Chapter 4 of the SPAS Draft EIR. Key issues that were analyzed and relevant to these educational institutions include noise, traffic, and changes to the RPZ associated with aviation safety.

SPAS-PH100025 Widener, Bill None Provided 8/25/2012

SPAS-PH100025-1

Comment:

Yes. I'm Bill Widener and I'm a resident of the city of Inglewood. I've lived in the airport area for 70 years, since I was almost a baby, and so I've seen a lot of changes in everything and that's good, but I'm speaking for the residents east of the airport. If they expand, fine. Just don't move that runway north any more because it's too far north as far as I'm concerned already. But, you know, I live in Inglewood and they've done sound insulation on all these apartment buildings and stuff and they haven't done it on single-residence homes. See, I hear about all these jobs and everything here and no one's defending the residents east of here.

You know, now, there was -- during some expansion period of the airport, a lot of my relatives and everything relocated in Atlanta because that's where all the jobs went at one time and so, you know, I realize that as these things happen and the expansion goes on that there's evolution and there will be more jobs automatically, you know, but let's just don't create any hardships for people. That's the whole trick, as far as I'm concerned, because we lost one house in Westchester at one time and -- you know, to the airport and it's part of a parking lot today.

Inglewood -- Westchester Elementary School I went to and it's gone completely because of being part of a parking lot.

So these are necessary things and I hope we can proceed and not hurt anybody. Thank you.

Response:

This comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Regarding lack of progress for providing sound insulation to single-family homes in the City of Inglewood, a comparison of the LAX ANMP Tables Update included with the Quarterly Report for the 2nd Quarter 2010 (as referenced in footnote 493 on page 4-666 of the SPAS Draft EIR) with the Quarterly Report for the 4th Quarter 2011, indicates that progress has been made towards reducing the number of incompatible residential dwelling units exposed to 65 CNEL or higher noise levels in the City of Inglewood. As shown on these tables, in the 4th Quarter of 2011, the number of incompatible residential dwelling units in the City of Inglewood was reduced by 1,423 single- and multi-family units and 984 single-family units compared to 2nd Quarter 2010 conditions.

Please refer to pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR, for a description of the Aircraft Noise Mitigation Program (ANMP) established to provide soundproofing to eligible properties exposed to 65 or higher noise levels, pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). Participants in the ANMP include communities within unincorporated Los Angeles County, the City of Los Angeles, City of Inglewood, and City of El Segundo. Each participating jurisdiction is responsible for implementing its own ANMP to mitigate noise impacts or eliminate incompatible land use within the communities surrounding LAX. Regarding priority for completion of sound insulation for specific properties under the existing ANMP, the commentor should contact the City of Inglewood, Residential Sound Insulation Department at (310) 412-5289.

As noted in LAX Master Plan Mitigation Measure MM-LU-1, priority would be given to the completion of the current ANMP, prior to adjusting the ANMP boundaries to include residential and non-residential noise-sensitive facilities that may be newly exposed uses under the selected SPAS alternative.

SPAS-PH100026 Gray, Gloria West Basin Water District 8/25/2012

SPAS-PH100026-1

Comment:

Good morning to the audience and folks in front. I want -- well, first of all, my name is Gloria Gray and I'm a resident of the city of Inglewood. I've lived in Inglewood for over 30 years and I want to acknowledge the fact that it's a good thing to have community meetings and so forth, so I know it's a requirement when you do an EIR and so forth.

I know that we're here to hear results and also to talk about the modernization proposal for the airport. It's always a good thing to upgrade any particular facility and certainly the airport is one that -- where it needs to happen and certainly that modernization will create jobs, I assume, for this community and so that's a good thing, because job -- increasing jobs in our community is very positive.

But I'm here also to address another issue which is very important and it should be important to the airport because it is important to our community and that is the issue of supporting the service workers at LAX.

You're probably aware of different demonstrations that have been going on. I have been a member of the union for many years so I do support organized labor and working family issues and so I beg to ask you to please consider the plight of the service workers. They have a right to benefits. They certainly have a right to health care. They have a right to jobs that will support them and their families and so I think, you know, looking at the issue of contracting out is very important. It's an issue throughout the state of California for local cities and municipalities.

And so I beg you to please look at protecting the service workers because they are the nuts and bolts of the airport. So, again, I encourage you to look at those issues and support their efforts, and I am here to support their efforts and will continue to do that.

So thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100027 Orellana, Patricia SEIU-USWW 8/25/2012

SPAS-PH100027-1

Comment:

My name is Patricia Orellana from Inglewood. I have two kids. I have worked at LAX for 14 years.

I'm here to support a modernization today, but it's not unconditional. I'm here to say that it's important if the airport and the community want to move forward together, that the airport needs to take more at hand in protecting workers against some of these contractors that work at the airport, like Aviation Safeguards.

What I am here to say is that both the workers and their families also have to progress in this modernization process. LAX can make new terminals, can build new routes for planes to land, but it is

the workers who work in it every day that make this airport function. If you want to make a nicer looking airport, a more functioning airport, you still have to address the issue of contractors. If not, you're going to get a beautiful, shiny airport on the outside, shiny and clean airport on the outside, but the dirt will be inside.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100028 Hamilton, Jacqueline — Tuskegee Airmen, Inc. — 8/25/2012

SPAS-PH100028-1

Comment:

I'm Jacqueline Hamilton with the Tuskegee Airmen organization. I lived in this area, the Manchester Square area, from 2001 to 2006, and one of the things we experienced in living in this area was a lot of fumes and a lot of problems with air quality. So I'm checking and reading your information here and also talking to the staff.

Another thing that I experienced was repeat crime victimization. Now, we're talking about jobs here and different organizations. One of the things that needs to be done is having safety for those of us who are in this area.

I'm still being repeatedly victimized by crime. My father's picture and information was displayed at LAX in a mural during the time that I lived in this area. I was victimized by stalking, illegal harassment, mail fraud, identity theft, theft, a lot of crimes, and I lived in the area of the Manchester Square area.

The address was 93112 Glasgow Place, a complex owned by Jesus Lozano, managed by Lillian Fogelback and also Maria Estrada. They all lied to me about receiving a relocation award, staying, prolonging my stay here in this area, continued to lie to me about receiving the award, and did nothing about the crime victimization and also the problems we had in living in this area with the fumes and other problems.

So one of the things I'm requesting is public community safety. We have information here about air quality and traffic control, all the other issues. We have received information that LAX is one of the most dangerous airports.

One of the things I'm also experiencing is repeat illegal corruption of my clear background record. It also includes harassment by officers, which is illegal.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PH300028-1 regarding relocation assistance. The commentor provides no substantiation for the claim that LAX is "one of the most dangerous airports." The comment regarding fumes and problems with air quality pertains to conditions in existence when the commentor resided in Manchester Square and does not pertain to the SPAS Draft EIR or the environmental impacts of the SPAS alternatives. Existing air quality at LAX is characterized in Section 4.2.3 of the SPAS Draft EIR.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100029 Eggers, Craig Neighborhood Council of Westchester Playa 8/25/2012

SPAS-PH100029-1

Comment:

My name is Craig Eggers. I represent the Neighborhood Council Westchester Playa del Rey and I chair the Airport Relations Committee and I wanted to dispel a few myths that seem to be floating around concerning our community.

The first myth is that we do not support modernization. That is absolutely incorrect. I agree with previous statements that the airport currently is an eyesore and a bit of an embarrassment. When you think about the passenger traveler experience, with the amount of money that's being invested in downtown Los Angeles and the revitalization there, I would think we'd really want to modernize this place within an inch of its life.

The second myth is that we do not support -- excuse me. We do support the environmentally superior alternative and the issues concerning the operational efficiency. There is no justification in operational efficiency or in safety as it's associated with the Runway Separation Plan that's currently there.

And most importantly, we're going to be hosting a town hall meeting for our Neighborhood Council on September 25th and we'd like to invite everyone to come out for that as well. We hope to have several high-level elected officials, including Councilman Rosendahl, join us and we welcome the opportunity to get your input and perceptions and feedback.

Thank you.

Response:

The commentor's support for the environmentally superior alternative (i.e., Alternative 2) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. In addition, please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield.

Please see Response to Comment PH200025-1 regarding the town hall meeting held by the Neighborhood Council of Westchester/Playa.

SPAS-PH100030 Cavalier, Richard None Provided 8/25/2012

SPAS-PH100030-1

Comment:

My name is Richard Cavalier and I live in Inglewood. I want to say that for modernization, yes; to move the runways north, no. We're talking about jobs. Nobody's talking about closing the airport. The jobs are already there. Many of the jobs for the modernization are temporary jobs, but the impact on the community is permanent and the way this airport operates, forever and ever, far outlasting me, I'm sure.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100030-2

Comment:

There are a couple of major problems. One is that the airlines right now stack everything over the city. All of the airplanes are dropping pollution over the city.

Response:

The SPAS Draft EIR addressed air quality impacts, including emissions from aircraft, in Section 4.2, Air Quality. Please also see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. The analysis includes the impact from aircraft located approximately five miles from the airport property line both east and west of the airport.

SPAS-PH100030-3

Comment:

There's an ocean to the west, and I don't know whether anyone has noticed it. Yes, sound carries over the ocean.

Share the wealth. The important things after our medical problems from what's being done and because the runways already let planes come in from the west, there's very, very little of a problem here.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Regarding impacts to health, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health

hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports a regional approach to accommodating air travel demands in Southern California.

SPAS-PH100030-4

Comment:

Now, what we're not talking about is grandfathering. There was one time a small airport for propeller planes. The jets arrived. That's fine.

The important thing is that I've also heard that someone said longer, wider aircraft. Yes, these aircraft are not here by the demands of the traveler. They're here by the demands of the bean counters who don't care what happens to anybody on the ground. Okay.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100030-5

Comment:

I have traveled in more than 40 countries. I've been in a lot of airports and they all around the world do more to take care of the people who are near the airport than is done here. People are being molested, and this is a matter of unilateral taking of the quiet enjoyment of home for everybody if the runway is moved north.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Aircraft noise impacts for the alternatives are presented in Sections 4.9 and 4.10.1 of the SPAS Draft EIR. This includes discussion of existing noise-related programs in Sections 4.9.3.3 and 4.9.5, such as the Aircraft Noise Mitigation Program, and the Voluntary Residential Acquisition/Relocation Program. As discussed in greater detail in Response to Comment SPAS-PC00034-18, LAWA has spent in excess of $1 billion for soundproofing or acquiring homes. LAWA also implements a number of operational measures to reduce noise which hare described starting on page 1-86 of the SPAS Draft EIR. As discussed therein, LAWA implements policies to (1) use preferred inboard runways for departures, (2) use Over-Ocean procedures, (3) conduct westward departures, (4) ban the use of SuperSonic Transport (SST), (5) restrict run-up activities, (6) reduce departure thrust on west flow operations, (7) discourage the use of reduced thrust departures during east flow operations, (8) use departure cutback procedures, and (9) use tug and tow procedures.

As summarized in Section 4.9.7 of the SPAS Draft EIR, those noise-sensitive uses newly exposed to noise levels of 65 CNEL or higher would be eligible for sound insulation under the Aircraft Noise Mitigation Program (ANMP) and through implementation of LAX Master Plan Mitigation Measure MM-LU-1, which would reduce interior noise levels to 45 CNEL. As concluded in Section 4.9.8 of the SPAS Draft EIR, interim impacts prior to completion of sound insulation and noise-sensitive areas newly exposed to outdoor noise levels of 75 CNEL or higher would be significant and unavoidable.

SPAS-PH100030-6

Comment:

Okay? So modernization, yes; north runways, no. And now let's make sense out of the airport that is here. They don't have unlimited rights.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH100031 Sambrano, Diane HSCV 8/25/2012

SPAS-PH100031-1

Comment:

Good afternoon. I've been here for a very long time. I've attended so many of these meetings, it's impossible to count them, and one thing is consistent. There seems to be a lack of understanding of the genuine impact that this airport has on the people who live around it. We're constantly hearing about those people who come in for a couple of months and get a job and then they leave and go back way far away.

We are always hearing about how important it is for the traveler who's here maybe four whole hours, but you know what? There are people who actually try to continue to live here and what we have experienced is not just horrific noise but all that black goo that lands on top of our lemons, our cars, on our mini blinds, and here's the surprise. We actually breathe the stuff.

And you know what? No matter how much I look at charts, wherever they are, there doesn't seem to be that adequate resultant determination about what's happening to our lives and yet I can tell you that this year, I've had to write six obituaries.

There are definite cancer clusters in the areas of Inglewood. Most of the women, roughly 65 in certain areas, are now either without breasts or dead. That's pretty significant, but we don't see that anywhere, and then there's those other pesky little cancers that leave your breasts but just eat you away everywhere else and we don't hear about that because either someone wants a job, someone wants an aircraft, somebody wants to sell another trinket. And I've got to tell you somewhere along the line, people's lives should outweigh that dollar bill. By the way, we're still impacted, even when those dollars actually go way far away to downtown L.A.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, construction traffic and equipment noise, in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor

habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

The commentor provides no evidence to support the claim that "There are definite cancer clusters in the areas of Inglewood. Most of the women, roughly 65 in certain areas, are now either without breasts or dead. That's pretty significant, but we don't see that anywhere, and then there's those other pesky little cancers that leave your breasts but just eat you away everywhere else." Please note that Section 4.7.1 of the SPAS Draft EIR addresses cancer risk and chronic and acute non-cancer health hazards associated with construction and operational activities that would occur under the SPAS alternatives. As indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

With respect to the "black goo that lands on top of our lemons, our cars, on our mini-blinds," it is assumed that the commentor is referring to "deposition," (i.e., the gravitational fallout of material--both solid and liquid--from the atmosphere). Commonly, this material, called particulate matter, consists of dust and soot that can form deposits or cause discoloration on outdoor surfaces (i.e., building materials, motor vehicles, small water bodies, etc.). Please see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. As indicated in Response to Comment SPAS-PC00043-2, to date, the research results indicate that aircraft do not contribute substantially to deposition.

SPAS-PH100032 Ouellet, Jim None Provided 8/25/2012

SPAS-PH100032-1

Comment:

Yeah. One of the information that's up on some of these bulletin boards says that LAX North Airfield was designed in the 1960s for 1960s aircraft. The Boeing 747 was also designed in the 1960s and began flying in 1970, just about the time that the North Airfield opened, so it was plainly designed to accommodate the 747.

Now, that 747 had a wingspan of 197 feet. Boeing's latest large jet, the 787-9, has a wingspan of exactly the same, 197 feet. The 747, the largest 747 has a wingspan of roughly 25 feet taller.

In terms of flying Airbus, which is the largest aircraft in and out, so far Airbus has something like about 240 orders for that jet, one-third of them from Emirates Airlines which flies, as far as I know, one flight in and out of LAX a day on a Boeing 777.

By contrast, the Boeing 787 has 824 orders. There will not be that many category VI jets flying in and out of LAX to justify moving all those runways.

Response:

As indicated at the top of page 2-2 of the SPAS Draft EIR, LAX does not have an airfield, in either the north complex or the south complex, that is fully designed for ADG V aircraft, such as the Boeing 747, or ADG VI aircraft, such as the Airbus A380. As also indicated, the primary departure runway on the north airfield, Runway 6R/24L, is too short for certain aircraft (e.g., fully-loaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield for departure.

The aircraft fleet mix used in the SPAS planning and analysis for future (2025) conditions takes into account the anticipated number of Boeing 787 as well as Airbus A380 and other aircraft types operating at that time. The fleet mix information is summarized in Appendix F-1 of the Preliminary LAX SPAS Report and additional details are contained in Appendix J1-1 of the SPAS Draft EIR. As described in Appendix F-1 of the Preliminary LAX SPAS Report, it is expected that operations of ADG VI aircraft will increase at LAX by the year 2025.

SPAS-PH100032-2

Comment:

The data in the EIR also suggests that moving the runways -- Runway 24R north either 260 feet or 340 feet will result in minimal efficiency gains. So it will create -- well, basically, it will create an awful lot of noise around the area, additional noise around the area with minimal gains in efficiency and a horrible expense in digging up a runway and moving it a few feet north.

That's all. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final

EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR regarding gains in efficiency associated with the SPAS alternatives, including Alternatives 1 and 5. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with the airfield alternatives.

Please see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR conclusions relative to aircraft noise impacts on surrounding communities.

SPAS-PH200001 Durazo, Maria E LA County Federation at Labor, AFL-C10 8/28/2012

SPAS-PH200001-1

Comment:

Good evening. Yes, Maria Elena Durazo and I am secretary-treasurer of the L.A. Federation of Labor.

You know, as passengers travel through LAX, there are thousands of very dedicated men and women who work hard to make sure that the experience of the passengers is safe, it's comfortable, and it's reliable, and I mean everyone from the flight attendants to the baggage screeners to the food, retail workers, the concession workers, cabin cleaners, customer service reps. The workers at LAX deserve to have a voice on the job. That's what we strive for and we want to ensure also that they have the tools, the training, and good, safe working conditions that they need to carry out their jobs.

LAX is a treasured asset for all of us. 300,000 people raise their families through the jobs, directly and indirectly, related to LAX. Every corner of the city and county is touched by economic vitality from this airport. So for us, the sooner we finalize a process that has been going on for over eight years, then an additional 8 and a half billion dollars in projects can begin and another 10,000 more good-paying jobs are created.

So in addition to the economic impact, we are glad that modernization will also address the safety issues on the runway that affect workers. So this time, let's refer to LAX as not as "the airport" but as "our airport" because it belongs to all of us. Our airport is long overdue for modernization. Therefore, alongside a coalition of LAX workers, residents, community and business allies, we urge a swift delivery of the Final EIR.

Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200002 Hathaway, Karen Los Angeles Area Chamber of Commerce 8/28/2012

SPAS-PH200002-1

Comment:

Thank you. My name is Karen Hathaway and I am the President of LAACO, Ltd./Los Angeles Athletic Club. I'm also the chairman of the Board of Los Angeles Area Chamber of Commerce.

Modernization of LAX is long overdue. In fact, LAX modernization is essential to the future of our city and now is the time to do it.

The economic impact of LAX on L.A. County is very well documented. It generates tens of billions of dollars and hundreds of thousands of jobs annually. It's not just an economic asset. Actually, it's an essential component in the financial stability of our entire region.

The citizens of our region have a huge stake in the global economy. Growing our tourism and exports are key to L.A.'s long-term economic health. A modern, safe, and efficient LAX is essential to keep visitor and business travelers coming here and to keep commerce flowing. Therefore, improving LAX is the most important economic project in our region today.

Significant improvements are under way; however, the Los Angeles Chamber of Commerce has partnered with labor and citizens to form the Coalition to Fix LAX Now because we see the financial implications of the job that's only half done. In these troubled times, our region faces many intractable problems with no obvious solutions and this is not one of them. The path is very clear.

LAX needs a complete package, a state-of-the-art terminal, a safe and efficient North Airfield, and good ground transportation access. All three elements are absolutely required and we are calling for the passage of the Specific Plan Amendment Study and its corresponding EIR. We urge the Board to aggressively proceed through the SPAS EIR process and move us forward into the 21st century.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200003 — Simon, David — Southern California Committee for the Olympic Games — 8/28/2012

SPAS-PH200003-1

Comment:

Thank you.

I am here representing the Southern California Committee for the Olympic Games, of which I serve as president of.

When the London Olympics ended two weeks ago, City Councilman Tom LeBonge introduced a motion in Council inviting our organization to recommend to the City whether Los Angeles might be able to bid again for the Olympic games in the near future. And while that has not worked its way through Council, I can tell you the answer is yes, there is an opportunity.

The 2016 games have been awarded to Rio. 2020 will be awarded next year to either Madrid, Tokyo, or Istanbul; and the 2024 games will be after that and the United States Olympic Committee will have to decide whether Los Angeles is the candidate to advance internationally to put that bid forward. But we could be on the verge of the best opportunity Los Angeles has had for 40 years to have a successful bid for the Olympic games. And just as the last Olympic games in 1984 was a tremendous catalyst for a major overhaul of the airport, so could a bid for the Olympic games in 2024 be a catalyst for the airport again.

So I am here just to let you know that this is being talked about. It's not yet broken into the news, but if it does and if we're successful, this could be something very significant for the airport.

I would invite you to consider in your planning the date of 2024 as a deadline. If there is an Olympic bid, an improved airport would obviously enhance it; but just as important, if there is an Olympic bid, it could be a tremendous catalyst for you and that deadline could be something that we could work together on.

Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200004 Norton, Kevin IBEW Local #11 8/28/2012

SPAS-PH200004-1

Comment:

Norton, with bad penmanship apparently.

Kevin Norton, IBEW Local 11, Electrical Workers Union. We represent about 500 workers who work at the airport on construction, as well as permanent employees of the airport. We're also a community stakeholder and have an office at 8333 Airport Boulevard, right down the street in Westchester.

LAX -- the modernization of LAX is critical. Anybody who does any air travel whatsoever would be hard-pressed to find an airport that is less impressive to a visitor than LAX, certainly not because of their lack of effort of the folks that run the airport, but because it's been very difficult to get any kind of modernization program under way with all of the considerable lawsuits and opposition.

The modernization program needs to move forward. We need to have jobs. About several hundred thousand people rely on the airport, whether it's from cargo jobs, airport-related jobs, whatnot, construction jobs, permanent jobs at the airport. It's critical for the area, for the region, and we really need a world-class airport.

Los Angeles is one of the greatest cities in the world, but you would never know it if you flew into LAX. You'd -- again, you'd be hard-pressed to find a less impressive airport, less modern. There's no connection to transit. There needs to be a connection to the light-rail line and we need a modern LAX. That's it.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200005 Broderick, Aaron IBEW Local #11 8/28/2012

SPAS-PH200005-1

Comment:

Hello. Aaron Broderick, IBEW, Local 11. An apprenticeship just started for me. My previous career, I did a lot of traveling with rock-and-roll bands and I traveled the world, five continents, 112 countries. I've seen a lot of airports and Los Angeles alone is a brilliant city, but to fly into it, it's somewhat tragic.

I think modernization of Los Angeles Local International Airport would be great for the community, bring us up to date with the rest of the world and actually give us competitive value. It's fairly difficult to look at it in its current state and see its value on an international level. It's really just behind the times and modernization is key.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200006 Sanchez, Maria USWW 8/28/2012

SPAS-PH200006-1

Comment:

Good evening. My name is Maria Sanchez. I have two children -- boys and two girls.

Good evening. My name is Maria Sanchez and I am the mother of two boys and two girls. I have been working for more than six years at the airport for the company SASIG (sic) and I've lived in the city of Compton for more than ten years.

I am here to support the modernization of the airport and to let them know that hardworking people like myself could escape poverty thanks to contractors from the airport -- people like myself that will not be able to escape poverty thanks to contractors, the airport contractors that are violating the law. MR. OSWALD: So if I can just interrupt for a second, what I'd like to do, since this gentleman knows the content, maybe he can go ahead and do that, translate for her. Thank you very much. I'm so sorry.

Good evening. My name is Maria Sanchez. I am a mother of two -- two sons and two daughters. I have more than six years working at the airport for the company ASIG and I have worked -- I lived and worked in the LAX area for ten years.

I am here to support the modernization of LAX but to also let you know that there are many of us who can not escape poverty because of companies like Aviation Safeguards.

It's important to know that -- so that everybody at the airport can prosper that LAWA needs to do something to protect the workers against some of these dirty and irresponsible contractors. I only ask you this so that everybody can progress, workers and their families as well.

LAX could make new terminals. LAX could fix the runways, but it is the workers that make the airport work. If you want to, you could fix the outside and have a very nice-looking airport, but if you don't fix

the issues with the contractors inside the airport, it will look beautiful on the outside, but it will be dirty on the inside.

Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200007 Lobera, Jose USWW 8/28/2012

SPAS-PH200007-1

Comment:

I am Jose Lobera. I am 77 years old. I have worked at LAX for 32 years and I have done this for many years to support my family, my children, my wife, and my grandchildren, who I'm very proud of.

I am a resident of the area of LAX and I work for a company called Aviation Safeguards, but it is difficult to sustain myself economically. Like all the workers at the airport, I feel that the modernization of the airport could be something very positive. I say that it could be something positive because I am worried that in the modernization of our airport, there is not enough consideration to the health and safety and to the well-being of the workers in the airport.

Nonetheless, I am here very faithfully saying that I am here to -- I am here to express support for the modernization of LAX, but only if it includes the thought to the prosperity of us, the workers at the airport.

Part of the modernization of LAX should be the removal of irresponsible contractors who are currently operating at the airport. Just such is the case of Aviation Safeguards, which owes 2.5 million dollars to our medical care. They keep violating the living wage and they do not listen to federal agents that supervise work at the airport. As long as you have contractors like this treating our contract like a joke, we can't talk about full prosperity.

Thank you for your attention. Together, employers, communities and workers can prosper.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200008 Underwood, Brenda None Provided 8/28/2012

SPAS-PH200008-1

Comment:

I'm mike [sic] shy, but it sounds like everybody is kind of thinking it's a good thing and it probably is, but I live in Manchester Square so I'll be uprooted and that's a scary thing.

But in the meantime, I live there and the airport promised to water the place and I need it to be rehooked up and watered because it's been three years and they have not watered it.

Also, we have a problem with -- there is 30 people living in vehicles there, which is kind of getting a little out of control, and we'll see what's going to happen. Okay. Bye.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200009 Hunter, Robbie LA/OC Building Trades Council 8/28/2012

SPAS-PH200009-1

Comment:

My name is Robbie Hunter. I'm the Executive Secretary of the Los Angeles and Orange County Construction Trades Council, and some of the comments are like to me sad. It's not just about the construction jobs. It's really the airport itself.

LAX as it exists today is dysfunctional, antiquated. It's unfriendly to the neighbors who surround it. It's also unfriendly to the aviation industry.

An LAX modernization program will cut congestion and pollution, runway work will make a safer airport for aviation, the central location of all the rental cars will relieve traffic and is a very welcome new fixture to the airport itself.

Eventually, passengers will arrive at LAX by mass transit instead of automobile. This will make the neighborhood around LAX more liveable. We would like to see the transit lines go directly into the airport itself and we hope that that's going to be added to the plan.

The environmental footprint of LAX will greatly be reduced by the new heating and air-conditioning and electrical systems that's being installed and we're glad to see that both from environmental aspects and for saving on electricity and water.

Thank you.

Response:

The commentor's support for a CONRAC (i.e., Alternatives 3, 4, 8, and 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with

Alternative 1 with the ground access components associated with Alternative 9. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

As indicated in Section 4.12.1 of the Draft EIR, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Alternatives 1, 2, 8, and 9 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect on-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

As indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-PH200010 Mitchell, Michael Mickey's Disneyland & Orange County Bus Co. 8/28/2012

SPAS-PH200010-1

Comment:

Hello. I'm Michael Mitchell. I own Mickey's Spaceship Shuttle. We're a small scheduled service company in LAX.

I represent like eight small companies, and we are very -- we go 35 miles before our first stop out of LAX. The FlyAway has come in and it's lost 40 million dollars. It's a complete failure except for the Valley, and they spent 6 million to make about $100,000 since 2006 to come downtown, but this is owned really by an overseas company and that 60 million that actually went to the company and people paying that could have gone to local people here that are minorities, Super Shuttle and Prime Time and taxis and stuff. The FlyAway's a completely ridiculous thing to have done in the first place, but everybody says it's losing 40 million and all this stuff but they can't stop it because it's all agreed to, which is -- Mr. Lawson says why we shouldn't keep doing something that's failing and that we have to keep doing this is ridiculous.

But anyway, with the Plan, I'm for Plan Number 4. Clifton Moore designed that airport exceptional. He worked in the sewer all the way up to where he drained the Richter and that's the best design you've got is Number 4. And even -- see, those big companies from overseas, they've constantly tried to kick the little companies out that are local so that they don't have any competition and this intermodal facility outside is really part of that. So if you do put the FlyAway and the Super Shuttle outside, let the small scheduled companies stay in the CTA and go around because we go 35 miles out, but the intermodal thing is a completely ridiculous design in the first place and it's in order to monopolize it for the overseas Fortune 500 company that's come in here -- that calls itself Coach USA -- which is actually going to Bay State Worth, Limited (phonetic) overseas to Ireland, and it's hidden from you all.

Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200011 Bashem, Greg Teamsters 986 8/28/2012

SPAS-PH200011-1

Comment:

And you did pronounce that correct. Thank you.

My name is Greg Bashem. I'm with Teamsters Local 986 and our Local represents several hundred workers directly in LAX or at least around the LAX area doing business with LAX. We represent airline pilots. We represent the jet mechanics. We represent the customer service reps. We represent jet refuelers. We represent the shuttle drivers that take customers in and out of the airport, out to the remote parking lots and hotels and stuff. We also represent the people that bring in the food for the flights, so -- and I'm sure I'm forgetting some others. But we also represent construction workers, ready-mix drivers, people that would benefit by this modernization of the airport.

The airline pilots are flying bigger and bigger jets and so those runways need to be expanded. I'm not saying to, you know, encroach on housing and stuff like that. I'm sure it can be done within the boundaries of LAX right now. But they do need to make those runways bigger to support those larger jets. That's a safety concern.

The rental area would help in the congestion that's surrounding LAX by having people go to several different places to drop off cars.

So you want to modernize LAX. That builds jobs. Those jobs will improve the economy in Los Angeles, and I'd like to see the Olympics here in 2024. So please do whatever you can to start green-lighting these yellow-lighted projects.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200012 Kelly, Michael The Los Angeles Coalition for the Economy of Jobs 8/28/2012

SPAS-PH200012-1

Comment:

Good evening. Michael Kelly. I'm the Executive Director for the L.A. Coalition for the Economy and Jobs.

We're strongly committed to working with regional policy makers to produce economic and income growth for this region and we're particularly focused on our cities' chief economic assets such as LAX, the ports, and our transportation network because they are most closely linked to economic growth in today's 21st century economy.

We're strongly supportive of L.A.'s current proposals to maintain and modernize LAX because, first and foremost, they're going to create a better environment with the airport's tens of thousands employees. They can work more safely and efficiently in meeting demands of a rising consumer demand to travel and trade grids and services around the world.

You know, secondly and more specifically, a realignment of the North Airfield, the building of the consolidated rental car facility and an automated people mover are all economically justified projects that are going to create tens of thousands of jobs. They're going to support new trade and tourism opportunities, improve the air quality in surrounding communities and throughout the region.

Most importantly, these projects are going to create a safer airport that's going to connect all of us to our family and friends around the world.

As we all know, the majority of the time, LAX is the very first impression of L.A. that California travelers see and experience.

Since roughly three-fourths of the world's purchasing power and almost 95 percent of the world's consumers are outside of the United States, L.A. should be our region's global business card that truly symbolizes our standing as a leading economic opportunity in the 21st century.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200013 O'Callaghan, Elsa None Provided 8/28/2012

SPAS-PH200013-1

Comment:

Hi, everyone. My name is Elsa and I love L.A. except that our airport is super depressing. I'm really excited to be here tonight to talk about modernization but specifically to support Alternatives 2 and 9.

An independent study from NASA has shown that no increased separation of the runways in the North Airfield is needed for safety and also maintains that there is no compelling case on safety grounds alone

for reconfiguring the airfield. The North Airfield should instead be adjusted, combining Alternative 2 and Alternative 9.

Appendix F2 of the Specific Plan Amendment Study shows that Alternative 2 will reduce delays more than any other alternative. The same appendix displays Alternative 2 creating the highest operational efficiency. The Draft Environmental Impact Study additionally concludes that Alternative 2 would have the lowest environmental impact. These two alternatives will further provide long-term, sustainable and diverse job growth, which is super important, to the residents of the city. Other alternatives do not provide the same investment in long-term jobs.

So, listen, we're all really excited to make these changes to LAX to make it more functional for Los Angeles residents and our visitors. We should really make this change that we are proud of that serves the community the best, creates jobs, and is super awesome.Alternative 2 and Alternative 9 are the best ways to make this happen.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to north airfield safety. Please see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives, including a discussion of delay associated with the alternatives. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 would not have the lowest environmental impact.

In addition, please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR, including job creation. The comment that the other alternatives do not provide the same investment in long-term jobs is unsupported by facts or evidence. In fact, all of the alternatives would provide an investment in long-term jobs, although fewer jobs would be associated with Alternative 4 than with the other alternatives.

SPAS-PH200014 Hosmer, Liz None Provided 8/28/2012

SPAS-PH200014-1

Comment:

Hi. My name is Liz and I'm a resident of Los Angeles.

This community wants a modernized, revitalized LAX that it can be proud of. Alternative 2 combined with Alternative 9 meets the SPAS goals by combining airfield, terminal, and transportation improvements.

Alternative 2 is a superior alternative in regard to operational efficiency and it also has the least environmental impact.

An independent study conducted by NASA has shown that no increased separation of the runways in the North Airfield is needed for safety.

Jobs are very important and LAX is a huge engine of economic growth in the Los Angeles region. It is important that the alternatives show and support long-term, sustainable and diverse job growth.

Honestly, an alternative that is too focused on airfield improvements alone will only create short-term, construction-focused jobs, not what we need to support in long-range planning. Please consider Alternative 2 combined with Alternative 9.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on page 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 would not have the lowest environmental impact.

Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to north airfield safety. In addition, please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including job creation. It should be noted that none of the SPAS alternatives includes airfield improvements alone. Please see Response to Comment SPAS-AL00007-6 regarding the fact that alternatives that only include airfield and terminal components (i.e., Alternatives 5 through 7) would only address all of the problems that the Yellow Light Projects were designed to address in conjunction with another alternative or portion thereof. Please see Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements.

SPAS-PH200015 Evans, Kathryn Neighborhood Council of Westchester Playa 8/28/2012

SPAS-PH200015-1

Comment:

Hello. My name is Kathryn Evans. I'm a resident of Westchester and I'm a local leader also of the Neighborhood Council of Westchester/Playa, and a member of the Airport Relations Committee.

I am very excited about the possibility of modernization and improvement at LAX. After considering the possible options for improvements, I'm excited to support a combination of Alternative 2 and Alternative 9 for the following reasons: The combination of Alternative 2 and Alternative 9 fulfills SPAS goals to have airfield, terminal, and transportation improvements.

The analysis in the DEIR and supporting documents show Alternative 2 to be superior to all others in airport operational efficiency. Appendix F2 of the LAX SPAS report shows that Alternative 2 reduces delays by 1.7 hours each day compared to the next most efficient alternative.

Analysis in the DEIR also shows Alternative 2 to be the superior alternative when air quality and environmental impacts are considered. Only Alternative 4 gets minimal improvements with lower conceptual emissions than Alternative 2, and Alternative 2 would have lower aircraft emissions than Alternatives 1, 3, 4, 5, 6 and 7.

In addition, Alternative 2 has less than half the amortized total greenhouse gas emissions than any other alternative that includes airfield improvements.

An independent evaluation by NASA has shown that no increased separation of the runways is needed to allow for safe operation of all aircraft at LAX.

The review panel said that it does not see a compelling reason on safety grounds alone for reconfiguring the North Airfield and that because the baseline will only pose a risk that is so low, they said reducing the risk further is of limited practical importance.

Jobs are very important and LAX is a huge engine of economic growth in the Los Angeles region and it is important that the alternatives chosen support long-term, sustainable and diverse job growth. Alternatives 2 and 9 do this.

As the first line of welcome to travelers of Los Angeles, I want to see a modern, state-of-the-art LAX connected to a leading transportation system so that we can reclaim the title of the nation's number one origination/destination and third-busiest airport in the country. Selecting Alternative 2 and Alternative 9 will be a solid investment in the Los Angeles regional economy and result in an airport that we can all be proud of.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements.

Regarding enhancements to the efficiency of the airfield under each alternative, please see Table 4.7.2-16 on page 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives, including a discussion of delay associated with the alternatives.

Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. Regarding the comment that Alternative 2 would have lower aircraft-related emissions than Alternatives 1, 2, 3, 5, 6, and 7, please see Response to Comment SPAS-PH200016-1. The comment that Alternative 2 would have less than half the total amortized greenhouse gas than any other alternative that includes airfield improvements is not entirely accurate. While the comment is correct to a certain extent, the analysis of total amortized greenhouse gas reflects only a small portion of the total greenhouse gas emissions associated with the alternatives, since amortized greenhouse gas applies to construction-related GHG emissions only, which are only approximately 1 percent of the total incremental GHG emissions associated with Alternative 2. As indicated in Table 4.6-6 of the SPAS Draft EIR, while Alternative 2 would have less than half the amortized greenhouse gas emissions (GHG) associated with construction, total incremental GHG emissions associated with Alternative 2, which include both operational and construction emissions, would only be approximately 4 percent lower than the total GHG emissions of Alternative 1 (i.e., 465,374 MTCO2e/year versus 485,002 MTCO2e/year). Moreover, when coupled with Alternative 9, the construction-related GHG emissions associated with Alternative 2 would be greater than the emissions associated with Alternative 2 alone. Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PH200016 Evans, Scott None Provided 8/28/2012

SPAS-PH200016-1

Comment:

Good evening. My name is Scott Evans and I am a member of the Westchester LAX community.

In my line of work, I travel through LAX at least once a month. I've seen what works at the best airports around the world and, frankly, LAX is an embarrassment. I wholeheartedly support LAWA's efforts to improve the airport and passenger experience.

As a taxpayer and a frequent customer of the airport, however, I believe improvements should be efficient and effective use of funds. Alternatives 2 and 9 in the SPAS report will provide the greatest benefit per dollar spent. According to LAWA's own studies, moving the North Runway is an unnecessary expense.

A NASA study Commissioned by LAWA found that the North Airfield is, quote, "extremely safe in its current configuration." Alternative 2's taxiway improvements will make it even safer. LAWA recently released the Environmental Impact Report, which reaches similar conclusions. They found Alternative 2 will have lower aircraft emissions than all other airfield-including alternatives and lower construction emissions than all but Alternative 4, which does simply nothing.

Alternative 2 would even lower aircraft emissions from today's levels, something that no other alternative does. The SPAS report, likewise, shows that Alternative 2, without moving the runways, is the most operational and efficient option, reducing delays more than any other alternative.

We've heard a lot about jobs this evening. Let's be clear. All of these alternatives will create jobs. The question we must ask is, "Which will provide good and sustainable jobs and not just temporary work?" Alternatives 2 and 9 create both short-term and long-term jobs that will better benefit the community and regional economy.

Everybody agrees that LAX needs to be fixed. Doing so will cost billions of dollars and that money needs to be spent wisely. Alternatives 2 and 9 are the most operationally efficient and environmentally friendly. They improve safety, they improve the passenger experience, and they create good, sustainable jobs. They are the most effective use of funds and will provide the greatest benefit to the airport, the customer, the community, and the economy.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The comment that Alternative 2 would have "lower aircraft emissions than all other airfield-including alternatives" is incorrect. As indicated in Table 4.2-13 of the SPAS Draft EIR, although Alternative 2 would have the lowest aircraft-related emissions under good weather conditions among the alternatives with airfield improvements (i.e., Alternatives 1 through 7), emissions associated with this alternative would be higher than Alternatives 1, 5, 6, and 7 for all pollutants under poor weather conditions, with the exception of PM10 and PM2.5, where the emissions associated with Alternative 2 would be the equivalent to Alternative 7, but would be higher than Alternatives 1, 5, and 6. The comment that Alternative 2 would lower aircraft emissions from today's levels is also incorrect. As indicated in Table 4.2-13 of the SPAS Draft EIR, aircraft-related emissions associated with all of the alternatives would be

higher when compared to baseline (2009) conditions. Total emissions of CO, VOC, NOx, associated with all of the alternatives, not just Alternative 2, would be lower compared to baseline (2009) conditions. As explained on page 4-121 of the SPAS Draft EIR, this is primarily due to reductions in emission from on-road motor vehicles, and reflects the fact that emission standards for motor vehicles will be more stringent in 2025 as compared to baseline conditions, thereby reducing daily emissions from these sources.

Please see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Regarding enhancements to the safety of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives, including a discussion of delay associated with the alternatives. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report).

SPAS-PH200017 Amano, Robert Hotel Association of Los Angeles 8/28/2012

SPAS-PH200017-1

Comment:

Robert Amano, Executive Director for Hotel Association of Los Angeles, representing the lodging industry here in the Greater Los Angeles region.

How do hotels tie into this formula? The statistics are staggering or sometimes hard to define at least, but what is easily obvious and easy to understand is that our primary facilities at LAX serves as a gateway to the world.

Tourism is a global industry. Not only does the airport provide accommodations to our national and domestic travelers, but we are the doormat, welcome mat for millions of tourists and visitors from around the globe annually, not to mention the tons of air, freight, and cargo which passes through our terminals.

Our hotels remain competitive and rely heavily on major meetings and conventions to fill our rooms; hence, the competitive infrastructure required for that is the Convention Center. LAX is no exception to the avid competition, which currently airport facilities locally, nationally, and globally are remodeling or remodernizing. Other airports are being constantly upgraded, enhanced facilities off of rebranded strategies and state-of-the-art technology and trend-setting services to attract not only the airline services, but to provide the ambient hospitality experience to the travelers.

It's been almost, I would say, three decades until the recent TBIT changes of modernization. So within that time, you know, LAX has never seen a meaningful upgrade. It's about time. The time is now. Otherwise, we're going to miss the flight into sustaining the City's visibility and vitality as an attractive building and tourism destination.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200018 Gat, Jonathan None Provided 8/28/2012

SPAS-PH200018-1

Comment:

Good evening. My name is Jonathan Gatt [sic]. I live in West L.A. and I'm here tonight representing no one other than myself. I use the airport every month and one in every four or five trips is an international trip, but I usually come in through the Bradley building. I think obviously there's consensus here tonight -- I think there's a consensus with anyone who's ever used the airport even once that it is time to do something and just about anything from the user perspective would be welcome.

Looking at some of these alternatives, I'm not going to try and say that I'm an expert on these sort of things, but I have seen consolidated rental facilities pop up at airports around the country and around the world. Again, as someone who rents cars at airports, that seems to work pretty well and the hodgepodge of facilities that we have near LAX is not particularly functional. I would welcome more mass transit links to the airport, although I doubt that many of my fellow Angelinos actually know what a bus is.

Now, just in closing, let me just say this: I picked up my mother, who came here from New York last week, at the airport and as we were turning onto Sepulveda heading towards where I live in West L.A., my mother looks over at me and says just out of the blue, "You know, Jon, Kennedy isn't so bad these days." Now, if that's not a wake-up calls, ladies and gentlemen, I don't know what is.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200019 Gonzalez, Ruben Los Angeles Area Chamber of Commerce 8/28/2012

SPAS-PH200019-1

Comment:

Thank you very much. My name is Ruben Gonzalez. I'm with the L.A. Area Chamber of Commerce. I am going to read into the record a letter on behalf of The Boeing Company.

"Boeing's Commercial Airplane Division manufactures the 747-800, the largest commercial aircraft built in the United States and the longest passenger aircraft in the world. The 747-800 has a wingspan of 224 feet, 7 inches, and is 250 feet, 2 inches, in length. This aircraft requires a Group VI airfield.

"Currently, Boeing customers have begun flying 747-800s into Los Angeles International Airport, which is not a Group VI airfield, nor is it even a Group V airfield in all weather conditions. Operating a 747-800 today at LAX requires special airfield operational accommodations. LAX will continue to see more and more 747-800s, as Boeing has had a robust sale of these aircraft worldwide; and as a major international hub, we anticipate a number of these aircraft transiting through LAX.

"We recently reviewed a report which stated that the Los Angeles International Airport generated 37.9 billion dollars in direct economic impact to the Southern California economy. This underlines the importance of commercial aviation from international trade to passenger spending. Given this background, we have a significant interest in the current Specific Plan Amendment Study process under way at LAX and specifically the reconfiguration of the North Airfield.

"Boeing urges Los Angeles Airport and City officials to select the necessary alternatives under SPAS to make LAX a Group V and Group VI airfield in all weather conditions. We understand that to do this requires moving the northern runway closer to existing businesses and residents. We trust that the City will work to find a balance with these interests while ensuring that LAX doesn't lose its position as a major international airport able to accommodate the world's newest aircraft.

"Sincerely, Shaunta Hyde, Director, Global Aviation Policy, Boeing Commercial Airplanes."

Thank you.

Response:

The commentor presented the letter that was later submitted as comment SPAS-PC00092-1; please refer to Response to Comment SPAS-PC00092-1.

SPAS-PH200020 Lambros, Richard Southern California Leadership Council 8/28/2012

SPAS-PH200020-1

Comment:

Thank you. Good evening. Richard Lambres [sic]. I'm the Managing Director of the Southern California Leadership Council. It's a pleasure to be here tonight.

Our organization includes membership -- our membership includes three former California governors, Governors Davis, Deukmejian, and Wilson, and our organization is a nonpartisan, nonprofit partnership focused on the long-term issues of Southern California, specifically issues that affect our economic development, job creation, and quality of life. And we have the pleasure often that other organizations don't, to be able to look at the long term and when you look at the long term for our region, it's essential that we have a modernized LAX. It's critical.

In fact, there is no business -- it would be hard to find a business in our region that is not benefited by a highly-effective, well-functioning Los Angeles International Airport.

The economic impacts have already been stated well by both the labor and business community. I would just add a couple thoughts. One is competitiveness. We sometimes think in Southern California that certain industries are sort of insulated from competitiveness. We thought that about film and television and now we find production moving throughout the world.

We're currently challenged in the same way with our ports. You know, we've had a new challenge because of the expansion of the Panama Canal and now we're seeing the same thing with air travel and goods movement and what is going on with our international airport. So it's critically important that we never lose sight of competitiveness, and that's where the long-term vision comes in. You've embarked on a long-term planning process. To your credit, you've done it well. You've taken your time. We support your process and we encourage you to move rapidly to completion of the process and move forward with the modernization that LAX needs. We know it will be critically important for the long-term benefit of our region, so thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200021 Rodine, Robert L The Polaris Group 8/28/2012

SPAS-PH200021-1

Comment:

I'm Robert Rodine. My firm is The Polaris Group. I'm speaking on behalf of myself and the Valley Industry and Commerce Association tonight.

In an April 2012 survey performed by Travel and Leisure Magazine, LAX ranked one above the anchor in the survey for La Guardia Airport. In this ranking of 22 airports, LAX was ranked at the bottom of the list for impression of safety standards, 21st in terms of security and check-in and cleanliness, and was generally characterized as worn out, having outdated infrastructure, and being overcrowded and subject to delays. We need to step up and make LAX modernization our mantra, not just in appearance, but in functionality as well.

In the words of Commissioner Torres-Gil, we can't forget that we are not just serving the community and stakeholders around the airport. LAX is serving 20-million-plus residents in Southern California as well as uncounted millions that depend on us internationally and this airport is critical as an economic engine.

The June 18, 2012 SPAS report to the DOAC [sic] enumerated seven integrated and stand-alone airfield alternatives. Alternative Number 5 was noted as being the one that does the most in meeting all planning objectives to the greatest extent. Alternative 5 -- it is my request that Alternative 5 be designated as the preferred alternative in the Final EIR.

Thank you.

Response:

The content of this comment is similar to comment SPAS-PC00026-1; please refer to Response to Comment SPAS-PC00026-1.

SPAS-PH200022 Schneider, Denny ARSAC 8/28/2012

SPAS-PH200022-1

Comment:

I'm Denny Schneider speaking to you as president of ARSAC and we've been working to have the airport fixed for years. LAX is unfriendly on several levels: getting to it, getting through it, getting out of it, and navigating the terminals in between. This Master Plan is a failure in fully solving those issues. It does help and we need to get moving, many years ago and now.

Now, I support and we support Alternative 2 for three reasons: It's the lowest cost, it results in the most efficient aircraft ground movement, and it is labeled the environmentally superior. And I can go on into all the other issues, including the fact that you need to make sure that the train goes into the airport, that you have mass transit in general to support this and avoid gridlock; but most of all, we need the most bang for our buck and there is never going to be enough money to do everything and you need to set your priorities.

The priorities must be as shown in Number 2, that you're going to fix the taxiways, that you're going to fix the terminals, and economic studies show that 80 percent -- I'm sorry -- 8 times better jobs and improvements by doing those land-side projects.

Now, there's no reason why some of those couldn't have been started many years ago and I just want to urge you to get going and do it already.

Response:

The content of this comment is similar to comment SPAS-PH300012-1; please refer to Response to Comment SPAS- PH300012-1. Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX. Regarding the comment that taxiway and terminal projects should have been started many years ago, the Crossfield Taxiway Project was completed in 2010 and the Bradley West Project, which includes major terminal improvements, is underway. Other terminal improvements have been completed or are underway throughout the airport, including substantial interior improvements to Terminal 6, which were completed in spring 2012, terminal improvements to Terminal 5, which are underway, and improvements to Terminals 7 and 8, which are anticipated to be completed in 2015. These, and other completed, ongoing, or planned taxiway and terminal-related projects are identified in Section 5.3 of the SPAS Draft EIR.

SPAS-PH200022-2

Comment:

I'm not going to harp on the issues of what it does to the local communities, because it really is a regional issue and if you do the wrong choices, it's going to affect everybody and that's why I'm so strongly telling you that we've dodged a bullet before. With the earthquakes a couple weeks ago, they were small ones. If it's a big one, we're in trouble. So, please, get on with it.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. As also noted therein, there are six major airports, not just LAX, serving the region.

Regarding earthquake risks at LAX, the 2010 Revised NOP and Initial Study for the SPAS Draft EIR explained why these risks for the SPAS alternatives are less than significant.

SPAS-PH200023 Herbst, David Mercury Air Group 8/28/2012

SPAS-PH200023-1

Comment:

Good evening. My name is David Herbst. I'm Chief Corporate Officer of Mercury Air Group and the past chairman of the Board of Westchester LAX Chamber of Commerce, which is now the LAX Coastal Chamber.

I have been a Westchester/Playa del Rey resident since 1987. Mercury has continually operated at LAX since 1955. My company will not profit from any decision that follows the SPAS.

I'm here today to speak in support of SPAS and specifically to ensure that the North Airfield is finally configured in such a way as to accommodate the next generation of longer and wider aircraft. It's hard to believe that LAX doesn't operate as a fully functional, approved Group V airport under FAA guidelines

when there are Group VI aircraft landing there today. LAX modernization needs to include its North Airfield.

My family and I live in Westchester. We bought our home. We remodeled it there, knowing we're next to one of the nation's largest airports. If the North Airway [sic] is moved 350 feet, it stays within the existing fence line. LAX is not talking about moving a runway to Manchester Boulevard, and moving a runway within LAX's footprint to me is not expansion. It's part of modernization.

I have worked hard to make Westchester a great place to live. I don't want to see LAX stomp out our community and I can support SPAS including moving the runway because I know it will not have the devastating effects some claim; and by making a decision, we can finally move on with our lives and allow LAX to have an airport that works for the next 50 years.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200024 McOsker, Tim Central City Association 8/28/2012

SPAS-PH200024-1

Comment:

Good evening. Tim McOsker, Mayer Brown law firm. I am an attorney here at downtown. I have no clients or financial interest or business related to this topic. I'm actually here as the past chair of the Central City Association and one of the members of the Coalition, one of the charter members of the Coalition urging you to move forward with modernization of the airport.

I also have had a small role over the years in City government, in that I had the pleasure of serving Mayor Hahn; and before serving Mayor Hahn, I had the pleasure of being in the City Attorney's office being an attorney to Mayor Riordan, and another story here is that the great Mayor Riordan worked very hard on this issue. My boss and friend, Mayor Hahn, worked very hard on this issue, and I really commend you and everyone working with Gina Marie Lindsey and with Mayor Villaraigosa to bring this modernization to a reality. It's really, really very important.

Not only from my CCA perspective is this important for economic development and for jobs and to bring our airport and our region forward and to remain, you know, on the cutting edge and on the rim of this -- of the Pacific; but this is also very, very important environmentally. I mean, you are going to be creating, you know, safety with separation of the airport. We're going to be creating opportunities to deal with traffic and congestion and I really commend everyone involved in this effort on behalf of CCA.

I thank you and I urge you to move forward.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200025	Eggers, Craig	Neighborhood Council of Westchester Playa	8/28/2012

SPAS-PH200025-1

Comment:

Thank you. My name is Craig Eggers. I'm a 30-year resident of Playa del Rey. I serve on the Neighborhood Council of Westchester/Playa and I chair our Airport Relations Committee. I'm speaking here today to support both Alternatives 2 and 9. These alternatives will bring billions of dollars in investment to LAX and the surrounding areas of the City of Los Angeles.

Alts 2 and 9 combined are the most affordable, cost-effective design option that ensures the capacity needs of the airport are ready to serve both the economy and tourism well in the future. Alts 2 and 9 will provide substantial permanent benefit, long-term jobs by modernizing the passenger facilities and transport systems.

Alts 2 and 9 do allow for safe airfield operations at LAX and Alt 2 is superior when it comes to the operational efficiency of the airport, and that's per your EIR, as well as demonstrated as the environmentally superior alternative EIR as well. Alt 9 reduces central terminal traffic and creates a consolidated rental car facility on property that's already owned by LAWA.

Our Neighborhood Council is hosting a community town hall meeting on September 27th at 7:00 p.m. It will be held in the auditorium at Westchester Enriched Science Magnet School, a.k.a. Westchester High School, and our moderator will be Richard Katz.

So today I want to personally invite Gina Marie Lindsey and her LAWA team to join us -- that's all of you guys. I'm also extending an invitation to our electeds, including Councilman Rosendahl; Congresswomen Waters and Hahn, Senators Feinstein and Boxer; Supervisors Knabe and Ridley-Thomas; Representatives Lieu and Bradford, and any other concerned elected that might be interested. And we don't want to forget that we are also inviting our Mayoral candidates for their input as well.

We are the first line of welcome through Bradley to Los Angeles and we want to see a modern, state-of-the-art LAX connected to reenriched transport system so we can reclaim the title as nation's number one origination/destination airport, one that as neighbors we can be proud of.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of project costs. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report). Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. It is noted that a town hall meeting held by the Neighborhood Council of Westchester/Playa (NCWP) to discuss the SPAS Draft EIR was held at the Westchester Enriched Sciences Magnets School on Thursday, September 27, 2012. In addition to presentations provided by representatives of community groups, at the invitation of the NCWP, LAWA staff were present at this town hall meeting and gave a presentation providing an overview of the SPAS project and associated Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PH200026 Jackson, Stephen None Provided 8/28/2012

SPAS-PH200026-1

Comment:

Thank you.

Good evening. I'm Stephen Jackson. I'm a citizen of over 30 years of Los Angeles. I continue to play docent to the continuing stream of visitors of family and friends who keep visiting me.

My comments are basically transit related. Direct, dependable transportation to and from LAX is imperative for this city and it's long overdue. I love Los Angeles. We're a world-class city with a very busy airport that's working toward being first class itself.

Cars have long been the dominant mode of transportation and we all know who how minor incident on the 405, the 105, or any connecting freeway can ruin the best-laid plans. Even on off hours it's not safe. I once landed at 12:30 a.m., figured a straight shot on the 405 would get me home, but no. There was an incident and I didn't get home until the middle of the morning.

The existing transit options for getting to and from LAX are much improved over what they were in years past. The FlyAway buses are excellent, but they are susceptible to the vagaries of our famous L.A. traffic. The Green Line avoids traffic, but it only goes near the airport and the subsequent shuttle vans have to navigate the same upper- and lower-level terminal congestion as everyone else.

As well, unless one lives near a Green Line station, connection from other transit routes is required, making a rail trip from popular destinations such as Hollywood a multiple-transfer and time-consuming affair. I doubt that any of this is news to anyone in this room, nor is the fact that in most of the world-class cities, there exist very efficient and reliable transit from downtown to the airports. New York, Boston, Washington National, Chicago come to mind. Even smaller cities such as St. Louis, Philadelphia, and Baltimore have direct rail access to their airports.

I'm going to cut to the chase because I'm running out of time. All the options for transit improvements are valid, but whichever one is chosen must have direct, dedicated rights-of-way into the airport or they're going to be stuck in traffic like everyone else.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

As noted by the commentor, all transit options presented in the SPAS Draft EIR alternatives, with the exception of Alternative 4, provide a direct, dedicated right-of-way into the airport via either an elevated busway or an Automated People Mover (APM) system to allow transit customers to avoid surface street congestion when accessing or departing the airport.

SPAS-PH200027 Kanter, Karen None Provided 8/28/2012

SPAS-PH200027-1

Comment:

Good evening. My name is Karen Kanter and I'm a long-time resident of Playa del Rey. I'm imploring LAWA to improve LAX by using Alternative 2.

What I think that we heard here tonight is that there is many, many areas of agreement of what needs to be done at LAX and the surrounding communities completely agree that, as Denny says, it needs to be modernized.

What we are adamantly opposed to, those of us who live in the Westchester/Playa del Rey area, is moving the northern runway closer to our business and our residential community. It has been shown over and over and over and over again that there is no compelling safety issue to demand the movement of the northern runway.

By insisting that it be proven that there is no safety issue, we have been called NIMBYs, those of us who live in the community. Moving the northern runway will disrupt the Westchester business community, threaten six neighboring schools, pose a threat to the health and the mental well-being of the surrounding communities, as well as subject an already beleaguered community with additional congestion and traffic, all of this to accommodate less than two percent of flights envisioned for years from now. For pointing this out, people keep calling us NIMBYs.

If anyone wonders why the middle class is being hollowed out in the City of Los Angeles, this is a prime example. To insist that the northern runway be moved closer to business and residential communities is an attack on a middle class neighborhood by an unholy alliance. We are being told over and over again that our neighborhood interests in our health, our safety, and our quality of life doesn't matter and is a testament to our selfish and unsophisticated interests.

Unlike those who are seeking to move the runway north, none of us who are here to oppose the movement of the north runway have a financial interest in doing so. Are community concerns of less value because we are middle class neighbors instead of hired guns? It has often been said that your rights end at my nose. There is simply no compelling reason to further degrade my community when there are other acceptable alternatives like Alternative 2.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District.

Related to health concerns, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health

hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-PH200028 Hamilton, Jacqueline — Tuskegee Airmen, Inc. — 8/28/2012

SPAS-PH200028-1

Comment:

I'm Jacqueline Hamilton of the Tuskegee Airmen organization and other organizations. I actually moved to the Manchester Square area of LAX during 2001 and lived there until 2006. At that time, I was working for a company called Unicom Systems, Incorporated and moved to the area -- actually, relocated to the area -- because we were also doing a time share with a company called Axiom. And working for Unicom Systems, Incorporated, I worked as a manager, software engineer, and also a consultant working on merger and acquisitions projects.

During this time, there was a mural painted at LAX with each of the Tuskegee Airmen, which included my father and his military group, and this was painted by Stan Stokes, commissioned by the City of Los Angeles Cultural Affairs Department. I state this because I know there were revenues generated in regards to that mural.

The problem was that several of us who lived in the Manchester Square area were severely victimized by crime, which included illegal stalking, harassment, theft, mail fraud, identity theft, criminal identity theft, and other crimes.

During this time, I was in contact with an officer by the name of Thomas Wigs (phonetic). I hear he is retired from LAPD, so I am seeking other officers who handled some of the crimes that we were victimized by in living in the Manchester Square area.

As the other woman spoke, there were people living in cars, trying to reside in empty vacant apartment buildings that are now demolished, and we need to know the status of all of that. I also speak because I was also falsely accused of having a bomb in one of my bags in the downtown area in October of 2007. These are ongoing crimes that a lot of us are being victimized by in living in the Manchester Square area.

I think the airport should be redesigned. We should go ahead with the project, especially in the Manchester Square area, because a lot of us were victimized and we don't know why.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH200029 Ouellet, Jim None Provided 8/28/2012

SPAS-PH200029-1

Comment:

Good evening. My name is Jim Ouellet. I'm a resident of Playa del Rey. I want to encourage L.A. World Airports and the City to pursue Alternative 2, which would leave the northernmost runway in place but improve the exits from the runway.

At an estimated cost of 205 million for airfield improvements, Alternative 2 is the most cost-effective means of improving the efficiency of airfield operations. Pursuing Alternative 2 allows L.A. World Airports to focus money where it will get the most bang for the buck on improving the terminals and moving passengers quickly and comfortably on to their destinations.

I've been trying to do a little math to figure out how many years it will take before improvements and efficiency from the various runway alternatives will pay off the cost of the improvements. However, in the 30 summer days since the proposal was released, I've been unable to find any place in the 6,000-page EIR where L.A. World Airports estimates how much money can be saved each year by improvements in efficiency under the various alternative proposals.

LAWA's rough estimate of the cost of moving the northernmost runway further north runs from 517 million to 717 million. Add in a few hundred million for rerouting and tunneling Lincoln Boulevard and you could be looking at a tab of a billion dollars.

The 2010 North Airfield Safety Study by NASA and a team of university professors estimated that LAX might save 15 million per year in improved operational efficiency by moving the northernmost runway further north. Recouping 700 million to 1 billion at the rate of 15 million per year means that moving the runway could take 50 to 65 years just to break even. Folks, we don't even invest in our children with that kind of time line.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.)

SPAS-PH300001 Stevens, Mike Councilman (Inglewood) 8/29/2012

SPAS-PH300001-1

Comment:

Thank you very much.

Hello, ladies and gentlemen. My name is Mike Stevens. Many of you probably do not remember me, maybe you do, but back about 1993, we fought together when we fought LAX expansion. We were able

to push back, then Mayor, Richard Riordan. People in this room, Westchester residents teamed up with El Segundo and Inglewood. And together, we combined, and we were able to stop that plan.

I'm only here tonight to say that I understand Labor's position, but I also continue to be very sympathetic to the resident's position, which is that even if you are a worker, you have to come home sometime. You have to come home, and you have to have a certain quality of life.

I would suggest, as we learned back in the day, the reason why they measure traffic by mean annual passengers, it all has to do with transportation. If you stop the transportation projects, you stop the project itself, because they must mitigate traffic. They must mitigate traffic.

They measure it not in number of flights, they measure according to passengers. So that gets into vehicle trips. So this is something for you to remember. So when we start talking that, then what are we really talking about? Well, you have a light rail line that's being proposed to come across into the airfield and various alternatives.

And I've only glanced at this. I haven't studied it as I have in the past, but I am going to once again. But what I must tell is this, if you stop -- if you stop the transportation project, you will stop this project. You have the interchange. You have the Sepulveda Boulevard Project. All these projects, but they come through a different entity, MTA, SCAG.

When we stopped Riordan, we had to go to all these different meetings. You have to become more involved.

Now, Alternative 4, of course, is the no alternative. And that's where basically they do slight extension on the runway. It was just pointed to me just a moment ago by one of LAX's staff people.

All I want to say to you is this, in closing, you can -- we together, the people together, if you -- if you approach this from the direct dynamic, you can stop it. And the dynamic is, in fact transportation.

You have Madison Square Garden, they now have a light rail line traveling down Prairie in Inglewood with the Green Line. You stopped that portion of the transportation project.

With that I'm going to conclude, and I like to see friendly faces here. And thank you very much.

Yes, I know, sir. I must say this. The great thing about it is that now I'm an elected official. I used to be just like you. And I sat there, and there would be no one to come forward. And I just want you to know that my office is here to support you in whatever you need.

Thank you very much.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300002 Rothenberg, Alan LA Chamber 8/29/2012

SPAS-PH300002-1

Comment:

I'm Alan Rothenberg, President of the LAWAC from 2005 to 2010, and incoming chair of the LA Chamber.

Modernizing LAX and separating the north airfield runways 350 feet to the north is essential for safety, operational efficiency, and competitive reasons.

You heard much last night about the NASA Ames Study, but what you didn't hear was that that study concluded that safety could be enhanced 40 to 55 percent by separating the runways.

Those academics gratuitously stated that in their opinion since LAX was already safe, based on their statistical probability study, it would not be cost effective to separate the runways.

Today is the 7th anniversary of Katrina.

Today is the 7th anniversary of Katrina. Years before that disaster, the Army Corps or Engineers recommended improving the levees. That recommendation was rejected because it would take a 100-year flood to overrun the levees, and therefore would not be cost effective. We know what happened.

I sure would not want to be a member of the Board of Airport Commissioner or on the City Council rejecting a chance to enhance safety of LAX by 40 to 55 percent, later having blood on the hands when a subsequent crash takes the lives of hundreds, maybe thousands of people.

By the way, upon receiving the NASA Ames Report, the FAA gave a scathing rebuttal of it, and was so incensed they sent a letter to Mayor Villarigosa [sic] admonishing LA -- LAWA to quote, "Reconfigure the north airfield to address safety risks and to improve efficiency."

Response:

The content of this comment is similar to comment SPAS-PC00034-1; please refer to Response to Comment SPAS- PC00034-1.

SPAS-PH300002-2

Comment:

Also, we heard last night that Alternative 5 would not be cost effective. I know you know, but I want to remind you LAX is financially self-sufficient. It doesn't take a penny from the taxpayers. It operates entirely on fees paid by airlines, passengers, concessionaires, and other non-airline revenues.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PH300002-3

Comment:

While the Draft EIR contains many options, there's only one that totally maximizes safety, efficiency, and competitiveness. Alternative 5 separates the runways 350 feet. Doing nothing dooms LAX to be less safe, antiquated, inefficient, and uncompetitive for yet another generation.

And make no mistake, Alternative 2 means, do nothing. In face of the unanimous comments that LAX must be modernized, doing nothing is simply unacceptable.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300002-4

Comment:

One last item to clarify from last night. Alternative 5 does not move the boundaries of LAX an inch. No home or business will be taken. And initial assessments by the FAA indicate that the RPZ will not require taking any homes or businesses with the possible exception an HVAC unit on the top of one office building.

Thank you.

Response:

The content of this comment is essentially the same as comment SPAS-PC00034-4; please refer to Response to Comment SPAS-PC00034-4.

SPAS-PH300003 Herbst, David None Provided 8/29/2012

SPAS-PH300003-1

Comment:

Yes, sir. Good evening. I'm here to read a statement on behalf of Former Mayor, Richard Riordan, who apologizes that he could not be here this evening.

Mayor Riordan writes, "I love LA, and I'm proud what our teamwork accomplished during my two terms in office."

"One item I was not able to complete was the modernization of Los Angeles International Airport. Today, I am pleased to see the positive progress being made on the new Tom Bradley International Terminal, adding new gates for the latest large aircraft as well as other improvements that will enhance the positive experience for visitors to Los Angeles, but this is not enough."

"The Los Angeles City Council approved the LAX Master Plan in 2004. Now, 8 years later, the approval process is just getting under way after a long delay of critically needed additional improvements to LAX."

"During my Administration, I proposed a Master Plan that would take the Airport to 2015, and the clock continues to tick for much needed LAX modernization."

"We still have yet to address moving the north airfield to accommodate today's modern aircraft, properly connecting LAX to our City's mass transit, and further enhancing overall airport safety and security."

"We've planned long enough. The time for action at LAX is now. As the LAX Specific Plan Amendment study process winds its way through public hearings and action by our Airport Commission and City Council, I call on our leaders to make the tough decisions necessary to ensure that LAX becomes a world class airport through the 21st Century."

"Thank you, Mayor Richard Riordan."

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300004 Stacey, Pam None Provided 8/29/2012

SPAS-PH300004-1

Comment:

Thank you. Good evening. My name is Pam Stacey, and I've lived in the Blind Hill area for the past 27 years. I'm here tonight to advocate for the adoption of Alternative 2 combined with the transportation features of Alternative 9.

I oppose and will move to obstruct adoption of any other plans, most especially any plan to move the north runways. Concerning the expansion, people often ask us, "What did you expect when you moved near the airport?" We all did our homework. We expected an improvement in technology and proper management and governance.

For the most part, as evidenced by how many of us have been here for so long, the Airport has been a decent neighbor. Only Alternative 2 allows that to continue.

Everybody in our neighborhood wants to see LAX revitalized and improved. We, too, use the Airport and know its ranking, but want it to be 21st century standards, which include green technology, the promotion of clean air, and minimal vehicle traffic.

Other plans are turning LA into a lumbering, oversized dinosaur. The people of Southern California and travelers to LAX deserve better. Most important to me, only Alternative 2 states that there will be minimal or no increase in pollution.

Making the -- moving the runway north will spew more toxins over more homes, that are even now compromised. It doesn't improve safety or air traffic to move the runway north. It does harm people. In only 2 blocks where I live, there are six cases of cancer, in only 2 blocks.

I know the complications, legitimate ones, to proving cause and effect of cancer clusters, but you all know, including our elected officials, Council Members and LAWA power brokers, that increased noise and pollution put people at greater harm and risk of cancerous toxins.

There comes a time when common sense has to rule while the science weighs in. That time is now, and that decision has to be Alternative 2.

Thank you.

Response:

The content of this comment is similar to comment SPAS-PC00172-1; please refer to Response to Comment SPAS-PC00172-1.

SPAS-PH300005 Andrade, Ricardo Laborers Local 300 8/29/2012

SPAS-PH300005-1

Comment:

Good evening. My name is Ricardo Andrade. I'm a Field Representative for Labor's Local 300. And I'm here on behalf of our Business Manager, Cesar Pascal. Our 450 members live in the immediate area of the Airport. And our 9,000 member utilize this airport or work at the Airport.

We stand firm on modernization of this airport. It's not expansion, it's modernization, and we support it.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300006 Billy, Dan IUOE Local #12 8/29/2012

SPAS-PH300006-1

Comment:

Good evening, ladies and gentlemen. My name is Dan Billy. I'm with the Operating Engineer Local 12, but I'm here on behalf of our Business Manager, William C. Wagner.

We represent 20,000 members of men and women, and operate heavy equipment. We're inspectors and also surveyors. And I'm here -- we've been in support of the LAX expansion from the beginning. And we're going to continue to support the modernization of this airport.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300007 Miller, Ron LA/OC Building Trades Council 8/29/2012

SPAS-PH300007-1

Comment:

Good evening. I'm Ron Miller, Representative of Los Angeles/Orange County Building Construction Trades Council. We represent 140,000 crafts men and women, many thousands that live around the Airport in the surrounding area.

We are here today so support the specific plan. LAX as it exists today is dysfunctional, antiquated, and unfriendly to the neighbors who surround it.

Our goal is to make the neighborhoods around LAX more livable, not less, and to give Los Angeles a truly world class airport that serves local, national and international passengers.

This specific plan gives us the ability to do both. LAX modernization is an efficiency program that will cut congestion and pollution, and will make the Airport safer. The central location for all car rentals will relieve traffic and is a long overdue improvement.

Eventually many passengers will arrive at LAX by mass transit instead of the automobile. And we'd like to see light rail go into LAX. These are improvements that will help the neighbors of LAX while serving passengers.

We all have a stake in reducing environmental impact of LAX. Our members are currently on the job at the Airport doing work that greatly reduces pollution. We are installing new systems for electricity, for heating and cooling.

We'd like to continue our work in making LAX more efficient and a good neighbor. We support the specific plan and urge you to move ahead.

Thank you.

Response:

The commentor's support for a CONRAC (i.e., Alternatives 3, 4, 8, and 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

As indicated in Section 4.12.1 of the Draft EIR, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Alternatives 1, 2, 8, and 9 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect on-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

As indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-PH300008 Rothenberg, Alan Contrarian Group, Inc. 8/29/2012

SPAS-PH300008-1

Comment:

Obviously, I'm not Peter Ueberroth. But Peter asked me to read the following.

I enthusiastically support the effort to continue the overall modernization of LAX. For the millions of visitors who come to Los Angeles each year, our airport offers the first, and often lasting, impression of our City now.

As a world class City, we should offer our visitors a world class, unforgettable experience. This was our goal in 1984 when Mayor Tom Bradley with the successful modernization effort at LAX. The Olympic Games in 1984 showcased Los Angeles to the rest of the world.

At LAX that meant the construction of a new, state-of-the-art international terminal, renovation of existing terminals, and construction of a roadway.

Simply put, the Olympic Games provided us a tremendous and rare opportunity to restore LAX as a show piece.

Nearly 30 years later, Los Angeles has once again embarked on a massive renovation of our landmark airport. And I solute Mayor Villarigosa [sic], and the Airport Commission, and the staff for embarking on a multi-billion dollar program.

While the projects are underway, especially the rebuilding of the Tom Bradley International Terminal, are greatly important to restoring the passenger experience, I know it is only the beginning in your efforts to fully modernize LAX.

It is our sincere hope to return the Olympic Games to Los Angeles for a third time. Preliminary plans are already underway for such an endeavor.

In the consideration most city's bid, decision makers will look at a city's airport and other infrastructure as one of the determining factors for consideration.

I encourage and urge you to continue your efforts to fully modernize LAX now, keeping the Olympic hopes alive. Once again, we're provided with a tremendous opportunity as what happened a generation ago when LAX accommodated those who came to experience the 1984 Olympics.

Like then, it will take the courage and perseverance of our elected officials and the Airport Commission to make this dream a reality. Now is that time again.

Best regards, Peter Ueberroth.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300009	**Morrison, Nancy-Gene W**	**None Provided**	**8/29/2012**

SPAS-PH300009-1

Comment:

I was here Saturday. And this past Monday, something occurred that has great concern to me. That's just 2 days ago. Monday afternoon, at approximately 1:35 p.m., I was driving south on Sepulveda Boulevard through the tunnel. And as I approached it, the sign said, "Danger. Fire in tunnel. Do not enter."

There was no warning that it was safe to enter. I called 911 on my cell phone using speaker. And after talking to 911, going to LAPD, LA Fire, LAX Fire, who had no idea that there was any sign saying, "Do not enter the tunnel," I got to LAX PD, who knew there was a malfunction with the sign, did not have anybody out there, any sign put up, any change. There is no place after Century Boulevard to turn to stop to do anything.

I am very concerned that you cannot communicate within the Airport at this point and are doing more. And if there were a fire in the tunnel, we need to have another way of doing things, which leads to needing more regionalization, and using Ontario and Palmdale, and having more of a regional system going on here.

Thank you.

Response:

The comment regarding a specific sign malfunction is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. This comment does not relate to the SPAS project and is beyond the scope of the SPAS EIR. No further response is required because that comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300010-2

Comment:

I do agree on Alternate 2 and 9, but not the moving of the runway.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PH300010-3

Comment:

I live in Playa del Rey, and we have to have our house power washed. We have to wash off all the soot that is everywhere. And it's just not healthful in this area.

Response:

The content of this comment is similar to comment SPAS-PC00043-2; please refer to Response to Comment SPAS-PC00043-2.

SPAS-PH300010-4

Comment:

We will never have the marvelous airport that the Mayor, the Chamber of Commerce, and everyone here wants us to have unless we start devoting our resources to putting an airport where there is space for it.

The City should follow the lead of Denver and Dallas and also Sacramento, which put their airports way out in the country, but now have popular, efficient, and thriving airports that are well-used. We should do the same here.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Relocation of LAX is not a feasible alternative because it fails to meet the fundamental SPAS project objectives as described in Section 2.2 of the SPAS Draft EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300011 Cope, Danna None Provided 8/29/2012

SPAS-PH300011-1

Comment:

I'm Danna Cope. I've lived in Westchester for many, many years. I'd like to speak, first, following up on what Ms. Morrison said, because it goes to the safety of the of north airfield. And this incident of having a warning sign -- warning sign malfunction is just one of the dangers of having the main LA basin airport in such a congested area.

Why wasn't someone, either Caltrans or LAWA, at the site with signs saying that the tunnel actually was safe. Why wasn't somebody covering the sign up, so that more people didn't get confused. Why wasn't the warning sign connection into the LAWA Fire Department? They would be the first responders if there's a fire. This is ridiculous.

Response:

The comment regarding a specific sign malfunction is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. This comment does not relate to the SPAS project and is beyond the scope of the SPAS EIR. No further response is required because that comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300011-2

Comment:

They need to develop other airports. And actually, it's one of the goals as listed in the Draft EIR. So where is the discussion and outline of plans for Ontario included in the Draft EIR. And where is the listing of the many, many jobs in the multitude of trades that would be created to benefit all of Southern California.

The time to develop an alternative airport is now. Why does LAWA want to wait many years from now when LAX reaches 75.

Response:

Please see Topical Response TR-SPAS-REG-1 regarding the role of LA/Ontario International Airport, Palmdale Regional Airport, and other airports in the region for meeting future air travel demands in Southern California.

The comment also raises employment issues. Employment is a purely economic impact not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PH300011-3

Comment:

LAWA needs to develop better, clearer communication with other agencies over a jurisdiction and corrective action that needs to be taken when a structure or roadway near or adjacent to LAX is malfunctioning.

Where are these safety plans in the Draft EIR? If LAWA does not receive an immediate response from another agency during an emergency, then LAWA should have an action plan that is launched. Where is this plan in the Draft EIR?

Response:

The SPAS Draft EIR addresses safety impacts of the SPAS project in Section 4.7.2 and addresses impacts to fire protection and law enforcement in Sections 4.11.1 and 4.11.2, respectively. The questions in the comment regarding the potential for malfunctions in the signage for the Sepulveda tunnel do not relate to the SPAS project and are beyond the scope of the SPAS EIR. Please see Response to Comment SPAS-PC00148-2 regarding emergency preparedness/response planning at LAX. No further response is required because that comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300011-4

Comment:

As to the alternatives, Alternative 2, plus the CONRAC and real train service to the whole central terminal area is the most economic, environmentally safe, and it is the most efficient.

Thank you.

Response:

The content of this comment is similar to comment SPAS-PC00128-5; please refer to Response to Comment SPAS-PC00128-5.

SPAS-PH300012 Schneider, Denny ARSAC 8/29/2012

SPAS-PH300012-1

Comment:

I'm Denny Schneider, President of ARSAC. I have spoken before, and I've continued to say, there are only four things that need to be fixed at LAX; getting to it, getting around it, getting between the terminals, and getting out of it.

Now, with that said, Alternative 2 is our preferred, because it's the least costly. It is the superior environmental, and it also the most efficient on the airfield.

Now, some of my friends would like to see the airfield changed, and I would question whether it's a safety issue at this time. They can handle those planes adequately now. The safety study from NASA was from the top academic experts in the country, handpicked by LAWA. And that is not the issue that we are faced with right now.

The issue that we're faced with is we have an airport that's falling apart. And it needs to be fixed. Everybody agrees to that, that it needs to be done now, not yesterday.

So in order to get that done, we don't have an unlimited supply of money. Regardless of whether most of it comes from the Airport itself, through various sources of income, or whether it comes from the community, which it is impacting as a general rule, the fact is that we have to set our priorities.

And if you don't fix the Airport land side first, you're not going to have any money left to do that. And you're going to lose out on all the jobs. And you're going to be telling the people who come here that they don't matter. So you need to fix that first.

Thank you.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00130-68 regarding conclusions of the NASS relative to north airfield safety. Please see Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements.

SPAS-PH300013 Ivy, George None Provided 8/29/2012

SPAS-PH300013-1

Comment:

My name is George Ivy, and looking around the room, I realize that I may be speaking as a relative new-comer to the LAX area. I've lived in Westchester for over 30 years. I've owned a home here for 30 years. I've raised two boys here, who are in their 20s now.

I've worked within 2 miles of my home here for the last 30 years. And I travel to and from LAX at least once a month, and have for the last 30 years, traveling about 2,000,000 miles. So I spend a lot of time in airports.

So given that, I understand the traffic and noise as a busy local resident, who spends a lot of time outdoors. I understand LAX access and facility improvements are necessary because I'm a very frequent user of those facilities.

And given that, and the various alternatives that have been proposed, I -- I want to support Alternative Number 2, with some additions from Alternative 9.

And I believe that combined they fulfill the SPAS goal of airfield, terminal, and transportation improvements for the benefits of the travelers and the residents.

Obviously, these alternatives will bring lots of investment, billions probably, to the LAX area and the City of Los Angeles. I think they are affordable and cost effective. I'm sure that they'll provide permanent, substantial, long-term jobs. And I think that's true of any of the alternatives.

They do -- I believe they do allow for safe airfield operations, in spite of some of the things I've heard. They certainly will help the Airport efficiency. I think they're environmentally the best.

And finally, I think the combined -- centralizing the rental car facilities will certainly help our traffic problems here.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to

which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

SPAS-PH300014 Papana, Titus Aviation Safeguards Org. 8/29/2012

SPAS-PH300014-1

Comment:

Good evening. My name is Titus Papana, and I work for Aviation Safeguards for 19 years now. I personally, and my employer does as well, support the modernization efforts at LAX, and the projects presented tonight.

Without the Airport, my quality of life would not be what it is today. Reinvesting in LAX is the best thing we could do for working families in the region.

I'm also here tonight because of the many false statements regarding Aviation Safeguards made by the SEIU at the public hearings. For the record, Aviation Safeguard is one of the best and safest employers at LAX, otherwise they would not have one of the lowest employee turnover, rates as 12 percent in the industry.

They also have 30 percent of employees that have been with them in excess of 10 years. SEIU makes false statements at your hearings and at LA City Council, and Airport Commission meetings because they can't get anyone to listen to them. Why? Also, because the SEIU is not a certified union at LAX or any airport in California.

They have no legal or labor law standing at LAX. So SEIU uses their extensive political influence to pressure companies at LAX to sign collective bargaining agreements instead of getting the vote of the workers to authorize this union -- this union.

Since the workers at Aviation Safeguard threw out SEIU, 93 percent of us have since received a pay increase, and health care of our choosing. Aviation Safeguard has spent 2 million more in wages each year for the employees, instead of forced to give that to the union.

All full-time employees level at LAX and Aviation Safeguards and other companies not represented by SEIU make a guaranteed living wage of $32,000 per year, otherwise only $18,000. Clearly, we have too much union at LAX.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300015 Fleming, Matthew None Provided 8/29/2012

SPAS-PH300015-1

Comment:

Hi. Good evening. My name is Matt Fleming. I'm a 22-year resident of Westchester and Playa del Rey. I actually graduated at Loyola Marymount, which brought me to the area originally.

I come at this meeting from a unique perspective. I'm a resident of 91st Street, which is the first street north of the Airport. I actually overlook the runways.

I have a view out of my kitchen of abandoned streets and light posts from the most recent expansion, where the promises at that time were, there's going to be green belts, it will be beautiful and all will be well.

Well, I don't have that. I have a view of concrete and abandoned streets, and now, being told a big commercial building behind my house. So I'm -- I'm a little dubious about hearing about promises with expansion.

Response:

Under the previously approved LAX Northside Plan, a 50-foot setback is required along 91st Street. The existing setback does not allow buildings, but will allow parking up to the property line. As part of the LAX Northside Plan Update currently underway, a number of community outreach meetings have been held with residents who live along West 91st Street and with the Westchester community at large. To respond to community concerns, LAWA is proposing, as part of the LAX Northside Plan Update, to increase the existing setback along West 91st Street from 50 feet to 100 feet and prohibit activity within the 100 foot area. Buildings and parking would not be allowed within the setback, creating an increased buffer zone between residences and future commercial development. The buffer zone would be landscaped with native plantings and would be secured with a fence to prevent access by the public. As part of the LAX Northside Plan Update, LAWA is also proposing to reduce building height limits to 45 feet, orient buildings along Westchester Parkway, and require surface parking lots to include robust landscaping plans and many shaded trees. Please also see Response to Comment SPAS-PC00108-2 regarding the LAX Northside Plan Update. Additional information regarding the LAX Northside Update, including a copy of the Notice of Preparation and Initial Study as well as a link to stay informed about the project, can be found at the following location: http://www.lawa.org/GDZ/projectDocuments.aspx.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300015-2

Comment:

Now, that being said, I also, for a living, I fly 800,000 miles a year. So I do understand the problems at LAX and what needs to be done. We need to have a consolidated rental car center. It's an embarrassment that when people come to this city, they have to be on shuttles, and go to Airport Boulevard to these awful rental car sites. We need that.

We need a rail into the Airport. We need to connect the terminals. It's embarrassing to be on a flight at LAX, and someone asks me for help when we land. And say, "Well, you dash and get your bags, and then walk three terminals around the horseshoe to go to your international flight." That's antiquated. That needs to be fixed.

Response:

The commentor's support for a CONRAC is noted, as is the commentor's support for rail into the terminals, and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, which includes a CONRAC. Please see Topical Response TR-SPAS-T-1 regarding transit, including the Airport Metro Connector Project, which is evaluating options for extending transit to the airport. LAX currently has a circulator system in the CTA. The system provides frequent, free shuttle service between terminals (approximately every 12 to 15 minutes, 24 hours a day), to assist passengers in getting from one terminal to another for airline connections.

SPAS-PH300015-3

Comment:

But anyone that says that moving the runways north is not expanding the blueprint of the Airport is a lie. You can't tell me that moving the runway that much closer to my kitchen is not going to be louder or more of an eyesore. It's just not a possibility.

So I ask for this. We need to have these jobs. We need to modernize the Airport. We need to do the projects that make sense, but don't move the runways north into Westchester and Playa del Rey, because that is -- that really is -- that's expansion of the Airport outside of its current boundaries. It is.

It will never ever withstand a court challenge. Let's do the projects we can do. Let's make everyone happy and get the thing done.

Thank you.

Response:

This comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise in Section 4.10.1. As indicated in that section, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Aesthetic impacts associated with the SPAS alternatives are addressed in Section 4.1 of the SPAS Draft EIR. As indicated in that section, LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas, and LAX Master Plan Commitment LU-4, Neighborhood Compatibility Program, would reduce impacts to aesthetic and visual resources along the northern boundary of the airport. In particular, LAX Master Plan Commitment DA-1 requires the provision and maintenance of landscaped buffer areas that will include setbacks, landscaping, screening, or other appropriate view-sensitive improvements with the goals of avoiding land use conflicts, shielding lighting, enhancing privacy, and screening views of airport facilities from adjacent residential areas. LAX Master Plan Commitment LU-4 addresses all issues relating to compatible land use, including landscape buffer issues as well as noise, light spill-over, odor, and vibration. In light of these applicable LAX Master Plan commitments, impacts on aesthetic and visual resources associated with the SPAS alternatives would be less than significant.

SPAS-PH300016 Carpio, Cecil None Provided 8/29/2012

SPAS-PH300016-1

Comment:

My name is Cecil Carpio, C-e-c-i-l, C-a-r-p-i-o. I'm from Inglewood, 90302. I've lived in the same location in my sacred home since 1973. We've talked about 1984 and the improvements that came to the Airport. Well, I've been around since '73, so I saw the improvements. And I also saw that nearly 30 years later, all of Inglewood is now impacted by LAX operations.

Once upon a time there was an Airport noise mitigation plan of the 1990s. And it was written in the program to protect the community surrounding LAX, especially Inglewood. Well, now that is a farcical and impotent document that does nothing to constrain the effects of LAX operations.

Response:

The commentor states that "all of Inglewood is now impacted by LAX operations." Existing conditions, while important to LAWA, are not impacts of the proposed SPAS project (see CEQA Guidelines Section 15125(a) and 15126.2(a)), and the comment does not address the SPAS Draft EIR or the SPAS project.

The commentor also suggests that impacts have accrued over the last 30 years. As discussed on page 4-796, footnote 570, of the SPAS Draft EIR, "the commercial aircraft fleet now operating in the United States is generally much quieter than the earlier aircraft fleets…the 65 CNEL contours for LAX under current and future conditions are generally smaller than the 65 CNEL [contours] for LAX from two decades ago."

The commentor also suggests that the airport noise mitigation measures are "farcical and impotent." Existing aircraft noise mitigation measures are discussed in Sections 4.9.3.3 and 4.9.5 of the SPAS Draft EIR, such as the Aircraft Noise Mitigation Program and the Voluntary Residential Acquisition/Relocation Program. As discussed in greater detail in Response to Comment SPAS-PC00034-18, LAWA has spent in excess of $1 billion for soundproofing or acquiring homes. To ensure that interior noise levels have been reduced to 45 CNEL or less after soundproofing (in conformance with Title 21), post-construction noise tests are conducted on a random sampling of homes to verify the efficacy of sound insulation. To date, all post-testing has confirmed that interior noise levels meet this requirement.

LAWA also implements a number of operational measures to reduce noise which are described starting on page 1-86 of the SPAS Draft EIR. As discussed therein, LAWA implements policies to (1) use preferred inboard runways for departures, (2) use Over-Ocean procedures, (3) conduct westward departures, (4) ban the use of SuperSonic Transport (SST), (5) restrict run-up activities, (6) reduce departure thrust on west flow operations, (7) discourage the use of reduced thrust departures during east flow operations, (8) use departure cutback procedures, and (9) use tug and tow procedures.

Please see Response to Comment SPAS-PH100025-1 regarding Inglewood's residential soundproofing program.

SPAS-PH300016-2

Comment:

Once upon a time there was big talk about having a regional solution to airport congestion. I'm still waiting for that thing to happen. I wonder how long that's going to take.

Considering all of the scare talk that we've had over the decades, ever since September 9th -- excuse me, September 11, it really seems that nothing has changed.

Let's talk about earthquakes. Let's talk about putting all of our eggs in one basket. There's a lot to be said about going regional. I'm still waiting. I'm hoping it happens.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. As also noted therein, there are six major airports, not just LAX, serving the region.

SPAS-PH300016-3

Comment:

I have 30 seconds left, a lot more to say. But at this point, I'm disgusted with the process. I continue to be part of the process. And hallelujah, here we are. Let's keep on coming until we die.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300017 Mitchell, Michael Mickey's Space Ship Shuttle 8/29/2012

SPAS-PH300017-1

Comment:

Hi. I'm Michael Mitchell. I own a bus company here. And we go 35 miles out on our first stop down in -- and 75 miles down to the Marine Base. And I represent 8 other companies, smaller companies. And we schedule services and we go on the loop and pick up people and go long distances.

Now the 98th Street Intermodal Transportation Facility, we're completely against that, because if you have a Christmas weekend with a million-and-a-half people leaving, to take them to another place outside the Airport on a bus for them to load the transportation companies is completely ridiculous. It will not work. It's completely ridiculous.

Clifton Moore designed the Airport to be able to get in there in 45 seconds at a curb, goes to 8 terminals. If you have car bomb, and blow up at one terminal, it's not as bad as having this place you take everybody. It will blow up everybody in one spot, just on the sense of security.

But now, we'd like to see the contracts being given to local people for all these different things that the Airport does. But, you know, just -- to if you do have big money making you somehow put this in to pick up people, please let us stay in the central area and go around and pick up, because we're going 75 miles out, you know.

If you want to super shuttle and them back there, go ahead and do that. But, you know, it's ridiculous to spend all that money for the buses to load your bags on one bus and go out there and unload and get on another vehicle versus right now, people can hardly find where to go when it's outside the baggage area, right now, you know. You have to get on the phone and tell them, "It's right in front of you."

To force them to do that is like Texas, where you get on and you spend like an hour going around trying to find out where you're at, you know. So please leave it like Clifton did it. He did -- he was a genius.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Notwithstanding the above, it is unclear whether the commentor understands that for those SPAS alternatives that propose the Intermodal Transportation Facility near 98th Street, specifically, Alternatives 1, 2, 8, and 9, the vehicles and passengers would still have direct access to and within the CTA and could also access the CTA from Manchester Square via the elevated busway proposed under Alternatives 1, 2, and 8, or via the APM under Alternative 9. Only under Alternative 3 would the CTA be closed to private vehicles; however, even under that alternative, passengers would have multiple facilities providing access to the CTA, including the Ground Transportation Center, the Intermodal Transportation Center, and the consolidated rental car facility. In short, none of the SPAS alternatives proposed a ground transportation system with "this place you take everybody" as suggested by the commentor.

SPAS-PH300018 Solorzano, Isidro Unite Here Local 11 8/29/2012

SPAS-PH300018-1

Comment:

Okay. My name is Isidro Solorzano. I live in the City of Paramount. I have worked for a year at the Airport at an in-flight catering company called Sky Chef. My coworkers and I make sure the flights leave on time with all the foods and liquor.

It's very important for me to have more good union jobs at the Airport. We need a modern airport that will provide jobs with a living wage. This will help the community and the many people I know that are out of work.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300019 Reeg, Kristin Unite Here Local 11 8/29/2012

SPAS-PH300019-1

Comment:

Hi. My name is Kristin Reeg, and I'm the Director for Airports and Food Service for Unite Here Local 11. And we have 20,000 members that all work in the tourism industry in different capacities, either in hotels or in the Airport, or at stadiums.

And so tourism in general is very, very important to our members. And we've, over -- over the years have really developed a good relationship with a number of businesses, concessionaires inside the Airport to really make sure that our members have a great standard of living.

And a lot of our members live right in Lennox, right in Hawthorne, right extremely close to the Airport. Some of them, I'll be talking to them in their house, and we stop for a minute and wait for the airplane to go over before we continue our conversations. It's just a part of everyone's lives.

And people really stay in these jobs for a long time, because they do provide a very good standard of living. There are often times the very first person that people see when get off their plane. They go straight to that favorite bartender of theirs. Or they go to the duty-free shop, you know, for a lot of foreign visitors.

We're working on a training program now, that, you know, now that the new west field, that the terminal has opened up -- that's going to be opening up in Tom Bradley. A training program so that our members have the new skills that they're going to need to succeed at the Airport, like, specialized kinds of cooking. We're not going to just have grill cooks anymore. We're going to have fine dining cooks inside the Airport, and a lot of fancy restaurants.

And we want to make sure that our members have those skills, have the language skills that they need, Japanese, whatever that is.

So, you know, we really do support having a modern airport that is going to provide many more good, quality jobs. We think just for our industry alone, including beverage and retail there will be at least 1,000 new jobs created. And so it's very important to us, and we support that.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300020 Saifi, Sean Central Coast Shuttle Services 8/29/2012

SPAS-PH300020-1

Comment:

Good evening, ladies and gentlemen. My name is Sean. I'm a representative of Central Coast Shuttle. We're a long distance transportation company that picks up underneath the green sign at LAX. It says buses and long distance trans.

We leave 6 times a day, 7 days a week. And first of all, we're here to commend the Committee for organizing such an event like this. You know, there's an old saying called NIMBY, not in my backyard.

So obviously, for everyone here, these new rules affect everyone in a different way. For us, I believe -- I think that modernization is definitely a correct way to go. I personally love LAX. I want to leave it the way it is.

I mean, I go to Dallas. I go to -- and a lot of other airports. JFK, I hate that train system, where you have to go to other terminals. I love how it's just a simple circle that connects the way it is.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300020-2

Comment:

If there was anything I would like to propose is maybe -- the car rental agency, I understand that. They do have the larger buses. They do cause a little bit more emission. I'm not too sure about that. I'm not a scientist or anything.

They do take up a lot of room. They can go to a parking lot. That could save up a lot of room. But as for long distance transportation companies, for them it's just, you know, travelers are coming from foreign places. For them it's really hard to communicate to them, where to stand. So another improvement could be better signage. That could also help improve -- address the message -- or addressing the modernization of LAX.

And I just want to thank you for your time.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300021 Marmol, Douglas Unite Here Local 11 8/29/2012

SPAS-PH300021-1

Comment:

Good evening. My name is Douglas Marmol. I work as cook at the Airport. I live in Hawthorne. I have worked at the Airport for 20 years.

Many of my coworkers have 30, 40 years working at the Airport as a bartender, server, cashier. We live in the neighborhoods near the Airport. Our good union jobs are very important to us. We support the modernization at LAX.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300022 Hanscom, Marcia Wetlands Defense Fund and Ballona Institute 8/29/2012

SPAS-PH300022-1

Comment:

Good evening. I'm Marcia Hanscom. I'm representing the Ballona Institute and Wetlands Defense Fund. And I guess this is really appropriate here at the Proud Bird, how wonderful that humans have learned to fly like the birds.

We all know, though, that there are public safety issues related to birds. And LAWA has spent a lot of money and effort to prevent bird strikes. And so I just want to point out that a short distance to the north is the Ballona Wetlands Ecological Preserve. Tens of thousands of birds winter there at Ballona each year.

So it makes no sense to me to move the runway north toward more birds. It seems to me that that needs to be studied. I didn't see anything in the Draft EIR about that. And we all know that that would have some devastating tragic consequences. So that seems to be important.

Response:

The potential for birdstrikes associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which proposed a northward shift of Runway 6L/24R 260, 350, and 100 feet, respectively, is addressed in Section 4.7.2 of the SPAS Draft EIR. As indicated on page 4-484 of the SPAS Draft EIR, LAX uses anti-perching devices on structures such as signs, lights, fences, and building edges. In accordance with FAA Advisory Circular 150/5200-33B, Hazardous Wildlife Attractants on or Near Airports, the airfield is maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. As indicated on page 4-569 of the SPAS Draft EIR, under all of the alternatives, no new facilities would be constructed or operational conditions implemented that would serve as attractants to birds. In accordance with FAA requirements, the airfield would continue to be maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. Therefore, impacts under all of the alternatives with respect to birdstrikes would be less than significant.

It is acknowledged that the separation distance would be approximately one to two miles between Runway 6L/24R under Alternative 5 and the Ballona Wetlands Ecological Preserve, as measured from the southern and northern edges of the wetlands, respectively. In light of LAWA's ongoing measures to deter nuisance wildlife, including birds, in accordance with FAA requirements, the decrease of 350 feet between the Ballona Wetlands Ecological Preserve and the northernmost runway at LAX (Runway 6L/24R) would not result in an increase in the risk of birdstrikes and, therefore, impacts under all of the alternatives, including Alternatives 1, 5, and 6, with respect to birdstrikes would be less than significant.

SPAS-PH300022-2

Comment:

I also, you know, want to just point out that when LAX was built, there really were few homes around, not that much traffic. And I know when I lived in Huntington Beach, I would -- I never would come to LAX. I would go all the way to Ontario, which was much further from my home, but I just didn't want to get in the middle of all this congestion.

So it seems to me that now that we have so much more density here, that we really do need to start thinking about moving a larger -- if we're talking about expanding anything, it should be in another area, like Palmdale.

I mean, we have land there, and I just don't understand why the airlines and LAWA doesn't embrace that idea. It would mean way more jobs, just add them all up. And we still would have something livable here.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. The topical response also discusses efforts to develop air service at Palmdale Regional Airport. Please also see Response to Comment SPAS-PC00096-24 regarding the suggestion to develop a major airport at an alternative location without the geographic constraints (i.e., surrounding densities) of those at LAX.

SPAS-PH300022-3

Comment:

So finally, I'd just like to say that in -- in conjunction with my comments, I would support Number 2.

Thank you.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PH300023 Peterson, Linda None Provided 8/29/2012

SPAS-PH300023-1

Comment:

My name is Linda Peterson, and I've been a resident of Playa del Rey for more than 15 years. First, let me say that I was dismayed by the fact that you're enumerated project objectives did not include the goal of regionalization of Southern California air traffic, which was at least a one time a goal of our current mayor of Los Angeles.

Only an aggressive regional approach to air transportation will mitigate the safety concerns, noise, congestion, and air pollution currently impacting all of us who live and are neighbors of LAX.

Only if the air traffic burden can be spread throughout the Southern California Region will we continue to see the jobs and economic benefits of a vibrant transportation system without unduly impacting any one portion of the Southern California community.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization.

SPAS-PH300023-2

Comment:

I really haven't had enough time to study all of the objectives, but at this -- all of the proposals, but at this time I -- I favor Alternative 2, combined with some aspects of either 8 or 9.

Certainly, the consolidated car rental facility makes sense, because it would remove traffic from the central terminal area.

Alternative 2 appears to be the best for modernization of LAX. I favor Alternative 2 because I'm convinced, not by Alan Rothenberg's scare tactics, but instead by the knowledgeable NASA experts, who studied the issue and determined that the disruption to local communities that would be caused by moving the runway north is completely unnecessary for either safety or operational efficiency.

The cost is also more reasonable in terms of the cost demolishing terminals or moving runways or putting Lincoln Boulevard below ground.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. As noted in Responses to Comments SPAS-PC00130-931 and SPAS-PC00173-3, no residential acquisition is proposed under any of the SPAS alternatives, and no acquisition is proposed within the Westchester Business District. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report).

SPAS-PH300023-3

Comment:

I want to tell the Chamber of Commerce and LAWA that all of us want a first class airport, but you're never going to have that in the current LAX location, given its geographic constraints. You're just going to keep applying band-aid solutions.

So bite the bullet and start building somewhere where there is room for a world class airport.

Thank you.

Response:

The content of this comment is similar to that of comment SPAS-PC00096-24; please refer to Response to Comment SPAS-PC00096-24.

SPAS-PH300024 Topal, Jack Westchester/Playa del Rey Neighborhood Council 8/29/2012

SPAS-PH300024-1

Comment:

Hi. I'm Jack Topal. I'm a member and director of the Westchester Playa del Rey Neighborhood Council. When I moved into our house 29 years ago, I knew I was near the Airport. We're half a block from Manchester and Foreman. And that was fine with me. Being near the Airport didn't bother me.

Now, it seems like the Airport is getting closer to me. In the middle of the night, I'll get up, and I'll turn off my cell phone, because I hear the stewardess say, "Turn off your cell phone." That's how close we're getting.

But seriously, I -- I really believe -- I don't want a north boundary expansion. And I move for Alternative 2 and 9. I don't want to have to get up one night and say, "Okay. I'll have a vegetarian meal when the stewardess announces that."

So let's have the Airport stay south, not north of the runway.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PH300025 Klein, Ellen None Provided 8/29/2012

SPAS-PH300025-1

Comment:

Hi. I'm Ellen Klein. I live two -- I live two short blocks -- I live two short blocks north of LAX. I heard somebody say NIMBY. I don't look at it that way at all. I -- I run up and down Westchester Parkway. I look at the Airport. I watch the planes land. I use the Airport. I sometimes work at the Airport. I'm glad it's nearby when I have to fly.

And I want to be a good neighbor. And I want the Airport to be a good neighbor to me. I don't see -- I do believe in modernization. Modernization will give us jobs. Everybody is talking about jobs. There are plenty of jobs in modernization, but it doesn't need to be expanded. What's there needs to be fixed.

If we're going to expand, we need to expand regionally. That's -- they want -- they want -- the neighbors there want us there. They want airports, not like here. There is a geographical boundary here. And it just won't work to go north or in any other direction.

Response:

The commentor's support of airport modernization but opposition to airport expansion is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization.

SPAS-PH300025-2

Comment:

I support Alternative 2. I would like to see less traffic in the central terminal. It's efficient. It's environmentally sound. It's cost effective. It has low impact on the neighborhood. And it will modernize the Airport, and make it the kind of airport it should be for tourists coming to LA, and not just a horrible experience for them.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PH300026 Ouellet, Jim None Provided 8/29/2012

SPAS-PH300026-1

Comment:

Good evening. My name is Jim Ouellet. I'm a resident of Playa del Rey. I want to encourage LAWA to pursue Alternative 2 and Alternative 9.

There's four reasons for that. The first is that Alternative 2 has the lowest runway north airfield construction cost.

Secondly, it results in the most airfield efficiency for LAX.

Third, it will result in the fewest delays in getting that work done.

And fourth, it will allow more money to be devoted to improving the experience and moving passengers through the terminals and onto their destinations.

The main reason for moving the runways north is to accommodate the L3080 made by Airbus. That plane is failing. It's falling far behind its sales targets. Airbus set a target for 2012 sales of 30. They only have 26 more to go.

Now, the main reasons that I can tell that LA Airports gives for expanding the runways north is safety and efficiency. The north airfield safety study said that the airfield is extremely safe at -- in its current configuration, if we do nothing to it.

They estimated the risk of a crash. They did everything they could to pump up the numbers, estimated the risk of a crash at once every 200 years. Now, 50 percent improvement that Mr. Rothenberg referred to means we might have a crash -- I don't know, it's either once every 300 years or once every 400 years, really.

The other reason is efficiency. The north airfield safety study estimated that -- that moving the runway north by 340 feet might result in cost efficiency savings of 15 million a year. That's not much.

The FAA sent an angry letter refuting the north airfield safety study. And the academic panel that prepared it, simply said, "This is bologna," my words.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Although Alternative 2 has the lowest north airfield construction cost of all of the alternatives except for Alternative 4, as identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) The comment that Alternative 2 "would result in the fewest delays in getting that work done" is noted. It would be speculative to estimate the number and length of delays associated with construction of each alternative. Because of the programmatic nature of the SPAS Draft EIR, the relative construction time for each alternative is not currently known. As indicated on page 2-57 of the

SPAS Draft EIR, the nine SPAS alternatives were formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for any of the alternatives. In conjunction with the preparation of more detailed design and engineering plans for airfield improvements, it is anticipated that several potential options for construction approaches and phasing will be explored.

Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. FAA's response to NASS's report is discussed on pages 4-505 and 4-506 in Section 4.7.2 of the SPAS Draft EIR. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00130-643 regarding fleet mix assumptions and information on why assumptions on aircraft fleet mixes in the 2009 and 2025 Design Day Flight Schedules were reasonable and supported by substantial evidence.

SPAS-PH300027 Bashem, Greg Teamsters Local 986 8/29/2012

SPAS-PH300027-1

Comment:

Good evening. My name is Greg Bashem.

I'm here as a representative, Teamsters Local 986. We represent several hundred workers here at LAX; airline pilots, aircraft mechanics. We represent the customer service representatives. We represent the jet refuelers. We represent shuttle drivers. We represent several hundred workers that directly work at LAX. All of those employee deserve a modernized revitalized LAX.

We also represent construction workers, ready mix drivers that pour the concrete for these runways, keep them repaired and everything else. We also have pipeline construction workers. LAWA needs fuel out to those terminal areas where those planes sit and drop off passengers. We represent the jet refuelers.

So all of these people would benefit with LAX being modernized, revitalized. And hopefully, I would hope that -- that all of these here people here want the best for LAX.

We're here for that. I would -- I looked at all the different alternatives. I want an alternative that doesn't displace people that live around the Airport, or at least minimalizes (sic) that. And I'd also like to have an airport that I could be proud of, because I do use LAX. And it's not up to par with other airports that I've traveled in and out of.

So please, you know, it's a -- it's an emotional opinion, you know, meetings here. We just want to make sure that LAX gets what it deserves, and that's a face lift.

Thanks.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300028 Underwood, Brenda None Provided 8/29/2012

SPAS-PH300028-1

Comment:

Okay. So I live in Manchester Square. Anybody else here in Manchester Square?

Yeah so, we wanted to be well-informed -- well-informed -- well-informed of how it's going to work for us, how is our property getting appraised, how much time do we have to move, are we getting our taxes rolled over, are we getting moving expenses. We want private meetings with LAWA about our situation, because we are actually going to be uprooted and thrown out into the cold.

Although, I really think that an airport should be outside the city, just like every other city I've been to in Europe and in the United States. It's kind of, like, right in the underfoot here.

But it is what it is, and you guys are going to put a car rental, I'm pretty sure about that, in -- on my house. So can we have meetings with Manchester Square, and not, you know, with other people who are like, "Yay, Airport." We want to know where we're going and how we're going to maneuver through this.

Thank you.

Response:

Acquisition of property and relocation of residents by federally-funded airports such as LAX is governed by the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (codified as amended at 42 USC 4601-4655), its implementing regulations (49 CFR Part 24), FAA Order 5100.37A, and Acquisition and Relocation Assistance for Airport Projects (April 4, 1994, P.L. 91-646). The statute and its implementing regulations are referred to jointly as the Uniform Act. To address relocation associated with the LAX Master Plan, the LAX Master Plan Final EIR included Master Plan Commitment RBR-1, which required preparation of a Residential and Business Relocation Plan in compliance with the Uniform Act, state and local regulations, and FAA Advisory Circular 150/1500-17. This commitment outlines the steps LAWA would undertake to address residential and business relocations, which includes fully informing eligible residential occupants and business owners of the nature of and procedures for obtaining relocation assistance and benefits. In fulfillment of this LAX Master Plan Commitment, LAWA prepared the LAX Master Plan Program Alternative D Draft Relocation Plan.1

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

1. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Program Alternative D Draft Relocation Plan, April 2004.

SPAS-PH300029 Roten, Rusty IBEW Local #11 8/29/2012

SPAS-PH300029-1

Comment:

Hi. My name is Rusty Roten. I'm a business representative for the International Brotherhood Electrical Workers, Local Union 11. I've been an electrician for 32 years. And before I became an electrician, I actually worked out at LAX for Delta Airlines when I was 17, a summer job. It was pretty cool.

Throughout my career, I've had the benefit of working at LAX. And in following the game plan of modernizing and always trying to make it a world class place, a show piece for Los Angeles. And most of Los Angeles has benefited from it. Los Angeles has grown and prospered and so have we all.

This -- this Airport needs to continue to modernize, do the right thing. As jet liners get bigger, you know, we need more room between them so that safety protocol can be adhered to.

And it's an appropriate modernization project as well as, you know, traffic mitigation, relocating some of the car rental agencies to a central location. Everything will better for all. And the money that everybody works and generates in this Airport goes to and is infused right back into the local economy. And these are definitely desperately needed jobs in this time in this economy.

Thank you for your time.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300030 Eggers, Craig NCWP-ARC 8/29/2012

SPAS-PH300030-1

Comment:

My name is Craig Eggers. I'm a 30-year resident of Playa del Rey. I don't have any financial interest in this -- in this project. I serve on the Neighborhood Council for Westchester Playa. And I chair our Airport Relations Committee.

I'm speaking today in support of both Alternatives 2 and 9. Combined they fulfill the SPAS goal of airfield, terminal, and transportation improvements, and that benefits the traveler.

These alternatives will bring billions of dollars of income investment into LAX and surrounding areas in the City of Los Angeles. Alts 2 and 9 combined are the most affordable and cost effective design options.

Alts 2 and 9 provide substantial, permanent, long-term jobs. Alts 2 and 9 do allow for safe airfield operations. And Alt 2 is superior when it comes to airport operational efficiency and is environmentally superior in its alternatives in air quality and other at environmental impacts.

Alt 9 reduces central terminal traffic and creates a consolidated rental car facility on property already owned by LAWA.

Our Neighborhood Council is hosting a community town hall meeting on September 27th at 7:00 p.m. It will be held in the auditorium at Westchester Enriched Sciences Magnate School AKA Westchester High. Our moderator will be Richard Katz.

So today, as yesterday, I want to personally invite Gina Marie and her team to participate in our town hall. And I also want to extend the invitation to Councilman Rosendhal [sic], Congresswomen Waters and Hahn, Senators Feinstein and Boxer, Supervisor Knabe and Riddley-Thomas, Representatives Lou and Bradford, and any other concerned electives.

Also, we want to invite the Mayoral candidates to weigh in on their opinions. We're the first line of welcome for travelers to Los Angeles. And we want a modern, state-of-the-art facility, too. One that, as neighbors, we can be proud of.

Thank you.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost alternative (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report).

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. Please see Response to Comment SPAS-PH200025-1 regarding the town hall meeting held by The Neighborhood Council of Westchester/Playa.

SPAS-PH300031 Singh, Donna None Provided 8/29/2012

SPAS-PH300031-1

Comment:

Good evening. My name is Donna Singh, and I live in the Briarwood Town House Complex in Inglewood I've been there about a year-and-a-half. And when I moved in, they told me the unit was insulated, and essentially, I would not hear any noise. Big lie.

I was here Saturday, and I listened to everyone say they had a right to a job, a right to a job with great benefits, and a right to a living wage. I'm here to tell you I have a right of peace and quiet. I have a right to clean air. I have a right to not have to clean my car every morning before I use it.

In the evening, when I go for my evening walk, so that I can exercise, I have my head phones on and try to listen to the radio. I can't do it because the jets are flying overhead.

Saturday when I left, I went home. And between 4:03 p.m. and 5:05 p.m., 24 jets flew directly overhead my unit. That doesn't include the jets that I could hear, but not see. Those jets are so low, I can almost reach out and touch them. I can read the letters on some of the wings. I can tell you which ones were United. I can tell you which ones were Southwestern (sic). And I can tell you which ones were American.

Now, I know LAX is here to stay. It's not going anywhere, but you need to do something about the noise. You need to do something about our right to have clean air and just being able to live a clean healthy life.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. This comment addresses alleged issues with existing conditions and does not comment on the analysis provided in the SPAS Draft EIR.

The commentor is referring in part to soundproofing associated with LAWA's Aircraft Noise Mitigation Program (ANMP) described on pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR. Under the ANMP incompatible uses (including residential) located within the noise impact area (i.e., exposed to 65 CNEL or higher noise levels) are eligible for sound insulation pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). To ensure that interior noise levels have been reduced to 45 CNEL or less after soundproofing (in conformance with Title 21), post-construction noise tests are conducted on a random sampling of homes to verify the efficacy of sound insulation. To date, all post-testing has confirmed that interior noise levels meet this requirement. Furthermore, with implementation of the SPAS project and as stated in LAX Master Plan Mitigation Measure MM-LU-1, LAWA will continue post-insulation noise monitoring to ensure achievement of interior noise levels at or below 45 CNEL.

Please also see Response to Comment SPAS-PC00008-1 regarding current programs to address existing high aircraft noise levels. The SPAS Draft EIR addresses impacts associated with aircraft noise in Section 4.10.1. As indicated in that section, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Regarding air quality, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

As indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult

workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

With respect to the comment that "I have a right to not have to clean my car every morning before I use it," it is assumed that the commentor is referring to "deposition," (i.e., the gravitational fallout of material, both solid and liquid, from the atmosphere). Commonly, this material, called particulate matter, consists of dust and soot that can form deposits or cause discoloration on outdoor surfaces (i.e., building materials, motor vehicles, small water bodies, etc.). Please see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. As indicated in Response to Comment SPAS-PC00043-2, to date, the research results indicate that aircraft do not contribute substantially to deposition.

SPAS-PH300032 Widener, William None Provided 8/29/2012

SPAS-PH300032-1

Comment:

Yeah, I'm William Widener, Bill Widener, and I've lived in the area for last 70 years. And, you know, I've seen a lot of change in LAX. Now, I saw them speak Saturday, on the issue, but last night at the Inglewood City Council Meeting, it was brought to my attention that the Sound Insulation Program isn't going all that well.

You know, it's been 30 years in existence. The house I live in, we bought 60 years ago, and it's not done at this time. So if they move the runway, they're going to have more homes that need to be insulated.

So if they're going to move the runway, then they need to insulate all the houses that are in the sound -- noise barrier area, you know. And if they're going to do that, before they do that, they need to finish where they were.

I understand this program has been in existence for 30 years, and if they haven't got done by 30 years -- if they're going to spend all that money that they're going to spend, especially to move a runway, then they need to figure the other expenses, and -- and maybe get some more contractors, and get in Inglewood and get their job done and pay for it.

Thanks.

Response:

The content of this comment is similar to comment SPAS-PH100025-1; please refer to Response to Comment SPAS-PH100025-1.

SPAS-PH300033 Koefoed, Erik None Provided 8/29/2012

SPAS-PH300033-1

Comment:

Hi. My name is Erik Koefoed. I've lived in Playa del Rey for 40 years. Something is wrong. We don't have the proper vision. I'm thinking -- talking about transportation. If anybody has traveled to Europe, I was born in Denmark, if anybody has been at the airport in Copenhagen, you will see something that phenomenal. Trains go directly into the airport.

When you go outside the airport, what do you see? New Mercedes, Mercedes Benz, BMWs, Volvos.

When you have visitors that come in to Los Angeles Airport, what do they see? Antique cars with bald tires. That ought to be changed.

I support Alternative 2 and 9.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PH300033-2

Comment:

And by all means, the Airport out at Ontario, that's where we should go. Let's get the people out of the freeways. Go to Ontario.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300034 Aniolek, Gregg None Provided 8/29/2012

SPAS-PH300034-1

Comment:

I'm Gregg Aniolek. I am a resident of Playa del Rey. And I am also an engineer, so I understand that LAWA has to put options out for the expansion or -- for modernization of the airport, but to steal Mr. Rosendhal's [sic] repeated comments, "Modernization. No expansion."

Those expansion ideas really should fall off the table first. If -- to -- we should look to San Francisco Airport and steal those ideas that they've done. I mean, it's an excellent airport. Now, I used to live there. The BART goes right to the airport. It doesn't go into it, it goes to it. It's got an automated people mover to a consolidated rental car facility. Very efficient. Vehicles are off the road. Excellent.

Response:

The comment regarding "Modernization. No Expansion." is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. None of the SPAS project objectives listed in Section 2.2 of the SPAS Draft EIR include expansion.

The commentor describes several features of San Francisco International Airport (SFO) that he recommends for LAX. Regarding rail transit, such as BART having a line to SFO, Los Angeles Metro has approved development of the Crenshaw/LAX Transit Corridor and Station which will provide a new transit line near LAX, in addition to the existing Metro Green Line, and will include a station near the

intersection of Aviation Boulevard and Century Boulevard. As described in Section 2.3 of the SPAS Draft EIR, Alternatives 1, 2, 8, and 9, propose an elevated busway or APM system to the CTA that can be integrated with the new Metro station. The APM system under Alternative 3 could also link to that station. Regarding the automated people mover (APM) to the consolidated rental car (CONRAC) facility at SFO, SPAS Alternatives 3 and 4 propose the same type system, and SPAS Alternative 8 provides essentially the same system using an elevated/dedicated busway instead of an APM. In summary, the very suggestions offered by the commentor are already included in the range of alternatives currently being considered for SPAS.

For these reasons, the commentor's suggested alternative was not evaluated in detail in the SPAS Draft EIR.

Please see Topical Response TR-SPAS-T-1 regarding further discussion of transit options into LAX.

SPAS-PH300034-2

Comment:

And we should also consider Heathrow Airport. If you look -- someone told these stats and I had to look them up myself. In 2011, Heathrow has 2 runways, LAX has 4. Heathrow has got 4.7 square miles, LAX has 5. And they moved more people in 2011 than the -- than LAX did.

Now, granted maybe LAX had more cargo, but nonetheless, there's some European efficiency that we have to capitalize on here. It really needs to be considered and not just the structure of the buildings and everything. So there's some ideas that really need to be taken from elsewhere.

Response:

The comment does not describe a specific potentially feasible alternative that should have been evaluated in the SPAS Draft EIR. Many of the improvements associated with the various SPAS alternatives seek to improve efficiency and quality of service at LAX. These include airfield improvements to improve the safety and efficiency, as summarized in Table 1-12 of the SPAS Draft EIR, and ground transportation system improvements as described in Chapter 2 of the SPAS Draft EIR. While the commentor's comparisons between Heathrow International Airport and LAX suggest that it's possible to "do more with less" (i.e., Heathrow handling more passengers within a smaller footprint and with fewer runways), such simple comparisons are not necessarily a true indicator of airport efficiency. There are many factors that influence the number of passengers accommodated at an airport, not the least of which is air travel market activity. Heathrow handled more passengers in 2011 than LAX not because it was more efficient than LAX, but rather there was comparatively more market demand for air travel through Heathrow. Heathrow has long been the major international airport serving Europe. In 2011, over 97 percent of the passenger activity was international 1, compared to approximately 16 percent for LAX. Another key difference between the airports is approximately 35 percent of the passenger activity at Heathrow was on connecting flights, compared to 30 percent at LAX. While Heathrow operates with fewer runways than LAX (2 at Heathrow compared to 4 at LAX), it has a greater number of aircraft gates to accommodate high volumes of passengers (203 passenger gates at Heathrow compared to 159 passenger gates at LAX). Again as noted above, however, it is not so much the physical layout of the two airports and number of facilities with each that makes the difference between the passenger activity levels at the two airports in 2011, but rather the air travel market demands specific to each airport.

1. Heathrow Airport, Heathrow Facts and Figures, Available: www.heathrowairport.com/about-us/facts-and-figures, accessed November 30, 2012.

SPAS-PH300034-3

Comment:

And as for concerns about the safety, let's face it, LAX has been very good. Since I've been living here, I don't know of any major incidents, unlike the Santa Monica Airport, where hear of a once a year crash.

In fact, to my knowledge, LAX has one rescue. When the Jet Blue airline's wheels rotated, instead of landing back over in Long Beach, bring it to LAX, a much more safer place to land.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300035 Ryavec, Mark Venice Stakeholders Association 8/29/2012

SPAS-PH300035-1

Comment:

Mark Ryavec. I'm a resident of Venice. I'm a former staff to the Los Angeles City Council. I have a Master's Degree in Urban Studies. And many years ago, I worked with the Westchester Business District Association on various planning issues here.

I'd like to make two points. One of them is I don't think that this is -- that this review of alternatives is adequate without looking at the possibility of growing Ontario, and thus reducing some of the need for some of the new facilities that you are identifying here.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the suggestion to consider and evaluate the expansion of LA/Ontario International Airport as an alternative to the LAX SPAS project.

SPAS-PH300035-2

Comment:

The other issue I'd point out is that I think that the this whole process should be an opportunity, not just to modernize the Airport, but also to significantly decrease the impact of the Airport on the residents surrounding the Airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Because the commentor does not identify any specific impact on residents, this response cannot provide specific responsive detail. However, the SPAS Draft EIR analyzes the potential environmental impacts of the SPAS project, in general, on surrounding residents. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300035-3

Comment:

And I would suggest that there is a possibility to take Alternative 3 and create out of it an Alternative 10. And that instead of large commercial developments in the center of the Airport, where the parking is now located, that, in fact, when you rebuild terminals -- under 3, when you rebuild Terminals 1, 2, and 3,

you -- by taking some of this space that's now devoted to parking structures, you could free up space to provide more gates there.

And this would remove the -- this would -- again, it would also move that inbound -- excuse me, the outbound runway, which is the one that's creating so much noise in Playa del Rey, it would move it 300 feet south, so that you would attenuate to some extent, by doing that, the noise you're currently hearing at that location.

Thank you.

Response:

The alternative suggested in the comment is the same as in comment SPAS-PC00078-5; please see Response to Comment SPAS-PC00078-5.

SPAS-PH300036 Leal, Marco None Provided 8/29/2012

SPAS-PH300036-1

Comment:

Hi. My name is Marco Leal. I live on 88th Street. I've lived in the Airport area for 26 years, 15 years in my current house. I studied Airport Planning and Management at Cal State LA. I have a Bachelor's Degree in that. I work on the Airport. I'm an aircraft mechanic. I taxi airplanes back and forth. I'm really tired of seeing this proposal for a centerfield taxiway on the north complex. We rarely use it on the south side. It will never get used on the north side.

Response:

The centerfield taxiway on the south side is used daily for aircraft arriving on Runway 7R/25L that are proceeding north to the passenger terminal area. FAA controllers direct pilots exiting the runway onto the south centerfield taxiway and have them proceed to a connecting taxiway to proceed across Runway 7L/25R to the terminal. See Figures 8 and 10 in Appendix F-2 of the Preliminary LAX SPAS Report for illustrations of the "South Arrival to North CTA" paths assumed under the 2009 conditions.

The same procedure would be utilized on the north side. Controllers would direct pilots exiting Runway 6L/24R onto the north centerfield taxiway and have pilots proceed to a connecting taxiway to cross over Runway 6R/24L to the terminal. See Figures 15 and 17 in Appendix F-2 of the Preliminary LAX SPAS Report for illustrations of the "North Arrival" paths assumed under the 2025 conditions.

SPAS-PH300036-2

Comment:

Also, do not relocate runway 6 left 24 right north even one foot. It's not needed.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300036-3

Comment:

I haven't had a chance to totally study every single alternative. You know, on face value, I kind of like Alternative 2.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PH300036-4

Comment:

Let's see. What else?

I was looking at the Manchester Square. I heard some of the residents' concerns there. I personally like the way the Orlando Airport is geared. They divided not by -- by arrivals and departures. They divided in four different ways. One of them being taxi cabs and limousines on one level; buses and shuttle vans on another level, rental cars on a another level, and pick up and drop off cars on a totally different level.

Now, if they were saying that, you know, Orlando isn't used as much as LAX, make it 8 levels. But it needs to be separated. And that would streamline it completely. And then, you know, as far as the rail is concerned, that actually would streamline it even more.

Response:

The alternative suggested in the comment is the same as in comment SPAS-PC00102-5; please see Response to Comment SPAS-PC00102-5.

SPAS-PH300036-5

Comment:

Let's see. I guess that's about all. Another issue that's really near and dear to my heart is the TSA. Personally, I'd like to see it abolished. We're never going to get hit by -- by terrorists. I mean, you're more likely to get hit by lightning than terrorists. You know, we don't need to be radiated, and we don't need to be groped. We should do it like the Israelis do. Airport security is not that difficult.

And that's it.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300037 Acherman, Robert None Provided 8/29/2012

SPAS-PH300037-1

Comment:

Good evening. My name is Robert Acherman. I'm a resident of the City of Torrance. In Torrance, we are impacted by LAX. We have low-flying planes departing for Asia and Australia flying over our homes late at night. And during the day, we get them from Long Beach Airport.

Our access in and out of Torrance is also affected by the gridlock caused by the LAX traffic on the 405 Freeway. I have family and many, many friends here in Westchester, Playa del Rey, so I'm very sympathetic to everyone who lives next to LAX.

Westchester, Playa del Rey was my home town of 37 years. Westchester, Playa del Rey is a hidden gem in the City of Los Angeles, a great place to live, work, and play, a friendly hometown atmosphere where generations of people have raised their families. I know we'd certainly like to keep it that way.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300037-2

Comment:

I have been reading the Draft EIR and SPAS reports, and I found many problems, but 2 minutes is not enough time to go through them in detail. These comments will be submitted later in writing.

From what I have read, it's clear that Alternative 2, combined with some ground access elements in Alternative 9 would be best for the Westchester, Playa del Rey community and the flying public.

This combination will provide the best cost benefits for the airlines and the least environmental impact on the surrounding communities.

We can have a safe, secure, and convenient LAX that does not expand in the surrounding communities of Westchester and Playa del Rey.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, Chapter 8 of the Preliminary LAX SPAS Report provides a financial analysis of each alternative. As identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative. Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that Alternatives 2 and 9 would present the least environmental impact on local communities.

A discussion of property acquisition that could occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. As indicated in these figures and tables, no residential acquisition or acquisition within Westchester or Playa del Rey is proposed.

SPAS-PH300037-3

Comment:

Furthermore, LAWA needs to do more to make good on its legal obligation in the stipulated settlement agreement to promote regionalization of air services in -- at Ontario and Palmdale. LAX cannot and should not be the only major gateway in and out of Southern California.

We had an earthquake today in Orange County. Imagine what one could do to LAX. How will people get in and out of our region if LAX is closed? This is why we need more capacity at Ontario and Palmdale now.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport and Palmdale Regional Airport. As also described therein, there are six major airports, not just LAX, serving the Southern California region.

Regarding earthquake risks at LAX, the 2010 Revised NOP and Initial Study for the SPAS Draft EIR explained why these risks for the SPAS alternatives are less than significant.

SPAS-PH300037-4

Comment:

And I noticed earlier there were some people reading other people's comments. It would great if those people would present them in person. It would just make that more personable.

Thank you.

Response:

The comment is noted.

SPAS-PH300038 Smith, Garrett None Provided 8/29/2012

SPAS-PH300038-1

Comment:

Hi. Good evening. I'm one of the -- I'm a resident of Westchester. And want to tell the few people that are here from labor that we are your allies. We support a living wage. We support more jobs. And we support modernization.

What we don't support is the runway being moved forward, encroaching into our neighborhood. LAX has not been a good neighbor. They haven't -- their contractors haven't been good employers to you. You know, and -- so you should be our allies in stopping the runway moving forward.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PH300039 Paxton, Lynne None Provided 8/29/2012

SPAS-PH300039-1

Comment:

Hi. I'm Lynne Paxton. I live in Playa del Rey. I'm recent here. And I'd just like to state that I'm against moving the runway to the north, as it will result in excessive noise spikes affecting the residents living to the north of the area of the Airport, as I do.

The decibel level studies are homogenized in that they represent an averaging of 24 hours per day, and 365 days per year. They don't address the actual noise spikes that come about. It's unknown at this point in time how great those noise spikes will increase if any moving of the runway to the north takes place. And I'm against moving any runway to the north.

Thank you.

Response:

The content of this comment is essentially the same as comment SPAS-PC00035-1; please refer to Response to Comment SPAS-PC00035-1.

SPAS-PH300040 Sambrano, Diane HSCV 8/29/2012

SPAS-PH300040-1

Comment:

Good evening. I live in the community called Inglewood. And I think that it's interesting there were several references made to the beginnings of this Airport.

And as the President of Local Historical Society, I want everyone to keep in mind that when the airport was put way down over there, near Airport Boulevard originally, no one had yet invented the jet aircraft.

And it seems everyone seems to forget that little tiny thing. I also want to remind everyone that the community that has taken the greatest hit is, in fact, that community that gave every single one of us the privilege of aerospace defense. And it is yet these senior adults now who are being impacted the greatest. It is they who are losing their quality life, they who are losing their homes. What a grand insult that is.

And yet, I hear other folks say, "How dare you people who live near the Airport be NIMBYs." Let me correct that. If you're going to call us names, make sure you call us the correct name, that would be CIMBY. For all these many years, the Airport has been "currently" in our backyard.

We are the ones significantly impacted by every negative thing. And yet, we have stood here and said, "We always want the employees to be treated fairly." We believe in regional approach. We believe that in case of some drama, there should be other airports to take that load. And LAWA has gone out of its way to not help Ontario or Palmdale develop as the plans were originally made when those two were purchased.

So I would hope that we do not expand any further and destroy any more of the Westchester and Inglewood communities, but perhaps simply modernize that property which you already own.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

A discussion of property acquisition that could occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. As indicated in these figures and tables, no residential acquisition or acquisition within Westchester or Inglewood is proposed.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport and Palmdale Regional Airport.

5. CORRECTIONS AND ADDITIONS RELATED TO THE SPAS DRAFT EIR

5.1 Introduction

As a result of clarifications to, and comments received on, the Draft Environmental Impact Report (Draft EIR) for the Specific Plan Amendment Study (SPAS), the following revisions are hereby made to the text of the SPAS Draft EIR. Changes in text are signified by strikeouts where text is removed and by italics where text is added, unless otherwise noted. These changes do not add significant new information to the EIR, nor do they disclose or suggest new or more severe significant environmental impacts of the Specific Plan Amendment Study. Changes to the Preliminary LAX SPAS Report are also identified herein.

5.2 Corrections and Additions to the SPAS Draft EIR Text

Chapter 1, Introduction and Executive Summary

1. Table 1-4 on page 1-48 of the Draft EIR has been revised. These revisions are consistent with the substantive analysis already provided on SPAS Draft EIR pages 4-51 through 4-52, and 4-76. Please see the following revised table.

Table 1-4

Water Supply	LS	LS	LS	LS	LS	LS	LS	LS	LS

Notes:

NA = Not Applicable
NI = No Impact
LS = Less Than Significant Impact
SM = Significant Impact (but mitigable to Less Than Significant)
SU = Significant Unavoidable Impact

[1] Alternatives 8 and 9 focus on ground access improvements, which do not pertain to aircraft noise; however, assuming the ground access improvements under those alternatives would be paired with airfield improvements proposed under Alternative 1, 2, 5, 6, or 7, there would be significant unavoidable aircraft noise impacts, as shown for Alternatives 1, 2, 5, 6, and 7.

[2] Alternatives 5, 6, and 7 focus on airfield improvements, which do not pertain to road traffic noise; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be less than significant road traffic noise impacts, as shown Alternatives 1, 2, 8, and 9.

[3] Alternatives 5, 6, and 7 focus on airfield improvements, which do not pertain to transit noise; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be significant but mitigable transit noise impacts or less than significant transit noise impacts, as shown for Alternatives 1, 2, 8, and 9, depending upon which alternatives are paired.

[4] Alternatives 5, 6, and 7 focus on airfield improvements, which do not pertain to on- or -off-airport surface transportation; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be significant unavoidable traffic impacts, as shown for Alternatives 1, 2, 8, and 9.

		Alt. 1	**Alt. 2**	**Alt. 3**	**Alt. 4**	**Alt. 5**	**Alt. 6**	**Alt. 7**	**Alt. 8**	**Alt. 9**
Topic	**Basis of Comparison**	**Value**	**Value**	**Value**	**Value**	**Value**	**Value**	**Value**	**Value**	**Value**
Off-Airport Transportation	Number of off-airport facilities (i.e., intersections and CMP facilities) significantly impacted relative to Baseline (2010 and no airport growth) conditions with no feasible mitigation available	1 (Intersection)	1 (Intersection)	12 (11 Intersections and 1 CMP facility)	2 (Intersections)	na	na	na	2 (Intersections)	2 (Intersections)
	Number of off-airport facilities (i.e., intersections and CMP facilities) significantly impacted relative to Future (2025 with airport growth) conditions with no feasible mitigation available	**~~43~~*42* (~~39~~*38* Intersections and 4 CMP Facilities)**	**~~43~~*42* (~~39~~*38* Intersections and 4 CMP Facilities)**	**42 (37 Intersections and 5 CMP Facilities)**	**~~45~~*43* (~~40~~*38* Intersections and 5 CMP Facilities)**	na	na	na	**~~48~~*46* (~~44~~*42* Intersections and 4 CMP Facilities)**	**~~48~~*46* (~~44~~*42* Intersections and 4 CMP Facilities)**

Notes:

LS = Less Than Significant Impact

[1] Impacts identified in **Bold** type are primarily attributable to future growth in airport activity that will occur regardless of the SPAS alternatives. Also, relative to off-airport transportation, significant impacts are primarily the result of the combination of increased airport activity levels and increased regional background traffic projected to occur by 2025.

[2] Construction emissions *and concentrations* shown for Alternatives 5 through 9 represent ranges of potential emissions *and concentrations* depending on which set of other airfield, terminal, or ground access improvements each alternative is paired with - see Table*s* 4.2-10*, 4.2-11, and 4.2-12* in Section 4.2, *Air Quality*.

[3] The ranges of emissions *and concentrations* shown for each alternative are based on the analysis of aircraft-related emissions *and concentrations* that accounted for differences in airfield activities under different weather/visibility conditions. The low end of the range typically represents good visibility with less spacing required between aircraft, and the high end of the emission range typically represents poor weather conditions with greater spacing between aircraft and more ground delay time - see Tables 4.2-13*, 4.2-15, and 4.2-16* in Section 4.2, *Air Quality*.

[4] Alternative 5 through 9 focus on airfield improvements or ground access improvements, but are assumed to be paired with the counterpart improvements of other alternatives in order to provide a complete set of improvements. Although no construction noise impacts are noted for Alternatives 5 through 7 relative to ground access improvements, and no impacts are noted for Alternatives 8 and 9 relative to airfield improvements, such impacts would likely occur depending on which other improvements each of those alternatives is paired with.

[1] LAWA and the LAX Coalition for Economic, Environmental and Educational Justice (LAX Coalition) have developed and entered into an agreement, the Community Benefits Agreement (CBA), to ensure that communities adversely affected by the LAX Master Plan Program also receive benefits as a result of implementation of the Program. The benefits and mitigations included in the CBA were negotiated independently from, and are not a part of, the LAX Master Plan Mitigation Monitoring and Reporting Program. The CBA contains a number of air quality mitigation measures, of which Sections X.A., X.F., X.K., X.L., X.M., and X.N. are applicable to SPAS.

[2] Alternatives 5, 6, and 7 focus on airfield improvements, and would not have any impacts related to ground transportation; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be impacts to ground transportation that would subject to this mitigation measure.

[3] Alternatives 8 and 9 focus on ground access improvements, and would not have any impacts associated with aircraft gates; however, assuming the ground access improvements under those alternatives would be paired with airfield improvements proposed under Alternative 1, 2, 5, 6, or 7, there would be impacts to gates that would be subject to this mitigation measure.

[4] This measure would reduce the cumulatively considerable contribution to impacts to aviation safety from building/structural penetrations of FAR Part 77 imaginary surfaces.

[5] This measure would address cumulatively significant impacts associated with solid waste generation and disposal.

Source: CDM Smith, 2012.

6. The first sentence in the first paragraph following the bullets on page 1-75 of the Draft EIR is hereby revised as follows:

   LAX Master Plan mitigation measures *and SPAS-specific mitigation measures* would reduce TAC emissions associated with all of the SPAS alternatives.

7. The first sentence of the second paragraph on page 1-84 of the Draft EIR is hereby revised as follows:

   Table 1-*17*~~18~~ provides a summary of the population, dwellings, and non-residential noise-sensitive facilities that would be within the 65 CNEL or higher noise exposure contour with the implementation of the various alternatives compared to baseline (2009) conditions. Alternative 5 would result in the least change in number of dwellings exposed to 65 CNEL or higher noise levels (4,315), followed in order by the Alternative 1 (4,370), Alternative 6 (4,462), Alternative 7 (4,485), Alternative 3 (4,508), Alternative 2 (4,531), and Alternative 4 (4,603).

8. The last paragraph on page 1-99 of the Draft EIR is hereby revised as follows:

   Table 1-24 identifies the impacts associated with each alternative following the implementation of the recommended SPAS-specific mitigation measures identified in Section 4.12.2.7.2. As illustrated in **Table 1-24**, Alternative 1, 2, 3, 4, 8, and 9 would all have significant and unavoidable impacts to intersections when compared to either Baseline (2010) Without Alternative conditions or Future (2025) conditions. When comparing to Baseline (2010) Without Alternative conditions, Alternative 3 would have the greatest number of significant, unavoidable impacts (11 intersections) after mitigation, whereas Alternatives 1 and 2 would have the fewest (1 intersection each). When comparing to Future (2025) conditions, Alternatives 8 and 9 would have the greatest number of significant, unavoidable impacts (~~44~~ *42* intersections) after mitigation, and Alternative 3 would have the fewest (37). Alternatives 1, ~~and~~ 2*, and 4* would have ~~39~~ *38* significant and unavoidable impacts after mitigation. ~~Alternative 4 would have significant, unavoidable impacts to 40 intersections after mitigation.~~

8. Table 1-24 on page 1-100 of the Draft EIR has been revised. Please see the following revised table.

Table 1-24

Summary of Off-Airport Transportation Impacts After Mitigation

	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 8	Alt. 9
Impacts Relative to Baseline (2010) Without Alternative Conditions						
Intersections	SU(1)	SU(1)	SU(11)	SU(2)	SU(2)	SU(2)
CMP Facilities - Arterial Monitoring Intersections	LS	LS	SU(1)	LS	LS	LS
CMP Facilities - Freeway Monitoring Stations	LS	LS	LS	LS	LS	LS
CMP Facilities - Transit Demand	LS	LS	LS	LS	LS	LS
Impacts Relative to Future (2025) Conditions						
Intersections	SU (~~39~~*38*)	SU (~~39~~*38*)	SU(37)	SU (~~40~~*38*)	SU (~~44~~*42*)	SU (~~44~~*42*)
CMP Facilities - Arterial Monitoring Intersections	SU(1)	SU(1)	SU(2)	SU(2)	SU(1)	SU(1)
CMP Facilities - Freeway Monitoring Stations	SU(3)	SU(3)	SU(3)	SU(3)	SU(3)	SU(3)
CMP Facilities - Transit Demand	LS	LS	LS	LS	LS	LS
Construction Impacts[1]	SU	SU	SU	SU	SU	SU

Notes:

LS = Less Than Significant Impact
SU = Significant Unavoidable Impact

Numbers in parentheses indicate the number of affected intersections/facilities.

Table 1-24

Summary of Off-Airport Transportation Impacts After Mitigation

[1] The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. It would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods. As such, the total number of intersections that may be temporarily significantly impacted during construction cannot be determined at this time.

Source: Fehr & Peers, 2012.

Chapter 2, Project Description

1. The second bullet on page 2-37 of the Draft EIR is hereby revised as follows:

   As a result of moving the APLL south to meet ADG VI standards, several gates would be eliminated *or downsized (i.e., would accommodate smaller aircraft types)*

2. The second sentence under the Disposition of Facility/Use column for the Taxi Holding Lot in Table 2-3 on page 2-50 of the Draft EIR is hereby revised as follows:

   Under Alternatives 1, 2, *8,* and ~~5 through~~ 9, the lot would move to the eastern portion of the Park One facility.

3. The fourth sentence of the third paragraph on page 2-55 of the Draft EIR is hereby revised as follows:

   Under Alternatives 1, 2, *8,* and ~~5 through~~ 9, the taxi and commercial holding lots for the shared-ride vans and charter buses/limousines would be relocated to the easternmost portion of the area currently occupied by the Park One parking facility.

Chapter 4, Environmental Impact Analysis

1. Table 4.2-4 on page 4-101 of the Draft EIR has been revised. The revisions to this table represent corrections to on-airport emissions to correct typographical errors for several on-airport sources. Regarding off-airport emissions, Table 4.2-4 in the SPAS Draft EIR contained a typographical error with respect to baseline (2009) emissions associated with off-airport roadways. The correct values are shown in the following table. Although reflected incorrectly in Table 4.2-4 of the SPAS Draft EIR, the correct values were used in all of the calculations of impacts that were completed for the SPAS Draft EIR. Therefore, the correct values were accounted for in the SPAS Draft EIR impact analysis and the corrections to the typographical error in the baseline (2009) emissions do not constitute significant new information to the EIR, nor do they disclose or suggest a new or more severe environmental impact. Please see the following revised table.

Table 4.2-4

Baseline (2009) Airport Emissions

	Peak Daily Emissions, lbs/day					
Emission Sources	**CO**	**VOC**	**NO_x**	**SO_2**	**PM10**	**PM2.5**
On-Airport Sources						
Aircraft	~~12,650~~ *13,740*	~~2,056~~ *2,182*	~~18,968~~ *19,159*	~~1,644~~ *1,707*	~~173~~ *178*	~~173~~ *178*

Notes:

Totals may not add due to rounding.

[1] On-airport stationary sources are natural gas combustion units for space heating and water heating.

[2] Off-airport stationary sources are natural gas combustion electric power generators supplying electricity to project facilities. Estimated that 22% of LADWP power is produced in the South Coast Air Basin (LADWP, 2011).

Sources: CDM Smith, 2012.

2. The fourth bullet on page 4-108 of the Draft EIR is hereby revised as follows:

- **LAX Master Plan Community Benefits Agreement; X.M., Limits on Diesel Idling.**

  This provision requires LAWA to prohibit idling or queuing of diesel-fueled vehicles and equipment for more than ten consecutive minutes on-site*, unless CARB adopts a stricter standard, in which case LAWA shall enforce that standard*. This requirement would be included in specifications for any SPAS alternative requiring on-site construction. *Subsequent to the adoption of the CBA, CARB has adopted a five-minute idling limit for diesel vehicles and equipment, so that limit is applicable to the SPAS alternatives.*

3. Table 4.2-11 on page 4-115 of the Draft EIR has been revised. Please see the following revised table.

4. Table 4.2-12 on page 4-117 of the Draft EIR has been revised. Please see the following revised table.

5. Table 4.2-13 on page 4-122 of the Draft EIR has been revised. Please see the following revised table.
6. Figure 4.2-2 on page 4-137 of the Draft EIR has been revised with respect to the NO_2 Annual concentration location. Please see the following revised figure.
7. Table 4.2-15 on page 4-139 of the Draft EIR has been revised. Please see the following revised table.
8. Footnote 1 in Table 4.2-16 on page 4-142 of the Draft EIR is hereby revised as follows:

   [1] The significance thresholds for PM10 and PM2.5 are based on project incremental thresholds developed by SCAQMD. Therefore, future ~~construction~~ *operational* concentrations are the values under a given alternative to be compared to the thresholds.

9. The note in Table 4.2-17 on page 4-156 of the Draft EIR Is hereby revised as follows:

   Mitigation measures are LAX Master Plan Mitigation Measures MM-AQ-1, MM-AQ-2, MM-AQ-3, MM-AQ-4; ~~and~~ components from Section X, Air Quality, of the LAX Master Plan Community Benefits Agreement~~.~~*; and SPAS-specific mitigation measures.*

10. Section 4.2.7 on page 4-160 of the Draft EIR is hereby revised as follows:

Notes:

Totals may not add due to rounding.

1 The significance thresholds for CO, NO_2, and SO_2 are based on California and/or National Ambient Air Quality Standards (CAAQS and/or NAAQS) which are absolute thresholds. Therefore, future operational concentrations are determined by adding existing background concentrations to the calculated future airport-related concentrations under a given alternative for comparison to the thresholds.

2 Alternatives 5 through 7 focus primarily on airfield improvements and related terminal and roadway improvements. Those improvements are compatible with the ground access improvements proposed under Alternatives 1, 2, 8, and 9. The range of peak concentrations presented for Alternatives 5 through 7 include the concentrations associated with construction of the alternative-specific airfield/terminal improvements plus the range of concentrations associated with construction of different ground access options under Alternatives 1, 2, 8, or 9. The total concentrations for Alternatives 5 through 7 would fall within the range shown for each depending on which set of ground access improvements is assumed.

3 Alternatives 8 and 9 focus primarily on ground access improvements; however, those improvements are compatible with the airfield improvements, and related terminal and roadway improvements, proposed under Alternatives 1, 2, 5, 6, and 7. The range of peak concentrations presented for Alternatives 8 and 9 include the concentrations associated with construction of the alternative-specific ground access improvements plus the range of concentration associated with construction of different airfield/terminal options under Alternatives 1, 2, 5, 6, or 7. The total concentrations for Alternatives 8 and 9 would fall within the range shown for each depending on which set of airfield improvements is assumed.

4 The 1-Hour CO threshold is the 1-Hour CO CAAQS since this standard is more stringent than the 1-Hour CO NAAQS.

5 The 8-Hour CO threshold is equivalent to both the 8-Hour CO CAAQS and 8-Hour CO NAAQS.

6 The 1-Hour NO_2 CAAQS is not *to be* exceeded.

7 The 1-Hour NO_2 NAAQS is based on the 3-year average of the 98th percentile of daily maximum 1-hour concentrations.

Table 4.2-11

Peak Construction Concentrations for CO, NO_2, and SO_2

Pollutant/ Source[1]	Averaging Period	Alt. 1 ($\mu g/m^3$)	Alt. 2 ($\mu g/m^3$)	Alt. 3 ($\mu g/m^3$)	Alt. 4 ($\mu g/m^3$)	Alt. 5[2] ($\mu g/m^3$)	Alt. 6[2] ($\mu g/m^3$)	Alt. 7[2] ($\mu g/m^3$)	Alt. 8[3] ($\mu g/m^3$)	Alt. 9[3] ($\mu g/m^3$)

[8] The annual NO_2 threshold is the annual NO_2 CAAQS since this standard is more stringent than the annual NO_2 NAAQS.
[9] The 1-Hour SO_2 CAAQS is not *to be* exceeded.
[10] The 1-Hour SO_2 NAAQS is based on the 3-year average of the 99th percentile of daily maximum 1-hour concentrations.
[11] The ~~1~~*24*-Hour SO_2 CAAQS is not *to be* exceeded.

[1] Project operational emissions are determined by subtracting existing airport emissions (see Table 4.2-~~104~~) from future airport emissions for each alternative. Totals may not add exactly due to rounding.

Table 4.2-13

Incremental Project Operational Emissions Compared to Baseline (2009) Conditions

Pollutant/ Source[1]	Alt. 1 lbs/day	Alt. 2 lbs/day	Alt. 3 lbs/day	Alt. 4 lbs/day	Alt. 5[2] lbs/day	Alt. 6[2] lbs/day	Alt. 7[2] lbs/day	Alt. 8[3] lbs/day	Alt. 9[3] lbs/day

[2] Alternatives 5 through 7 focus primarily on airfield improvements and related terminal and roadway improvements. Those improvements are compatible with the ground access improvements proposed under Alternatives 1, 2, 8, and 9. The emissions presented relative to airfield operations (i.e., aircraft, APU, and GSE) under Alternatives 1, 2, 5, 6, and 7 are specific to characteristics of each of these alternatives; however, the non-airfield emissions (i.e., roadways, parking, stationary, and off-airport) shown for Alternatives 5 through 7 reflect the range of those types of emissions for Alternatives 1, 2, 8, and 9. The total emissions for Alternatives 5 through 7 would fall within the range shown for each, depending on which set of ground access improvements is assumed. The emissions presented relative to both airfield and non-airfield operations for Alternatives 3 and 4 are specific to the characteristics of each of these alternatives, which still provide a basis for comparison with the other alternatives.

[3] Alternatives 8 and 9 focus primarily on ground access improvements; however, those improvements are compatible with the airfield improvements, and related terminal and roadway improvements, proposed under Alternatives 1, 2, 5, 6, and 7. The emissions presented relative to non-airfield operations (i.e., roadways, parking, stationary, and off-airport) under Alternatives 1, 2, 8, and 9 are specific to characteristics of each of these alternatives; however, the airfield emissions (i.e., aircraft, APU, and GSE) shown for Alternatives 8 and 9 reflect the range of those types of emissions for Alternatives 1, 2, 5, 6, and 7. The total emissions for Alternatives 8 and 9 would fall within the range shown for each, depending on which set of airfield/terminal improvements is assumed. The emissions presented relative to both airfield and non-airfield operations for Alternatives 3 and 4 are specific to the characteristics of each of these alternatives, which still provide a basis for comparison with the other alternatives.

[4] In addition to the emission ranges associated with alternative airfield and ground access development discussed in table notes 2 and 3 above, ranges in aircraft and APU emissions were developed from various weather conditions that impact airfield activity. The low end of the range typically represents good visibility with less spacing required between aircraft, and the high end of the emission range typically represents poor weather conditions with greater spacing between aircraft and more ground delay time.

[5] GSE operations and activity levels are assumed to be directly related to aircraft activity levels; therefore, GSE emissions are the same for all future alternatives since aircraft activity is the same for all alternatives in 2025.

[6] On-airport stationary sources are natural gas combustion units for space heating and water heating.

[7] Off-airport stationary sources are natural gas combustion electric power generators supplying electricity to project facilities. It is estimated that 22 percent of LADWP power is produced in the South Coast Air Basin (Los Angeles Department of Water and Power, 2011 Power Integrated Resource Plan, December 22, 2011).

Total	Annual	9	9	9	9	9	9	8	8 to 9	8 to 9
Threshold[13]	Annual	80	80	80	80	80	80	80	80	80
Significant?	Annual	**No**	**No**	**No**	**No**	**No**	**No**	**No**	**No**	**No**

Notes:

Totals may not add due to rounding.

1 The significance thresholds for CO, NO_2, and SO_2 are based on California and/or National Ambient Air Quality Standards (CAAQS and/or NAAQS) which are absolute thresholds. Therefore, future operational concentrations are determined by adding existing background concentrations to the calculated future airport-related concentrations under a given alternative for comparison to the thresholds. Totals may not add exactly due to rounding.

2 On-airport roadway and parking-related concentrations for Alternatives 5, 6, and 7 are assumed to be equal to the roadway and parking-related concentrations for Alternatives 1 and 2 for comparative purposes only. Alternatives 5, 6, and 7 are airfield/terminal improvement options only and do not impact on-airport roadway and parking configurations. See Appendix C for summaries of source contributions to peak receptors.

Table 4.2-15

Peak Operational Concentrations including Background

Pollutant/ Source[1]	Averaging Period	Alt. 1 ($\mu g/m^3$)	Alt. 2 ($\mu g/m^3$)	Alt. 3 ($\mu g/m^3$)	Alt. 4 ($\mu g/m^3$)	Alt. 5[2,14] ($\mu g/m^3$)	Alt. 6[2,14] ($\mu g/m^3$)	Alt. 7[2,14] ($\mu g/m^3$)	Alt. 8[3] ($\mu g/m^3$)	Alt. 9[3] ($\mu g/m^3$)

[3] Aircraft and APU-concentrations for Alternatives 8 and 9 are assumed to be within the range of aircraft and APU-related concentrations for Alternatives 1, 2, 5, 6, and 7. Alternatives 8 and 9 are ground access (i.e., on-airport roadway and parking options) only and do not impact airfield or terminal configurations. See Appendix C for summaries of source contributions to peak receptors.

[4] The 1-Hour CO threshold is the 1-Hour CO CAAQS since this standard is more stringent than the 1-Hour CO NAAQS.

[5] Although the CAAQS and NAAQS background design value are different, because the standards are the same and CAAQS background is higher, this represents a more conservative value.

[6] The 8-Hour CO threshold is equivalent to both the 8-Hour CO CAAQS and 8-Hour CO NAAQS. Although the CAAQS and NAAQS background design value are different, because the standards are the same and CAAQS background is higher, this represents a more conservative value.

[7] The 1-Hour NO_2 CAAQS is not to be exceeded.

[8] The 1-Hour NO_2 NAAQS is based on the 3-year average of the 98th percentile of daily maximum 1-hour concentrations.

[9] The annual NO_2 threshold is the annual NO_2 CAAQS since this standard is more stringent than the annual NO_2 NAAQS.

[10] The 1-Hour SO_2 CAAQS is not to be exceeded.

[11] The 1-Hour SO_2 NAAQS is based on the 3-year average of the 99th percentile of daily maximum 1-hour concentrations.

[12] The 3-Hour SO_2 NAAQS is not to be exceeded more than once per year.

[13] The 24-Hour SO_2 NAAQS and CAAQS, and annual SO_2 NAAQS, are not to be exceeded.

[14] Concentrations from Alternatives 5 through 7 may vary slightly from the values shown depending on the ground access option that is selected. However, the aircraft are the major contributor to the peak concentrations, therefore this variation would be minor.

LAX Specific Plan Amendment Study Draft EIR	**Peak Operational Concentrations Locations Alternative 1**	Figure **4.2-2**

This page intentionally left blank.

4.2.7 Mitigation Measures

With respect to all construction-related impacts from air emissions associated with the SPAS project, LAWA is committed to mitigating temporary construction-related emissions to the maximum extent feasible and has established some of the most aggressive construction emissions reduction measures in Southern California, particularly with regard to requiring construction equipment to be equipped with emissions control devices. The framework identified in the MPAQ for reducing air emissions associated with construction of the Master Plan and the specific means for implementing the mitigation measures described in Section 4.2.5, as well as all of the measures identified in Table 4.2-8, would be used to reduce air emissions associated with implementation of the SPAS project. These mitigation measures establish a commitment and process for incorporating all technically feasible air quality mitigation measures into each component of the SPAS project as each element of that project is constructed. At a programmatic level, this provides the most comprehensive means of ensuring air emissions will be reduced to the maximum extent feasible. In addition, the *LAWA Sustainable Airport Planning, Design and Construction Guidelines* encourages contractors to implement a number of voluntary measures that would reduce criteria pollutant and greenhouse gas emissions. Through the sustainability program, contractors are encouraged to implement such measures as: further reduce vehicle and equipment idling times; comply with Tier 4 emission standards for non-road diesel equipment; retrofit existing diesel equipment with particulate filters and oxidation catalysts; replace aging equipment with new low-emission models; and consider the use of alternative fuels for construction equipment. ~~There are no feasible measures that could be adopted at this time to reduce air emissions further. Therefore, no additional project-specific mitigation measures are recommended in connection with SPAS.~~ *To address construction-related air quality impacts associated with Alternatives 1 through 9, the following mitigation measure specific to SPAS is proposed:*

- ***MM-AQ (SPAS)-1. Additional Measures to Supplement the LAX Master Plan Mitigation Plan for Air Quality - Construction-Related Mitigation Measures (Alternatives 1 through 9).***

  For purposes of SPAS, LAWA will expand the existing LAX Master Plan Mitigation Plan for Air Quality Construction-Related Mitigation Measures to include the following specific actions:

  - *On-road trucks used on SPAS construction projects with a gross vehicle weight rating of at least 19,500 pounds shall, at a minimum, comply with USEPA 2007 on-road emissions standards for PM10 and NO_x.*
  - *Prior to January 1, 2015, all off-road diesel-powered construction equipment greater than 50 horsepower used on SPAS construction projects shall meet USEPA Tier 3 off-road emission standards. After December 31, 2014, all off-road diesel-power construction equipment greater than 50 horsepower used on SPAS construction projects shall meet USEPA Tier 4 off-road emissions standards. Tier 4 equipment shall be considered based on availability at the time the construction bid is issued. LAWA will encourage construction contractors to apply for SCAQMD "SOON" funds to accelerate clean up of off-road diesel engine emissions.*

It is estimated that all of the alternatives would have significant impacts relative to operational emissions of SO_2*, PM10, and PM2.5; and* operational concentrations of NO_2, *PM10, and PM2.5* ~~and operational concentrations of SO_2~~. As indicated in the impacts discussion above, the vast majority (over 95 percent) of the emissions contributing to those significant impacts (i.e., causing exceedances of the applicable 1-hour CAAQS and NAAQS) would occur from aircraft during takeoff. Other than potential future improvements in aircraft engine technology and associated reductions in air pollutant emissions, there are no feasible means to mitigate emissions during

aircraft takeoff because the only measures are related to aircraft operational options, such as reduced thrust take-off, which are at the sole discretion of the pilot. However, as noted above, LAWA is committed to mitigating operational air quality impacts to the maximum extent feasible. The specific measures (i.e., MM-AQ-3, Transportation-Related Mitigation Measures, and MM-AQ-4, Operations-Related Mitigation Measures) described in Section 4.2.5 would also be applied to the SPAS project. ~~Although these measures would not mitigate operational impacts to a level that is less than significant, they would reduce impacts associated with the SPAS alternatives to the maximum extent feasible.~~ *To address operational air quality impacts associated with Alternatives 1 through 9, the following mitigation measures specific to SPAS are proposed:*

- ***MM-AQ (SPAS)-2. Additional Measures to Supplement the LAX Master Plan Mitigation Plan for Air Quality - Transportation-Related Mitigation Measures (Alternatives 1 through 9).***

  For purposes of SPAS, LAWA will expand the existing LAX Master Plan Mitigation Plan for Air Quality Transportation-Related Mitigation Measures to include the following specific actions:

  - *LAWA will develop an information technology system that LAWA employees and the general public can utilize with consumer electronics that will provide real-time information regarding local and regional traffic conditions for travel to and from LAX.*
  - *LAWA will incorporate quick entry and exit parking systems in the project level design of future parking lots/structures associated with the SPAS project.*
  - *LAWA will include advanced signage in the design of future parking structures that could advise airport users of available parking spaces within the structure.*

- ***MM-AQ (SPAS)-3. Additional Measures to Supplement the LAX Master Plan Mitigation Plan for Air Quality - Operations-Related Mitigation Measures (Alternatives 1 through 9).***

  For purposes of SPAS, LAWA will expand the existing LAX Master Plan Mitigation Plan for Air Quality Operations-Related Mitigation Measures to include the following specific actions:

  - *Although the SPAS project does not alter air cargo handling at LAX, LAWA will provide the appropriate electrical infrastructure for those cargo handling tenants that have a need for such facilities and request them from LAWA. LAWA will monitor the development of electric truck engines and the design standards for these engines and associated charging infrastructure. The selection of appropriate infrastructure for installation at LAX will be made when air cargo facilities are updated.*
  - *LAWA will require the use of electric lawn mowers and leaf blowers, as these units become available for commercial use, for landscape maintenance associated with the SPAS project.*
  - *LAWA will require the conversion of sweepers to alternative fuels or electric power for ongoing airfield and roadway maintenance. In the 2006 GSE inventory, two of ten sweepers were electric powered and one was either CNG or LPG fueled. HEPA filters will be installed on airport sweepers where the use of HEPA filters is technologically and financially feasible and does not pose a safety hazard to airport operations.*
  - *LAWA will conduct a comprehensive GSE inventory update to identify and assess the current fuel type composition of GSE operating at LAX, to help to guide next steps in supporting and encouraging the use of alternative fueled GSE at LAX.*

When the specific elements of the SPAS project are implemented, additional project-specific mitigation measures may be identified to further reduce air quality impacts.

11. The first sentence of the second paragraph on page 4-179 of the Draft EIR is hereby revised as follows:

    Within the north airfield, this vegetation association occurs on a long narrow remnant slope along the northern edge of the north airfield, with component native species including ~~bush lupine (*Lupinus chamissonis*), coast buckwheat (*Eriogonum parvifolium*),~~ *deerweed (Acmispon glaber), beach evening primrose (Camissonia cheiranthifolia), annual bur-sage (Ambrosia acanthicarpa), white everlasting (Pseudognaphalium canescens), and* telegraph weed (*Heterotheca grandiflora*), and non-native species including *wavy sea lavender (Limonium perezii), filaree (Erodium spp.), pampas grass (Cortadaria selloana), fountain grass (Pennisetum setaceum), veldt grass (Ehrharta spp.), hottentot fig (Carpobrotus edulis), English plantain (Plantago lanceolata), wild oats (Avena fatua),* yellow starthistle (*Centaurea solstitialis*), summer mustard (*Brassica geniculata*), and acacia (*Acacia cyclops* and *A. retinoides*).

12. The third sentence of the third paragraph on page 4-185 of the Draft EIR is hereby revised as follows:

    Subsequent surveys did not detect any additional sensitive species; however, wildlife species previously detected are assumed to still occur, with the exception of the ~~San Diego~~ *Riverside* fairy shrimp, spadefoot toad, and San Diego black-tailed jackrabbit, as discussed below.

13. The first sentence of the fifth paragraph on page 4-199 of the Draft EIR is hereby revised as follows:

    As indicated in Section 4.3.2.3, the ~~analysis of indirect effects from~~ *discussion of existing conditions and biological resource sensitivity related to* light emissions, air pollutant emissions, and noise is based upon the ~~evaluation~~ *information* contained within the LAX Master Plan EIR, which is incorporated by reference into this EIR.

14. The paragraph under the heading "Ground Support Equipment and Auxiliary Power Units" on page 4-390 of the Draft EIR is hereby revised as follows:

    Data on the specific GSE types and times-in-mode[1] used for servicing several common aircraft types were obtained from a survey at LAX. ~~Although operations of APUs are expected to contribute to GHG emissions, EDMS does not estimate CO_2 emissions or fuel consumption; therefore, APUs are not included in the emissions inventory.~~ Default GSE information included in EDMS, along with emission factors taken from the CARB OFFROAD2007 model,[2,3] were used to supplement the site-specific data. The use of alternative-fueled GSE (e.g., gasoline- and propane-fueled GSE) under baseline conditions was also determined. The future (2025) year inventories of alternative-fueled GSE were based on these evaluations; the annual operating hours for the GSE in the future year inventories were scaled upwards based on the ratio of landing/takeoff operations in 2025 and 2009.

    GHG emissions were estimated from operation of APUs when an aircraft is on the ground with its engines shutdown. APUs burn Jet A fuel and create exhaust emissions like the engines that power flight. EDMS does not estimate GHG emissions from APUs, nor does it estimate fuel usage from APUs. As a result, it was necessary to estimate GHG emissions separately from EDMS.

    EDMS assigns APUs to specific airframes; therefore, it was possible to identify the types of APUs used by aircraft at the airport. A 1995 report entitled Technical Data to Support FAA's Advisory Circular on Reducing Emissions from Commercial Aviation[3a] contains fuel flow data that were used to translate an APU's minutes of operation per landing/takeoff operation (LTO) into fuel consumption data. Professional judgment was used to assign APUs from the 1995 report when there was not an exact match with the type of APU assigned in EDMS. Although the 1995 report was never finalized by the FAA and would therefore only contain draft fuel flow values, these values were used because APU fuel consumption data are otherwise not readily available.

Total annual fuel consumption was ultimately calculated from each aircraft's annual LTOs, the surrogate APU's fuel flow (pounds per hour), and the APU operating time per LTO. A density of 6.74 pounds per gallon was assumed, which is the average density from the ASTM International Standard for Jet A (Specification D1655-04a).[3b] The density was used to convert the fuel flow data from pounds to gallons. Emission factors for Jet A were obtained from The Climate Registry's 2012 Climate Registry Default Emission Factors.[3c]

[1] Time-in-mode is the time that an emission source spends in a specific mode of operation.

[2] California Air Resources Board, OFFROAD2007 Model, Available: http://www.arb.ca.gov/msei/offroad/offroad.htm.

[3] Although CARB no longer maintains the OFFROAD2007 model for GSE and has replaced it with the category-specific emission inventory models and databases, the 2011 Inventory Model for In-Use Off-Road Equipment (Construction, Industrial, Ground Support, and Oil Drilling), available at http://www.arb.ca.gov/msei/categories.htm#offroad_motor_vehicles, does not estimate GHG emissions. As a result, OFFROAD2007 was used to estimate emissions of CO2, CH4, and N2O from GSE.

	2,205,133	***22,984***	***82,486***	***2,310,602***	

Notes:

Totals may not add due to rounding.

1 CO_2e = carbon dioxide equivalent
2 CO_2e emissions are determined by multiplying the individual pollutant emissions by its respective GWP. The GWPs used in this analysis are from the IPCC's Second Assessment Report (1995). The GWP for CH_4 is 21 and the GWP for N_2O is 310.
3 CO_2 = carbon dioxide
4 CH_4 = methane
5 N_2O = nitrous oxide
6 CH_4 and N_2O emissions were estimated from the Los Angeles World Airports GHG Emissions Inventory (CDM, 2008).
7 EDMS does not provide GHG emissions or fuel consumption data for APUs; therefore, GHG emissions cannot be estimated.

Source: CDM Smith, 2012.

16. The third sentence of the first paragraph on page 4-398 of the Draft EIR is hereby revised as follows:

> As shown above in **Table 4.6-2**, approximately ~~30~~ *32* percent of the total GHG emissions in baseline conditions for SPAS are associated with aircraft *and ground support* operations and another ~~69~~ *68* percent of the total GHG emissions are associated with on-airport and off-airport vehicle travel *and parking*.

17. The third bullet on page 4-402 of the Draft EIR is hereby revised as follows:

- **LAX Master Plan Community Benefits Agreement; X.M., Limits on Diesel Idling.**

  This provision requires LAWA to prohibit idling or queuing of diesel-fueled vehicles and equipment for more than ten consecutive minutes on-site*, unless CARB adopts a stricter standard, in which case LAWA shall enforce that standard*. This requirement would be included in specifications for any SPAS alternative requiring on-site construction. *Subsequent to the adoption of the CBA, CARB has adopted a five-minute idling limit for diesel vehicles and equipment, so that limit is applicable to the SPAS alternatives.*

18. The first sentence of the last paragraph on page 4-404 of the Draft EIR is hereby revised as follows:

> On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 1 would be approximately ~~13.06~~ *12.86* percent less than the per capita (per passenger) GHG emissions for baseline conditions.

19. Table 4.6-6 on pages 4-405 and 4-406 of the Draft EIR has been revised. Please see the following revised table.

20. The first sentence of the third paragraph on page 4-407 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 2 would be approximately ~~13.69~~ *13.47* percent less than the per capita (per passenger) GHG emissions for baseline conditions.

21. The first sentence of the second paragraph on page 4-408 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 3 would be approximately ~~13.32~~ *13.11* percent less than the per capita (per passenger) GHG emissions for baseline conditions.

22. The first sentence of the first paragraph on page 4-409 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 4 would be approximately ~~14.29~~ *14.06* percent less than the per capita (per passenger) GHG emissions for baseline conditions.

23. The first sentence of the fourth paragraph on page 4-409 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 5 would be between approximately ~~13.05~~ *12.84* and ~~15.00~~ *14.76* percent less than the per capita (per passenger) GHG emissions for baseline conditions, depending on which set of ground access improvements this alternative is paired with.

24. The first sentence of the second paragraph on page 4-410 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 6 would be between approximately ~~13.44~~ *13.23* and ~~15.40~~ *15.15* percent less than the per capita (per passenger) GHG emissions for baseline conditions, depending on which set of ground access improvements this alternative is paired with.

25. The first sentence of the last paragraph on page 4-410 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 7 would be between approximately ~~13.19~~ *12.99* and ~~15.15~~ *14.91* percent less than the per capita (per passenger) GHG emissions for baseline conditions, depending on which set of ground access improvements this alternative is paired with.

26. The first sentence of the last paragraph on page 4-411 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 8 would be between approximately ~~14.80~~ *14.56* and ~~15.61~~ *15.35* percent less than the per capita (per passenger) GHG emissions for baseline conditions, depending on which set of airfield improvements this alternative is paired with.

27. The first sentence of the third paragraph on page 4-412 of the Draft EIR is hereby revised as follows:

    On a per capita (per passenger) basis, the GHG emissions associated with implementation of Alternative 9 would be between approximately ~~14.83~~ *14.59* and ~~15.64~~ *15.39* percent less than the per capita (per passenger) GHG emissions for baseline conditions, depending on which set of airfield improvements this alternative is paired with.

    asures would reduce TAC emissions associated with all of the SPAS alternatives.

Table 4.6-6

Incremental Changes in GHG Emissions Compared to Baseline Conditions

Source	Baseline[1] $MTCO_2e$/year[4]	Incremental Increase or Decrease Compared to Baseline: Alt. 1 $MTCO_2e$/year[4]	Alt. 2 $MTCO_2e$/year[4]	Alt. 3 $MTCO_2e$/year[4]	Alt. 4 $MTCO_2e$/year[4]	Alt. 5[2] $MTCO_2e$/year[4]	Alt. 6[2] $MTCO_2e$/year[4]	Alt. 7[2] $MTCO_2e$/year[4]	Alt. 8[3] $MTCO_2e$/year[4]	Alt. 9[3] $MTCO_2e$/year[4]

Table 4.6-6

Incremental Changes in GHG Emissions Compared to Baseline Conditions

Notes:

[1] Emissions totals may not add due to rounding.
[2] Alternatives 5 through 7 focus primarily on airfield improvements and related terminal and roadway improvements. Those improvements are compatible with the ground access improvements under Alternatives 1, 2, 8, and 9. The emissions presented relative to airfield operations (i.e., aircraft, APU, and GSE) under Alternatives 1, 2, 5, 6, and 7 are specific to characteristics of each of these alternatives; however, the non-airfield emissions (i.e., roadways, parking, stationary, and off-airport) shown for Alternatives 5 through 7 reflect the range of those types of emissions for Alternatives 1, 2, 8, and 9. The total emissions for Alternatives 5 through 7 would fall within the range shown for each, depending on which set of ground access improvements is assumed. The emissions presented relative to both airfield and non-airfield operations for Alternatives 3 and 4 are specific to the characteristics of each of these alternatives, which still provide a basis for comparison with the other alternatives.
[3] Alternatives 8 and 9 focus primarily on ground access improvements; however, those improvements are compatible with the airfield improvements, and related terminal and roadway improvements, under Alternatives 1, 2, 5, 6, and 7. The emissions presented relative to non-airfield operations (i.e., roadways, parking, stationary, and off-airport) under Alternatives 1, 2, 8, and 9 are specific to characteristics of each of these alternatives; however, the airfield emissions (i.e., aircraft, APU, and GSE) shown for Alternatives 8 and 9 reflect the range of those types of emissions for Alternatives 1, 2, 5, 6, and 7. The total emissions for Alternatives 8 and 9 would fall within the range shown for each, depending on which set of airfield/terminal improvements is assumed. The emissions presented relative to both airfield and non-airfield operations for Alternatives 3 and 4 are specific to the characteristics of each of these alternatives, which still provide a basis for comparison with the other alternatives.
[4] $MTCO_2e$/year = metric tons carbon dioxide equivalent per year
[5] GSE operations and activity levels are assumed to be directly related to aircraft activity levels; therefore, GSE emissions are the same for all future alternatives since aircraft activity is the same for all alternatives in 2025.

Source: CDM Smith, 2012.

28. The second bullet on page 4-443 of the Draft EIR is hereby revised as follows:

- **LAX Master Plan Community Benefits Agreement; X.M., Limits on Diesel Idling.**

  This provision requires LAWA to prohibit idling or queuing of diesel-fueled vehicles and equipment for more than ten consecutive minutes on-site*, unless CARB adopts a stricter standard, in which case LAWA shall enforce that standard*. This requirement would be included in specifications for any SPAS alternative requiring on-site construction. *Subsequent to the adoption of the CBA, CARB has adopted a five-minute idling limit for diesel vehicles and equipment, so that limit is applicable to the SPAS alternatives.*

29. The note in Table 4.7.1-10 on page 4-479 of the Draft EIR is hereby revised as follows:

Mitigation measures are LAX Master Plan Mitigation Measures MM-AQ-1, MM-AQ-2, MM-AQ-3, MM-AQ-4*;* ~~and~~ components from Section X, Air Quality, of the LAX Master Plan Community Benefits Agreement~~.~~*; and SPAS-specific mitigation measures.*

30. The fifth sentence of the first paragraph on page 4-481 of the Draft EIR is hereby revised as follows:

Regarding acute non-cancer health hazard impacts, the comprehensive mitigation program developed as part of the LAX Master Plan Final EIR and the specific means for implementing the mitigation measures, described in Section 4.2.5*, in addition to the SPAS-specific mitigation measures identified in Section 4.2.7,* provide the most comprehensive means of ensuring impacts will be reduced to the maximum extent feasible.

31. The first sentence of the second paragraph on page 4-481 of the Draft EIR is hereby revised as follows:

LAX Master Plan mitigation measures *and SPAS-specific mitigation measures* would reduce TAC emissions associated with all of the SPAS alternatives.

32. The following text is hereby added to page 4-687 of the Draft EIR following the first bullet:

- ***MM-LU-3: Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn.***

  Current studies of aircraft noise and the ability of children to learn have not resulted in the development of a statistically reliable predictive model of the relative effect of changes in aircraft noise levels on learning. Therefore a comprehensive study shall be initiated by LAWA to determine what, if any, measurable relationship may be present between learning and the disruptions caused by aircraft noise at various levels. An element of the evaluation shall be the setting of an acceptable replacement threshold of significance for classroom disruption by both specific and sustained aircraft noise events.[533a]

[533a] *A study entitled Evaluating the Impact of Aviation Noise on Learning is currently underway to determine when aircraft noise impacts student learning and what noise metric(s) best defines impact on learning. The final study is expected to be completed mid- to late-2013. The implementation of LAX Master Plan Mitigation Measure MM-LU-4 is contingent upon the results of this study.*

- ***MM-LU-4: Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise.***

  Prior to completion of the study required by Mitigation Measure MM-LU-3, Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn, and within six months of the commissioning of any relocated runways associated with

implementation of the LAX Master Plan, LAWA shall conduct interior noise measurements at schools that could be newly exposed to noise levels that exceed the interim LAX interior noise thresholds for classroom disruption of 55 dB Lmax, 65 dB Lmax, or 35 Leq(h), as presented in Section 4.1 Noise, of the Final EIS/EIR. All school classroom buildings (except those within schools subject to an avigation easement) that are found through the noise measurements to exceed the interim interior noise thresholds, as compared to the 1996 baseline conditions presented in the Final EIS/EIR, would become eligible for soundproofing under the ANMP.

Upon completion of the study required by Mitigation Measure MM-LU-3 and acceptance of its results by peer review of industry experts, any schools found to exceed a newly established threshold of significance for classroom disruption based on comparison with 1996 baseline conditions due to implementation of the LAX Master Plan, shall be eligible for participation in the ANMP administered by LAWA, unless they are subject to an existing avigation easement. A determination of which schools become eligible will be made following application of the new threshold based on measured data.

33. The last sentence of footnote 570 on page 4-796 of the Draft EIR is hereby revised as follows:

This is evidenced by the fact that the 65 CNEL contours for LAX under current and future conditions are generally smaller than the 65 CNEL for LAX from two decades ago~~ even though the number of daily aircraft operations back then were comparatively lower~~.

34. The following text is hereby added following the first full paragraph on page 4-828 of the Draft EIR:

Also, as part of the MMRP, LAWA adopted three mitigation measures pertaining to Land Use and designed to address the ANMP and aircraft noise impacts and classroom disruption. These mitigation measures are also applicable to the SPAS alternatives and were considered in the aircraft noise analysis herein.

- ***MM-LU-1. Implement Revised Aircraft Noise Mitigation Program.***

  LAWA shall expand and revise the existing ANMP in coordination with affected neighboring jurisdictions, the state, and the FAA.[585a] The expanded Program shall mitigate land uses that would be rendered incompatible by noise impacts associated with implementation of the LAX Master Plan, unless such uses are subject to an existing avigation easement and have been provided with noise mitigation funds. LAWA shall accelerate the ANMP's timetable for achieving full compatibility of all land uses within the existing noise impact area pursuant to the requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6) and current Noise Variance. With the exception of a possible new interior noise level standard for schools to be established through the study required by Mitigation Measure MM-LU-3, Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn, the relevant performance standard to achieve compatibility for land uses that are incompatible due to aircraft noise (i.e., residences, schools, hospitals and churches) is adequate acoustic performance (sound insulation) to ensure an interior noise level of 45 CNEL or less. As an alternative to sound insulation, incompatible property may also achieve compatibility if the incompatible use is converted to a noise-compatible use.

  LAWA shall revise the ANMP to incorporate new, or expand existing measures, including, but not necessarily limited to, the following:

  - *Continued implementation of successful programs to convert existing incompatible land uses to compatible land uses through sound insulation of structures and the acquisition and conversion of incompatible land use to compatible land use.*

- *Ongoing monitoring and provision of annual updates in support of the requirements of the current LAX Noise Variance pursuant to the California Airport Noise Standards, with the updates made available (upon request) to affected local jurisdictions, the ALUC of Los Angeles County, and other interested parties.*
- *Continue the current pre- and post-insulation noise monitoring to ensure achievement of interior noise levels at or below 45 CNEL.*
- *Accelerated rate of land use mitigation to eliminate noise impact areas in the most timely and efficient manner possible through:*
  - *Increased annual funding by LAWA for land use mitigation;*
  - *Reevaluating avigation easements requirements with sound insulation mitigation;*
  - *Provision by LAWA of additional technical assistance, where needed, to local jurisdictions to support more rapid and efficient implementation of their land use mitigation programs;*
  - *Reduction or elimination, to the extent feasible, of structural and building code compliance constraints to mitigation of sub-standard housing.*
- *Revised criteria and procedures for selection and prioritization of properties to be sound insulated or acquired in consideration of the following:*
  - *Insulation or acquisition of properties within the highest CNEL measurement zone;*
  - *Acceleration of the fulfillment of existing commitments to owners wishing to participate within the current ANMP boundaries prior to proceeding with newly eligible properties;*
  - *Insulation or acquisition of incompatible properties with high concentrations of residents or other noise-sensitive occupants such as those housed in schools or hospitals.*
- *Amend ANMP to include libraries as noise-sensitive uses eligible for aircraft noise mitigation.*

Upon completion of acquisition and/or soundproofing commitment under the current Program, expand the boundaries of the ANMP as necessary over time. LAWA will continue preparing quarterly reports that monitor any expansion of the 65 CNEL noise contours beyond the current ANMP boundaries. Based upon these quarterly reports, LAWA will evaluate and adjust the ANMP boundaries, periodically as appropriate, so that as the 65 CNEL noise contours expand, residential and noise-sensitive uses newly impacted by 65 CNEL noise levels would be included within the Program.

[585a] *Subsequent to the approval of the LAX Master Plan, LAWA completed a revised Aircraft Noise Mitigation Program in accordance with the provisions of LAX Master Plan Mitigation Measure MM-LU-1. LAWA continues to implement the ANMP and operate under a variance to achieve compatibility of all land uses within the noise impact area. In addition, LAWA has removed the requirement for an avigation easement in most cases, and has identified places of worship eligible for soundproofing.*

- ***MM-LU-3. Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn.***

  Current studies of aircraft noise and the ability of children to learn have not resulted in the development of a statistically reliable predictive model of the relative effect of changes in

aircraft noise levels on learning. Therefore, a comprehensive study shall be initiated by LAWA to determine what, if any, measurable relationship may be present between learning and the disruptions caused by aircraft noise at various levels. An element of the evaluation shall be the setting of an acceptable replacement threshold of significance for classroom disruption by both specific and sustained aircraft noise events.[585b]

[585b] *A study entitled Evaluating the Impact of Aviation Noise on Learning is currently underway to determine when aircraft noise impacts student learning and what noise metric(s) best defines impact on learning. The final study is expected to be completed mid- to late-2013. The implementation of LAX Master Plan Mitigation Measure MM-LU-4 is contingent upon the results of this study.*

- ***MM-LU-4. Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise.***

  Prior to completion of the study required by Mitigation Measure MM-LU-3, Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn, and within six months of the commissioning of any relocated runway associated with implementation of the LAX Master Plan, LAWA shall conduct interior noise measurements at schools that could be newly exposed to noise levels that exceed the interim LAX interior noise thresholds for classroom disruption of 55 dBA Lmax, 65 dBA Lmax, or 35 Leq(h), as presented in Section 4.1, Noise, of this Final EIS/EIR. All school classroom buildings (except those within schools subject to an avigation easement) that are found through the noise measurements to exceed the interim interior noise thresholds, as compared to the 1996 baseline conditions presented in the Final EIS/EIR, would become eligible for soundproofing under the ANMP.

  Upon completion of the study required by Mitigation Measure MM-LU-3 and acceptance of its results by peer review of industry experts, any schools found to exceed a newly established threshold of significance for classroom disruption based on comparison with 1996 baseline conditions due to implementation of the LAX Master Plan, shall be eligible for participation in the ANMP administered by LAWA, unless they are subject to an existing avigation easement. A determination of which schools become eligible will be made following application of the new threshold based on measured data.

35. The seventh sentence of the first paragraph under the heading "Airport Facilities" on page 4-930 of the Draft EIR is hereby revised as follows:

    Alternatives 1, 2, 3, 5, 6, and 7 include high-speed *exits* ~~exists~~ for arriving aircraft to exit from the runway and transition onto a taxiway that directs aircraft away from noise-sensitive uses located to the north.

36. The last sentence of the first paragraph under the heading "Curbside Impacts" on page 4-1139 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-1, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

37. The last sentence of the second paragraph under the heading "CTA Roadway Link Impacts" on page 4-1140 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-2, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

38. The last sentence of the first paragraph under the heading "Curbside Impacts" on page 4-1140 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-1, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

39. The last sentence of the second paragraph under the heading "CTA Roadway Link Impacts" on page 4-1149 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-2, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

40. The last sentence of the first paragraph under the heading "Curbside Impacts" on page 4-1149 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-1, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

41. The last sentence of the second paragraph under the heading "CTA Roadway Link Impacts" at the top of page 4-1150 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-2, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

42. The last sentence of the first paragraph under the heading "Curbside Impacts" on page 4-1150 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-1, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

43. The last sentence of the first paragraph under the heading "CTA Roadway Link Impacts" at the bottom of page 4-1150 of the Draft EIR is hereby revised as follows:

    Mitigation Measure MM-ST*(OA)* (SPAS)-2, defined in Section 4.12.1.10.2, is proposed to mitigate this impact.

44. Table 4.12.1-40 on page 4-1167 of the Draft EIR has been revised. Please see the following revised table.

45. The following text under the heading "Recommended Mitigation Program" on page 4-1178 of the Draft EIR is hereby revised as follows:

    - **MM-ST*(OA)* (SPAS)-1. Relocate Existing Taxi Loading Zone at TBIT (Alternatives 1, 2, 4, 8, and 9).**

      LAWA will relocate the existing taxi loading zone at TBIT to the curve located between TBIT and Terminal 4. This change would provide a larger passenger loading area for the private vehicles along the TBIT inner curbside.

    - **MM-ST*(OA)* (SPAS)-2. Change Departures and Arrivals Level Commercial Vehicle Curbside Operations (Alternatives 1, 2, 4, 8, and 9).**

      LAWA will implement operational changes to commercial modes such that SPAS-related impacts to roadway links would not exceed the threshold of significance. LAWA will determine at the time of implementation which commercial mode(s) should be relocated. LAWA will consider options such as changing hotel and rental car shuttle operations from their current dual loop operation to a single loop operation on the departures and arrivals level curbsides respectively, while the employee shuttle operation could be changed from its existing single level operation on the departures level to a dual loop operation.

46. The last paragraph on page 4-1178 of the Draft EIR is hereby revised as follows:

> **Table 4.12.1-44** shows the results of the analysis for the proposed mitigation on the TBIT arrivals level inner curbsides while **Table 4.12.1-45** provides the results for the proposed mitigation of the CTA roadways. As indicated in **Table 4.12.1-44**, implementation of Mitigation Measure MM-ST*(OA)* (SPAS)-1, Relocate Existing Taxi Loading Zone at TBIT, would reduce impacts to curbsides associated with Alternatives 1, 2, 4, 8, and 9 to a level that is less than significant. As indicated in **Table 4.12.1-45**, implementation of Mitigation Measure MM-ST*(OA)* (SPAS)-2, Change Departures and Arrivals Level Commercial Vehicle Curbside Operations, would reduce impacts to all departures and arrivals level roadways under Alternatives 1, 2, 4, 8, and 9 in the future (2025) condition to a level that is less than significant. The results of the analysis are presented in Appendix K1, *On-Airport Transportation*.

Table 4.12.1-40

Public Parking Demand - Capacity

		Baseline (2009) Spaces			Future (2025) Spaces		Future (2025) Airport Parking Space Supply

Note:

Future (2025) Without Alternative V/C reported above was based on ICU Methodology. However, this intersection impact was determined based on CMA Methodology, where Future (2025) Without Alternative V/C was calculated as 0.698 (LOS B) and City of Los Angeles significant impact threshold is a V/C increase of 0.04 or greater for LOS C.

Note:

Future (2025) Without Alternative and With Alternative V/C reported above was based on ICU Methodology. Based on the City of El Segundo significance criteria, an intersection would only be impacted if the resulting LOS is E or F and the project-related traffic increase is greater than 0.02. This intersection was also analyzed based on City of Los Angeles CMA Methodology, where Future (2025) Without Alternative V/C was 0.504 (LOS A) and Future (2025) With Alternative V/C was 0.585 (LOS A). This intersection would not be impacted based on application of the significance criteria for both cities.

60. The second paragraph on page 4-1283 of the Draft EIR is hereby revised as follows:

> **Table 4.12.2-26** identifies the impacts associated with each alternative following the implementation of the recommended SPAS-specific mitigation measures identified in Section 4.12.2.7.2. As illustrated in **Table 4.12.2-26**, Alternative 1, 2, 3, 4, 8, and 9 would all have significant and unavoidable impacts to intersections when compared to either Baseline (2010) Without Alternative conditions or Future (2025) conditions. When comparing to Baseline (2010) Without Alternative conditions, Alternative 3 would have the greatest number of significant, unavoidable impacts (11 intersections) after mitigation, whereas Alternatives 1 and 2 would have the fewest (1 intersection each). When comparing to Future (2025) conditions, Alternatives 8 and 9 would have the greatest number of significant, unavoidable impacts (~~44~~ *42* intersections) after mitigation, and Alternative 3 would have the fewest (*37* ~~38~~). Alternatives 1 and 2 would have *38* ~~40~~ significant and unavoidable impacts after mitigation. Alternative 4 would have significant, unavoidable impacts to *38* ~~40~~ intersections after mitigation.

61. Table 4.12.2-26 on page 4-1284 of the Draft EIR has been revised. Please see the following revised table.

Table 4.12.2-26

Summary of Off-Airport Transportation Impacts After Mitigation

	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 8	Alt. 9
Impacts Relative to Baseline (2010) Without Alternative Conditions						
Intersections	SU(1)	SU(1)	SU(11)	SU(2)	SU(2)	SU(2)
CMP Facilities - Arterial Monitoring Intersections	LS	LS	SU(1)	LS	LS	LS
CMP Facilities - Freeway Monitoring Stations	LS	LS	LS	LS	LS	LS
CMP Facilities - Transit Demand	LS	LS	LS	LS	LS	LS
Impacts Relative to Future (2025) Conditions						
Intersections	SU(*38*~~39~~)	SU(*38*~~39~~)	SU(37)	SU(*38*~~40~~)	SU(*42*~~44~~)	SU(*42*~~44~~)
CMP Facilities - Arterial Monitoring Intersections	SU(1)	SU(1)	SU(2)	SU(2)	SU(1)	SU(1)
CMP Facilities - Freeway Monitoring Stations	SU(3)	SU(3)	SU(3)	SU(3)	SU(3)	SU(3)
CMP Facilities - Transit Demand	LS	LS	LS	LS	LS	LS
Construction Impacts[1]	SU	SU	SU	SU	SU	SU

Notes:

LS = Less Than Significant Impact
SU = Significant Unavoidable Impact

Numbers in parentheses indicate the number of affected intersections/facilities.

[1] The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. It would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods. As such, the total number of intersections that may be temporarily significantly impacted during construction cannot be determined at this time.

Source: Fehr & Peers, 2012.

62. The fourth bullet on page 4-1288 of the Draft EIR is hereby revised as follows:

- **76. Inglewood Avenue and Lennox Boulevard (Alternative 3).**

  The addition of a second through lane on both the northbound and southbound approaches would fully mitigate the project impact at this location; however, this widening of the northbound and southbound approaches would require narrowing of existing sidewalk on ~~Imperial Highway~~ *Inglewood Avenue*, resulting in policy infeasibility and impacts to alternative modes of transportation. No other feasible improvements have been identified. Therefore, this impact would remain significant and unavoidable under Alternative 3.

63. The second bullet on page 4-1291 of the Draft EIR is hereby revised as follows:

- **10. Arbor Vitae Street and Aviation Boulevard (Alternatives 1-2, 3, 4, 8, and 9).**

  The mitigation measure at this location is to widen the eastbound approach to the intersection of Arbor Vitae Street and Aviation Boulevard to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes and one right-turn lane. Implementation of this improvement can be accomplished within the existing right-of-way and would fully mitigate the significant impacts under the Alternatives 1-2, 4, 8, and 9. Under Alternative 3, this modification to the eastbound intersection approach would not provide effective mitigation and no other feasible improvements have been identified to mitigate the impacts under Alternative 3. Therefore, this impact would remain significant and unavoidable under Alternative 3.

  ~~A component of the LAX Master Plan would include widening and reconfiguration of both streets at the subject intersection in order to achieve the following lane configuration: northbound one left-turn lane, two through lanes, and one right-turn lane; southbound one left-turn lane, one through lane, and one shared through/right-turn lane; eastbound one left-turn lane, two through lanes, and one shared through/right-turn lane; and westbound two left-turn lanes, two through lanes, and one right-turn lane. Implementation of this improvement would fully mitigate the significant impacts under Alternatives 1-2, 4, 8, and 9, however could not be accommodated within the existing right-of-way and would require removal of existing business (economic and policy infeasibility) and may create additional environmental impacts associated with demolition and construction, such as noise, air quality and therefore is considered infeasible. No feasible physical improvements have been identified. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 4, 8 and 9.~~

  ~~Under Alternative 3, the above improvements were found to be ineffective in improving the project impacts at this location; therefore, it is not recommended. The Westchester Community Plan, an element of the City's General Plan, includes policies to improve Arbor Vitae Street west of Aviation Boulevard and Aviation Boulevard south of Arbor Vitae Street south of Aviation Boulevard to provide six through lanes. To fully mitigate the impact under Alternative 3 would require the provision of dual left-turn lanes on the northbound approach, which may conflict with the cross-section adopted in the City's Westchester Community Plan, and therefore, may not be feasible. No other feasible improvements have been identified to mitigate the project impact under Alternative 3.~~

  ~~In summary, no feasible improvements are available to fully mitigate the project impact under Alternatives 1-2, 3, 4, 8, and 9 without additional right-of-way acquisition. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.~~

64. The first paragraph under the fourth bullet on page 4-1293 of the Draft EIR is hereby revised as follows:

- **27. La Tijera Boulevard and Centinela Avenue (Alternatives 1-2, 4, 8, and 9).**

  The addition of a second southbound left-turn lane would fully mitigate the project impact at this location. However, this improvement could not be accommodated

with the existing right-of-way and would require narrowing of existing sidewalks on La Tijera Boulevard, which would result in policy infeasibility and impacts to alternative modes of transportation. No *other* feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable.

65. The following sentence is hereby added to the end of the second paragraph of the fourth bullet on page 4-1293 of the Draft EIR:

If permitted by the FAA, LAWA *will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location and the impact is considered to be significant and unavoidable.*

66. The last paragraph of the third bullet on page 4-1294 of the Draft EIR (Intersection 36. La Cienega Boulevard and Century Boulevard (Alternatives 1-2, 3, 4, 8, and 9)) is hereby revised as follows:

The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. *In addition, if permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location.* No other feasible improvements have been identified to fully mitigate the project impact under Alternatives 1-2, 3, 4, 8, and 9. Therefore, the impact at this location would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

67. The fifth bullet on page 4-1295 of the Draft EIR is hereby revised as follows:

- **52. Inglewood Avenue and El Segundo Boulevard (Alternative 3).**

The addition of a separate southbound right-turn lane and additional westbound through lane would fully mitigate the project impact at this location. Due to existing right-of-way and physical constraints that would require removal of existing business on El Segundo Boulevard and narrowing of the existing sidewalk on Inglewood Avenue north of El Segundo Boulevard, these improvements are considered infeasible. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No feasible improvements have been identified. Therefore, this impact would remain significant and unavoidable under Alternative 3.

68. The fifth bullet on page 4-1296 of the Draft EIR is hereby revised as follows:

- **63. Hawthorne Boulevard and Lennox Boulevard (Alternatives 1-2, 4, 8, and 9).**

The potential improvement evaluated at this location is to restripe the southbound approach to provide an additional left-turn lane and one additional through lane, which would require removal of the raised center median on Hawthorne Boulevard. The resulting southbound configuration would be two left-turn lanes, three through lanes, and one shared through/right-turn lane. This improvement would fully mitigate the identified impact; however, it could not be accommodated within the existing right-of-way and would require removal of existing business on Hawthorne Boulevard (economic and policy infeasibility) and create additional

environmental impacts associated with demolition and construction, such as noise, air quality, etc. Therefore, this improvement is considered infeasible. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 4, 8, and 9.

69. The sixth bullet on page 4-1297 of the Draft EIR is hereby revised as follows:

- **76. Inglewood Avenue and Lennox Boulevard (Alternatives 1-2, 3, 4, 8, and 9).**

  The addition of a second through lane on both the northbound and southbound approaches would fully mitigate the project impact at this location~~,~~; *however* ~~This~~ *this* widening of the northbound and southbound approaches would require narrowing of existing sidewalk on ~~Imperial Highway~~ *Inglewood Avenue*, resulting in policy infeasibility and impacts to alternative modes of transportation. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No other feasible improvements have been identified. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

70. The third bullet on page 4-1298 of the Draft EIR is hereby revised as follows:

- **86. La Brea Avenue/Overhill Avenue and Stocker Street (Alternatives 1-2, 3, 4, 8, and 9).**

  The potential improvement evaluated at this location would modify the southbound approach to provide additional through capacity by converting the southbound free right-turn lane to a shared through/right-turn lane, resulting in two left-turn lanes, two through lanes, and one shared through/right-turn lane. Implementation of this improvement could be accomplished within the existing right-of-way, but would remove the raised island on the northwest corner of the intersection. Because this improvement would only partially mitigate the project impact in certain peak hours but would worsen conditions in others, it is not recommended. To fully mitigate the impact at this location would require the provision of a southbound through lane, which is not feasible within the existing right-of-way and would require narrowing sidewalks on La Brea Avenue, which would result in policy infeasibility and impacts to alternative modes of transportation. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location.* No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

71. The fourth bullet on page 4-1298 of the Draft EIR is hereby revised as follows:

- **87. La Brea Avenue and Slauson Avenue (Alternatives 1-2, 3, 4, 8, and 9).**

  The potential improvement evaluated at this location is to restripe the southbound approach to provide one left-turn lane, two through lanes, and one shared through/right-turn lane and to eliminate the existing southbound right-turn overlap phase. Implementation of this improvement would partially mitigate the project impact at this location. *If permitted by the*

FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

72. The second bullet on page 4-1299 of the Draft EIR is hereby revised as follows:

- **93. La Cienega Boulevard and Stocker Street (Alternatives 1-2, 3, 4, 8, and 9).**

  Due to right-of-way and physical constraints at this intersection, no feasible improvements have been identified. It is noted that a recent study conducted for SCAG developed a grade separation concept design for La Cienega Boulevard at Stocker Street. Pending further study of these concepts to determine their feasibility, however, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9. If this grade separation concept becomes feasible, LAWA can provide fair share contribution to this improvement, subject to FAA approval, to fully mitigate the project impact at this location. *If permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location and the impact is considered to be significant and unavoidable.*

73. The third bullet on page 4-1299 of the Draft EIR is hereby revised as follows:

- **95. La Cienega Boulevard and 120th Street (Alternatives 1-2, 3, 4, 8, and 9).**

  The addition of a second southbound left-turn lane would fully mitigate the project impact at this location. However, this improvement could not be accommodated within the existing right-of-way, but would require removal of existing business on the east side La Cienega Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc. Therefore, this improvement is considered infeasible. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No feasible improvements have been identified *that would fully mitigate the identified impact*. Therefore, this impact would remain significant and unavoidable.

74. The second bullet on page 4-1301 of the Draft EIR is hereby deleted:

- ~~**114. Sepulveda Boulevard and Manchester Avenue (Alternatives 1-2, 3, 4, 8, and 9).**~~

  ~~The addition of a westbound right-turn lane would be the potential improvement to mitigate the project impact at this location. However, this improvement would result in an offset of more than four feet for the westbound through travel lanes, removal of street parking on the north side of Manchester Avenue east of Sepulveda Boulevard, and may conflict with the City's roadway classification standards for Manchester Avenue. This improvement would require further exploration with LADOT and may not be feasible. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would be significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.~~

  ~~If addition of the westbound right-turn lane becomes feasible, the project impact can be fully mitigated at this location under Alternatives 1-2, 3, 4, 8, and 9.~~

75. The fourth bullet on page 4-1301 of the Draft EIR is hereby revised as follows:

- **119. Ocean Avenue/Via Marina and Washington Boulevard (Alternatives 1-2, 3, 4, 8, and 9).**

  The potential improvement for this location would be restriping the westbound approach to provide a separate right-turn lane. Because it would not fully mitigate the project impact and because it would entail removal of approximately six on-street parking spaces, this improvement is not considered feasible. To fully mitigate the project impact at this location would require the provision of additional eastbound and westbound through lanes.

  However, these improvements would require widening of the eastbound and westbound approaches and departures, which would require removal of existing business on Washington Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore are considered infeasible. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

76. The third bullet on page 4-1304 of the Draft EIR is hereby revised as follows:

- **156. Walgrove Avenue and Washington Boulevard (Alternatives 1-2, 3, 4, 8, and 9).**

  This stop-controlled intersection meets the standard traffic signal warrants[715] recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines and the criteria for installation of a traffic signal under existing conditions. Installation of a signal would improve the traffic operations at this location and could fully mitigate the project impact. However, installation of a traffic signal at this location would be the responsibility of Culver City and, given the close proximity to upstream/downstream signals, may not be acceptable to Culver City. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, the impact at this location would be significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9. *If installation of a signal becomes feasible at this location, LAWA would provide a fair share contribution, subject to FAA approval, to this improvement, which would fully mitigate the project impact at this location.*

[715] This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. It estimates future development-generated traffic compared against a sub-set of the standard traffic signal warrants recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines. This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured, rather than forecast, traffic data and a thorough study of traffic and roadway conditions by an experienced engineer. Furthermore, the decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible local agency should undertake regular monitoring of actual traffic conditions and accident data, and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

77. The third bullet on page 4-1306 of the Draft EIR is hereby revised as follows:

- **173. Western Avenue and Imperial Highway (Alternatives 1-2, 4, 8, and 9).**

  The addition of a separate eastbound right-turn lane would fully mitigate the project impact at this location. However, this improvement would require additional right-of-way acquisition from private property on the southwest corner of this intersection, and would significantly disrupt that existing business due to loss of off-street parking spaces, which would result in economic and policy infeasibility. Therefore, this improvement is determined to be infeasible. *If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location.* No feasible improvements are available to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under Alternatives 1-2, 4, 8, and 9.

78. The fifth bullet on page 4-1310 of the Draft EIR is hereby revised as follows:

- **MM-ST (SPAS)-19. Modify the Intersection of Sepulveda Boulevard and Grand Avenue (Intersection 60) (Alternatives 1-2, 8, and 9).**

  ~~The mitigation measure for this location is to restripe the eastbound approach to provide additional right turn capacity. The resulting eastbound lane configuration would be one left-turn lane, one shared left-/through/right-turn lane, and one right-turn lane. This improvement would be a full mitigation for project impacts under the Future (2025) With Alternatives 1-2, 8, and 9 scenarios.~~ *The mitigation measure for this location is to restripe the westbound approach to provide additional left-turn capacity by restriping a through lane to a shared through/left-turn lane. Minor changes to the lane assignment signage would also be necessary. The resulting westbound lane configuration would be two left-turn lanes, one shared through/left-turn lane, one through lane and one right-turn lane. This improvement would be a full mitigation for project impacts under the Future (2025) With Alternatives 1-2, 8, and 9 scenarios.*

79. The additional mitigation measures listed below are hereby added following the second bullet on page 4-1313 of the Draft EIR:

- ***MM-ST (SPAS)-37. Modify the Intersection of Arbor Vitae Street and Aviation Boulevard (Intersection 10) (Alternatives 1-2, 4, 8, and 9).***

  The mitigation measure for this location is to widen the eastbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would fully mitigate the project impact under the Future (2025) With Alternatives 1-2, 4, 8, and 9 scenarios.

- ***MM-ST (SPAS)-38. Modify the Intersection of La Tijera Boulevard and Centinela Avenue (Intersection 27) (Alternatives 1-2, 4, 8, and 9).***

  The mitigation measure for this location is to provide a fair share contribution to the improvement of this intersection as part of a grade separation project that would also affect the adjacent section of La Cienega Boulevard, subject to FAA approval and should the grade separation project be found to be feasible and implementation pursued by the affected local agencies. In addition, if permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Because the grade separation project is in the early design and conceptual

planning stages, however, it is not fully defined nor adopted at this time and the impact at this location would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

- ***MM-ST (SPAS)-39. Fair Share Contribution to a Traffic Signal at the Intersection of Overland Avenue and Kelmore Street/Ranch Road (Intersection 153) (Alternative 3).***

  The mitigation measure for this location is to provide a fair share contribution to the installation of a traffic signal, subject to FAA approval and should it be implemented by the City of Culver City. Because it is uncertain that it will be implemented, however, the impact at this location would remain significant and unavoidable under Alternative 3.

- ***MM-ST (SPAS)-40. Fair Share Contribution to a Traffic Signal at the Intersection of Overland Avenue and Sawtelle Boulevard (Intersection 154) (Alternative 1-2, 3, 4, 8, and 9).***

  The mitigation measure for this location is to provide a fair share contribution to the installation of a traffic signal, subject to FAA approval and should it be implemented by the City of Culver City. Because it is uncertain that it will be implemented, however, the impact at this location would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

- ***MM-ST (SPAS)-41. Fair Share Contribution to a Traffic Signal at the Intersection of Walgrove Avenue and Washington Boulevard (Intersection 156) (Alternative 1-2, 3, 4, 8, and 9).***

  The mitigation measure for this location is to provide a fair share contribution to the installation of a traffic signal, subject to FAA approval and should it be implemented by the City of Culver City. Because it is uncertain that it will be implemented, however, the impact at this location would remain significant and unavoidable under Alternatives 1-2, 3, 4, 8, and 9.

- ***MM-ST (SPAS)-42. Contribute to ITS (Intelligent Transportation Systems) Improvements at 11 Study Intersections within the Jurisdiction of Los Angeles County (Intersections 27, 36, 52, 63, 76, 86, 87, 93, 95, 119, and 173) (Alternatives 1-2, 3, 4, 8, and 9).***

- *Los Angeles County Department of Public Works staff determined that improvements to the County's intelligent transportation systems (ITS) equipment would improve traffic operations where no feasible physical mitigation measures have been identified. As partial mitigation for the identified cumulative impacts, LAWA will make a monetary contribution to upgrading the County's ITS system at these intersections, if permitted by the FAA. Because the contribution to Los Angeles County is conditional pending approval by FAA and because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location and these impacts would remain significant and unavoidable.*

80. The first paragraph on page 4-1314 of the Draft EIR is hereby revised as follows:

A summary of the effectiveness of the proposed intersection mitigation measures under Future (2025) with Alternatives conditions is presented in **Table 4.12.2-33**, and a detailed listing for the impacted peak hours of these intersections is shown above in **Table 4.12.2-19**. As shown in **Tables 4.12.2-33** through **4.12.2-38**, under Future (2025) with Alternatives, there are *17* ~~16~~ fully mitigated intersections, 13 partially mitigated intersections, and *25* ~~27~~ intersections for which there are no feasible mitigation measures for a total of *38* ~~40~~ intersections with significant and unavoidable residual impacts under Alternative 1-2; there are 13 fully mitigated intersections, 15 partially mitigated intersections, and *22* ~~23~~ intersections for which there are no feasible mitigation measures for a total of *37* ~~38~~ intersections with significant and unavoidable residual impacts under Alternative 3; there are *13* ~~12~~ fully mitigated intersections, *16* ~~15~~ partially mitigated

intersections, and *22* ~~25~~ intersections for which there are no feasible mitigation measures for a total of *38* ~~40~~ intersections with significant and unavoidable residual impacts under Alternative 4; and there are *15* ~~14~~ fully mitigated intersections, 17 partially mitigated intersections, and *25* ~~27~~ intersections for which there are no feasible mitigation measures for a total of *42* ~~44~~ intersections with significant and unavoidable residual impacts under Alternatives 8 and 9. Under Alternative 1- 2, impacts at one CMP arterial monitoring intersection and three CMP freeway monitoring stations would be significant and unavoidable. Under Alternatives 3 and 4, impacts at two CMP arterial monitoring intersections and three CMP freeway monitoring stations would be significant and unavoidable. Under Alternatives 8 and 9, impacts at one CMP arterial monitoring intersection and three CMP freeway monitoring stations would be significant and unavoidable. Under each alternative, transit impacts would be less than significant.

	Number of Intersections with No Feasible Mitigation	14	11	~~22~~ *21*	~~13~~ *12*	12	19	~~9~~ *8*	13	~~22~~ *21*	11	13	~~24~~ *23*	11	13	~~24~~ *23*
	Number of Significantly Impacted Intersections after Mitigation			~~40~~ *38*		~~38~~ *37*			~~40~~ *38*			~~44~~ *42*			~~44~~ *42*	

Notes:

Full - Intersections that can be fully mitigated to a level less than significant with recommended mitigation measures.
Partial - Intersection operating conditions would be improved with recommended mitigation measures, however; would not be fully mitigated and would remain significant and unavoidable.
N.F.M. - No Feasible Physical Mitigation measures are available. Project impacts remain significant and unavoidable.

Notes:

Full - Intersections that can be fully mitigated to a level less than significant with recommended mitigation measures.
Partial - Intersection operating conditions would be improved with recommended mitigation measures, however; would not be fully mitigated and would remain significant and unavoidable.
N.F.M. - No Feasible Physical Mitigation measures are available. Project impacts remain significant and unavoidable.

[1] This stop-controlled intersection is expected to operate at oversaturated condition, based on the vehicle delay reported for the worst-case approach. This intersection was also evaluated using the ICU methodology and the resulting project-related incremental increase in V/C ratio is greater than the City of Culver City adopted significance criteria.

[2] *The impact at this intersection would be partially mitigated by a monetary contribution by LAWA, pending FAA approval, to the County's ITS system. Because the County does not have a method for quantifying the benefits of this type of improvement, however, no quantitative V/C reduction has been taken.*

Notes:

Full - Intersections that can be fully mitigated to a level less than significant with recommended mitigation measures.
Partial - Intersection operating conditions would be improved with recommended mitigation measures, however; would not be fully mitigated and would remain significant and unavoidable.
N.F.M. - No Feasible Physical Mitigation measures are available. Project impacts remain significant and unavoidable.

[1] This stop-controlled intersection is expected to operate at oversaturated condition, based on the vehicle delay reported for the worst-case approach. This intersection was also evaluated using the ICU methodology and the resulting project-related incremental increase in V/C ratio is greater than the City of Culver City adopted significance criteria.

[2] *The impact at this intersection would be partially mitigated by a monetary contribution by LAWA, pending FAA approval, to the County's ITS system. Because the County does not have a method for quantifying the benefits of this type of improvement, however, no quantitative V/C reduction has been taken.*

Notes:

Full - Intersections that can be fully mitigated to a level less than significant with recommended mitigation measures.
Partial - Intersection operating conditions would be improved with recommended mitigation measures, however; would not be fully mitigated and would remain significant and unavoidable.
N.F.M. - No Feasible Physical Mitigation measures are available. Project impacts remain significant and unavoidable.

[1] This stop-controlled intersection is expected to operate at oversaturated condition, based on the vehicle delay reported for the worst-case approach. This intersection was also evaluated using the ICU methodology and the resulting project-related incremental increase in V/C ratio is greater than the City of Culver City adopted significance criteria.

[2] *The impact at this intersection would be partially mitigated by a monetary contribution by LAWA, pending FAA approval, to the County's ITS system. Because the County does not have a method for quantifying the benefits of this type of improvement, however, no quantitative V/C reduction has been taken.*

Note:

Alternatives 1 through 4 consist of airfield, terminal, and ground access improvements. Alternatives 5 through 7 focus on airfield and terminal improvements only. Alternatives 8 and 9 focus on ground access improvements only. The airfield/terminal improvements associated with Alternatives 1, 2, 5, 6, and 7 could be paired with the ground access improvements associated with Alternatives 1, 2, 8, or 9. Similarly, the ground access improvements associated with Alternatives 1, 2, 8, and 9 could be paired with the airfield improvements associated with Alternatives 1, 2, 5, 6, or 7. The full impacts of any alternative must consider airfield, terminal, and ground access contributions. The airfield, terminal, and ground access improvements associated with Alternatives 3 and 4 are specific to each of those alternatives and cannot be paired with other alternatives.

This page intentionally left blank.

Chapter 5, Cumulative Impacts

1. The first sentence in Section 5.5.7.1 on page 5-80 of the Draft EIR is hereby revised as follows:

   Unlike air quality, for which standards have been established that determine acceptable levels of pollutant concentrations, no *federal* standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts.

Chapter 7, Other CEQA Considerations

1. The third bullet under the heading "Off-Airport Transportation" on page 7-3 of the Draft EIR is hereby revised as follows:

   - Traffic thresholds would be exceeded when compared to future (2025) conditions for the following alternatives:
     - Alternatives 1 and 2: ~~39~~ *38* intersections; 1 CMP arterial monitoring intersection; 3 CMP freeway monitoring stations
     - Alternative 3: 37 intersections; 2 CMP arterial monitoring intersections; 3 CMP freeway monitoring stations
     - Alternative 4: ~~40~~ *38* intersections; 2 CMP arterial monitoring intersections; 3 CMP freeway monitoring stations
     - Alternatives 8 and 9: ~~44~~ *42* intersections; 1 CMP arterial monitoring intersection; 3 CMP freeway monitoring stations

5.3 Corrections and Additions to Appendices to the SPAS Draft EIR

Appendix C Air Quality

1. Tables 2, 3, 4, 5, 6, 7, 8, 15, 16, 30, 31, 32, 33, 34, 35, 36, 43, 44, and 65 in Attachment 3 of Appendix C of the Draft EIR have been revised to update the 1-hour NO2 NAAQS background concentration for all alternatives. Please see the following revised tables.

Appendix F Greenhouse Gas Emissions

1. Tables 10 through 19 in Appendix F of the Draft EIR have been revised to update the emission calculations for all alternatives and baseline. Please see the following revised tables.
2. Tables 74 and 75, which provide emission calculations for GHG emissions for APUs for baseline conditions and all alternatives, are hereby added to Appendix F of the Draft EIR. Please see the following tables.

Appendix I-2 Land Use Incompatibility Tables

1. Table 10 on page 34 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on pages 4-703 and 4-704 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 7 of Appendix I-2.*

2. Table 16 on page 44 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on page 4-713 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 13 of Appendix I-2.*

3. Table 22 on page 54 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on pages 4-722 and 4-726 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 19 of Appendix I-2.*

4. Table 28 on page 64 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on pages 4-732 and 4-736 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 25 of Appendix I-2.*

5. Table 34 on page 74 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on pages 4-745 and 4-746 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 31 of Appendix I-2.*

6. Table 40 on page 84 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on page 4-756 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 37 of Appendix I-2.*

PM2.5	24-hr	2.5	2.5	**Yes**

Note:

The 1971 SO2 national standards (24-hour and annual) were revoked on June 22, 2010; however, they will remain in effect until one year after an area is designated for the 2010 standard. Since the USEPA has not yet designated areas for the 2010 standard, the revoked SO2 standards are still included in this analysis.

Notes:
Average concentration is modeled output from AERMOD, version 12060.
Project concentration is difference between given alternative and baseline (project increment).
Total concentration is project concentration plus monitored background concentration.
98th percentile (high 8th high in AERMOD) only applicable to NAAQS.

Note:

The 1971 SO2 national standards (24-hour and annual) were revoked on June 22, 2010; however, they will remain in effect until one year after an area is designated for the 2010 standard.

Since the USEPA has not yet designated areas for the 2010 standard, the revoked SO2 standards are still included in this analysis.

Notes:
Average concentration is modeled output from AERMOD, version 12060.
Project concentration is difference between given alternative and baseline (project increment).
Total concentration is project concentration plus monitored background concentration.
98th percentile (high 8th high in AERMOD) only applicable to NAAQS.

Notes:

Data summarized in table is based on the Design Value for each pollutant.

Ozone NAAQS is attained when the fourth highest eight hour concentration in a year, averaged over three years, is equal to or less than the NAAQS; therefore, 4th high summarized and averaged over 3 years.

CO NAAQS is not to be exceeded more than once a year; therefore, 2nd high from monitoring data used for background concentration (based on design value).

For PM10 NAAQS, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration over 150 ug/m3 is equal to or less than one; therefore, 2nd high used for background concentration.

Resources:

Except for CO 1-hr, all data obtained from ARB website, http://www.arb.ca.gov/adam/index.html.

CO 1-hr data are available on SCAQMD website, http://www.aqmd.gov/smog/historicaldata.htm.

PM2.5 is not monitored at LA Westchester, so the monitoring data from the South Coast LA County 1 & 2 were used.

SO2 3-hour data obtained from EPA Air Data for North Main Street (http://www.epa.gov/air/data)

Design Values to Add to Modeled Concentrations

$C_{ppm} = C_{\mu g/m3} \times 0.02445/MW$

Pollutant	Molecular Weight (g/mol)	Averaging Period	CAAQS ug/m3	NAAQS ug/m3
CO	28	1-Hour	4,581	4,581

Source: EDMS 5.1.3, Baseline-VisW (Adjusted Taxiway Speed), AC_MAIN.dbf.

Note:

Annual aircraft operations are calculated higher than EDMS because of rounding differences.

Key:

APU = auxiliary power unit
CH4 = methane
CO2 = carbon dioxide
CO2e = carbon dioxide equivalent
gal/yr = gallons per year
lb/hr = pounds per hour
lb/yr = pounds per year
MT/year = metric tons per year
MTCO2e/year = metric tons carbon dioxide equivalent per year
N2O = nitrous oxide

Source: EDMS 5.1.3, Alt 1-VisW (Adjusted Taxiway Speed), AC_MAIN.dbf.

Note:

Annual aircraft operations are calculated higher than EDMS because of rounding differences.

Key:

APU = auxiliary power unit
CH4 = methane
CO2 = carbon dioxide
CO2e = carbon dioxide equivalent
gal/yr = gallons per year
lb/hr = pounds per hour
lb/yr = pounds per year
MT/year = metric tons per year
MTCO2e/year = metric tons carbon dioxide equivalent per year
N2O = nitrous oxide

7. Table 46 on page 94 in Appendix I-2 of the Draft EIR is hereby revised to add the following footnote:

   [3] *Impacts on parks are considered significant if newly exposed to noise levels of 75 CNEL or higher, as described on pages 4-762, 4-765, and 4-766 in Section 4.9.6 of the SPAS Draft EIR. A listing of these parks is provided in Table 43 of Appendix I-2.*

Appendix K2-3 Intersection Lane Configurations

1. The existing lane configurations for Intersections #1, #3, #4, #15, and #114, shown on pages 1, 2, and 9 of Appendix K2-3 of the Draft EIR, have been revised. The existing and/or future lane configurations for Intersections #1, #3, #4, #10, #15, #60, and #114, shown on pages, 17, 18, 21, and 25 of Appendix K2-3 of the Draft EIR, have been revised. Please see the following revised figures.

Appendix K2-6 Intersection Level of Service Worksheets

1. The level of service worksheets for Intersection #1 have been modified. These worksheets replace what is shown in Attachments 4 and 5 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
2. The level of service worksheets for Intersection #3 have been modified. These worksheets replace what is shown in Attachments 4 and 5 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
3. The level of service worksheets for Intersection #4 have been modified. These worksheets replace what is shown in Attachments 4 and 5 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
4. The level of service worksheets for Intersection #10 have been modified. These worksheets replace what is shown in Attachment 6 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
5. The level of service worksheets for Intersection #15 have been modified. These worksheets replace what is shown in Attachments 1, 2, and 4 through 6 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
6. The level of service worksheets for Intersection #60 have been modified. These worksheets replace what is shown in Attachment 6 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).
7. The level of service worksheets for Intersection #114 have been modified. These worksheets replace what is shown in Attachments 1, 2, 4, and 5 of Appendix K2-6 of the Draft EIR. Please see replacement worksheets provided in Attachment 4 of Part II of this Final EIR (provided in electronic format only).

[1] LAWA and the LAX Coalition for Economic, Environmental and Educational Justice (LAX Coalition) have developed and entered into an agreement, the Community Benefits Agreement (CBA), to ensure that communities adversely affected by the LAX Master Plan Program also receive benefits as a result of implementation of the Program. The benefits and mitigations included in the CBA were negotiated independently from, and are not a part of, the LAX Master Plan Mitigation Monitoring and Reporting Program. The CBA contains a number of air quality mitigation measures, of which Sections X.A., X.F., X.K., X.L., X.M., and X.N. are applicable to SPAS.

[2] Alternatives 5, 6, and 7 focus on airfield improvements, and would not have any impacts related to ground transportation; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be impacts to ground transportation that would subject to this mitigation measure.

[3] Alternatives 8 and 9 focus on ground access improvements, and would not have any impacts associated with aircraft gates; however, assuming the ground access improvements under those alternatives would be paired with airfield improvements proposed under Alternative 1, 2, 5, 6, or 7, there would be impacts to gates that would be subject to this mitigation measure.

[4] This measure would reduce the cumulatively considerable contribution to impacts to aviation safety from building/structural penetrations of FAR Part 77 imaginary surfaces.

[5] This measure would address cumulatively significant impacts associated with solid waste generation and disposal.

5.5 Corrections and Additions to Appendices to the Preliminary LAX SPAS Report

Appendix E2-1, LAX Ground Transportation Study Report

1. The second sentence of the first paragraph in the right column on Page 64 of Appendix E2-1 of the Preliminary LAX SPAS Report is hereby revised as follows:

   The gated passenger schedule*,* representing the aircraft gating scenario illustrated in ~~the~~ Figure A-7 *and* used as the future condition for this study*,* ~~was created from the passenger schedule for the~~ *is commensurate with a* 78.9 MAP activity level. *This schedule was developed by LAWA and was also used by the Academic Panel for the North Airfield Safety Study*~~, developed with the assistance of the National Aeronautics and Space Administration (NASA) to support various north~~ airfield simulation efforts.

2. The second sentence on page 72 of Appendix E2-1 of the Preliminary LAX SPAS Report is hereby revised as follows:

   Future 78.9 MAP conditions (modeled using the ~~NASA~~ *gated passenger* schedule *developed by LAWA commensurate with a 78.9 MAP activity level* without the midfield processor) showed that at TBIT the LOS significantly worsens.

Appendix F-2, North Runway Alternatives Simulation Analysis

1. The following text on page 3 of Appendix F-2 of the Preliminary LAX SPAS Report is hereby revised as follows:

   - Calibrate the simulation model to ensure that the model adequately approximates actual operations at LAX. The LAX calibration compared simulated hourly operations and airfield travel times with actual performance data for March 29, 2005, collected from the airlines serving LAX. *The simulation model was subsequently verified and revalidated in 2007 and 2009 based upon updated operational performance data.*

2. Table 14 on page 91 of Appendix F-2 of the Preliminary LAX SPAS Report has been revised. Please see the following revised table.

3. Table 16 on page 107 of Appendix F-2 of the Preliminary LAX SPAS Report has been revised. Please see the following revised table.
