As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the

alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-41

Comment:

- 119. Ocean Avenue/Via Marina & Washington Boulevard: Because of the physical constraints, the finding of "economic and policy infeasibility" would appear to be realistic. Mitigation would require some form of system approach for the Marina Del Rey area, with potential participation by the project.

Response:

The comment states agreement with the finding of the SPAS Draft EIR that no mitigation is feasible for the intersection of Ocean Avenue/Via Marina and Washington Boulevard (study intersection 119) but suggests that LAWA should consider contributing to transportation improvements elsewhere in the Marina del Rey area. See also Response to Comment SPAS-AL00001-1 regarding unspecified transportation funding. The comment does not provide any specific information regarding the "system approach"; therefore, it is not possible to provide a more detailed response.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-42

Comment:

- 173. Western Avenue & Imperial Highway: The improvement identified at this location (addition of a separate eastbound right-turn lane) has the potential for a functional right turn lane, which may require some restriping and minor sidewalk adjustment. This improvement could be pursued as a means of alleviating the projected LOS E.

Response:

The comment states that it may be feasible to implement the mitigation concept described for the intersection of Western Avenue and Imperial Highway (study intersection 173), the provision of additional eastbound capacity. The commentor's suggestion is different from the measure evaluated on page 4-1306 of the SPAS Draft EIR. The SPAS Draft EIR analysis assessed the potential to provide a

separate eastbound right-turn lane, which would require additional right-of-way acquisition on the private property occupied by a one-story restaurant on the southwest corner of this intersection, and concluded that economic, policy, and environmental reasons made the acquisition of right-of-way infeasible.

The comment suggests that roadway restriping and sidewalk narrowing could provide a narrower functional right-turn lane, instead of a standard full right-turn lane. Because the sidewalk there is only approximately 12 feet wide, it was determined that the sidewalk there could not feasibly be narrowed while maintaining the current level of pedestrian safety and if implemented would result in secondary impacts to alternative modes of transportation (pedestrian access). The location of this intersection is adjacent to other commercial buildings, a residential neighborhood, and a community college, each of which generates pedestrian activity. Therefore, the commentor's suggestion is considered economically infeasible, socially infeasible, infeasible based upon policy considerations, and infeasible due to inconsistency with the project objectives (i.e., inconsistent with the objective of advancing "economic growth and vitality of the Los Angeles region").

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-43

Comment:

5.0 ADDITIONAL STUDIES AND MITIGATION ARE NEEDED TO REDUCE NOISE AND AIR QUALITY IMPACTS ASSOCIATED WITH THE SPAS ALTERNATIVES

Noise impacts have been a consistent concern to the County and the planned growth to 78.9 MAP by 2025 (from the 56.5 MAP in the year 2009 baseline) adds to that concern. The increased passenger levels would be accommodated by an increase of 30% in average daily aircraft operations, and accompanied by a 40% increase in passenger traffic (using larger capacity aircraft).

As discussed in §2 of this Comment Letter, LAX passenger traffic has been relatively flat near 60 MAP for almost 10 years and it may be optimistic to anticipate attainment of the 78.9 MAP cap by 2025. The economic downturn of the last 5 years has adversely impacted business and leisure travel such that extrapolation of the airline passenger growth trend has been distorted. Therefore, it may take longer than forecast to reach the passenger cap.

No dramatic improvements in aircraft emissions or noise levels are anticipated in the future fleet compared to existing conditions. As a result, a slower rate of growth will spread out the impact horizon but will not likely affect the final impact profile. However, one implication of a possibly delayed build-out timeframe is that building LAX "convenience" improvements (e.g. passenger processing systems, customs, etc.) will induce passenger traffic growth that might have used alternative airports had the improvements been better phased to match actual MAP growth.

In other words, the proposed improvements may undermine regionalization of air service, which is contrary to LAWA's Settlement commitment to encourage the growth of passenger activity at

underutilized LAWA-owned commercial airports in the region. Monopolizing or cannibalizing of demand retards airport regionalization. This is a central and long-standing point of concern for Los Angeles County and communities around LAX, as discussed more fully in Section 6 below.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports a regional approach to accommodating air travel demands in Southern California. Also, please note that this comment does not raise any new significant environmental issues or address the adequacy of the analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15205(a)).

The commentor's statement that "it may take longer than forecast to reach the passenger cap" is speculative. Appendix F-1 of the Preliminary LAX SPAS Report describes in detail the methodology, substantial evidence, and assumptions used in forecasting that the passenger activity level at LAX will reach 78.9 MAP by 2025. The activity level forecast already takes into consideration the economic downturn of the past several years.

Regarding comments that the SPAS alternatives will induce passenger traffic growth that might have used alternative airports, or lead to the "monopolizing or cannibalizing of demand" within the region, the commentor provides no data or analysis in support of that claim, which is speculative in nature. Moreover, as described in Section 2.2 of the SPAS Draft EIR, the project objectives associated with SPAS include making improvements to the north airfield that support the safe and efficient movement of aircraft at LAX, improving the ground access system to better accommodate airport-related traffic, maintaining LAX's position as the premier international gateway, planning improvements that do not result in more than 153 passenger gates at 78.9 MAP - consistent with the LAX Master Plan and the requirements of the Stipulated Settlement, enhancing safety and security at LAX, minimizing environmental impacts on surrounding communities, and producing an improvement program that is efficient, sustainable, feasible, and fiscally responsible. The SPAS improvements are intended to address problems specific to LAX that the Master Plan Yellow Light Projects were proposed to address.

Regarding the commentor's reference to additional concerns being discussed in Section 6 of the comment letter, please refer to Responses to Comments SPAS-AL00008-51 and SPAS-AL00008-52 for responses that address those concerns.

SPAS-AL00008-44

Comment:

5.1 Noise impacts require further study in the SPAS Draft EIR

While the Draft EIR noise analysis methodology is based on approaches that are recognized as industry standards, the analysis still falls short. An extensive level of effort was given to achieve full public disclosure of noise impacts, particularly from aircraft operations. The methodology description further outlines the possible shortcomings of relying completely on a computer model, even when the input data has been very carefully developed (as in this case). The fact that the FAA requires use of the Integrated Noise Model (INM) for noise impact analysis obscures the fact that the noise contour maps show an exact delineation of impacted versus not impacted uses when the actual location has a substantial margin of uncertainty. The methodology description notes that there may be differences between modeled results and measured noise levels resulting from both uncertainties in each approach as well as possible biases in either technique but no values are presented that would allow for public understanding of the possible range of modeling uncertainty. For full disclosure, it would be instructive to show in the Draft EIR both model and measurement data for the 2009 baseline case to determine the typical difference between the two approaches and to see if there are any distinct biases in those differences.

The methodology description notes that there is a 95% confidence level that the model-measured levels will be within 3 to 5 decibels of each other. However, decibels are a logarithmic progression. For an identical noise generation scenario, it takes twice as many events to increase noise levels by + 3 dB. A

fleet of 2,000 identical aircraft in identical operation would generate a + 3 dB increase above the same scenario with 1,000 identical aircraft because 10 x log(2000/1000)=+3 dB. The discussion notes that a + 3 dB difference between modeling and measurement is not necessarily a significant difference. The County believes that a 1,000 aircraft per day difference is a significant difference and should be analyzed accordingly.

Response:

The commentor inquires about multiple topics related to the SPAS Draft EIR aircraft noise analysis assumptions, methodology, and impact results. The commentor first suggests that the noise analysis "falls short" because the analysis relies upon modeled rather than measured data.

As acknowledged by the commentor, the SPAS aircraft noise analysis "is based upon approaches that are recognized as industry standards" and includes input data that "has been very carefully developed." As also acknowledged by the commentor, analytical models often have a 95 percent confidence interval of plus or minus 3 dBA. Detailed discussion and the rationale regarding the selection of modeled rather than measured data is provided in Section 4.10.1.1.4 of the SPAS Draft EIR and Sections 2 through 2.2 in Appendix J1-1 of the SPAS Draft EIR.

As discussed on page 1 in Section 2 of Appendix J1-1 of the SPAS Draft EIR, "[a]lthough differences between measured and modeled noise levels can occur, the related variances between the two are expected to remain consistent over a series of modeled scenarios (i.e., the difference between measured baseline noise and measured future noise conditions [assuming this was feasible.], would be the same as the difference between modeled baseline noise and modeled future noise conditions)…While modeled and measured aircraft noise data may not always match precisely, it is the most comprehensive and reliable approach given the limitations described above and the geographic scope of the analysis [see SPAS Draft EIR Figure 4.10.1-6]."

Furthermore the INM modeling results provide data which typically cannot be provided by measured data. As discussed further on page 1 in Section 2 of Appendix J1-1 of the SPAS Draft EIR, "In addition the INM can compute noise at specific points on the ground (e.g., residences, schools, places of worship, and other non-residential noise-sensitive facilities)." Furthermore, localized measurements may not always accurately represent noise levels because measured noise levels can be affected by highly localized factors, such as nearby structures, nearby landscaping, or other localized noise sources.

This approach used in the SPAS Draft EIR is consistent with CEQA, which allows the lead agency to make reasonable assumptions, including assumptions associated with aircraft noise levels. (See Public Resources Code Section 21080(e).) As also discussed under State CEQA Guidelines Section 15204(a), "reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require the lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors." Given the limitations associated with measured data, LAWA appropriately determined modeled data was more appropriate for the SPAS aircraft noise analysis. This analysis appropriately provides "decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." (State CEQA Guidelines Section 15151.)

The comment also states, "The fact that the FAA requires use of the Integrated Noise Model (INM) for noise impact analysis obscures the fact that the noise contour maps show an exact delineation of impacted versus not impacted uses when the actual location has a substantial margin of uncertainty." LAWA has not however ignored localized factors and recognizes, as acknowledged on page 4 in Section 2.2 of Appendix J1-1 of the SPAS Draft EIR that "a line drawn on a map does not imply that a particular noise condition exists on one side of the line and not on the other." The application of the noise insulation mitigation program, as discussed on page 4-686, is based upon noise measurements and ongoing monitoring at the specific parcels. As discussed on page 4-795 of the SPAS Draft EIR, LAWA provides Los Angeles County with these measured noise levels as part of the noise variance.

In a previous comment (comment SPAS-AL00008-13), which relates to the present discussion, the commentor further refers to the fact that "a 3 decibel (dB) difference should not be discounted in the Draft EIR as less than significant." The commentor is referring the differences between measured baseline data and modeled baseline data, and suggests that the difference between the two should be considered a significant impact. However, under CEQA, impacts are made in comparison to existing conditions (baseline); existing conditions are therefore not impacts of the project. (See State CEQA Guidelines Section 15125(a) and 15126.2(a); see also Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App. 4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far beyond its scope"]. For the purposes of CEQA analyses, the aircraft noise analysis assesses noise-sensitive uses and noise increases above existing modeled conditions. (See Section 4.10.1.4 of the SPAS Draft EIR for further details.) The significance of the impact is based primarily upon the difference between the future with alternative scenarios versus baseline scenario, and it would not be appropriate to compare future modeled conditions with existing measured conditions. As discussed above in this response, the difference between measured baseline noise and measured future noise conditions (assuming this was feasible), would be the same as the difference between modeled baseline noise and modeled future noise conditions. Therefore, making a comparison between future modeled conditions and existing measured conditions, would overstate impacts and would not be realistic.

The commentor provided a mathematical analysis and stated that "for an identical noise generation scenario, it takes twice as many events to increase noise levels by + 3 dB." As analyzed in Appendix J1-1 of the SPAS Draft EIR, the SPAS Draft EIR aircraft noise analyses accounted for an additional 444 average annual day (AAD) operations between the 2009 baseline and the 2025 conditions. Such a difference in the number of AAD operations was fully analyzed in the SPAS Draft EIR aircraft noise analyses.

SPAS-AL00008-45

Comment:

5.2 Differential use of the north and south airfields may play a key role in noise impacts

The selection of a blanket aircraft noise threshold of significance of a + 1.5 dB CNEL increase where noise-sensitive areas are exposed to levels exceeding 65 dB CNEL ignores the fact that a +1.5 dB CNEL increase at a 65 dB CNEL baseline is less of an issue than a +1.5 dB CNEL increase above a 75 dB CNEL baseline. A sliding scale threshold that recognizes the difference in impact severity as a function of the baseline would be more instructive and useful. With regard to a +1.5 dB increase, all things being equal, it requires a 41% increase in identical noise generating events to achieve a corresponding +1.5 dB noise level increase. While a 1.5 dB change would be almost undetectable under ambient conditions, the modification in the physical environment that might cause that change can be very large. For example, the noise level from 140,000 cars per day is only +1.5 dB higher than from 100,000 per day, but 40,000 more cars could create a major traffic impact even if the noise increment is barely detectable.

Response:

In accordance with the City of Los Angeles CEQA threshold guidance, "a significant impact on ambient noise levels would normally occur if noise levels at a noise sensitive use attributable to airport operations exceed 65 dB CNEL and the project increases ambient noise levels by 1.5 dB CNEL or greater."1 That City of Los Angeles threshold was utilized for the SPAS aircraft noise impacts analysis, as acknowledged on page 4-825 of the SPAS Draft EIR. This threshold is consistent with the Federal Aviation Administration (FAA) Order 5050.4B which establishes the threshold of significance at DNL 1.5 dB at or above DNL 65 dB (see Table 7.1 of Order 5050.4B).

This threshold is considered conservative, given that a 3 dBA increase is considered noticeable, as acknowledged in one of Los Angeles County's recent Draft EIRs.2

A vast majority of areas located inside the 75 dB CNEL contour is located within airport property, under both the 2009 baseline and 2025 conditions. Refer to Figure 4.10.1-11 in Section 4.10.1.3 of the SPAS Draft EIR for an illustration of the 2009 conditions 75 CNEL noise contours. See Section 4.10.1.6 of the

SPAS Draft EIR for figures depicting the 2025 conditions 75 CNEL noise contours under each SPAS alternative.

The commentor further states that "While a 1.5 dB change would be almost undetectable under ambient conditions, the modifications in the physical environment that might cause that change can be very large. For example, the noise level from 140,000 cars per day is only +1.5 dB higher than from 100,000 per day, but 40,000 more cars could create a major traffic impact even if the noise increment is barely detectable."

The commentor's analogy regarding a 1.5 dB increase in noise levels and an attendant increase in traffic volumes confuses "cause and effect" and fails to accurately reflect how the off-airport transportation analysis was conducted. The off-airport transportation analysis (Section 4.12.2) was used to determine the number of vehicle trips generated, which was then used to determine the amount of noise that would be generated from those vehicle trips; as discussed in the road traffic noise methodology discussion (Section 4.10.2.2 of the SPAS Draft EIR). All reasonably foreseeable changes to the environment caused by the project have been accounted for in their individual resource sections in Chapters 4 and 5 of the SPAS Draft EIR.

1. City of Los Angeles, Environmental Affairs Department, L.A. CEQA Thresholds Guide, 2006, page I4-5.
2. LA County Draft EIR for "Disney ABC Studios at The Ranch" Project: "For purposes of this analysis, a 'substantial noise increase' is defined as an increase of 3 dBA when the ambient noise level is greater than 45 dBA and an increase of 5 dBA or greater when the ambient noise level is 45 dBA or below. The 3 dBA threshold represents the minimum change in noise that is detectable by the average human listener, whereas 5 dBA represents the change in noise that is considered clearly noticeable." (LA County Draft EIR, page V.C-21.) Available at: http://planning.lacounty.gov/case/view/vesting_tentative_tract_map_no._071216_conditional_use_permit_2009-00126_di/; a direct link to the first volume is provided here: http://planning.lacounty.gov/assets/upl/case/tr_071216_deir-volume1.pdf.

SPAS-AL00008-46

Comment:

Besides the anticipated MAP growth (which may or may not occur within the adopted planning horizon), unincorporated areas east of Runways 7/25, most heavily impacted by airfield noise compared to any community in southern California, are also sensitive to any change in runway utilization patterns. Runway and flight track selection has been performed by a computer model and it is not possible to independently verify future utilization patterns. The Lennox community is mainly impacted by the aircraft landing on 25L, and to a certain extent by run-up and initial take-off roll by aircraft on Runway 25R. There is likely a preference by airlines based in Terminals 4 - 8 to use the south airfield closest to their gates. The Draft EIR does not include a preliminary gate assignment map if Terminals 1, 2 and 3 are demolished and a linear concourse is built; however greater pressure on using the south airfield can be expected with increased north/south gate asymmetry under this alternative.

- The Draft EIR should include a preliminary gate assignment map if Terminals 1, 2 and 3 are demolished and a linear concourse is built, and analyze the potential for greater pressure on south airfield use in conjunction with increased north/south gate asymmetry.

Response:

The projected gate positions for Alternative 3 used for airfield modeling are depicted in Figure 23 of Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-AL00008-47

Comment:

5.3 Environmental justice requires consideration of balanced airfield operations to reduce noise impacts on the community of Lennox

As part of the Draft and Final EIR, LAWA should guarantee a semi-equal balance of north/south runway selection similar to a mitigation measure for airfield operations as a means of protecting Lennox and other unincorporated communities from even greater noise impacts. This recommendation is reinforced by the issue of environmental justice: almost 90% percent of the Lennox community, which is the only residential neighborhood around LAX having some homes within the 75 dB CNEL noise contour, is a predominantly minority community and is the most heavily impacted. It is the only community with an additional school potentially noise-impacted above baseline conditions for most SPAS alternatives. Noise protection for this community should be a priority item consistent with LAWA's commitments in the Settlement Agreement.

- The Draft EIR should identify noise protection for Lennox as a priority consistent with LAWA's commitments in the Settlement Agreement, as well as CEQA's requirements for lead agencies to consider whether environmental and public health burdens associated with a project might disproportionately impact certain communities.

Response:

The assignment of aircraft to either the north airfield or the south airfield is at the discretion of the FAA air traffic control tower, consistent with the procedures and responsibilities set forth for air traffic controllers in FAA Order 7110.65, and is not within the jurisdiction or ability of LAWA. However, as described in Section 2.2 of the SPAS Draft EIR, one of the project objectives pertaining to the north airfield improvements is to lengthen the primary departure runway (Runway 6R/24L), which is currently too short for certain large aircraft (e.g., fully-loaded Boeing 747-400) on long-haul flights. Alternative 1, 2, 3, 5, 6, and 7 include a 1,250+ foot easterly extension of Runway 6R/24L, which can support a better balance between the north airfield and south airfield relative to operations of large heavy aircraft.

As described in Section 4.9.3.3 of the SPAS Draft EIR, LAWA has an extensive aircraft noise mitigation program (ANMP), which includes homes that are subject to aircraft noise levels of 65 CNEL and above. In conjunction with the ANMP, LAWA supports the soundproofing of homes impacted by aircraft noise through provisions of the LAX Master Plan Community Benefits Agreement (Section III)) and the LAX Master Plan Stipulated Settlement (Exhibit A - Additional Mitigation Measure A). Both the Community Benefits Agreement and the Stipulated Settlement specifically identify the County of Los Angeles, within which Lennox is located, as a recipient of residential soundproofing funds and other aircraft noise mitigation provisions from LAWA. None of the SPAS alternatives negate or diminish those existing commitments.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Jefferson Elementary School, which is located in Lennox, would be significantly impacted by aircraft noise for future (2025) conditions compared to baseline (2009) conditions. This impact would occur under any and all of the alternatives for airfield improvements (i.e., Alternatives 1 through 7), irrespective of whether there is a northward runway move (Alternatives 1, 5, and 6), a southward runway move (Alternatives 3 and 7), or no runway move (Alternatives 2 and 4). However, Jefferson Elementary School, along with other schools within the Lennox School District, is specifically included in Exhibit A of the Settlement Agreement entered into between LAWA and the Lennox School District in February 2005, which provides for the soundproofing of school facilities.

Also, CEQA does not require an EIR to include an environmental justice analysis. CEQA is concerned with physical impacts on the environment, such as whether and where the SPAS alternatives increase noise levels. It is not concerned with the social or economic status of the affected communities, or whether low income or minority communities are disproportionately affected by noise impacts. "Economic and social changes resulting from a project shall not be treated as significant effects on the environment." (State CEQA Guidelines Section 15131(a).) "[T]he question under CEQA is whether a project will affect the environment of persons in general, not whether a project will affect particular persons." (Eureka Citizens for Responsible Government v. City of Eureka (2007) 147 Cal.App.4th 357, 377.)

SPAS-AL00008-48

Comment:

5.4 Regionalization is a viable means for reducing impacts to noise and air quality

Only one noise mitigation measure vaguely hints at regionalization as a viable means for reducing impacts when it acknowledges that a "reduction in aircraft operations" would have a noise control benefit. Contrary to the Settlement Agreement, the proposed LAX improvements would likely serve as a disincentive for airlines to shift flights to Ontario or for passenger service to start up again from Palmdale. Unless there is a coupling of LAX improvements with economic incentives for airlines to shift some flights to other LAWA airports, no significant change at under-utilized Ontario or non-utilized Palmdale is expected. Regionalization must be included in the mitigation measure mix because most of the measures in the current mitigation plan are based on voluntary actions and benefits from departure pattern changes, which are negligible in terms of overall noise level reductions.

- Regionalization must be included in the mix of mitigation measures since most measures in the current plan are based on voluntary actions benefits from departure pattern changes, which are negligible in terms of overall noise level reductions.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding regionalization, which includes a discussion of LA/Ontario International Airport and Palmdale Regional Airport.

The current noise abatement program at LAX, as summarized on page 4-827 of the SPAS Draft EIR, includes several measures related to aircraft departures based on the fact the highest noise levels associated with aircraft operations occur during takeoffs; however, the program also includes many other measures as well. The most notable of these measures include the preferential runway use, whereby aircraft departures typically occur on the inboard runways and aircraft arrivals occur on the outboard runways, which places the noisier of those two type operations farthest away from residential communities to the north and south of the airport. Additionally, the Over-Ocean procedures, which occur between the hours of midnight and 6:30 a.m., call for both arrivals and departures to occur to the west over the bay/ocean instead of over populated areas to the east. The noise abatement program also includes measures limiting certain on-airport aircraft activities so as to avoid or reduce potential noise impacts on noise-sensitive uses nearby, such as restricting jet engine "run-ups" during the night and delineating areas where aircraft are only allowed to be towed while on the ground.

The comment presents no facts or evidence showing that regionalization would mitigate the significant noise and air quality impacts of the SPAS alternatives. Further, as described in SPAS Draft EIR Section 6.2, shifting LAX aviation activity to other airports could cause significant air quality and noise impacts at those airports.

The comment suggests that the SPAS alternatives are "contrary to the Settlement Agreement." However, nothing in the Stipulated Settlement specifically requires shifting flights to Ontario, or passenger service from Palmdale to resume.

SPAS-AL00008-49

Comment:

5.5 Air quality impacts require further study in the SPAS Draft EIR

The Draft EIR predicts that significant unavoidable air quality impacts will occur during construction activities for all SPAS alternatives, and for all pollutants, using SCAQMD-recommended CEQA significance thresholds. Significant levels of emissions of SO2, PM-10 and PM-2.5 are calculated to derive from increased airfield operations to achieve a 78.9 MAP service level. Acute toxic air contaminant (TAC) exposure associated with acrolein in jet engine exhaust at the airport fence-line is calculated to exceed the generally accepted hazard index for that TAC.

The analytical approach used to evaluate site-specific impacts was to calculate airport-related emissions associated with each alternative (but not combined alternatives), perform a dispersion analysis, superimpose the predicted concentration upon the background, and then compare the combined exposure to acceptable incremental thresholds or to ambient air quality standards. It would appear, however, that the analysis did not consider the 405 Freeway as a major source of air pollution upwind of homes, schools and other sensitive land uses. This is a significant oversight because the freeway carries roughly 330,000 vehicles per day during a peak month on segments near LAX with strongly prevailing west to east winds. Peak airport activity impacts are shown to be at the eastern property line for most pollutants and most alternatives. The impact analysis is remiss in using background concentrations measured in Westchester to characterize the non-airport baseline in communities directly east of the freeway; LAWA should modify the Draft EIR to include a supplemental set of background measurements set at the eastern property boundary.

- The air quality impact analysis is remiss in using background concentrations measured in Westchester to characterize the non-airport baseline in communities directly east of the freeway; LAWA should modify the Draft EIR to include a supplemental set of background measurements set at the eastern property boundary near the 405 Freeway.

Response:

The South Coast Air Quality Management District (SCAQMD) has developed specific guidelines for conducting air quality impact analyses in CEQA documents, the CEQA Air Quality Handbook (SCAQMD 1993). The pertinent section of the guidelines for approach to determine existing air quality at a project site is spelled out in Chapter 8, Section 8.1:

"Existing Air Quality. To characterize the site-specific air quality setting, the environmental document should contain a summary of the most current air quality data. The data must be derived from the nearest District monitoring station located in the same source receptor area(s) (SRA) as the project (see map in Figure 8-3). Some stations do not monitor all pollutants. In that instance, information on the remaining pollutants should be drawn from the nearest upwind station which monitors the pollutants…."

The nearest SCAQMD monitoring station is the LAX Hastings site (Station 820, also known as the Southwest Coastal Los Angeles County monitoring station, or Los Angeles - Westchester Parkway site), which is located on LAX property. This site monitors ozone (O3), carbon monoxide (CO), nitrogen dioxide (NO2), sulfur dioxide (SO2), and respirable particulate matter (PM10). This site does not monitor fine particulate matter (PM2.5); therefore, PM2.5 data was collected from the nearest station that monitors this pollutant - the North Long Beach Station (Station 072, also known as the South Coastal 1 Los Angeles County monitoring station). The existing air quality data at LAX for the most recent three years available from these stations were summarized in Section 4.2.3.3, Table 4.2-3, of the SPAS Draft EIR.

The peak background concentration for many of the pollutants were obtained during periods when the wind was blowing from the east, across the I-405 freeway and other major roadways, to the monitoring station. In such cases, the freeway contributions to background concentrations are included in the analysis. For example, the peak background 1-hour NO2 concentrations used for the ambient background (0.094 ppmv, equivalent to 177 micrograms/cubic meter) occurred on November 15, 2008, between 9:00 a.m. and 10:00 a.m. The hourly wind direction for this hour was from the east-southeast (106 degrees) at 4.3 meters/second (9.8 mph). The ambient background concentration would have included contributions from vehicles traveling on Westchester Boulevard, vehicles at the intersection of Sepulveda and Century Boulevards, aircraft operating on the north airfield (Runways 24L and 24R), portions of the air cargo handling activity along the south side of Century Boulevard, as well as traffic on I-405 between I-105 and Century Boulevard. Given the hourly wind speed of approximately 10 mph, emission sources beyond I-405 to the east may also contribute to this background concentration. The peak hourly CO concentration used for background also occurs when the wind is blowing from the east-southeast. Establishing and operating a monitoring station along the I-405 Freeway is not required for this project under CEQA since SCAQMD monitoring station does collect impacts from sources to the east, including the I-405.

SPAS-AL00008-50

Comment:

5.6 Air quality mitigation measures are weak and outdated

The air quality impact mitigation discussion relies heavily on commitments made during the adoption of the LAX Master Plan EIR. Some of these measures are nebulous, lack force, outdated, and contain no contingency measures if parts of the mitigation menu prove to be infeasible. Caveats such as "as soon as possible, to the extent feasible, minimum practical, encourage, promote, if feasible" should be reviewed to verify feasibility and, where feasibility is uncertain, provide back-up measures that are equally effective. Measures that reference smog alerts are outdated: there has not been a second-stage smog alert in more than 20 years, so agreeing to stop work is a meaningless mitigation measure. Limiting engine idling to ten minutes has generally been replaced to five minutes consistent with state law for on-road trucks. The use of outdated and ineffective air quality mitigation measures is inexcusable in light of the Draft EIR determination that impacts on air quality, greenhouse gases and human health risks will all be significant, adverse and 'unavoidable.'

The air quality mitigation plan should eliminate outdated mitigation measures and include state-of-the-art commitments, including use of a specified percentage of low emissions engines in heavy equipment to reduce off-site migration of ozone precursors and carcinogenic diesel particulate matter.

Response:

The mitigation measures that were applied to the SPAS alternatives are summarized in Section 4.2.5 of the SPAS Draft EIR. These measures included 17 mitigation actions that will be applied to construction activities and an additional 17 mitigation actions that will be applied to operational sources. However, the potential emissions benefits were only quantified for three (3) specific actions: use of diesel particulate filters on construction equipment, watering to reduce construction activity fugitive dust, and estimated LAX FlyAway ridership use to reduce passenger and employee trips to and from the airport. The LAX FlyAway ridership was estimated from recent ridership use of the existing FlyAway stations. While LAWA has committed to the other mitigation measures listed in Section 4.2.5, estimates of emission reductions by 2025 for those was determined to be too speculative to be appropriate to include in the evaluation, and the analysis does not take any emission-reduction credit for these measures or rely on them to reduce impacts.

An important issue that LAWA faces when establishing mitigation measures is that it does not own or operate most of the sources. To ensure that projects constructed with LAWA approval comply with all mitigation measures, LAWA would incorporate the construction measures into specifications that the construction contractors must follow. The ability to enforce operational mitigation measures is more difficult. LAWA has been incorporating what can be enforced through lease agreements. However, under the Interstate Commerce Clause of the U.S. Constitution, the federal government limits the amount of direct control LAWA can place on the airline tenants with regard to activity restrictions (i.e., the Commerce Clause authorizes Congress to regulate commerce in order to ensure that the flow of interstate commerce is free from local restraints imposed by various states or local agencies - the channels of interstate commerce include roadways, waterways, and airways, and the "instrumentalities" of interstate commerce include people as well as vehicles, machines, etc., which are employed or used in the carrying out of commerce). Therefore, the language in the operational mitigation measures is drafted to reflect these restrictions on enforcement.

Where recent federal, state, or local air quality regulations have become more stringent than the mitigation measures, such as in the case of idling restrictions for heavy-duty trucks in California, where the 2008 California Air Resources Board requirement limits most idling to no more than five minutes whereas the 2004 LAX MMRP has a limit of 10 minutes, the more stringent regulations of the state will be followed.

Additionally, the SPAS Draft EIR is a programmatic document. Generally speaking, program EIRs analyze broad environmental effects of the program with the acknowledgement that site-specific environmental review will be required when future development projects are proposed under the

approved program. (State CEQA Guidelines Section 15168.) Mitigation measures are components of the Draft EIR and are subject to the same requirements regarding their level of detail. (See State CEQA Guidelines Section 15126.4.) An attempt to provide mitigation measures for project-level impacts would be speculative at this point given the lack of information about future site-specific development. When such development is proposed, the project level environmental document prepared will include specific enforceable measures as needed.

Notwithstanding the above, LAWA has added several new mitigation measures related to air quality impacts, based on suggestions provided by the South Coast Air Quality Management District; please see Responses to Comments SPAS-AR00002-5 through SPAS-AR00002-41.

SPAS-AL00008-51

Comment:

6.0 LAWA HAS NOT PURSUED SETTLEMENT COMMITMENTS TO SUPPORT REGIONALIZATION OF AIR SERVICE

The Settlement Agreement includes two separate sections that outline LAWA's obligation to take the lead in promoting regional airports other than LAX. The two sections are summarized below:

- Section VII-Regional Airport Working Group: LAWA shall invite the FAA, SCAG, the Counties of Los Angeles, Orange, Ventura, Riverside and San Bernardino, and airport operators in the Los Angeles region to participate in a regional airport working group to make plans to achieve a regional distribution of air traffic demand. The regional working group will consider a framework for coordinating all airport master planning and facility construction consistent with the adopted SCAG Regional Aviation Plan. For the purposes of effectuating a regional approach to southern California's air transportation needs, the regional group shall consider (1) coordinating with the southern California Regional Airport Authority or its successor; (2) the feasibility of entering into a joint powers agreement to create a regional airport authority; and for (3) supporting legislative efforts to create such an authority. Notwithstanding the above, the City of Los Angeles and LAWA shall maintain financial and operational control of LAX, Ontario, Palmdale and Van Nuys Airport.

- Section VIII-Regional Strategic Planning: LAWA shall develop a regional strategic planning initiative to encourage the growth of passenger and cargo aviation activity at underutilized LAWA-owned commercial airports in the region (currently ONT and Palmdale). The regional strategic planning initiative will be prepared annually and will describe potential marketing strategies, potential opportunities for increased utilization of under-utilized facilities and other techniques by which LAWA will coordinate and support regional strategic planning for LAWA-owned commercial airports in the region. The first regional strategic planning initiative will be prepared by December 31, 2006.

The issue of regionalization has always been central to the petitioners' concerns, and appropriately so. Regionalization of passenger demand is the cornerstone for long-term mitigation of impacts on surrounding neighborhoods associated with expanded service at LAX.

6.1 Regionalization of air service is the key to reducing significant adverse SPAS impacts to less than significant levels

SPAS Draft EIR Section 6.2 discusses LAWA's commitments to regionalization of air service, and the mitigation value of regionalization. That commitment, pursuant to the Settlement Agreement, was that this SPAS study would identify Specific Plan Amendments "creating conditions that encourage airlines to go to other airports in the region." (SPAS Report, p. 9) With respect to LAWA's commitments, §6.2 of the DEIR notes that Specific Plan §7.H calls for LAWA to undertake passenger and airline surveys and studies the results of which would help LAWA identify actions to encourage airlines to provide domestic passenger service at other airports in the region. This same discussion goes on to say that it is not possible to identify those actions, because they would be determined by results of the surveys and studies. In other words, the Draft EIR does not assess results of these studies because LAWA has not fulfilled this requirement of the Settlement Agreement or Specific Plan.

Absent study and survey results, the Draft EIR instead offers a programmatic review that identifies five airports potentially capable of receiving 'some aspect of activity shifted from LAX': Burbank, Long Beach, John Wayne, Ontario and Palm Springs. Palmdale is not included on this list because 'no airline has successfully sustained a sufficient passenger base to maintain operations there, even with LAWA subsidies.' The Draft EIR states that increased future activity levels at the remaining airports is already contemplated in the 2012 and 2008 SCAG Regional Transportation Plans and associated environmental documents, implying that SCAG is responsible for activity at airports in the region. It is important to recognize, however, that actions by SCAG and other agencies do not relieve LAWA of its obligations under the Settlement Agreement and Specific Plan §7.H.

The Draft EIR then outlines, at a programmatic level, the environmental benefits at and around LAX that might be associated with regionalization of air passenger service, key portions of which are summarized in Table 8 below:

Table 8. SIGNIFICANT 'UNAVOIDABLE' ADVERSE IMPACTS THAT WOULD BE MITIGATED AT LAX THROUGH AIR SERVICE REGIONALIZATION

IMPACTS LISTED AS SIGNIFICANT & UNAVOIDABLE IN SPAS Draft EIR §7.1	MITIGATION BENEFITS THAT WOULD RESULT FROM REGIONALIZATION AS LISTED IN Draft EIR 6.2
AIR QUALITY & GREENHOUSE GAS EMISSIONS	Air Quality and Greenhouse Gas emission impacts associated with flights, construction and airport-related traffic would be shifted to the other airport regions and thereby reduced at and around LAX.
HUMAN HEALTH RISKS	Human health risks associated with toxic air contaminant emissions associated with flights, construction and airport-related traffic would be shifted to the other airport regions and thereby reduced at and around LAX.
LAND USE COMPATIBILITY	Land use incompatibility impacts associated with noise-sensitive uses would be shifted to the other airport regions and thereby reduced around LAX.
NOISE	Noise associated with aircraft, construction and airport-related traffic would be shifted to the other airport regions and thereby reduced at and around LAX.
TRAFFIC	Vehicle trips to, from and within the airport would be shifted to the other airport regions and thereby reduced at and around LAX.
UTILITIES	Impacts on utility and service systems including solid waste would be shifted to the other airport regions and thereby reduced at and around LAX.

- The potential environmental benefits of air service regionalization (noted in SPAS Draft EIR §6.2 and summarized in Table 8) correspond exactly to the discussion of significant adverse environmental impacts that LAWA claims (in SPAS Draft EIR §7.1) cannot be mitigated to less than significant levels: Air Quality, Greenhouse Gas Emissions, Human Health Risks, Land Use Compatibility, Noise, Traffic and Utilities. This highlights the critical necessity to create conditions that actually encourage use of other airports, not just doing studies; the Draft EIR must be revised to reflect this priority.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. The topical response explains how the potential amendment to Section 7.H of the LAX Specific Plan would promote regionalism. Please note that the comment does not present any evidence or raise any new significant environmental issues or address the adequacy of the analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15205(a)).

The comment states that the SPAS Draft EIR implies that "SCAG is responsible for activity at airports in the region." LAWA disagrees that the SPAS Draft EIR makes this implication. LAWA acknowledges that SCAG is responsible for regional airport planning, but not for the on-the-ground activity at airports.

Regarding Table 8, the comment presents no facts or evidence showing that regionalization would mitigate the significant impacts listed. Further, as described in Section 6.2 of the SPAS Draft EIR, shifting LAX aviation activity to other airports could cause significant air quality and noise impacts at those airports. The impact analyses in Section 6.2 are not limited to potential environmental benefits at LAX, but also consider impacts at the other airports. Section 6.2 does not conclude--for any impact analyzed--that there are net environmental benefits of regionalization, when considering the region as a whole, and any such conclusion would be speculative.

SPAS-AL00008-52

Comment:

6.2 LAWA has not honored its commitments to air service regionalization

Despite the significant mitigation potential associated with regionalization, LAWA has made only token efforts to fulfill the regionalization requirements contained in the Settlement Agreement and Specific Plan. In Settlement §VII, LAWA agreed to invite FAA, SCAG, airport operators and the counties of Los Angeles, San Bernardino, Orange, Ventura and Riverside to participate in a regional airport working group that would join forces to achieve regional distribution of air traffic. This group was going to coordinate with the Southern California Regional Airport Authority (reactivated in 2005), consider creation of a Regional Airport Joint Powers Authority, and support appropriate legislation. In practice, however, this group met briefly during 2006 and then disbanded and LAWA has taken no substantive steps whatsoever to fulfill this commitment.

In Settlement §VIII, LAWA agreed to develop a Regional Strategic Planning Initiative to encourage expanded passenger & cargo use of Ontario and Palmdale airports, with annual reports & marketing strategies. LAWA did hire a director to oversee this effort and several strategies were discussed, but the effort fell apart in its infancy and LAWA has not taken steps to revive the RSP initiative.

During the 6 years since the Settlement was finalized, Ontario Airport has made numerous efforts to gain greater control over its destiny. Recently, cities and counties in the Inland Empire have formed the Ontario International Airport Authority in a renewed attempt to gain control of Ontario Airport and to attract more passengers and airline service. The San Bernardino County Board of Supervisors on August 28, 2012 unanimously approved a new government agency to oversee L.A./Ontario International Airport. The August 2012 vote established the Ontario International Airport Authority as a joint-powers arrangement with the City of Ontario, which has been steadily pressuring LAWA to turn the airport over to local officials, and Ontario City Council members subsequently voted to approve the new agency.

The five-Member authority includes Ontario City Council members Alan D. Wapner and Jim Bowman as well as San Bernardino County Supervisor Gary Ovitt, whose district includes the cities of Chino, Chino Hills, Montclair, Ontario and a portion of Upland. Formerly the mayor of Ontario and Chairman of the Board of Supervisors, Ovitt is also a past president of SCAG and a current board member of the San Bernardino Associated Governments, the transportation planning agency. Goals of the newly created JPA are to help Ontario Airport rebound from the economic downturn of recent years while positioning itself for long-term growth.

SCAG has endorsed the transfer of control of this facility to the City of Ontario, and the Ontario JPA continues to seek support from the City of Los Angeles and from LAWA. However, the City and LAWA have steadfastly refused to relinquish control to Ontario and continue to assert that the lack of service to Ontario is attributable to the economy and the decisions of airlines. In September 2012 the City of Los Angeles again rejected efforts by Ontario to take control of the airport, citing the diversion of funds from LAWA as the basis for their decision.

It is evident that the weak economy has impacted air service at regional airports throughout and beyond southern California. And it is true that Ontario International Airport has seen a pronounced decline in passengers, as have other regional air facilities throughout and beyond southern California, including LAX. The brief hiatus in air travel demand could have enabled LAWA and the City of Los Angeles to devote even greater attention to pursuing their commitments (per Settlement Sections VII and VIII, and Specific Plan Section 7.H) so that the framework for successful regionalization would be firmly in place when air travel demands rebound in future years. LAWA and the City have failed to take advantage of this opportunity.

Instead, LAWA has ignored these most essential commitments and now seeks to label as 'unavoidable' the significant adverse impacts on air quality, human health, greenhouse gas emissions, noise and traffic associated with the proposed SPAS alternatives. Regionalization of air service can effectively mitigate these impacts and LAWA has the obligation - as Lead Agency under CEQA, as signator to the 2006 Settlement Agreement, and as author of the Specific Plan - to ensure that this is accomplished to the fullest possible degree.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. The topical response specifically discusses issues pertaining to LA/Ontario International Airport. Please note that comments related to LAWA's support of regionalization do not raise any new significant environmental issues or address the adequacy of the analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15205(a).)

SPAS-AL00008-53

Comment:

7.0 THE COUNTY STRONGLY SUPPORTS ALTERNATIVES THAT CONNECT LAX TO THE REGIONAL RAIL SYSTEM

The lack of an adequate transit system is responsible for some of the most pressing environmental impacts on unincorporated communities around LAX. Several identified components (including the construction of the Crenshaw/LAX light rail line with a stop at LAX and the construction of an ITC at Continental City with a pedestrian bridge to the existing Metro Green Line Station) will greatly improve airport access, and at the same time reduce traffic and noise concerns. The Draft EIR is not entirely clear, however, as to which of the Alternatives would include these components.

Draft EIR Table 4.6-7 provides a discussion of potential measures set forth by the California Office of the Attorney General to reduce greenhouse gas emissions (GHG). One of the stated Land Use measures is to 'incorporate public transit into the project's design' (page 4-416). The accompanying discussion states, "With the exception of Alternative 4, all of the SPAS alternatives include facilities that can improve and encourage transit use at the airport, such as the Intermodal Transportation Facility (ITF) (Alternatives 1, 2, 8 and 9), the Ground Transportation Center (GTC and [ITC (Alternative 3), and the elevated/dedicated busway or Automated People Mover (APM) that would connect the CTA to the ITF and the future LAX/Crenshaw Metro Light Rail Station (Alternatives 1, 2, 8 and 9).

It appears, however, that the connection to the future LAX/Crenshaw Metro Light Rail Station is also be part of Alternative 3 and that Alternative 3 would additionally include a pedestrian bridge connection to

the Metro Green Line. Draft EIR §4.9.6.3 (Alternative 3) states, "Alternative 3 reflects the improvements of the approved LAX Master Plan (i.e., Alternative D) and consists of the implementation of all components of the LAX Master Plan, including the Yellow Light Projects. The components that are pertinent to the land use analysis include the construction of an ITC at Continental City with a pedestrian bridge to the existing Metro Green Line Station; development of a CONTAC at Lot C; development of two APM systems connecting the ITC, GTC, CONRAC, and CTA, with a planned connection to the future Metro LAX/Crenshaw Light Rail Train Station.." The foregoing contrasts subtly with the discussion contained in Table 4.6-8 (GHG Reduction Measures from the Governor's Office of Planning and Research), where one of the stated Land Use and Transportation measures is to 'incorporate...public transit into the project design' (page 4-419). The accompanying discussion states, "With the exception of Alternative 4, all of the SPAS alternatives include facilities that can improve and encourage transit use at the airport, such as the ITF (Alternatives 1, 2, 8 and 9), the GTC and ITC (Alternative 3), and the elevated/dedicated busway or APM that would connect the CTA to the ITF and the future LAX/Crenshaw Metro Light Rail Station (Alternatives 1, 2, 8 and 9).

In addition to clarifying proposed transit improvements, it would be helpful if the EIR would analyze the overall transportation benefits of potential ground transportation improvements (including the full range of mitigation options-proposed and rejected) in comparison with the transportation benefits associated with proposed SPAS transit improvements (as linked to various SPAS alternatives). Further a more detailed micro-simulation might facilitate assessment of the complex secondary impacts noted in Section 4 of our comment letter (concerning traffic impacts and mitigation commitments).

In closing, we again emphasize that the County is strongly supportive of any SPAS alternatives that would enhance the direct connections between LAX and Metro's Light Rail Lines (including the Crenshaw/LAX Line and the Metro Green Line), as well as future connections to the regional rail system. The County also supports measures to increase local bus service to the airport terminals, perhaps through enhancement of the existing bus terminal at Lot C or a new terminal at Aviation and Century Boulevards. The County thanks LAWA for its consideration of the transit recommendations herein, as well as the traffic recommendations contained in Section 4 of this comment letter.

- Please provide clarification as to the Metro connections and/or improvements associated with each of the potential SPAS alternatives.

- Please provide an analysis that contrasts the transportation benefits associated with proposed transit improvements with the transportation benefits of proposed and rejected traffic mitigation measures.

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. The topical response clarifies the transit-related ground access components associated with each of the SPAS alternatives.

Regarding the consistency of the SPAS alternatives with the Attorney General and Governor's Office of Planning and Research suggested GHG reduction measure of incorporating public transit into the project's design, the SPAS Draft EIR sections cited by the commentor clearly explain the different ways that the SPAS alternatives do incorporate public transit into the "project design." The comment does not indicate any errors in these SPAS Draft EIR discussions.

Sections 14.12.1 and 14.12.2 of the SPAS Draft EIR analyze the on-airport and off-airport impacts of the SPAS alternatives as a whole. However, the commentor is requesting separate transportation impact analyses for two individual components of the SPAS alternatives: ground transportation improvements and transit improvements. CEQA does not require an EIR for an integrated project to analyze the impact of individual project components, just the project as a whole. This is especially the case for a Program EIR, which is prepared for a series of actions "that can be characterized as one project." (State CEQA Guidelines Section 15168(a).)

The SPAS alternatives were designed and analyzed as complete systems. That is, impacts to transportation were analyzed based on the assumption that all of the ground access improvements associated with a particular alternative would be implemented, including both non-transit-related improvements (such as the ITF or parking in Manchester Square) as well as transit-related

improvements (such as connectivity to the future Metro Aviation/Century Station). Moreover, many of the SPAS ground access improvements include components that are non-transit related as well as components that are transit related. For example, the dedicated busway is not a transit-related improvement by itself; however, the proposed stop at the Metro Aviation/Century Station would provide access to transit and can, therefore, be considered a transit-related improvement.

Also, the commentor requests evaluation of the transportation benefits of transportation mitigation measures proposed for implementation, as well as rejected mitigation measures. Draft EIR Sections 14.12.1.10 and 14.12.2.7 of the SPAS Draft EIR analyze the transportation benefits of those transportation mitigation measures proposed for implementation. As described in Section 4.12.2.7 of the SPAS Draft EIR, a number of transportation mitigation measures are not feasible to implement. CEQA does not require discussion of infeasible mitigation measures. As discussed in State CEQA Guidelines Section 15126.4(a)(1) and (a)(5), "The EIR shall describe feasible measures…If the Lead Agency determines that a mitigation measure cannot be legally imposed, the measure need not be proposed or analyzed." (See also Concerned Citizens of South Central Los Angeles v. Los Angeles Unified School Dist. (1994) 24 Cal.App.4th 826, 841.)

Although it was not based on a detailed micro-simulation, the on-airport transportation analysis contained in the SPAS Draft EIR is sufficient and appropriate for addressing the potential impacts of the SPAS alternatives. The comment does not provide any facts or evidence indicating that the SPAS Draft EIR transportation impact methodologies were inadequate. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors (Section 15204(a) of the State CEQA Guidelines). Moreover, consistent with Section 15151 of the State CEQA Guidelines, the SPAS Draft EIR transportation impact analysis provided "a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." EIRs for plan-level projects need not be as detailed as EIRs for specific projects. (State CEQA Guidelines Section 15146(b).) More detailed project-level analysis would be conducted if individual second-tier projects are proposed for implementation. At that time, detailed design-level data would be developed, providing the basis to complete project-level CEQA analysis of transportation impacts using more detailed micro-simulation.

Comments indicating support for any SPAS alternative that would enhance the direct connections between LAX and Metro's light rail lines (e.g., Alternatives 1, 2, 3, 8, and 9), as well as support for construction of an ITC at Continental City with a pedestrian bridge to the existing Metro Green Line Station (i.e., Alternative 3) are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Please also see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Response to Comment SPAS-AL00003-8 regarding connectivity to Metro bus operations. Please see Responses to Comments AL00008-32 through AL00008-42 regarding the traffic recommendations contained in Section 4 of the commentor's letter.

The comment is noted.

SPAS-AL00009 Miyamoto, Charlotte County of Los Angeles Department of Beaches and Harbors 10/10/2012

SPAS-AL00009-1

Comment:

The Los Angeles County Department of Beaches and Harbors has the following comments on the Draft Environmental Impact Report (Draft EIR) for the Los Angeles International Airport (LAX) Specific Plan Amendment Study (SPAS):

The Off-Airport Transportation traffic study indicates on Page 4-1301, the project would have a significant impact at the intersection of Lincoln Boulevard and Washington Boulevard. The report states, "The addition of a southbound through lane would fully mitigate the project at this location. However, adding a southbound through lane would require widening of the southbound approach and departure... is considered infeasible... No other feasible improvements has been identified to fully mitigate the project impact...Therefore, this impact would remain significant and unavoidable..." We disagree that there are no other feasible mitigation measures. Costco also had an impact on the Lincoln/Washington intersection and was required to pay Culver City $1.5 million towards the SR90 Connector Road to Admiralty Way project to mitigate their impact. Similarly, this project should contribute towards the SR90 Connector Road to Admiralty Way project to mitigate this project's impact or contribute to Admiralty Way improvements, since Admiralty Way serves as a "relief valve" to Lincoln Boulevard when it reaches capacity.

Table 4.12.2-25 shows in the PM peak hour Admiralty/Fiji LOS A, Admiralty/Mindanao LOS B and Admiralty/Palawan LOS B. These levels of service show less congestion than the levels of service shown in recent previous traffic studies. Provide the backup data to verify these levels of service.

All the intersections of Lincoln Boulevard near Marina del Rey show worse levels of service after the project, except the intersection of Lincoln/Mindanao shows no change in the PM peak hour. This appears to be an error. Provide the backup data to verify these levels of service.

We have also sent you these comments via e-mail.

Response:

The content of this comment letter is identical to comment letter SPAS-AL00001; please refer to the responses to comment letter SPAS-AL00001.

SPAS-PC00001 Lowell, William None Provided 8/25/2012

SPAS-PC00001-1

Comment:

I WOULD LIKE TO KNOW WHY WE HAVE NOT GOTTEN OUR NOISE EASEMENT MONEY THAT WAS PROMISED LAST OCTOBER 2011 WHEN WE SIGNED THE PERMISSION FOR THEM TO FLY OVER OUR HOUSE, WHEN I ASKED HER WHEN I SIGNED THE PAPER SHE SAID MOST LIKELY IN FEBRUARY 2012. IT DID NOT HAPPENED, WHO'S RESPONSIBLE FOR GETTING IT DONE? IT IS IRRESPONSIBLE FOR IT NOT BEING DONE.

Response:

The "noise easement" refers to sound insulation of eligible properties located within the noise impact area (i.e., 65 CNEL or higher noise levels) under the Aircraft Noise Mitigation Program (ANMP), as described on pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR. Participants in the ANMP include communities within unincorporated Los Angeles County, the City of Los Angeles, the City of Inglewood, and the City of El Segundo. Each participating jurisdiction is responsible for implementing its own ANMP to mitigate noise impacts or eliminate incompatible land use within the communities surrounding LAX. Because the commentor's property (located at 10615 Buford Avenue, in the community of Lennox) is within Los Angeles County, the County of Los Angeles Economic and Housing Development, Residential Sound Insulation Program/Noise Easement Acquisition Program is responsible for implementing the ANMP. Under the Noise Easement Acquisition Program, those properties within the highest impacted areas of Lennox are required to sign a noise easement before beginning any sound insulation work. If all criteria are met and the property participates in the Sound Insulation Program, the property owner is entitled to receive $2,500 per property for single-family, duplex, or triplex units and $500 for condominiums. Regarding individual cases, the commentor should contact the County's Residential Sound Insulation Program/Noise Easement Acquisition Program at (323) 890-7325 or (323) 838-5033.1

Comment:

Where are the fleet mixes used for each alternative in the Air Quality analysis?

Response:

The detailed aircraft fleet mixes used in the technical analyses are presented in Appendix J1-1 of the SPAS Draft EIR. Table 3 presents the fleet mix used for the baseline (2009) conditions, while Table 8 presents the fleet mix used for all alternatives in 2025. The aircraft fleet mix is also summarized in Appendix F-1 of the Preliminary LAX SPAS Report: Table 8 for 2009 and Table 12 for 2025.

SPAS-PC00003 Recinos, Jorge L None Provided 8/25/2012

SPAS-PC00003-1

Comment:

I am very happy for the project of the airport expansion but I ask that at the same time I'd like you to pay attention to the salaries of each worker and that they are below the minimum wage and that is not enough to live on. The airport expansion should continue but we the workers are the ones suffering with the poverty of the airport

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00004 Garner, Ryan None Provided 8/25/2012

SPAS-PC00004-1

Comment:

- Traffic in Central Terminal Area is a disaster.
- Need a Multi-Modal solution desparately (i.e. rail, bus, all grade - separated)

Response:

The comment regarding existing traffic in the CTA is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

With regard to the second part of the comment, as described and depicted in Chapter 2 of the SPAS Draft EIR, the SPAS alternatives seek to incorporate multimodal solutions. Specifically, as described in Chapter 2, an Intermodal Transportation Facility (ITF), defined on page 4-1091 in Section 4.12.1.6.1, is included as part of Alternatives 1, 2, 8, and 9, and an Intermodal Transportation Center (ITC) is included as part of Alternative 3. Further, LAWA is working cooperatively with Metro to explore options to better connect the airport with the expanding regional rail system, specifically the new Crenshaw/LAX Transit Corridor and the extended Green Line, which will include a new station at Century and Aviation Boulevards. Please also see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00004-2

Comment:

- I strongly support Alternative 3 for taffic & grud trasportation access

Response:

The commentor's support for Alternative 3 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00005 Boyiaris, Nick None Provided 8/25/2012

SPAS-PC00005-1

Comment:

Unless you move south of Rwy 24L the noise patterns over Westchester and Playa Del Rey & surrounding communities will increase so much more than currently.

Response:

A discussion of project impacts resulting from aircraft noise under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As analyzed therein, under Alternatives 1 through 7, some areas within Westchester, Playa del Rey, and surrounding communities would be newly exposed to noise levels of 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or

higher noise contours, outdoor noise levels above 75 CNEL, and single event aircraft noise levels which results in classroom disruption. As concluded in Sections 4.9.7, 4.9.8, and 4.10.1.8 of the SPAS Draft EIR, interim impacts prior to implementation of LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1, would be significant and unavoidable. In addition, impacts on parks and certain residential uses within outdoor private habitable areas newly exposed to noise levels of 75 CNEL or higher (which would not occur in the communities of Westchester or Playa del Rey) would be significant and unavoidable.

Although the commentor's property is located within the 65 CNEL noise contour and, as implied by the commentor in Comment SPAS-PC00005-2, has received soundproofing, noise exposure at the commentor's property could increase by 1.5 CNEL or higher (not accounting for existing insulation) within the 65 CNEL contour under Alternatives 1 through 7 as analyzed in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. In conformance with Title 21 requirements, interior noise levels must be 45 CNEL or less. As stated in LAX Master Plan Mitigation Measure MM-LU-1, LAWA would continue post-insulation noise monitoring to help ensure achievement of interior noise levels at or below 45 CNEL. Currently, LAWA conducts post-construction noise tests on a random sample of homes to verify the efficacy of the soundproofing installation. To date, all testing has confirmed that interior noise levels have been reduced to 45 CNEL through soundproofing, as required.

SPAS-PC00005-2

Comment:

People cannot stay in their homes, that have been soundproofed, for 24 hrs per day. When today's quiet planes fly to and from Rwy 24R one cannot hear anything but the aircraft's engines roaring.

Response:

Impacts associated with each alternative related to aircraft noise are provided in Section 4.10.1.6. The comment questions the effectiveness of the Aircraft Noise Mitigation Program (ANMP) (soundproofing). As discussed under Mitigation Measure MM-LU-1, LAWA shall expand and revise the existing ANMP. (See Section 4.9.5, Section 4.9.6.10, Section 4.10.1.8 of the SPAS Draft EIR.) As part of the ANMP, LAWA includes pre- and post-insulation noise monitoring to ensure achievement of interior noise levels at or below 45 CNEL. (See page 4-686 of SPAS Draft EIR.) However, as acknowledged in Section 4.9.8 and 4.10.1.8 of the SPAS Draft EIR, some aircraft noise impacts would remain significant and unavoidable, due in part to noise levels in some outdoor habitable areas and interim impacts before implementation of the mitigation measures.

SPAS-PC00005-3

Comment:

Stay further south of Rwy 24L or else buy out every home owner all the way to Manchester.

Response:

This comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The commentor suggests LAWA "buy out every homeowner all the way to Manchester." The commentor does not specify whether he is referencing Manchester Square, located east of the airport, or Manchester Avenue, located north of the airport.

Under CEQA, impacts are only required for significant impacts, and mitigation measures must have a rough proportionality and nexus to those impacts. (See State CEQA Guidelines Sections 15041 and 15126.4(a)(3).) Many of the areas potentially included within the scope of the commentor's suggestion are not significantly impacted by the SPAS alternatives (e.g., see Figure 4.10.1-15 of the SPAS Draft EIR for aircraft noise impacts under Alternative 1). As discussed on page 4-666 of the SPAS Draft EIR, "[d]ecisions to pursue noise insulation or acquisition are made by each jurisdiction. Sound insulation under the ANMP has been prioritized for residential land uses." As described on pages 4-664 through

4-667 in Section 4.9.3.3 of the SPAS Draft EIR, incompatible uses (including residential) located within noise impacted areas (i.e., 65 CNEL or higher noise levels) are eligible for sound insulation under the Aircraft Noise Mitigation Program (ANMP). As summarized in Section 4.9.7 of the SPAS Draft EIR, those residential uses and non-residential noise-sensitive facilities newly exposed to noise levels of 65 CNEL or higher under Alternatives 1 through 7, including those alternatives that move runway 6L/24R northward, would be eligible for sound insulation under the ANMP and through implementation of LAX Master Plan Mitigation Measure MM-LU-1. The LAX Master Plan noise and land use mitigation measures fully mitigate the significant noise impacts on interior noise levels once implemented, as defined under California Code of Regulations, Title 21, Section 5033 (see page 4-933 of the SPAS Draft EIR). Furthermore, LAWA has spent hundreds of millions of dollars for soundproofing homes, including homes in areas north of LAX. These types of decisions do not need to be revisited in every subsequent environmental document. (See Citizens of Goleta Valley v. Board of Supervisors of Santa Barbara County (1990) 52 Cal.3d 553.)

SPAS-PC00006 Callahan, Edward None Provided 8/25/2012

SPAS-PC00006-1

Comment:

The traffic mitigation make sense - though there is no attempt to mitigate the 105 back up.

Response:

The comment that "the traffic mitigation makes sense" is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The comment regarding the SPAS Draft EIR making "no attempt to mitigate the 105 backup" is noted; however, as presented in Section 4.12.2.6, no significant traffic impacts were identified at the CMP freeway monitoring locations on I-105. As stated in Section 4.12.2.7.1 of the SPAS Draft EIR, significant and unavoidable impacts were found at two study intersections from which queues extend onto westbound I-105 during peak times. While mitigation measures were identified that would reduce the level of the significant impacts identified at I-105 Ramps (e/o Aviation Boulevard) & Imperial Highway (MM-ST (SPAS)-24 at study intersection 74) under Alternative 3 and at Sepulveda Boulevard & I-105 Westbound Ramps (n/o Imperial Highway) (MM-ST (SPAS)-1 at study intersection 139) under Alternatives 1-2, 4, 8, and 9 (see Section 4.12.2.7.2), no mitigation measures were identified that would fully mitigate the significant impacts at those intersections.

SPAS-PC00006-2

Comment:

Moving the runway north and claiming that this will not affect noise is ridiculous. The reality is that more air traffic will be on the north runways.

Response:

The comment suggests that the SPAS Draft EIR concludes that the alternatives "will not affect noise." Contrary to this assertion, some aircraft noise impacts were determined to be significant and unavoidable, as summarized in Section 4.10.1.8 of the SPAS Draft EIR.

The commentor is also suggesting that more traffic on the north runways would generate more aircraft noise on the northside.

Page 4-828 in Section 4.10.1.6 of the SPAS Draft EIR clearly lists the anticipated CNEL changes in 2025 with an increase in passenger activity, an associated increase in the number of operations, as well

as an anticipated change in fleet mix. As a result, the overall size of the future (2025) aircraft noise contours under each of the alternatives increases when compared with the baseline (2009) conditions.

Section 4.10.1.6 provides the comparison of aircraft noise impacts for all alternatives. Table 4.10.1-55 provides a summary of the population, dwellings, and non-residential noise-sensitive facilities that would be within the 65 CNEL or higher noise exposure contour with the implementation of the various alternatives compared to the baseline (2009) conditions. Any increase in the number of people that would be impacted by aircraft noise will be due to the growth in aircraft activity projected to occur by 2025. The table also compares the implementation of the various alternatives to 2025 "no additional improvements" conditions.

While it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. As indicated in Sections 4.9, Land Use and Planning, and 4.10.1, Aircraft Noise, and summarized in Tables 1-16 and 1-17 of the SPAS Draft EIR, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward (Alternatives 1, 5, and 6) than would occur in moving 6R/24L southward (Alternatives 3 and 7) or not moving either runway (Alternatives 2 and 4), and the total residential population newly exposed to 65 CNEL would be lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to >65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) or do not move the runways (Alternatives 2 and 4). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower with alternatives that move Runway 6L/24R northward--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas north of the airport. That is, although more homes to the north of the airport would be impacted by noise with a northward move of Runway 6L/24R, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in a general overall decrease in the numbers of homes and people exposed to aircraft noise impacts.

SPAS-PC00007 Gat, Jonathan None Provided 8/25/2012

SPAS-PC00007-1

Comment:

CHANGES AND MODERNIZATION MUST TAKE PLACE. TOO MUCH OF THE FACILITY IS OUT OF DATE. I THINK THE IDEA OF A CONSOLIDATED CAR RENTAL FACILITY IS A GOOD ONE. A SINGLE LINEAR TERMINAL ON THE NORTH SIDE IS PROBABLY A VERY EFFICIENT ALTERNATIVE.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00008 Schneider, Gary N None Provided 8/25/2012

SPAS-PC00008-1

Comment:

I LIVE IN DEL REY, A NEIGHBORHOOD JUST NORTH OF PLAYA VISTA. IN RECENT YEARS, I HAVE EXPERIENCED MASSIVE INCREASES IN NOISE LEVELS FROM LAX.

Response:

The commentor is located approximately 2.6 miles away from LAX and approximately 2 miles away from LAX's 60 CNEL contour (depending upon the SPAS alternative) and 2.3 miles from Santa Monica Airport. For discussion of the alternatives' impacts associated with aircraft noise, please see Section 4.10.1 of the SPAS Draft EIR.

While it is accepted that aircraft activity at LAX has and continues to generate high levels of noise that are incompatible with residential and other noise-sensitive land uses near the airport, these issues are currently addressed through the following programs:

- The Aircraft Noise Mitigation Program (ANMP) and Residential Soundproofing Program. Under the ANMP, incompatible land uses (defined as residential dwellings, schools, hospitals and convalescent homes, and churches/places of worship) located within the 1992 fourth quarter 65 CNEL noise contour or within the 65 CNEL areas extending beyond the 1992 contour based on the most recent quarterly report, are eligible for sound insulation or, in some cases, acquisition. The residential soundproofing program provides sound insulation for eligible residential units through such measures as replacing loose-fitting doors and windows with acoustically rated doors and windows to reduce interior noise levels to 45 CNEL. (See also Section 4.9.3.3 of the SPAS Draft EIR.)

- The Aircraft Noise Abatement Program. This program provides for the abatement of aircraft noise through operation or source noise control including aircraft traffic, flight, and runway use procedures. (See Section 4.10.1.5 of the SPAS Draft EIR.)

- Noise complaint hotline, and internet based electronic complaint form and flight tracking system. In order to inform the public and track and respond to noise complaints associated with a specific flight (for example high single event noise levels associated with early turns, missed approaches, or low altitude), LAWA maintains a 24-hour noise complaint hotline ((424) 64-Noise), and an electronic complaint form and Internet flight tracking system (http://www.lawa.org/welcome_lax.aspx?id=788).

- Voluntary Residential Acquisition Program for Manchester Square and the Belford area. This Program was established based on interest from homeowners and residents who requested that LAWA purchase their properties in lieu of soundproofing. Acquisition, demolition, and clearing are currently underway. This program is independent of the LAX Master Plan. (See pages 4-667 and 4-668 in Section 4.9.3.3 of the SPAS Draft EIR.)

- LAX Community Noise Roundtable. The LAX Community Noise Roundtable was created by LAWA in September 2000 in an effort to help reduce and mitigate adverse noise impacts on surrounding communities from LAX operations. Membership of the Roundtable consists of local elected officials and staff, representatives of congressional offices, members of recognized community groups, the FAA, the Air Transportation Association, and LAWA Management. (See http://www.lawa.org/LAXNoiseRound Table.aspx.)

- LAX Area Advisory Committee. The LAX Area Advisory Committee works in conjunction with the Board of Airport Commissioners and LAWA Community Relations staff to address concerns in their respective communities resulting from airport operations, including noise, traffic, and signs. The 19-member committee is comprised of representatives appointed by elected officials from communities

surrounding LAX, including Culver City, El Segundo, Hawthorne, Inglewood, Lennox, Marina del Rey and Westchester/Playa del Rey. (See http://www.lax.aero/LAXAAC.aspx.)

The commentor suggest that there has been a "massive increase" in noise levels in recent years, but this assertion is not supported by facts or evidence. As discussed on page 4-796 of the SPAS Draft EIR, both the project level analysis and the cumulative analysis account for the fact that the commercial aircraft fleet now operating in the United States is generally much quieter than the earlier aircraft fleets based on the Congressional mandate that new aircraft comply with strict noise levels standards (i.e., Stage 4 certification) and older noisier aircraft (Stage 1 and Stage 2) be retired from operation (14 CFR Part 36). This is evidenced by the fact that the 65 CNEL contours for LAX under current and future conditions are generally smaller than the 65 CNEL contours for LAX from two decades ago.

SPAS-PC00008-2

Comment:

ANY THOUGHT OF MOVING THE NORTH RUNWAY 100'-350' FARTHER NORTH WOULD MAKE LIFE & LIVING INTOLERABLE!

IT IS OUT OF THE QUESTION TO THINK OF RELOCATING THE NORTH RUNWAY FARTHER NORTH!

Response:

A discussion of project impacts resulting from exposure to aircraft noise levels of 65 CNEL or higher under the Alternatives 1 through 7 (which includes the relocation of Runway 6L/24R northward under Alternatives 1, 5, and 6) is provided in Sections 4.9 and 4.10.1 of the SPAS Draft EIR. As shown in Figures 4.9-7, 4.9-8, 4.9-9, 4.9-10, 4.9-11, 4.9-12, and 4.9-13 of the SPAS Draft EIR, the community of Del Rey would not be newly exposed to high noise levels under Alternatives 1 through 7. Furthermore, as shown in Figures 4.10.1-16, 4.10.1-19, 4.10.1-22, 4.10.1-27, 4.10.1-30, and 4.10.1-33 of the SPAS Draft EIR, the community of Del Rey would not be exposed to high single event aircraft noise levels associated with nighttime awakening under existing conditions or as a result of the SPAS project. Please see Response to Comment SPAS-PC00008-1 regarding current measures underway to address existing high aircraft noise levels. Please also see Responses to Comments SPAS-PC00042-5 and SPAS-PC00130-938 regarding the effects of noise on humans. In general, potential aircraft noise impacts of the proposed SPAS alternatives on the community of Del Rey would be less than significant due to the distance of this community from LAX (approximately 2.5 miles to the north).

SPAS-PC00009 Aguilar, Angela M SEIU 8/24/2012

SPAS-PC00009-1

Comment:

I live in San Bernardino and I would like that the Ontario airport be modernized as I live over there and travel every day to LAX. I'd like to work closer to where I live, as it takes 2 hours of travel time because there is no work near Ontario. I hope that Ontario Airport would be larger and that I could earn a fair living, we do not want dirty contractors.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00014 Rodriguez, Crissel SEIU-USWN 8/25/2012

SPAS-PC00014-1

Comment:

I am not in favor with the current plans of expansion at LAX. As an organizer and supporter of workers at LAX I have found that this modernization project is an insult for the citizens around LAX that live in poverty stricken areas. As a global studies major I have studied how developing countries often times have a company operating within its villages and everything around the company, the cities, the infrastructure is in shambles. When I drive through the streets of Inglewood and Hawthorne I am dismayed that citizens live next to a billion dollar hub and receive no economic rewards. It is time to reconsider how resources are distributed and these modernization projects continue to be part of the problem, rather than the solution.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

As part of the LAX Master Plan Stipulated Settlement, subject to LAWA's ability to use airport revenue to the extent permissible under federal law and policies, or to develop other state or federal funding sources, LAWA will provide funding to Inglewood, Los Angeles County, El Segundo, and ARSAC totaling $266 million over a 10-year period to include: (1) accelerated noise mitigation for Inglewood, Los Angeles County and El Segundo; (2) job training and increased job opportunities; (3) traffic mitigation for Inglewood and El Segundo; (4) street removal and landscaping in the dunes west of Pershing Drive; and (5) street lighting in Westchester. An additional commitment of $60 million will be spent by LAWA on various air quality and environmental justice programs. Details of the Community Benefits Agreement are provided at http://ourlax.org/comBenefits.aspx.

SPAS-PC00015 Baca, Mary J None Provided 8/25/2012

SPAS-PC00015-1

Comment:

1) Intermodal Transportation facilities included in Alternatives 8 and 9 would transfer all the traffic currently associated with the car rentals into one area closer to homes.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The changes to the on-airport and off-airport transportation systems associated with operation of a CONRAC under Alternatives 8 and 9 are included in the transportation impacts analyses included in Section 4.12.1, On-Airport Transportation, and Section 4.12.2, Off-Airport Transportation, of the SPAS Draft EIR.

SPAS-PC00015-2

Comment:

3) Second choice would be Alternative 2 which addresses safety concerns without increasing the impact on Westchester area

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-168 regarding conclusions of the NASS relative to north airfield safety. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on page 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements in safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives.

SPAS-PC00015-3

Comment:

2) terminals should be improved without adjusting runways therefore alternative 4 is preferrable.

Response:

The commentor's support for Alternative 4 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which

couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00016-1

Comment:

I HAVE BEEN HEARING FOR SEVERAL YEARS, THAT LANDING ADG6 AIRCRAFT NOW REQUIRES NON STANDARD OPERATIONS. IF THIS IS DONE FREQUENTLY, WHY DOESN'T THAT BECOME THE STANDARD OPERATION

Response:

As described in Section 4.7.2, Safety, of the SPAS Draft EIR, the LAX airfield does not meet the Federal Aviation Administration's (FAA) separation standards for ADG VI aircraft set forth in Advisory Circular (AC) 150/5300-13A, Airport Design. As such, in order to ensure an acceptable level of safety while these aircraft operate, a series of restrictions are in place on ADG VI and other aircraft. Standardization of ADG VI operations refers to constructing airfield infrastructure that meets the FAA's separation standards, thus removing the operational restrictions.

SPAS-PC00017 None Provided None Provided 8/25/2012

SPAS-PC00017-1

Comment:

I am not in favor of moving north runway north as in Alternative 1, 5, & 6. NASA study commented that no changes need to be made for safety

Response:

The comment regarding not being in favor of moving the north runway north as in Alternatives 1, 5, and 6 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The NASA study, specifically the North Airfield Safety Study (NASS), did not comment "that no changes need to be made for safety." The academic panel reviewing the results of the analysis completed by NASA Ames offered their opinion that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield. The NASS did determine that improvements to, and reconfiguration of, the north airfield would reduce the risk of a fatal runway collision. Additional discussion of the NASS and several other safety studies completed for the north airfield is provided in Section 4.7.2 of the SPAS Draft EIR.

Comment:

Financial impact: For each alternative please explain how it will be funded
specifically: what is the total projected cost for ea. alternative? - what % of that cost is the responsibility of the airlines - what % is added to ticket fees - what % will be funded by bonds, etc.

Response:

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. Rough-order-of-magnitude cost estimates for the SPAS alternatives were developed as part of SPAS. The cost estimates are discussed in Chapter 8 of the Preliminary LAX SPAS Report, with detailed information provided in Appendix G.

SPAS-PC00020 None Provided None Provided 8/25/2012

SPAS-PC00020-1

Comment:

What is the required buffer zone between the operational airport & the residential area?

Response:

There are various safety zone requirements set forth by the FAA relative to airport runways, and associated airspace, and taxiways. Section 4.7.2, Safety, of the Draft EIR describes such requirements and Figure 4.7.2-2 within that section delineates the typical nature, location, and dimensions of such safety areas. Figures 4.7.2-3 and 4.7.2-4 of the Draft EIR illustrate where those safety areas are located relative to the existing north airfield configuration, and Figures 4.7.2-6 through 4.7.2-19 show where the safety areas would be located with the airfield improvements proposed under SPAS Alternatives 1 through 7. As discussed in the section and shown on the figures, residential uses are currently located within the runway protection zone (RPZ) east of Runway 6L/24R and would remain in the RPZ under Alternatives 2, 3, 4, and 7. Under Alternatives 1, 5, and 6, the RPZ would shift westward and residential uses would no longer be within the RPZ.

Comment:

Posters 4.1-4.3 did not identify incompatible uses that are non-residential such as places of assembly (parks, schools child care centers etc.). Not sure if this was left out because there are no such uses w/in the runway protected zones.

Response:

Presentation Boards 4.1 through 4.3, used in Public Meetings during the SPAS Draft EIR public review period, summarize and illustrate information from Section 4.7.2, of the SPAS Draft EIR. The runway protection zone (RPZ) maps shown on Board 4.3 are from that section of the SPAS Draft EIR and delineate the nature and location of uses located within the two RPZs at the eastern ends of the runways in the north airfield. Such uses include residential and non-residential uses such as offices, commercial, parking, vacant, and government. There are no places of assembly such as parks, schools, or child care centers within those RPZs at the east ends of the runways. Park uses are located within the RPZ at the western end of Runway 6R/24L, as shown in green in Figures 4.7.2-4 (baseline conditions), 4.7.2-7 (Alternative 1), 4.7.2-9 (Alternative 2), 4.7.2-11 (Alternative 3), 4.7.2-13 (Alternative 4), 4.7.2-15 (Alternative 5), 4.7.2-17 (Alternative 6), and 4.7.2-19 (Alternative 7). The subject park uses include Vista del Mar Park on the east side of Vista del Mar (roadway) and a portion of Dockweiler State Beach on the west side of the Vista del Mar (roadway).

SPAS-PC00026 Rodine, Robert L The Polaris Group 8/28/2012

SPAS-PC00026-1

Comment:

Thank you. I'm Robert Rodine. My firm, The Polaris Group, provides economic and financial consulting, in part to the aviation industry.

In a few short years LAX, in spite of enormous private investment in our region, has descended to become the airport that was ranked #2 among the worst by Travel & Leisure Magazine in April 2012. That puts LAX just 1 above the anchor, LaGuardia, and below #3 from the bottom, Philadelphia.

In this ranking of 22 airports LAX was ranked at the bottom of the list for impression of safety standards, 21st in Check-in/Security and Cleanliness, and was generally characterized as worn out, having outdated infrastructure and being overcrowded and subject to delays.

If we don't want to become a Detroit we need to step up and make LAX Modernization our constant mantra. Not just in appearance but in functionality as well. In the words of Commissioner Torres-Gil we can't "forget that we are not just serving the community and the stakeholders around the Airport..." LAX is "serving 20 million plus residents in Southern California as well as uncounted millions that depend on us internationally..." and "this Airport is a critical economic engine of Los Angeles."

The June 18, 2012, SPAS report to the BOAC enumerated 7 Integrated and Standalone Airfield Alternatives that will move us toward the Modernization of our Airport that is so gravely needed. It is crystal clear, from the chart included on page 7 of the Report, that Alternative 5, representing the relocation of Runway 24 R 350 feet northward is the one Alternative that does the most in meeting "all planning objectives to the greatest extent." In view of this I strongly urge that this Alternative 5 be designated as "The Preferred Alternative" in the final EIR.

Response:

The commentor's support for Alternative 5 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. It should be noted that, the Management Report to BOAC on June 18, 2012 identified four integrated alternatives (Alternative 1 through 4), three stand-alone airfield alternatives (5 through 7), and two stand-alone ground transportation alternatives (8 and 9). All nine of these alternatives are evaluated in the SPAS Draft EIR.

Table 1-2 of the SPAS Draft EIR provides an evaluation of the relationship between the objectives of the proposed project and each of the SPAS alternatives. As indicated therein, each alternative meets the planning objectives to a different extent. Only Alternatives 3 and 5 fully meet the planning objective

related to providing north airfield improvements that support safe and efficient movement of aircraft at LAX. Please also see Response to Comment SPAS-PC00149-2 regarding a discussion of the project objectives associated with the north airfield improvements.

SPAS-PC00027 Cherry, Nate RTKL 8/28/2012

SPAS-PC00027-1

Comment:

WE ARE TOLD THAT GROWTH PROJECTIONS ARE BASED UPON SCAG NUMBERS . . .

HOW DO THE PLANS EVALUATE OFFSITE GROWTH IN THE AREA RELATED TO SPECIFIC INDUSTRIES THAT BENEFIT FROM CLOSE PROXIMITY TO THE AIRPORT (BIOMEDICAL, LOGISTICS, ETC..)

Response:

The analysis of cumulative impacts in Chapter 5 of the SPAS Draft EIR relied, in part, on regional projections of population, housing, and employment prepared and adopted by SCAG as part of the SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Cumulative impacts were evaluated on an aggregate, regional basis; off-site growth related to specific industries that benefit from proximity to the airport were not evaluated in the SPAS Draft EIR. However, the projections included in the SCAG RTP/SCS are based on an assumption of aviation activity at LAX of 78.9 million annual passengers, the same activity level as projected in the SPAS Draft EIR. For the reasons described on pages A-19 and A-20 of the 2008 SPAS NOP, and page A-20 of the 2010 SPAS NOP, as the SPAS alternatives do not include residential or business development, SPAS would not directly or indirectly induce population or housing growth, and no further analysis of induced growth was required in the SPAS Draft EIR.

SPAS-PC00028 Cherry, Nate RTKL 8/28/2012

SPAS-PC00028-1

Comment:

HOW DO THE ALTERNATIVES ANTICIPATE GROWTH IN CARGO THRUPUT? DO THEY WEIGH RELATIVE BENEFIT OF VARIOUS IMPROVEMENTS TO ROAD AND OTHER INTERMODAL CONNECTIONS?

Response:

The SPAS alternatives would not influence future cargo activity at LAX. However, the aviation forecast that was developed for the SPAS analysis projected total future aviation activity at LAX in 2025, including cargo operations. The methodology and assumptions pertaining to future cargo activity are described on page 24 of Appendix F-1 of the Preliminary LAX SPAS Report.

Impacts of the SPAS alternatives on off-airport roads are addressed in Sections 4.12.2 of the SPAS Draft EIR. The majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. All of the SPAS alternatives except for Alternative 4

provide connectivity to regional transit. Please see Topical Response TR-SPAS-T-1 regarding intermodal connections associated with the SPAS alternatives.

Attached Comments to Spas

REQUEST FOR RESPECT
Spas meetings are not announced to local transportation companies. Please have meetings on how the past companies are to be involved with LAX.

These companies have been here for decades and pay loop fees and do not cost any subsidized loss of money.

Please allow us information on how we will be treated in the new design.

We go long distances out to 75 miles to Santa Barbara, Palmdale, the Marine Base.
Our first stops are 35 miles off airport property. Please allow us to know with meetings on how we are to be treated in the future with your plans.

Response:

Please see Responses to Comments SPAS-PC00048-5 and SPAS-PC00130-358 regarding the extensive public outreach LAWA undertook to notify the public of the open house/public meetings that were held at the outset of the SPAS process and during the review period for the SPAS Draft EIR. These meetings were open to all members of the public, including companies that provide transportation services to LAX passengers. Information regarding how commercial vehicles, including shared ride vans shuttles and scheduled bus operators would be accommodated by the SPAS alternatives can be found on pages 4-1091 through 4-1093 of the SPAS Draft EIR and on page 2 of Appendix E2-2 of the Preliminary LAX SPAS Report. As indicated in the SPAS Draft EIR, for those alternatives that include an ITF (i.e., Alternatives 1, 2, 8, and 9), arriving passengers would travel to the

ITF to board certain shared ride vans and scheduled buses. Departing passengers using shared ride vans or scheduled buses would continue to be dropped off directly at their terminal. Under Alternative 3, all private and commercial vehicles, with the exception of LAWA FlyAways, would be precluded from entering the CTA and, instead, would use the planned GTC. The implementation of Alternative 4 would not result in changes to circulation of commercial vehicles, including shared ride vans and scheduled bus operations. (Alternatives 5, 6, and 7 focus on airfield improvements only; these alternatives would be paired with the ground access features of Alternative 1, 2, 8, or 9.)

SPAS-PC00032-2

Comment:

Please do not let the off shore monopoly transportation companies push us out of service we are a very important support system for when they are to big to fail and we keep the prices in check for the passengers needs and necessities.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00032-3

Comment:

Where are we in this plan?

Response:

The subject table was included within presentations given by LAWA staff during preparation of the SPAS Draft EIR. The column on the left delineates the alternative number and type of alternative (i.e., integrated alternatives, airfield alternatives, ground access alternatives) of the nine alternatives addressed in the SPAS Draft EIR. The column on the right indicates the main features of the potential SPAS development concepts that were previously referred to by their main project elements, prior to being formalized as SPAS Draft EIR alternatives. The main features summarized in the right-hand column are consistent with the descriptions of each alternative that are presented in Chapter 2, Project Description, of the SPAS Draft EIR.

As to the commentor's question "Where are we in this plan?" the nine alternatives summarized in the table represent the potential development options for SPAS that were addressed in the SPAS Draft EIR and will be considered by the decision-makers prior to taking action the on SPAS project. The alternatives summary table was not intended to include any information on individual shuttle services.

Comment:

TO: The BOAC of LAWA.The fly away to the valley is ok, The other fly away services should be estopped.

Provisions of the U.S. Code That Prohibit Diversion of Airport Revenues to Non-Airport Purposes, 49 U.S.C. 47101-47133

Section 47101(a)(13).
Airports should be as self-sustaining as possible under the circumstances existing at each particular airport and in establishing new fees, rates, and charges, and generating revenues from all sources, airport owners and operators should not seek to create revenue surpluses that exceed the amounts to

be used for airport system purposes for which airport revenues may be spent under section 47107(b)(1)....

FAA rule for airport operators

The airport owner is obligated to the Government to ensure that the facilities of the airport are made available to the public on fair and reasonable terms without unjust discrimination. Any lease or agreement granting the right to serve the public on the premises of an airport so obligated should be subordinate to the authority of the owner to establish sufficient control
over the operation to guarantee that patrons will be treated fairly. This applies not only to the purveyors of aeronautical services but to restaurants, shops, parking lots, ground transportation, and any establishment retaining commodities and/or services to the public.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00032-5

Comment:

To: The Honorable LAWA Airport Commissioners and Director Gina Marie

The Fly Away is not self-sustaining against FAA rules.

The Fly Away is a non- airport event and is a diversion of funds against FAA rules.
Regionalization of airports has happened and the volume of passengers is lowest in 20 years For 32 years the local companies have taken passengers without any cost to LAX, to all the destinations that the Fly Away and more. This would have saved LAX about 30 million dollars if the Fly Away had not started in 2006 and the 10 million dollars a year that the Fly Away took in transportation money from the public riding it would be in the hands of local drivers and not the over seas corporations that the Fly Away has subsidized with so much money. That money would help in the stores and businesses in the local area in Los Angeles and not France.

I have handed in a survey with hundreds of persons signing that they want Mickey's Space Ship Shuttle's Service. This was handed in a few years ago and Sandy Miller has them on file. We go long distances over 75 miles to the Marine Base in Orange County with a first drop off airport point of 35 miles. There are 8 scheduled service companies like ours that have been here for over 20 years at the scheduled service green stop. We expect that all the LAWA Commissioners and the wonderful President and Vice President and Director will allow these smaller and locally owned companies to be grand fathered into the plan of the CTA in the future of LAX to stay in service with the many hundreds of thousands of passengers that are loyal to us from the long distance areas we serve like Santa Barbara, Palmdale, Santa Maria, and the Marine Base. Companies like ours offer the public a not putting all your eggs in one basket design that the wonderful Director Gina Marie has warned about with other events in LAX. We agree with her and support her help to the local L.A. businesses. If you only have large fortune five hundred companies like Veolia that is from France and the Fly Away which is also owned over seas via L.A., Texas, Phenix, New York, Delaware over to Ireland. Many large companies go bankrupt and the airport is stuck without any recourse. This is why the free services that pay the loop fees to the airport and give a profit to the airport without any RFP's and loss of money are valuable to the airport. They are self sustaining which the Fly Away is not by a long run, and the people are use to them over the decades and do not want to change.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00032-6

Comment:

The Clifton Moore design of the CTA is perfect it is safe for a car bomb would only effect one terminal and if you collected all the people at one place like the design for over in West Chester it would be centered in one place for everyone and more dangerous for a car bomb. The way it is designed now it is spread out and as the vehicles service the passengers they are within 45 seconds curb & gone and the passengers love it and why fix something that is not broken.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. It is assumed that the comment that states "if you collected all the people at one place like the design for over in West Chester [sic]" is a reference to the Ground Transportation Center associated with the approved LAX Master Plan (SPAS Alternative 3). Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. The Security Assessment concluded that "the various SPAS alternatives…do not themselves create greater or lesser vulnerabilities to hostile actions than do existing conditions" (page ES-5). Specifically, the assessment found that the GTC associated with Alternative 3 would increase airport security (page 5-6).

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00032-7

Comment:

The Fly Away is a dead horse that cost an arm and a leg. Give this all back to the local companies like Super Shuttle and Prime Time and keep the money here in L.A. Think of the passengers not the contractors giving money to the mayor. Passengers first. The Valley run has been around the for 32 years and is now a loss of 4 1/2 million dollars a year including the parking facility. The parking facility is built and cannot be taken back but the contract for service can be stopped and given to the many on-call services like Super Shuttle and Prime Time Shuttles that are always on the way from the valley and would take over the fly away operation for free due to 400 vans that need to come back to LAX. This would take the cars off the street and add the people to vans that come back anyway. This is a more efficient use of vans returning, the parking structures use, and CTA would be without large 48 passenger buses that average the size of the vans of 6 passengers giving more space in the airport for cars, less pollution, terrible noise from the large cng engines, also the money given to the van drivers of 15 million dollars a year taken away by the fly away given over seas would help the local economy and the vans they owned would be in better mechanical service since they have to maintain them themselves, as well as the passengers would have a way to go back and forth to the airport at a now basis since they only walk up to the CSR on the curb and load onto the vans to get back to their cars in the valley.

You may say we are keeping the money in the U.S.A. now with the new company Bauer's Limousine Service Inc. PSC - 8361 from San Francisco. The Decision from last year moving some authority to L.A. area does not have LAX airport on the decision like all the other Scheduled Service Companies. The fact that this is a foot note in the decision shows that it appears as the same owners are involved over seas but have made a deal in New York to transfer it all to Bauer just as they did in past with other AKA's. Note foot note with the usual suspected words of trade secrets that allows hide the over seas trick of a tax dodge. so to speak. or legal tax dodge.

1 The ruling provides that the confidential information will remain under seal for a period of two years from the date of the ruling. During this period the information shall not be made accessible or disclosed to anyone other than (a) Commissioners and Commission staff; (b) other parties to this proceeding who have executed a reasonable nondisclosure agreement with Applicant; or (c) upon further order or ruling of the Commission, the assigned Commissioner, the assigned ALJ or the ALJ then-designated as Law and Motion Judge. If Applicant believes that further protection of this information is needed after two years, it may file a motion stating the justification for further withholding the information from public inspection, or for such other relief as the Commission rules may then provide. The motion must be filed no later than 30 days before the expiration of the protective order.

So this did not go out to bid just as the first bid for the Fly Away in 2006 it went to the one bid company that had made the deal to transfer in New York City as I was told by Mr. Bauer on the phone last Friday. This company appears to be the the same over seas AKA design as coach america, gray line, california charters, airport bus of bakersfield, disneyland express, tour coach, starline, vip tours, etc. all having another name and as you have been shown before on an IRS receipt all owned by Banies Pickwick LTD in Ireland. What the mother Corporation does is not buy the new company they ask them to allow them to trade stock let them stay in place to run it and then they control it just as if nothing happened. They have done this over and over with many companies and I would suggest this is happening again here. Why don't you ask them to let you the LAX commissioners read the hidden secret trade information in the puc decision for why would you let a confidential fact go if you are giving them 15 million dollars. You see with local companies before the new fortune five hundred big boys hit town we did all this for nothing and you got paid for our loop fees and the public had phones at the baggage area so they could call us free and everyone could happily go out get right on and not have to go to over seas companies because they had no choice because the French company took over all the advertisement on the airport and helped there other French buddies Veolia by taking all the courtesy phones out of the terminals and make the public have less information that discriminated the local companies out of a lot of business, until the public caught on and now know to call by cell phone and do it. The Phone board that is touch screen just as it was in 1997 is not used and should be taken out and the courtesy phones put back in to help those that have ADA, are hard of hearing, are speaking other languages and will work when the electricity is off which the new JCD advertisement ones that are way out side the baggage area do not and the whole thing was to control public info and help their French buddies veolia transportation and Gray Line being the only companies seen by the public. This is unfair competition. The fly away had helpers on the curb for the first few years, they are gone now. This is illegal and also unfair competition and discrimination of marketing. Some how the Karma seems to come back on them for this. While I am thinking of it JC Decaux makes 120 million dollars a year and gives LAX some of this. But why job this out just to rent signs, can't the city do this and save 120 million dollars going over seas. Why can't LAX put up signs for 120 million dollars and not give it to them. This all seems so easy to give money over seas all the time. Why? We all know why down deep. But it will take time and remember Leland Wong? Cities are going bankrupt and the Fly Away is losing millions. Shut it down now. Our smaller 9 passenger buses are the best size and safer as well and take up very little room in the CTA with the emissions of a private car at most. We also use cng. The amount of load of persons unless it is a large charter is less than 9 passengers so why the big buses? It does not make sense. Let Super Shuttle do this and Prime Time and the Scheduled buses that have been doing it for decades. We pay loop fees and without money flying away to france for nothing. To us local companies it is a hugh mistake to do the fly away and since 2006 it has taken 60 million dollars from the local companies in fares and you have given them 60 million with a $35 million loss not including the parking lot in the valley for 33 million so this has lost 120 million dollars not including parking totally from local business and taxes. Commissioner Zifkin called it Alice in wonder land. How much do you need to know? It has been 6 years, in another 6 years 240 mill.

We have families that work hard helping people going to Orange County from all over the world many taking us 8 or 10 times in a row from Australia, New Zealand, Canada, Tahiti, Hawaii, England, they use us all the time over and over, please allow them to do what they want and let us service them. They do not want to ride big buses that are by fact easier to catch sicknesses on because of the amount of persons, are so dangerous there are people killed on the big buses every day. They are the dangerous way to travel the world. google bus wrecks and see why you should never ride one. Ever.

USA TODAY found at least 42 deaths of motor coach occupants and drivers were not reported using NHTSA's standard definition of a motor coach from 1995 to 2009, the most current year for which data are available. Since 2003, 32 fatalities were not included, which represents a 24% increase from the 133 deaths the agency counted.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The LAX FlyAway program and shared-ride shuttle services such as Super Shuttle and Prime Time provide travelers with a range of transportation options for getting to and from LAWA. Providing a broad range of options makes it more likely that travelers will consider and choose alternative transportation to and from the airport, rather than driving individually in private automobiles, all of which supports the overall goal of reducing traffic, air pollution, and noise impacts. While shared-ride shuttle services might appeal to some travelers, others might be more attracted to an option that allows them to park their vehicles at a secure lot and board a bus that will transport them directly to the airport for a reasonable fee without numerous intermediate stops along the way, and provide the same service on the return trip. In the event the FlyAway program were to be terminated, the elimination of the clean modern 48-passenger FlyAway buses within the CTA would be replaced by numerous individual privately-owned vehicles or several 9-passenger vans for each bus replaced. There is no evidence that elimination of FlyAway buses would result in a net reduction in traffic, air pollution, and noise within the CTA, as suggested by the commentor. In fact, in 2011, the FlyAway network had an average daily ridership of 3,790 passengers, reduced vehicle emissions by almost 24 tons per day, and removed 3,221 vehicle trips per day (i.e., approximately 1,175,700 trips per year), traveling a combined total of 65,505 miles per day on roads approaching LAX.1

1. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP), 2011 Annual Progress Report, October 2012.

SPAS-PC00033 Riordan, Richard J Former Mayor of LA 8/25/2012

SPAS-PC00033-1

Comment:

We've planned long enough. The time for action at LAX is now.

I was honored to serve as Mayor of Los Angeles from 1993 to 2001. I love L.A. and I am proud of what our teamwork accomplished during my two terms in office. One item I was not able to complete was the modernization of Los Angeles International Airport (LAX).

Today, I am pleased to see the positive progress being made on the new Tom Bradley International Terminal, adding new gates for the latest large aircraft as well as other improvements that will enhance the positive experience for visitors to Los Angeles. But this is not enough.

The Los Angeles City Council approved the LAX Master Plan back in 2004. Now, eight years later, the approval process is just getting underway for long delayed and critically needed additional improvements to LAX.

During my administration, I proposed a Master Plan that would take the airport to 2015 and the clock continues to tick on much needed LAX modernization. We still have yet to address moving the north airfield to accommodate today's modern aircraft, properly connecting LAX to our City's mass transit and further enhancing overall airport safety and security. We've planned long enough. The time for action at LAX is now.

As the LAX Specific Plan Amendment Study (SPAS) process winds its way through public hearings and action by our Airport Commission and City Council, I call on our City leaders to make the tough decisions necessary to ensure that LAX becomes a world class airport for the 21st Century.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034 Rothenberg, Alan LA Area Chamber of Commerce 8/29/2012

SPAS-PC00034-1

Comment:

I'm Alan Rothenberg, President of BOAC from 2005 to 2010 and incoming Chair of the LA Chamber.

Modernizing LAX and separating the north airfield runways is essential for safety, operational efficiency and competitive reasons.

The NASA-Aames study concluded that safety could be enhanced 40-55% by separating the runways. Those academics gratuitously stated that since LAX was already safe, based on the statistical probability of a crash it would not be cost effective to separate the runways.

Absolutely incredible! Today is the 7th anniversary of Katrina. Years before that disaster the Army Corp of Engineers recommended improving the levees. It was rejected because it would take a 100 year flood to overrun the levees so it would not be cost effective .Tragically, the 100 year flood came.

I sure would not want to be a member of BOAC or the Council who rejected a chance to enhance safety at LAX by 40-55% and later have blood on my hands when a subsequent crash takes the lives of 100s, maybe 1000s of people.

By the way, upon receiving the NASA-AAmes report, the FAA was incensed and sent a letter to Mayor Villaraigosa admonishing LAWA to "reconfigure the north airfield...to address...safety risks" and "to improve efficiency".

Response:

The comment is noted, along with the FAA letter referenced in the comment, and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS Draft EIR addresses a range of options for improvements to the north airfield, including one, Alternative 5, that meets FAA standards for ADG V and ADG VI aircraft.

SPAS-PC00034-2

Comment:

Regarding cost effectiveness, please understand that LAX is financially self-sufficient. It doesn't take a penny from the taxpayers. It operates entirely on fees paid by airlines, passengers, concessionaires and other non-airline revenues.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00034-3

Comment:

While the draft EIR studied many options, there is only one that maximizes safety, efficiency and competitiveness: Alternative 5; separating the runways 350 feet.

Doing nothing dooms LAX to be less safe, antiquated, inefficient and uncompetitive for yet another generation. And make no mistake: Alternative 2 being advocated by a handful of people means do nothing. In the face of the unanimous comments that LAX must be modernized, doing nothing is simply unacceptable.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-4

Comment:

One last item to clarify: Alternative 5 does not move the boundaries of LAX an inch. No homes or businesses will be taken. Initial assessments by the FAA indicate that the RPZ will not require taking any homes or businesses, with the possible exception of the HVAC UNIT ON TOP OF ONE OFFICE BLD

Response:

As noted in Table 4.9-5 in Section 4.9.6.1 of the SPAS Draft EIR, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components, although acquisition would be required for the ground access components with which these alternatives would be paired.

As described in Section 4.7.2.6.5 of the SPAS Draft EIR, under Alternative 5 the 350-foot northward shift of Runway 6L/24R would place portions of two multi-story structures and rooftop utilities within Part 77 surfaces and result in additional businesses in Westchester, near Sepulveda being located within the RPZ, as shown in Figure 4.7.2-15. As indicated in Section 4.7.2.6.1, of the SPAS Draft EIR, there are several options that can be considered relative to addressing potential safety hazards associated with incompatible structures and uses being located within controlled airspace areas; however, a determination as to the most suitable and practical option cannot be made until more detailed levels of planning and engineering on the selected alternative, if any, can be conducted in consultation with the FAA. It would be premature and speculative to say at this time whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

Section 4.7.2 of the SPAS Draft EIR includes an analysis of impacts associated with modification or removal of structures and uses within the RPZ, should that occur in the future.

SPAS-PC00034-5

Comment:

Adopt Alternative 5. FIX LAX NOW

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-6

Comment:

My name is Alan Rothenberg. From 2005 through 2010 I was President of the Los Angeles World Airways Board of Airport Commissioners. Currently I am First Vice-Chair of and in 2013 will be Chair of the Los Angeles Area Chamber of Commerce.

From 1984, with the opening of the Tom Bradley International Terminal and the construction of the Upper Roadway in the Central Terminal Area in time for the 1984 Los Angeles Olympics there had been no material improvement to LAX. Plans proposed by Mayors from Bradley, to Riordan, to Hahn had been stalled, Finally in December 2004 the City Council adopted a Master Plan ("Alt D"), consisting of several important projects designated as "Green Lit" projects which could be constructed immediately, and designated others as "Yellow Lit" requiring studying alternatives.

Following settlement of a lawsuit that challenged the Master Plan, some $4 Billion of capital improvements have finally been made to LAX, the highlights of which are new reconfigured South Airfield runways, a new Central Utilities Plant (replacing one built in the 1960s) and, of course the magnificent Bradley West Terminal, the first phase of which is nearing completion.

However, the vital "yellow Lit" projects have been delayed until now. Those projects include:

- Phase two of the Bradley West Terminal;

- A midfield concourse to be connected to Bradley West;

- Remodeling and/or replacing the antiquated terminals 1,2 and 3;

- Re-engineering and reinforcing the upper roadway to enhance security ;

- Construction of a CONRAC;

- Creation of an automatic people mover to bring passengers from the CONRAC and from the terminal to be built by the MTA for the extension of the Crenshaw and Green Lines to LAX.

The required review (the Specific Plan Amendments or SPAs) was delayed for several years as a number of studies were made regarding the necessity to separate the runways and build a center taxiway on the North Airfield to enhance safety, all of which concluded that safety would be enhanced by separating the runways, the last of which, the so-called NASA-Aames study, concluded that safety would be improved by 40 to 55%. Following that study and certain inaccurate responses to it, the FAA strongly and unequivocally reiterated in writing what it had been telling LAWA for years, that the North Airfield runways had to be separated and reminding LAWA that the North Airfield did not meet the minimum FAA standards for Group V aircraft (e.g. 747s, 777s, the new Boeing Dreamliner) and Group VI aircraft (A380 and 747-800). A copy of that letter is being submitted along with this testimony.

Response:

The comment is noted, along with the FAA letter referenced in the comment, and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00034-7

Comment:

While safety and security are primary objectives for LAWA, and separating the North Airfield runways should be done for those reasons alone, it is of crucial importance to do so in order to enable LAX to operate at maximum efficiency and to assure that LAX will remain competitive.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-8

Comment:

Currently, because the runways are too close together, whenever a Group VI aircraft is taking off or landing, one of the parallel runways must be shut down. Based on existing and prospective orders for the new large aircraft from Airbus, maker of the A380 and Boeing, maker of the 747-800, unless the North Airfield runways are separated operating efficiencies will be adversely affected. I am submitting herewith an Airbus memo showing their forecasts for A380s at LAX. I have been advised by both Airbus and Boeing that they will be filing written comments supporting the necessity to separate the runways.

Response:

The comment and the attached letter from Airbus are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Subsequent to providing this comment, Boeing and Airbus each submitted written comments on the Draft EIR, which are included, along with written responses by LAWA, in the Final EIR as Comment Letters SPAS-PC00092 and SPAS-PC00113, respectively. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-9

Comment:

Competitively, it is also urgent for LAX to separate the runways to accommodate the new large aircraft. Their range is such that flights from Asia and Australia, for example, can readily overfly Los Angeles. Other cities in the Western United States such as San Francisco, Seattle, Denver, Phoenix, Las Vegas and Dallas, all of whom have invested billions of dollars in modernizing their airports, can now be reached. Qantas, currently the airline bringing the most international passengers to LAX and a leading purchaser of the A380, is submitting written support for separating the runways. And, in fact, earlier in the process, when it appeared that Los Angeles might not go forward with the necessary runway separation, Qantas moved one daily flight to San Francisco. A study in 2006 by LAEDC concluded that the loss of just one daily international flight cost the region $632 million and 3,120 jobs annually. We simply cannot allow that to happen!

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-10

Comment:

The draft EIR studied many separation options, but to me there is only one: separate the runways by 350 feet north. The existing Alt. D is clearly an unworkable and disastrous alternative. Doing nothing means that LAX will be doomed for another generation to be an antiquated, inefficient, uncompetitive airport, that has not enhanced safety and security to the extent it should. Even at 340 feet, LAX will not even meet current FAA standards, although the FAA has indicated its willingness to continue to grant the necessary waiver to accommodate such a separation.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-11

Comment:

As stated previously, the decision to separate the runways is the key to unlocking the modernization of LAX:

-Phase two of Bradley West
-The midfield concourse
-Remodeling terminals 1, 2 and 3
-Reconstructing the Upper Roadway
-Building a CONRAC
-Creating an APM from the CONRAC and the Crenshaw/Green Line extensions.

As the recently prepared LAEDC Report concluded, LAX is an economic engine for the entire region, responsible for close to $40 billion to the economy and close to 300, 000 jobs. The projects outlined above are estimated to involve an additional $8.5 billion in hard costs of construction alone and close to another 100,000 jobs over the next 10-15 years.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-12

Comment:

The numbers from the LAEDC Report establish that LAX is responsible for more jobs than the aerospace industry, the entertainment industry, the burgeoning technology industry and the region's fashion design ,apparel manufacturing and wholesaling business.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-13

Comment:

Travel and Tourism, the largest sector of our economy urgently depends on a modern airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-14

Comment:

Just as our Port has to be modernized in anticipation of new competition from the almost completed expanded Panama Canal, so, too, does LAX have to be modernized to compete for travelers and cargo from other airports in the western United States. (Sometimes overlooked, LAX is the 2nd leading cargo airport in the U.S., trailing only Memphis, home of FedEx)

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-15

Comment:

All of this can be accomplished with no taking of homes and minimal, if any, disruption to the businesses along Sepulveda Blvd..

Response:

As indicated in Table 4.9-5 in Section 4.9.6.1 of the SPAS Draft EIR, no residential acquisition is proposed under any of the SPAS alternatives, including Alternative 5. Please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District, which includes businesses along Sepulveda Boulevard. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. Indirect impacts to businesses along Sepulveda Boulevard due to such factors as project-related traffic or location within the RPZ were analyzed in Sections 4.12.2 and 4.7.2 of the SPAS Draft EIR.

As discussed on page 4-1183 in Section 4.12.2 of the SPAS Draft EIR, because the focus of Alternative 5 is on airfield and terminal improvements, this alternative, in itself, would not result in off-airport transportation impacts that could result in business disruption along Sepulveda Boulevard. As depicted

in Figure 4.7.2-15 of the SPAS Draft EIR, some businesses along Sepulveda Boulevard would be located within the RPZ under Alternative 5. As described in Response to Comment SPAS-AL00007-26, it is unknown whether acquisition would be necessary for addressing the presence of incompatible structures or uses within RPZ areas under any alternative. Please also see Response to Comment SPAS-PC00034-4 regarding impacts to businesses associated with Alternative 5.

SPAS-PC00034-16

Comment:

The CONRAC, MTA line extensions and the people mover will mean fewer cars on the surface streets.

Response:

The comment is correct and reflects the intent of those proposed ground transportation system improvements. Consolidation of the existing rental car operations dispersed around the airport into a single location will support the utilization of a single consolidated rental car shuttle system, thereby reducing the number of individual company shuttles currently traveling on local streets. The approved Metro Crenshaw/LAX Transit Line and Station will promote the use of transit to and from the airport, thereby reducing individual car trips. The proposed elevated/dedicated bus system (Alternatives 1, 2, and 8) and APM systems (Alternatives 3 and 9), which include a stop at the Metro facility noted above, will also help reduce vehicle trips on surface streets at and near the airport.

SPAS-PC00034-17

Comment:

The new large aircraft are quieter, less polluting and more fuel efficient than the older generation of planes they will replace, so there will be no degradation of the environment.

Response:

Newer generation large aircraft, such as the Airbus A380 and Boeing 747-8 and 787, are relatively cleaner, quieter, and more fuel efficient than older generations of large aircraft such as the 747-400. (See pages 4-796 and 4-1330 of the SPAS Draft EIR.) The assumptions used for the SPAS Draft EIR analysis of aircraft-related impacts, such as air quality and noise, take into consideration the growing number of such newer large aircraft in the fleet mix anticipated for future years (i.e., 2025).

SPAS-PC00034-18

Comment:

Over the past decade LAWA has spent in excess of $1 billion in soundproofing or acquiring homes disaffected by LAX operations. To the very limited extent, if any, that it is necessary LAWA will continue to do so, although I emphasize that it is not foreseen to be necessary.

Response:

As noted by the commentor, LAWA has spent in excess of $1 billion for soundproofing or acquiring homes. A review of LAWA records indicates that total expenditures to date include approximately $373 million for residential acquisition; $154 million for soundproofing (City of Los Angeles); $186 million for the Sound Insulation Grant (SIG) Program; $286 million in FAA funding for these programs at LAX; and $45 million in LAWA spending for a total of approximately $1.04 billion to soundproof or acquire homes.

Please see Response to Comment SPAS-PC00034-4 regarding acquisition of properties.

Regarding soundproofing, as shown in Tables 4.9-18 and 4.9-19, in Section 4.9.6.5 of the SPAS Draft EIR, under Alternative 5, some residential uses and non-residential noise-sensitive facilities would be newly exposed to 65 CNEL or higher noise levels or experience a noise increase of 1.5 CNEL or higher within 65 CNEL or higher noise contour in 2025 compared to 2009 baseline conditions. These properties would be eligible for sound insulation under LAX Master Plan Mitigation Measure MM-LU-1.

SPAS-PC00034-19

Comment:

Once the modernization has been completed, Los Angeles will be proud of its gateway to the world.

As the Coalition of the business community and labor has stated: "Enough is Enough" we must Fix LAX Now.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00034-20

Comment:

I enthusiastically support the efforts to continue the overall modernization of Los Angeles International Airport (LAX). For the millions of visitors who come to Los Angeles each year, our airport offers the first, and often lasting, impression of our city. As a world-class city, we should offer our visitors a world-class unforgettable experience.

This was our goal in 1984 when Mayor Tom Bradley led a successful modernization effort at LAX. The Summer Olympic Games of 1984 showcased Los Angeles to the rest of the world, and we worked hard to leave a positive and lasting impression for the thousands of athletes, journalists and fans who attended. At LAX, this meant the construction of a new, state-of-the art international terminal, renovation of the existing terminals, and a new mode of transportation within the airport through the construction of an upper roadway. Simply put, the Olympic Games provided us a tremendous and rare opportunity to restore LAX as a showpiece within the aviation industry.

Nearly thirty years later, Los Angeles is once again embarked on a massive renovation of our landmark airport and I salute Mayor Villaraigosa, the Airport Commission and its staff for embarking on a multi-billion dollar program. While the projects underway, especially the rebuilding of the Tom Bradley International Terminal, are greatly important to restoring the passenger experience, I know it is only the beginning in your efforts to fully modernize LAX. The projects you are currently considering will play an even more important role in securing LAX's role as the nation's leader in aviation. We need a renovated airfield that adequately accommodates the aircraft fleet currently being built. We need direct and easy public transportation to connect LAX to the rest of the community. We need passenger-friendly, first-class terminals to greet passengers and provide them with a positive first glimpse of Los Angeles.

It is our sincere hope to return the Olympic Games to Los Angeles for a third time. Preliminary plans are already underway for such an endeavor. In the consideration of a Host City's bid, decision-makers will look at a city's airport and infrastructure as one of the determining factors for consideration. I encourage and urge you to continue your efforts to fully modernize LAX now - keeping the Olympics hope alive.

Once again, we are provided with a tremendous opportunity, as what happened a generation ago when LAX accommodated those who came to experience the 1984 Summer Olympics. Like then, it will take the courage and perseverance of our elected officials and the Airport Commission to make this dream a reality. Time after time, we've seen this is a city of courageous people. Now is that time once again.

Response:

It is noted that this comment letter includes as an attachment a copy of the comment letter on the SPAS Draft EIR submitted by Peter Ueberroth (SPAS-PC00055). The comments in the attachment are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their

consideration prior to taking any action on the SPAS project. No further response is required because the comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00035 Paxton, Lynne None Provided 8/29/2012

SPAS-PC00035-1

Comment:

I AM AGAINST MOVING ANY RUNWAY TO THE NORTH AT ALL.

MOVING ANY RUNWAY TO THE NORTH WILL RESULT IN EXCESSIVE NOISE SPIKES AFFECTING RESIDENTS LIVING TO THE NORTH, AS I DO.

THE DECIBLE LEVEL STUDIES PRESENTED ARE HOMOGENIZED BY AVERAGING-OUT DATA OVER 24 HR. DAYS AND A 365 DAY YEAR.

ACTUAL NOISE SPIKES WOULD GREATLY INCREASE THE DECIBLE LEVEL TO WHICH RESIDENTS WOULD BE SUBJECTED BY AN UNCOMPUTED, UNPRESENTED AMOUNT.

RECENT TAKE-OFFS ON THE NORTHERN-MOST RUNWAY (350 FT NORTH OF THE "NORMAL" TAKE-OFF RUNWAY) GAVE US RESIDENTS A TASTE OF WHAT IT WOULD BE LIKE MOVING A RUNWAY 350, 200 OR 100 FT NORTH.

I AM ADAMATLY OPPOSED TO ANY SOLUTION INVOLVING MOVING ANY RUNWAY TO THE NORTH.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Section 4.10.1, Aircraft Noise, of the Draft EIR addresses the aircraft noise impacts associated with each of airfield improvements alternatives (i.e., Alternatives 1 through 7), including those alternatives that propose moving Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6). Section 4.9, Land Use and Planning, also discusses aircraft noise impacts, based on the technical analysis completed for Section 4.10.1. Changes in aircraft noise levels for each alternative, compared to 2009 baseline conditions, are delineated in the noise contour figures presented in those sections and are described in the associated text.

The community noise impact assessment completed for the Draft EIR is based upon the CNEL metric, which takes into account individual noise events (i.e., sound energy) throughout the 24-hour day, as representative of average conditions throughout the course of the year. More importantly, CNEL applies penalties for noise events occurring in the evening and nighttime hours, to account for noise during those periods being more intrusive. CNEL is widely recognized and used for community noise impact evaluations as described in Section 4.10.1.1.2. The aircraft noise impact analysis also provided analysis associated with nighttime awakenings, based in part upon the SEL noise metric, which accounts for "maximum sound level and the duration of the sound." (See SPAS Draft EIR Sections 4.10.1.1.2 and 4.10.1.2.3).

Regarding the commentor's reference to recent aircraft departures (take-offs) on Runway 6L/24R, which is normally used only for aircraft arrivals (landings), such activity occurred periodically in late August 2012, while repairs to Runway 6R/24L were underway. The runway noise levels during that period would not be representative of noise levels associated with operations on Runway 6L/24R if relocated northward by 100 feet, 260 feet, or 350 feet because the subject runway relocations would not change the normal (preferential) usage of Runway 6L/24R for arrivals.

SPAS-PC00038-2

Comment:

As it is now

(1) 757's & 737's reverse thrusters are deafening already. Adding better placed crossways makes a lot of sense as it allows planes to decelerate without waking the dead

Response:

The comment is noted. It appears that the commentor is referring to the use of high-speed runway exits (taxiways) for the arrival aircraft when referencing "crossways." As noted on page 4-930 in Section 4.10.1.7 of the SPAS Draft EIR, Alternatives 1, 2, 3, 5, 6, and 7 include improving the locations of high-speed exit taxiways from the outboard runway. The improvements of the high-speed exit taxiways from the runway would allow the aircraft to exit the runway with reduced reverse thrust that directs aircraft away from noise-sensitive uses.

Relatedly, there is a typographical error in the seventh sentence of the first paragraph under the heading "Airport Facilities" on page 4-930 of the SPAS Draft EIR (i.e., "exists" should be "exits"). As such the subject sentence has been revised. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-PC00038-3

Comment:

(2) 747 long hauls taking off currently vibrate my whole house. If you move the runways further north I'll NEVER be able to enjoy my house again.

Response:

The impacts associated with aircraft noise from each SPAS alternative are presented in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. Regarding vibration impacts associated with aircraft operations, consistent with the findings of the studies discussed below, the vibrations created by low-frequency noise from aircraft operations at LAX are not of significant magnitude to cause physical structural damage in standard residential construction.

Aircraft-generated vibrations are typically caused by low frequency noise energy produced by both engine and airframe sources. As described Topical Response TR-N-8 of the LAX Master Plan Final EIR, low frequency noise and its energy impacts were studied thoroughly in the mid-1970s with the inception of supersonic transport (SST) Concorde operations (LAX Master Plan Final EIR-Part II page 2-118). This aircraft was the loudest certified aircraft by International Civil Aviation Organization (ICAO) standards operating in the United States at that time, but is no longer in service. While the noise levels associated with that aircraft are much greater than that associated with today's typical commercial airline fleet mix, the effects of low frequency energy and vibration on the integrity of residential structures were found to be negligible from operation of the SST Concorde. Analyses conducted of five historic sites near the proposed subsonic flight path of the Concorde aircraft revealed breakage probabilities from noise-induced vibration for windows, brick chimneys, a stone bridge, and a plaster ceiling to be less than .001 percent per year.1 It was found that exposure to normal weather (such as thunder or wind loads) produces a higher probability of breakage than vibrations from the Concorde.

At Sully Plantation, Virginia, the test location nearest the Concorde flight path and therefore most likely to sustain vibration damage, calculations were based on a sound level of 104 dBA for each overflight, or an effective pressure of 0.313 pounds per square foot (psf). Estimates of the probability of breakage from one Concorde overflight are about one in every million years. The Concorde's contribution to the cumulative damage of a house in the neighborhood of Kennedy Airport was found to be insignificant. Everyday vibrations from wind and household activities were greater than those caused by aircraft in the worst conditions around normal airports.2

As presented in Table 2 of Appendix J1-2 of the SPAS Draft EIR, peak noise level computations for each of the SPAS alternatives indicate that equivalent or greater levels are achieved at five off-airport locations for 2009 baseline conditions, only one of which had residential uses (within the Belford area where homes are in the process of being acquired due to high noise levels). However, by 2025 none of the off-airport grid locations assessed around the airport would be exposed to noise at or above 104 dBA. Based upon the evaluations at Sully Plantation described above, the likelihood of breakage caused by aircraft at LAX is less than the one chance in every million years.

In April 2002, the Federal Interagency Committee on Aircraft Noise (FICAN) released a report "FICAN on the Findings of the Minneapolis-St. Paul International Airport (MSP) Low-Frequency Noise (LFN) Expert Panel," whereby, the Committee agreed with the findings of the MSP LFN Expert Panel Consensus that:

FICAN concurs with the findings that low-frequency noise from civil aircraft will not pose a public health risk, risk of structural damage, or an increase in indoor speech interference. These findings are consistent with the extensive Federal research on the civil SST, which would produce much higher levels of low-frequency noise than the subsonic aircraft operating at MSP. The issue of low-frequency noise and its impact on structures and people was explored in detail as part of the environmental assessment of the introduction of Concorde supersonic transport operations into the United States. Potential impacts were found to be negligible. Field studies found that the noise-induced vibrations as a result of Concorde overflights cause little or no structural damage. In addition, the Concorde sound pressure levels at low frequencies were found to be well below the EPA threshold for potential health impact.

In terms of other vibration effects like rattling and shaking, the long sound waves from low frequency (propeller, engine exhaust etc.) noise cause the associated vibrations and rumbling symptoms that are typically experienced by residents living near airports. As discussed above, these vibrations are not stressful to residential structures and create less of a risk of damage than typical household activities and wind gusts. As discussed above, there is no evidence to suggest that there are any secondary potential health impacts associated with vibration or that noise levels would significantly impact the enjoyment of the property beyond those impacts already disclosed in the aircraft noise analysis.

SPAS-PC00038-4

Comment:

If you do opt to move the runway, is it possible to be bought out? The loss of property value will eat ALL of my equity, if I'm even able to sell it.

Response:

There are no significant environmental impacts associated with any of the SPAS alternatives that warrant such an action by LAWA. Based on the street address indicated on the written comment, the commentor's residence is located northeast of the intersection of Lincoln Boulevard and Manchester Avenue, approximately 0.7 mile north of the nearest runway at LAX. The subject location is well outside of the 65 CNEL noise contour for 2009 baseline conditions and for 2025 conditions under all of the SPAS alternatives, based on the aircraft noise contours presented in Section 4.10.1 of the SPAS Draft EIR. No significant impacts related to noise or other environmental issues are identified in the SPAS Draft EIR relative to that area. Please also see Response to Comment SPAS-PC00005-3 for discussion of acquisition at other locations.

Regarding concerns about property values, it should be noted that, per Section 15131(a) of the State CEQA Guidelines, "economic or social effects of a project shall not be treated as significant effects on the environment." Although considerations other than environmental impacts have a role in the action

taken by the decision-makers, the purpose of an EIR is to focus on significant environmental effects associated with a proposed project.

SPAS-PC00039-2

Comment:

- Moving North Runway further up will be too much hassle (Community Redevelopment, legal issues, noise, problems, etc).

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

A discussion of property acquisition that could occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. As indicated in these figures and tables, no residential acquisition or acquisition within the Westchester Business District is proposed.

Please see Response to Comment SPAS-PC00130-931 regarding the potential for changes in the RPZ to have an impact on the Westchester Business District and homes.

The SPAS Draft EIR addresses impacts associated with aircraft noise and with construction traffic and equipment noise in Sections 4.10.1 and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant.

However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

Comment:

Alter 2
SP: 9
Fix the traffic
do not change runway pattern

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00042 Mitchell, Michael S Mickey's Space Ship Shuttle 8/29/2012

SPAS-PC00042-1

Comment:

1.2 98th Street Intermodal Transportation Facility
The proposed 98th Street ITF would be a multi-level facility located between 96th Street and 98th Street, west of Airport Boulevard. At approximately 14 acres (single level), the ITF would provide a variety of transportation activities, including a yet-to-be determined number of public parking spaces. Airport users Los Angeles International Airport 1 LAX Specific Plan Amendment Study Report July 2012 Appendix E2-2 - SPAS Alternatives Ground Transportation System Elements could use the ITF for remote passenger pick up and drop off. In addition, arriving passengers would travel to the ITF to board a door-to-door shuttle or scheduled bus such as the LAX FlyAway. Departing passengers using door-to-door shuttles or scheduled buses would continue to be dropped off directly at their terminal.

The ITF would likely include three levels of structured parking with a total of approximately 4,900 spaces. There would also be a plaza area for the busway/Automated People Mover (APM) station, waiting areas for passengers using the FlyAways and shared ride vans, and commercial support spaces to offer waiting passengers and their friends and family desired amenities such as food and beverages or other conveniences to encourage use of this facility. These functions may be on a separate level from the public parking.

The specific access/egress points have yet to be determined, but there would likely be driveways on 96th Street, 98th Street, and Airport Boulevard. Separate driveways for private vehicles and commercial vehicles would likely be provided. For safety or queuing considerations, some of the driveways might be limited to right-turn in/right-turn out.

NOTE:
If you have to build this structure above Please allow the long distance scheduled bus services - the Ventura Airporter, Bakersfield airport bus, Disneyland Express, Antelope Valley Shuttle, Santa Maria Shuttle, Shuttle 2000, Shuttle One, and Mickey's Space Ship Shuttle that are not fly away and super shuttle, prime time to stay in the CTA. We need two circuits for our long distance 35 mile first drop off services. Separate the Street Intermodal Transportation Facility local transportation from the long distance transportation by putting the long distance transportation in the CTA. This allows for our long distance passengers not to have as much time to load with baggage and we are at a 45 second rule at the curb just as the courtesy service buses for hotels and parking buses are. We pay loop fees as we have always and we are not bank rolled by the city. We do this free and pay loop fees.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00042-2

Comment:

- Problems -

- The central terminal area design does not meet current airport security needs associated with vehicular access to airport facilities. Put the personal passenger car down the center roads only.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. This comment presents personal opinions about security that are unsupported by facts, and therefore does not constitute substantial evidence under CEQA. Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. The Security Assessment concluded that "the various SPAS alternatives…do not themselves create greater or lesser vulnerabilities to hostile actions than do existing conditions" (page ES-5).

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00042-3

Comment:

- The curb-front and access road system used for drop-off and pick-up of passengers in the terminal area was not built for today's level of traffic.

Not true, the passenger car can be re-routed down the center of the airport that is not used and only have access to parking lots. Leave the Commercial companies on the outside road ways. The one mile circle is the best you can get for area and service. To make this area smaller off airport will congest the area terribly.

Response:

The comment seems to be suggesting that passenger car traffic be routed down Center Way, which bisects the CTA on an east-west axis, and that commercial vehicles, such as shuttles, buses, and taxis, utilize World Way, which extends around the interior perimeter of the CTA. Such an assignment of vehicle types to roadways within the CTA is not feasible for several reasons. First, Center Way, including Center Way North and Center Way South, is a one-way street allowing only eastbound traffic movements. It is not wide enough nor is it designed for two-way traffic. As such, in-bound (i.e., westbound) passenger traffic would still have to utilize World Way North coming into the CTA. Much of the daily passenger traffic is associated with dropping off or picking up passengers at the curbsides of the terminals, which are accessible only from World Way. Additionally, entrances to the public parking structures within the CTA are located along World Way and are not accessible from Center Way. Based on the above, implementation of the suggested change in roadway assignments is not considered to be feasible.

SPAS-PC00042-4

Comment:

best solution:
- Access remains the same as it is today.
- If it is not broke do not fix it.

Please consider that you are completely making a mistake to put a one mile circle of traffic that now holds it's own even on Christmas and holidays and put this out side in a one block square area.

Response:

The commentor appears to refer to transit within the Central Terminal Area (CTA), and recommends that no changes be made in the CTA. Section 2.2 of the SPAS Draft EIR describes the problems associated with access within the CTA, providing the basis for the project objective to improve the ground access system at LAX. Section 4.12 of the SPAS Draft EIR describes and evaluates changes in the CTA associated with each of the nine alternatives. The SPAS Draft EIR evaluates a reasonable

range of alternatives, however, it is not necessary to prepare alternatives for individual project components as the commentor suggests. It should be noted that the deteriorating level of service within the CTA was addressed in Section 4.3.1 of the LAX Master Plan EIS/EIR. The LAX Master Plan (i.e., Alternative D), received final approval in May 2005, seven years ago.

SPAS-PC00042-5

Comment:

This is crazy plus the airplanes land right over it and the noise is so bad you will get law suites from ear damage.

Response:

An overview of the effects of noise on humans, including hearing loss, communication interference, sleep disturbance, physiological responses, and annoyance, is provided in Section 4.10.1.1.3 of the SPAS Draft EIR. As stated therein, hearing loss is generally not a concern in community noise problems, even very near a major airport or a major freeway. Environmental noise does not have an effect on hearing threshold levels particularly due to the fact that environmental noise does not approximate occupational noise exposures in heavy industry, very noisy work environments with long-term exposure, or certain very loud recreational activities such as target shooting, motorcycle or automobile racing, etc. The Occupational Safety and Health Administration (OSHA) identifies a noise exposure limit of 90 dBA for 8 hours per day to protect from hearing loss (higher limits are allowed for shorter duration exposures). Noise levels in neighborhoods, even in very noisy neighborhoods, are not sufficiently loud to cause hearing loss. While the results of the analysis provided in Section 4.10.1.6 of the SPAS Draft EIR indicate that aircraft noise impacts for all of the SPAS alternatives would be significant, such impacts would not reach the level that would result in hearing damage.

SPAS-PC00042-6

Comment:

It is right in the flight path and where an airplane if it is running out of gas will crash.

Response:

The site of the proposed ITF is over 800 feet south of the flight path of the nearest runway - Runway 6R/24L. Runway 6R/24L is used primarily for departures, while Runway 6L/24R is used mostly for arrivals. The proposed ITF is over 1,500 feet south of the approach path of Runway 6L/24R. Notwithstanding the above, any aircraft encountering an emergency situation would be subject to special flight procedures determined by the air traffic control tower, with the objective to protect the safety of those in the aircraft as well as those on the ground.

SPAS-PC00042-7

Comment:

The cost to bus or train people out to this area should be given to the workers not the construction if you want to invest into a great airport. Please do not let the political influence of the construction companies and lobbyist of the planning people to allow this to happen. It is just as bad a design as the expansion of the fly away that is losing 40 million dollars and taking 60 million dollars from the local companies that do this for free. You do not need the fly away it was taken care of for 32 years before you tried to pay someone to compete with the local companies. Why pay someone to compete with the local area businesses and those you pay are from over seas. THis is the 99% problem, giving only advantage to the big over seas businesses and not local. THis is terrible. Please consider what you are intentionally doing to local business in scheduled services. Keep the cta the same it works great. If you want to lighten the traffic bus personal traffic to lot c and let passenger cars pick up. But do not stop that which works better than any other in the world now.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00042-8

Comment:

Concerning:
1.2 Intermodal Transportation Facility.
Please change E2-2 spas page 4 to do away with the Intermodal Transportation Facility. If you have to do this which is a sin. Let us local scheduled service companies stay in the CTA let super shuttle, prime time, and fly away go out there. Let us stay the way it is now with the Santa Barbara Airbus. Antelope Valley, Santa Maria Bus, Oxnard Airporter, Shuttle One, Shuttle 2000, Airport Bus of Bakersfield, Disneyland Express, and Mickey's Space Ship Shuttle.

Response:

The SPAS Draft EIR provides a full range of alternatives, including Alternatives 3 and 4, which do not include an ITF. The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Comment:

We have owned a townhouse in lower Playa del Rey for the last 10 years.

Having worked at home for 8 of those years, I can tell you that even with double pane windows the noise is somewhat audible, but if the window was opened a crack, I could not have a phone conversation even with a noise cancellation headset.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Section 4.10.1 of the SPAS Draft EIR for discussion of impacts associated with aircraft noise. Please also see Response to Comment SPAS-PC00008-1 regarding current measures underway to address aircraft noise.

SPAS-PC00043-2

Comment:

We used to live on Convoy Street on the Marina Peninsula between Speedway and Pacific and never experienced the kind of air pollution we are now experiencing being that much closer to the airport. Now in Playa del Rey, every weekend we must first wash down our 3 balconies and patio before we can sit on the furniture, not to mention having to power wash the stucco on the outside of the building.

Response:

Deposition of particles and soot is a common occurrence in urban and suburban areas. Though often thought to be associated with airports and aircraft, various studies of deposition have not found any such link. Several of these studies are listed below with a summary of each study's findings.

- Boston-Logan - The first of these studies took place in and near Logan International Airport and involved the collection of atmospheric fallout at multiple sites located both on the airport and in nearby communities.1 Chemical analyses of the samples were also conducted in an attempt to identify the source(s) of the material. The findings suggest that deposition in the vicinity of Logan International Airport results from the combined effects of many urban-related sources (including motor vehicles, marine aerosols, and wind-blown dust) and that the contribution from the airport is indistinguishable from background levels.
- Charlotte-Douglas International - Another study was conducted around Douglas International Airport in Charlotte, North Carolina.2 Deposition particles were collected at both ends of the primary (north-south) runway, and at three locations in the community - north, south, and east of the airport. An advanced chemical fingerprinting (ACF) analysis was performed on the collected samples. The samples were compared to Jet A fuel samples, engine exhaust wipe samples, and a 'typical' urban dust sample from the National Institute of Science and Technology (NIST). The analysis focused on the comparison of saturated hydrocarbons, overall distribution of polycyclic aromatic hydrocarbons (PAH), ratios of selected homologues in the PAHs, and the presence of trace biomarkers called triterpanes and steranes. The results indicated that community samples and runway samples of saturated hydrocarbons, PAHs, and trace biomarkers were all similar to the NIST urban dust sample, and noticeably different than the jet fuel and engine wipe samples indicating that jet fuel and jet engine exhaust from the airport did not contribute significantly to the soot deposition samples analyzed.
- Chicago-O'Hare - A similar study was conducted in the vicinity of O'Hare International Airport involving the collection of soot/particulate matter and "chemical fingerprinting" of the material.3 The results indicate that the samples bore little resemblance to either unburned jet fuel or soot from jet exhaust and concluded that the fallout is most likely from regional pollution (i.e., not attributable to distinct sources).
- LAX (SCAQMD) - Air monitoring studies were also performed in the vicinity of LAX by the South Coast Air Quality Management District.4 For these studies, samples of atmospheric fallout were collected adjacent to the airport and at numerous residences located in the communities of El Segundo, Inglewood, Lennox, and Hawthorne. While soot particles were present in all the samples and generally in greater abundance than at other locations in the South Coast Air Basin, the studies concluded that there was "no discernable pattern of fallout material under LAX's flight path which would indicate a predominate influence from aircraft."
- LAX (LAWA) - A study commissioned by LAWA in 1998 that collected and evaluated atmospheric deposition samples at six sites surrounding LAX arrived at similar conclusions as the SCAQMD study listed above.5

In addition, researchers studying the deposition of particulate matter and trace metals to Santa Monica Bay and the bay watershed determined that the bulk of material being deposited was in particle size categories greater than 10 micrometers in diameter, meaning greater than PM10.6 Particles of this size are not emitted by aircraft, nor do the aircraft emitted particles ever coagulate/aggregate into particles larger than approximately 0.05 micrometers in diameter.7 Particles of this size do not settle out by gravity (referred to as sedimentation), but are carried downwind for large distances before being removed through rainout/washout or dry deposition.8

From all of these studies, it is reasonable to assume that atmospheric deposition of soot, dust and other forms of particulate matter occurs in measurable quantities in the vicinities of these large metropolitan airports. However, because air pollution in urban areas is generated by many different sources (both natural and man-made) and because many of the constituents are petroleum-based (e.g., burned and unburned fossil fuels), it is difficult to isolate and attribute the full impact of airports and aircraft on atmospheric deposition in urban areas. To date, the research results indicate that aircraft do not contribute substantially to deposition.

SPAS-PC00043-3

Comment:

We moved to PDR knowing we were close to the airport, however, we may no longer be able to live here if the airport moves the north runway EVEN CLOSER to our home, increasing the airport noise we experience, the additional pollution we will have to breathe, and the transportation impacts.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-PC00043-4

Comment:

We support measured that would keep the LAX a safe airport. After reading the current SPAS report and the draft EIR we ascertained that there is NOTHING of magnitude to be gained by reconfiguring the north runway. It will not make the airport safer or more efficient. We strongly oppose this measure.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The content of this comment is similar to comment SPAS-PC00053-4; please refer to Response to Comment SPAS-PC00053-4. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00043-5

Comment:

We implore you to look for other alternatives such as regional airports, better transit, relocation of car rentals, etc. to accommodate future air travel needs and to not increase the burden of Westchester and Playa del Rey residents?

Response:

Please see Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. Please see Topical Response TR-SPAS-T-1 regarding transit as related to the SPAS improvements. Regarding relocation of rental car operations, Alternatives 3, 4, 8, and 9 include a Consolidated Rental Car (CONRAC) facility.

SPAS-PC00044 Child, Herb None Provided 7/30/2012

SPAS-PC00044-1

Comment:

As a neighbor and stakeholders in the LAX area, we are absolutely opposed to the expansion of the North runway. It has been proven by NASA and a panel of safety experts that an expansion north is not necessary for safety.

Response:

The comment regarding not being opposed to "expansion of the North runway" is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The NASA study, specifically the North Airfield Safety Study (NASS), did not conclude that improvements to the north airfield are not necessary for safety. The academic panel reviewing the results of the analysis completed by NASA Ames offered their opinion that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield. Note also that, as discussed in Section 4.7.2 of the SPAS Draft EIR, the FAA identified several critical flaws in the assumptions, methodology, and conclusions of the NASS. The NASS did determine that improvements to, and reconfiguration of, the north airfield would reduce the risk of a fatal runway collision. Additional discussion of the NASS and several other safety studies completed for the north airfield is provided in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00044-2

Comment:

FURTHER, the real proponents of this expansion are the runway construction companies and its unions. They are expressing their usual self GREED. Most of these union workers do not live in the neighborhood and have no stake in this project except for more money for themselves.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00044-3

Comment:

We do not object to the rental car centralization at Manchester Square as it does not appear to add significantly to the noise level in our Playa/ Westchester area.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The commentor's statement is correct. As indicated on pages 4-942 and 4-943 in Section 4.10.2 of the SPAS Draft EIR, the ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9, including development of a Consolidated Rental Car Facility (CONRAC) in Manchester Square proposed under Alternatives 8 and 9, would result in changes in road traffic noise levels at off-site noise-sensitive receptors; however, the predicted changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL at off-site receptor locations and,

therefore, would be less than significant. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

SPAS-PC00045 Edelman, Lynn None Provided 7/28/2012

SPAS-PC00045-1

Comment:

A 2010 North Runway Safety Study conducted by NASA and a panel of Academic Experts found that the North Runway Complex is extremely safe, even at future fleet mix and traffic levels, and that the existing configuration would not unduly impact operational efficiency at LAX.

The inclusion of any work on the north runway brings into question the validity of ALL of the proposed work on LAX.

The runway work is so CLEARLY a boondoggle, that it brings into question the competence and integrity of the whole plan.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00044-1 and Section 4.7.2 of the SPAS Draft EIR for a discussion of the North Airfield Safety Study (NASS) and several other safety studies completed for the north airfield. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00046 Pida, Jayson None Provided 8/11/2012

SPAS-PC00046-1

Comment:

You know the previous mayor/committees approved a plan that everyone liked : moving all the terminal/rental parking and the TSA security checks to an off-site area then destroying the old north side terminals and increasing the space between the runways that way. The city and LAWA even bought up an ENTIRE neighborhood for the off-site location -- it now sits boarded up or weed-choked like some 3rd world battle scene.

And now it's back to this nightmare...has everyone up to this mayor lost their minds ??

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00046-2

Comment:

Has anyone REALLY considered or calculated the astronomical economic loss or the destruction to people's lives ???

Response:

The commentor provides no evidence that SPAS would result in "astronomical economic loss or the destruction of people's lives." CEQA does not require purely social or economic impacts to be analyzed in an EIR. (State CEQA Guidelines Section 15064(e).) As required by CEQA, the SPAS Draft EIR evaluates physical impacts on the environment associated with over 20 topical issues and how such impacts have the potential to affect residents in surrounding communities.

SPAS-PC00046-3

Comment:

Of the massive traffic problems that will extend into Santa Monica from cutting off Lincoln blvd

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. In response to the statement of whether or not SPAS Draft EIR "…considered or calculated….the massive traffic problems that will extend into Santa Monica from cutting off Lincoln Boulevard," Lincoln Boulevard would not in fact be 'cut off.' Under Alternatives 1, 5, and 6, modifications to Runway 6L/24R would require realignment of a portion of Lincoln Boulevard but there would be no capacity reduction following construction. Section 4.12.2.5 of the SPAS Draft EIR lists the LAX Master Plan commitments and mitigation measures that are applicable to the SPAS alternatives, including those related to minimizing construction-related traffic effects. Section 4.12.2.6.3 of the SPAS Draft EIR discusses temporary traffic impacts to the off-airport transportation system during construction.

SPAS-PC00046-4

Comment:

or all the residences/businesses that will be destroyed along the Westchester Pkwy ?? Such as Otis College of Fine Art or the apartments and houses in Playa Del Rey and what about all the MAJOR businesses and office buildings that WILL be destroyed along Sepulveda Blvd from the airport to Manchester blvd -- this would tear out the economic heart of Westchester,

Response:

Regarding analysis of property acquisition impacts on the Westchester community associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. A discussion of property acquisition that would occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. As indicated in these figures and tables, no residential acquisition or acquisition of businesses along Westchester Parkway or acquisition of Otis College would occur under any of the SPAS alternatives, and no major businesses or office buildings would be destroyed along Manchester Boulevard. As listed in Table 2-4 and shown in Figure 2-11 of the SPAS Draft EIR, businesses proposed for acquisition along Manchester Boulevard include a vacant office building, Hollywood CPR, and Valet Air Park. In addition, as indicated in Figure 2-10 and listed in Table 2-3 of the SPAS Draft EIR, no businesses or offices, with the exception of the urgent care facility, along Sepulveda Boulevard or Westchester Parkway would be affected by the SPAS alternatives.

SPAS-PC00046-5

Comment:

not to mention all the new noise and pollution problems.
Someone has lost their mind (or they're just plain evil). Count me in to fight this all the way to the end.

Not-going-to-Take-it-anymore

Response:

The comment noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant

and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Comment:

YOU NEED TO LET METRO GO TO LAX AND STOP DRAGGING YOUR FEET

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00048 Mitchell, Michael S Mickey's Space Ship Shuttle 8/29/2012

SPAS-PC00048-1

Comment:

- Problems -
- The central terminal area design does not meet current airport security needs associated with vehicular access to airport facilities.
- The curb-front and access road system used for drop-off and pick-up of passengers in the terminal area was not built for today's level of traffic.

best solution:
- Access remains the same as it is today

The best design is right now, just make the fly away not go in at the same time for all it's services, if you time them 5 minutes a part this is the answer to stop your fly away congestion. Any normal company design knows this. The ITF should not be used, leaving it the way it is does not discriminate the other companies that have been there for over 20 years.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. SPAS Alternative 4 reflects an option whereby no ITF, Ground Transportation Center, or Intermodal Transportation Center would be constructed, such as proposed in the other SPAS alternatives. While Alternative 4 includes a consolidated rental car facility, which would reduce the number of individual rental car company shuttles traveling within the CTA, it does not include the changes to service requested in the comment. Alternative 4, along with all the other SPAS alternatives evaluated in the SPAS Draft EIR, will be considered by decision-makers before taking action on the project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00048-2

Comment:

If a bomb was to be used it is more dangerous in one place at the ITF, much more dangerous than at 8 terminals.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please note that this comment presents personal opinions about security that are unsupported by facts and therefore, do not constitute substantial evidence under CEQA. Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. The Security Assessment concluded that "the various SPAS alternatives…do not themselves create greater or lesser vulnerabilities to hostile actions than do existing conditions" (page ES-5). Specifically, the assessment found that the ITF associated with Alternatives 1, 2, 8, and 9 would increase airport security (pages 5-3, 5-4, 5-11, and 5-12). Please also see Sections 6.3.1.6, 6.3.2.6, 6.3.8.6, and 6.3.9.6 of the Preliminary LAX SPAS Report.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00048-3

Comment:

It is safe now and the the city is going broke and cannot carry more money going to bonds. the bond market is a bubble now. Note all the cities going bankrupt next door to lax.

Response:

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements, including bonds. As noted in that response, no general tax dollars would be used to pay for any of the proposed on-airport improvements. Moreover, general airport revenue bonds are repaid from airport revenues generated from airport users. The bonds are guaranteed only by the revenues from the airport and are not backed by the City of Los Angeles. Please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield.

SPAS-PC00048-4

Comment:

The ITF is not fair to the local scheduled service companies, about 8 of them. This is a way of allowing the off shore monopolies company contracts to push the local companies out of the way and stop competition that keeps the public prices in check. The puc is against monopolies and so is the FAA. %10 of businesses must be small local business is an FAA rule. The local companies like Mickey's Space Ship Shuttle have taken hundreds of thousands of public passengers and they love us. Please do not put us out of business for this terrible design to stop the Clifton Moore design that works so well now. If you want to take only prime time and super shuttle out to the ITF do that but leave the scheduled service at the inter curb. Do not throw the baby out with the bath water on this. You have made a great mistake just designing the fly away bus company the local companies did this for free for 32 years and the way you are doing it is losing 40 million dollars and taking 60 million from local companies that would have made that money if it were not for this terrible design the fly away. Leave the valley schedule and maybe the down town but you have taken all this money over seas for the fly away company is over seas owned and bankrupt.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00048-5

Comment:

Please have meetings with the local companies for we are left out of the whole planning and this is discrimination.

Response:

This comment is noted. LAWA undertook an extensive public participation program in 2006, the outset of the SPAS process, to solicit public input from interested stakeholders. A series of six public meetings was held concerning various aspects of the SPAS planning process. These meetings were open to all members of the public, including companies that provide transportation services to LAX passengers. Documentation of these meetings is provided in Appendix D-1 of the Preliminary LAX SPAS Report.

In addition, LAWA conducted three open house/public meetings in August 2012 during the SPAS Draft EIR public review period to solicit comments on the SPAS Draft EIR. These meetings were also open to all members of the public, including companies that provide transportation services to LAX passengers. Materials from these meetings were posted on the project website, www.laxspas.org. In the event individuals were unable to attend the open house/public meetings, LAWA hosted a virtual online meeting from September 10, 2012 to October 10, 2012, which included audio recordings with information pertaining to the topics addressed at each of the eight meeting stations, accompanied by the visual materials that had been presented at each of the stations. The virtual meeting was accessible to all members of the public. Please see Response to Comment SPAS-PC00130-358 regarding the extensive public outreach LAWA undertook to notify the public of these open house/public meetings and the virtual meeting.

Comment:

There are many good options here, and I'm especially enthusiastic about the proposals for a people mover to a (hopefully built) Metro station, as well as changes to the northern terminals to allow access from one to the other without going through security again. Changes to the runways to reduce delays are also needed. I would like to voice my support for the project to counter the NIMBYism that will likely comprise the bulk of the comments. It's unfortunate the some people and business will be impacted, but this is a regional issue, and if we want to consider ourselves a world-class city, we need a functional, modern, world-class airport.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00050 Schneider, Barry None Provided 7/29/2012

SPAS-PC00050-1

Comment:

I would like to invite you to night of television watching at my house.

It consists mainly of stopping the program on our television while aircraft pass over our homes, at times, every three minutes, now so close and low that not ever the triple paned sound windows installed by airport sound stops the outrageous decibels from filling our home.

While this might sound like a minor inconvienence in light of international travel and growth for LAWA, it has, due to the ever encroaching runways, become an almost intolerable living situation.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Note that the comment primarily addresses existing conditions and does not address or comment on the noise analysis conducted in the SPAS Draft EIR, which addresses noise impacts of the SPAS alternatives. The commentor is referring in part to soundproofing associated with LAWA's Aircraft Noise Mitigation Program (ANMP) described on pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR. Under the ANMP incompatible uses (including residential) located within the noise impact area (i.e., exposed to 65 CNEL or higher noise levels) are eligible for sound insulation pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). To ensure that interior noise levels have been reduced to 45 CNEL or less after soundproofing (in conformance with Title 21), post-construction noise tests are conducted on a random sampling of homes to verify the efficacy of sound insulation. To date, all post-testing has confirmed that interior noise levels meet this requirement. It is not clear from the comment what is meant by "ever encroaching runways" as no change to runways in the north airfield (closest to Playa del Rey) have occurred in recent years. Furthermore, with implementation of the SPAS project and as stated in LAX Master Plan Mitigation Measure MM-LU-1, LAWA will continue post-insulation noise monitoring to ensure achievement of interior noise levels at or below 45 CNEL.

Please also see Response to Comment SPAS-PC00008-1 regarding current programs to address existing aircraft noise levels.

SPAS-PC00050-2

Comment:

I have no fight with expansion, just stop coming closer to homes in the Playa area. Or better yet, if you want to make all of Playa del Rey like the fallow "deadlands" as we locals call the weed covered concrete and old and broken street light lined areas near our homes, simply buy up the rest of Playa del Rey and fly to your hearts content and we will all move on…

Response:

As analyzed in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR, some areas in Playa del Rey would be newly exposed to noise levels of 65 CNEL or higher, or experience increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours under SPAS Alternatives 1 through 7 compared to 2009 baseline conditions. Please see page 4-686 of the SPAS Draft EIR, which includes expansion and revisions to the existing ANMP program, under Mitigation Measure MM-LU-1.

Regarding the commentor's suggestion to "simply buy up the rest of Playa del Rey," please see Response to Comment SPAS-PC00005-3, regarding purchase of property within noise impacted areas.

Furthermore, not all areas in Playa del Rey would be significantly impacted; therefore, such a measure would be out of proportion to the scope of environmental impacts and would lack a sufficient nexus. (See State CEQA Guidelines Section 15041.)

SPAS-PC00050-3

Comment:

All we are saying, is, enough is enough. Expand no more -- you have had all you need for safety and profit. Let us live some semblance of a normal life without further encroachment.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00050-4

Comment:

As an aside, I would offer an odd scientfic theory, one I learned of while writing the screenplay on the life of Nikola Tesla -- he discovered that sound could be altered or eliminated if met with the same frequency of sound. While I am no scientitst, merely a writer, there does exist a method of eliminating or at least disapating the mind shattering, house rattling jet blast that hits our neighborhood on a daily and nightly basis, at times in to the early AM hours well after midnight that seems far closer than ever in the twelve years I've lived here.

It might interest your acoustic engineers (if such people exist in your purview, which I think they do not) to perhaps look into Mr. Tesla's theory on frequency, since he was the bonifide genius who gave us AC power, the electric motor and more or less made our modern age, such as it is, available to the human race.

Response:

The comment refers to the work of Nikola Tesla and his theory that one sound could be nullified with the use of an equal sound of identical frequency but 180 degrees out of phase. In essence, sound is a series of positive and negative pressure waves propagated through a media, in this case air. If an equal sound made of pressure waves of the same frequency but sequenced so that every positive pressure part of the original wave is met with an equal sound of negative pressure and vice versa then the waves would cancel out and there would be no sound. In today's modern era, this is called Noise Cancellation or Active Noise Control. This technology cannot be used to reduce noise levels across a broad geographic area of noise receptors. Noise travels in a spherical pattern, and while a speaker might reduce noise at one location, it would increase noise levels at other locations (i.e., constructive interference). While outdoor Active Noise Control research has been conducted at the source of the noise (i.e., the aircraft), that technology is not yet mature and useable for practical application. NASA has current research to use Active Noise Control within aircraft engines to cancel noise at its source and this technology will likely have practical use in future generations of aircraft jet engines. NASA has published research on this technology (NASA FACTS, Making Future Commercial Aircraft Quieter, FS-1999-07-003-GRC, which is available at http://www.nasa.gov/centers/glenn/about/fs03grc.html.) This technology is not yet mature to implement in aircraft, nor does LAWA have the legal or practical authority to set aircraft design standards, which are controlled by the FAA and the aircraft manufacturers. Therefore, the suggested measure is considered legally, technologically, environmentally (i.e., increase in noise impacts) and socially infeasible.

SPAS-PC00052-1

Comment:

We are homeowners that reside near the corner of Manitoba and Earldom Ave in Playa del Rey. We have lived in this house for over 27 years.

We have learned to live with the airport as our neighbor. Our house has been sound-proofed and we are only bothered by noise when we are outside, with family or friends, and have learned to stop talking and remain still for the 30 - 45 seconds for a plane to take off before being able to resume our conversation.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Section 4.10.1 of the SPAS Draft EIR for discussion of impacts associated with aircraft noise. Please also see Response to Comment SPAS-PC00008-1 regarding current measures underway to address aircraft noise.

SPAS-PC00052-2

Comment:

We have learned to wash down the ourdoor furniture, our BBQ covers and our deck often to try to mitigate the damage caused by air particulates from the airport operation and aircraft.

We have learned to have the paint ready to do the frequent touch up of paint corrosion caused by airport pollution.

Response:

The content of this comment is similar to comment SPAS-PC00043-2; please refer to Response to Comment SPAS-PC00043-2.

SPAS-PC00052-3

Comment:

We have learned to adjust our travel route when traveling south to avoid areas of traffic conjestion caused by airport traffic on Sepulveda and road closures on Pershing when some traveling dignitary requires stepped up security.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Fixing existing conditions, such as existing traffic, are important issues which are considered by the decision-makers, however fixing/mitigating existing conditions is beyond the scope of the CEQA analysis and this EIR because such conditions are not associated with the proposed alternatives. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a); Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App. 4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far beyond its scope"].) Such conditions were however included in the baseline in the SPAS Draft EIR for each resource area. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00052-4

Comment:

And on some lovely days and evening even enjoy watching the plans land and take off from our front porch.
So we have learned to pay the price of having an International airport in our backyard and still maintain a quality of life afforded us by our location in the community of Playa del Rey.

That said...

We are very upset to learn that there is still a distinct possibility that the airport will move the north runway EVEN CLOSER to our home, increasing the airport noise we experience, the pollution we endure, and the transportation impacts to our surrounding neighborhood streets.

Response:

The content of this comment is similar to comment SPAS-PC00043-3; please refer to Response to Comment SPAS-PC00043-3.

SPAS-PC00052-5

Comment:

We are all for measures that would keep the LAX a safe airport. After pouring over the current SPAS report and the draft EIR we conclude that there is NOTHING of magnitude to be gained by reconfiguring the north runway. It will NOT make the airport safer NOR more efficient. We OPPOSE this measure.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The content of this comment is similar to comment SPAS-PC00053-4; please refer to Response to Comment SPAS-PC00053-4. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00052-6

Comment:

Our community has borne the brunt of the quality of life impacts of our International Airport. It is time for the rest of the region to do its share. Why is it not possible to put the intelligence and experience of the "powers-that-be" to work to TRULY developing a regional plan that would spread the pain for whatever gain they are hoping to achieve with measures that ensure the City of Los Angeles can accomodate future air travel needs?

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California.

SPAS-PC00053 Miller, Malcom None Provided 8/3/2012

SPAS-PC00053-1

Comment:

I have been a homeowner in Playa del Rey for over 30 yrs., living on Earldom Ave. between Redlands and Manitoba. Although there was some airport noise when I moved it, I was attracted to the small town feel and closeness to the ocean. I was able to have friends over and enjoy barbeques in my backyard with little airport noise disruption.

Over the years, as LAX has expanded, I have enjoyed my backyard much less, airport pollution in the neighborhood has greatly increased, congestion has increased, and property values have severely suffered.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00053-2

Comment:

I have adapted and learned to continue enjoying our small town in spite of these changes. I have questioned with Los Angeles desiring the benefits of a renowed International Airport why a more forward looking and innovative plan has not been conceived, rather than piecemeal expansions that shortly become inadequate and need further expansion. In its current location, the airport will continue to be insufficient as travel, size of planes, etc. increase.

Response:

As described in Section 1.1, Project Background, of the Draft EIR, the types of improvements being considered in the SPAS process are related to the LAX Master Plan, which was approved by the City of Los Angeles in December 2004. The LAX Master Plan is designed and intended to establish the overall long-term development framework for LAX. The LAX Master Plan provides for modernization of the runway and taxiway system, redevelopment of the terminal area, improvement of access to the airport, and enhancement of passenger safety, security, and convenience. The SPAS-related improvements are what are referred to as the "Yellow Light Projects" associated with the LAX Master Plan and, consistent with the long-term development plan set forth by LAX Master Plan, are designed in light of the future increase in airport activity to 78.9 million annual passengers at LAX.

SPAS-PC00053-3

Comment:

I am very upset to learn that there is still a distinct possibility that the airport will move the north runway EVEN CLOSER to our home, increasing the airport noise we experience, the pollution we endure, and the transportation impacts to our surrounding neighborhood streets.

Response:

The content of this comment is similar to comment SPAS-PC00043-3; please refer to Response to Comment SPAS-PC00043-3.

SPAS-PC00053-4

Comment:

We are all for measures that would keep the LAX a safe airport and Los Angeles a major international hub. After reviewing the current SPAS report and the draft EIR I conclude that there is not the vision to achieve these goals by reconfiguring the north runway. It will NOT make the airport safer NOR more efficient nor plan for the future. I OPPOSE this measure both as a local resident and a person who has been proud to live in Los Angeles and its vision in so many areas.

Response:

Comment noted. Section 4.7.2, Safety, of the Draft EIR addresses impacts related to aviation safety and efficiency. As addressed in that section, and summarized in Table 4.7.2-16 (and reproduced as Table 1-12 in the Executive Summary), each of the seven SPAS alternatives that involve airfield improvements responds differently to the various safety and efficiency factors analyzed in the section. As delineated therein, those alternatives proposing substantial airfield improvements, particularly those that include the addition of a center parallel taxiway between the runways, were found to be better relative to taxiing and holding aircraft staying clear of object free zones and runway safety area surfaces, and in providing pilots and FAA air traffic controllers more time and distance in which to manage aircraft movements on the airfield, as well as providing pilots with improved visibility down Runway 6R/24L before crossing, than would otherwise occur without such airfield improvements.

With regards to whether and how the various alternatives support the objective (goal) to keep LAX a major international hub, Table 1-2 of the Draft EIR provides a preliminary evaluation of the relationship between the objectives of the proposed project and each of the SPAS alternatives. As indicated therein relative to the objective to maintain LAX's position as the premier international gateway in supporting

and advancing the economic growth and vitality of the Los Angeles region, those alternatives proposing substantial airfield improvements, such as Alternatives 1, 3, and 5, more fully responded to that objective than did the other alternatives.

SPAS-PC00054 Gutierrez, Judy None Provided 9/5/2012

SPAS-PC00054-1

Comment:

Unlike most of our neighbors, we became residents of this area of Playa Del Rey after our homes in San Fernando Valley burned down in 2008. Our decision to move to an area where wildfires could never be part of our lives again, we chose this area based on proximity to the beach and frankly we fell in love with living here.

We've learned to tolerate all the things our other neighbors have talked about - the noise, constant dirt, dust, film on anything left outside and anything near an open window. We are grateful that the previous owner participated in the insulated windows and soundproofing provided by the airport. I know that these improvements must not have been willingly offered to satisfy airport neighbors, but as a result of a consolidated objection to the airport request for more expansion. Thank you previous homeowners for fighting the fight that helps me have a home that can be tolerable when all the windows are closed.

Imagine moving from the hot San Fernando Valley to a new location by the sea. We never left our windows open in the valley, spring and summer were too hot and winter was too cold. Here even with the noise we leave the windows open to enjoy the ocean breeze. The noise is the trade off and we have gotten used to it.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. With respect to "constant dirt, dust, film on anything left outside and anything near an open window," it is assumed that the commentor is referring to "deposition," (i.e., the gravitational fallout of material, both solid and liquid, from the atmosphere). Commonly, this material, called particulate matter, consists of dust and soot that can form deposits or cause discoloration on outdoor surfaces (i.e., building materials, motor vehicles, small water bodies, etc.). Please see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. As indicated in Response to Comment SPAS-PC00043-2, to date, the research results indicate that aircraft do not contribute substantially to deposition. With respect to the comment that soundproofing must have been provided as a result of a "consolidated objection to the airport request for more expansion," as stated on page 4-664 in Section 4.9.3.3 of the SPAS Draft EIR, LAWA conducts soundproofing of eligible properties pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). LAWA has had a robust sound insulation program in place since 1997, with demonstration projects occurring as early as the 1980s, well in advance of the LAX Master Plan and related Stipulated Settlement.

SPAS-PC00054-2

Comment:

We are FIRMLY OPPOSED to moving the north runway closer to our home!!! The situation now is somewhat tolerable, and if the planes are closer I fear that the decibel levels approved with the previous upgrades no longer be relevant. Even with the windows closed it will become difficult to have any peace.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR for discussion of the impacts associated with aircraft noise of each of the SPAS alternatives. As stated in LAX Master Plan Mitigation Measure MM-LU-1, LAWA will continue post-insulation noise monitoring to ensure achievement of interior noise levels at or below 45 CNEL. Currently, LAWA conducts post construction noise tests on a random sample of homes to verify the efficacy of the soundproofing installation. To date, all testing has confirmed that interior noise levels have been reduced to 45 CNEL, as required.

SPAS-PC00054-3

Comment:

When airport workers are in runway areas they wear headgear to protect their hearing from the noise. I have a neighbor who currently wears a version of this protection when she works in her yard. As someone who as complete hearing loss in one ear I find myself wondering what kind of protection I should be taking to protect what hearing I have left and that leads me to the following question and statement.

I have 2 points to make about the runway movement:

1. Have studies been made about new decibel level safety for people nearby? If not, why not?

Response:

The comment is noted. Please see Response to Comment SPAS-PC00042-5 regarding the effects of noise on humans related to hearing loss.

SPAS-PC00054-4

Comment:

2. I feel that this airport runway movement is a precursor for having the new super jumbo jets take off from the northern runways. Moving the runway is like the old saying about letting the camel put his head in the tent, once in pretty soon the camel has moved into the tent completely. Move the runways first then super jumbo jets are next. At that point sadly, the neighborhood will not have a say in the matter.

Response:

Comment noted. Section 2.2, Project Objectives, of the SPAS Draft EIR specifically acknowledges that LAWA is seeking to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX, including the largest aircraft types currently in service and anticipated for the future, in all weather conditions. These aircraft types include Aircraft Design Group (ADG) V aircraft, such as the Boeing 747-400, and ADG VI aircraft, such as the Airbus A380. Those aircraft types can, and do, currently operate (i.e., take-off and land) on the north airfield (See Section 2.3.1 of the SPAS Draft EIR). The airfield improvements proposed under the various alternatives are intended to enhance the safety and efficiency of such operations, both now and into the future. It is anticipated that ADG V and VI aircraft will continue to operate at LAX, irrespective of whether any of the SPAS alternatives are approved, but would do so without the safety and efficiency improvements described in the Draft EIR if no airfield improvements are implemented. The potential impacts associated with each of the SPAS alternatives, including the operation of ADG V and VI aircraft on the north airfield, are evaluated in the SPAS Draft EIR.

SPAS-PC00055 Ueberroth, Peter V Contrarian Group, Inc. 8/27/2012

SPAS-PC00055-1

Comment:

I enthusiastically support the efforts to continue the overall modernization of Los Angeles International Airport (LAX). For the millions of visitors who come to Los Angeles each year, our airport offers the first, and often lasting, impression of our city. As a world-class city, we should offer our visitors a world-class unforgettable experience.

This was our goal in 1984 when Mayor Tom Bradley led a successful modernization effort at LAX. The Summer Olympic Games of 1984 showcased Los Angeles to the rest of the world, and we worked hard to leave a positive and lasting impression for the thousands of athletes, journalists and fans who attended. At LAX, this meant the construction of a new, state-of-the art international terminal, renovation of the existing terminals, and a new mode of transportation within the airport through the construction of an upper roadway. Simply put, the Olympic Games provided us a tremendous and rare opportunity to restore LAX as a showpiece within the aviation industry.

Nearly thirty years later, Los Angeles is once again embarked on a massive renovation of our landmark airport and I salute Mayor Villaraigosa, the Airport Commission and its staff for embarking on a multi-billion dollar program. While the projects underway, especially the rebuilding of the Tom Bradley International Terminal, are greatly important to restoring the passenger experience, I know it is only the beginning in your efforts to fully modernize LAX. The projects you are currently considering will play an even more important role in securing LAX's role as the nation's leader in aviation. We need a renovated airfield that adequately accommodates the aircraft fleet currently being built. We need direct and easy public transportation to connect LAX to the rest of the community. We need passenger-friendly, first-class terminals to greet passengers and provide them with a positive first glimpse of Los Angeles.

It is our sincere hope to return the Olympic Games to Los Angeles for a third time. Preliminary plans are already underway for such an endeavor. In the consideration of a Host City's bid, decision-makers will look at a city's airport and infrastructure as one of the determining factors for consideration. I encourage and urge you to continue your efforts to fully modernize LAX now - keeping the Olympics hope alive.

Once again, we are provided with a tremendous opportunity, as what happened a generation ago when LAX accommodated those who came to experience the 1984 Summer Olympics. Like then, it will take the courage and perseverance of our elected officials and the Airport Commission to make this dream a reality. Time after time, we've seen this is a city of courageous people. Now is that time once again.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Comment:

How on earth could anyone pretend that the operation of a major airport is GOOD for the environment

Response:

The SPAS Draft EIR comprehensively evaluates the environmental impacts that would result from implementation of the SPAS alternatives, including adverse impacts. Significant environmental effects are identified in Section 7.1 of the SPAS Draft EIR.

SPAS-PC00057 Williams, Rendric None Provided 7/29/2012

SPAS-PC00057-1

Comment:

Alternative 1 is the best choice both for the people and city of Los Angeles. The northern runways need a taxiway for safe operations of new age jetliners. As well as LAX is the first piece of land most visitors see when they arrive and leave. It is important we keep it updated so we don't lose business to other cities with brand new facilities. International Airlines want to spend thier big dollars at a state of the art facility. We can turn LAX into an even better aviation center with alternative 1.

Response:

The commentor's support for Alternative 1 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Regarding enhancements to safety under Alternative 1, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00062 Rothman, Jeffrey None Provided 8/25/2012

SPAS-PC00062-1

Comment:

E-mail is cabra_bom_da_peste@yahoo.com I have been a Westchester resident for 29 years. During this time I am concerned re additional development in the airport owned and airport adjacent area along Westchester Parkway. Currently run or ride a bicycle. Building of additional parking areas and transport facilities will increase traffic. Building of additional airport related business facilities in the area will also increase traffic. My concern is that a significant increase in traffic along Westchester Parkway will make this corridor no longer the pleasant and safe place it is to walk run and bike. Jeffrey Rothman

Response:

The comment expresses a concern that additional development on airport-owned land along Westchester Parkway would increase traffic levels and reduce pedestrian and bicycle safety there. As a point of clarification, as indicated on page 5-22 in Chapter 5 of the SPAS Draft EIR, the LAX Northside Plan Update project, which would establish new regulations for development on 340 acres north of LAX, is separate from the SPAS project/alternatives that were analyzed in the SPAS Draft EIR. The environmental analysis of the LAX Northside Plan Update project is in progress and will be circulated for public review once it is complete. The SPAS Draft EIR assumed full development of the LAX Northside Plan project as previously approved in 2004, a background condition in the Future (2025) without Alternatives; thus, the cumulative effects of both projects were considered.

Furthermore, traffic conditions are not expected to increase under project or cumulative conditions, such that they would result in a significant impact to bicycle access along Westchester Parkway. Intersection 123 is the most representative of traffic conditions along Westchester Parkway, and this intersection will not be significantly impacted under project or cumulative conditions. (See Tables 4.12.2-14 and 4.12.2-21 [Alternative 1-2], Tables 4.12.2-15 and 4.12.2-22 [Alternative 3], Tables 4.12.2-16 and 4.12.2-23 [Alternative 4], Tables 4.12.2-17 and 4.12.2-24 [Alternative 8], and Table 4.12.2-18 [Alternative 9].

Furthermore, Westchester Parkway, which was financed and constructed by Los Angeles World Airports, currently provides sidewalks, landscaping, and raised medians. Under Alternatives 1, 4, and 5, a portion of Lincoln Boulevard would be reconfigured to accommodate modifications to Runway 6L/24R, including the existing connection between Westchester Parkway and Lincoln Boulevard. Any necessary changes to Westchester Parkway would be designed and constructed in accordance with City standards. As described in the SPAS Draft EIR, the alternatives and cumulative projects at LAX would be required to comply with the LAX Street Frontage and Landscape Development Plan Update, which provides for the enhancement of pedestrian, bicycle (including bicycle lane standards), and vehicular circulation on streets internal to and surrounding LAX. (See SPAS Draft EIR pages 4-13, 4-694 [Alternative 1], 4-707[Alternative 2], 4-717 [Alternative 3], 4-729 [Alternative 4], 4-739 [Alternative 5], 4-749 [Alternative 6], 4-759 [Alternative 7], 4-769 [Alternative 8], 4-773 [Alternative 9].) As further discussed in the SPAS Draft EIR, the project would be consistent with the City of Los Angeles 2010 Bicycle Plan, including "existing or planned bicycle lanes/paths in the LAX area, including those along Pershing Drive, Imperial Highway, Westchester Parkway…" (See SPAS Draft EIR pages 4-699 [Alternative 1], 4-709 [Alternative 2], 4-721 [Alternative 3], 4-730 [Alternative 4], 4-741 [Alternative 5], 4-751 [Alternative 6], 4-761 [Alternative 7], 4-771 [Alternative 8], 4-774 [Alternative 9].) Impacts associated with operational bicycle access along Westchester Parkway would be less than significant. Construction-related impacts to bicycle facilities are discussed on Draft EIR page 4-1282 of the SPAS Draft EIR.

SPAS-PC00063-1

Comment:

It is essential that there be some kind of Metro/light rail connection that brings passengers from around the city either a) directly to the terminals OR b) directly to a fast and efficient APM service that brings passengers directly to the terminals. This should dramatically reduce the automobile circus in the Central Terminal Area

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00064 Siegel, Howard None Provided 8/25/2012

SPAS-PC00064-1

Comment:

As usual there is no direct connection of any public MetroRail or any other type of rail connection into the airport. Having to get off one public transportation system and then having to get on another is simply stupid. I think Heathrow Express and there is a great system

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00065 Haukohl, Kurt None Provided 8/27/2012

SPAS-PC00065-1

Comment:

Several of the Alternative taxiway layout schemes are problematic specifically recommended against in the FAA Engineering Brief #75 and in newer versions of the FAA AC 150-5300-13 change 17. Direct high speed crossing of a second parallel runway are high incursion points nationally.

Response:

The SPAS Draft EIR includes and evaluates seven alternatives that propose different configurations for potential airfield improvements, the majority (five) of which are consistent with the recommendation in FAA Advisory Circular (AC) 150/5300-13 change 17, dated 9/30/2011, that states "Avoid high speed exits that lead directly onto another runway." and are also consistent with the recommendations in the subsequent AC 150/5300-13A, dated 9/28/2012, that states "Ideally, aircraft exiting the runway via a high speed exit taxiway should continue on the parallel taxiway in the landing direction." Alternatives 1, 3, 5, 6, and 7 each include runway relocation to increase the separation between the two parallel runways in the north airfield and the addition of a parallel center taxiway to which proposed high-speed exits from Runway 6L/24R would connect. Alternatives 2 and 4, in which neither runway is relocated,

are the only alternatives with high-speed exits directly leading to a second parallel runway. Due to insufficient separation between the runways, a parallel taxiway is infeasible.

The commentor fails to specify exactly why he believes the alternatives' taxiway layout schemes are problematic in light of Engineering Brief #75. Nevertheless, contrary to the commentor's suggestion that the SPAS alternative taxiway layouts may be inconsistent with FAA Engineering Brief #75, the high-speed exits for Runway 6L/24R in Alternative 2 are located such that they cross Runway 6R/24L in the last third depending on operational direction per the recommendation of FAA Engineering Brief #75. That is also the case for Alternatives 1, 3, 5, 6, and 7. Alternative 4 represents the airfield that would be reasonably expected to occur if none of the Yellow Light Projects or their identified alternatives are constructed. As such, the runways and associated taxiways would remain in their existing locations. In conclusion, the safety implication of Alternative 2 is that it does improve safety by relocating the high-speed exits to the last third of the runway and by changing the angle of how aircraft would approach and cross Runway 24L. The safety implication for Alternative 4 is there is no safety improvements because no changes are made to the high-speed exits and how aircraft would cross Runway 24L.

Also, the design strategies of Engineering Brief #75 are only recommendations. Key elements of the brief were incorporated into AC 150/5300-13A, with which the proposed alternatives comply. Specifically, please refer to Section 401.b.(5) on page 117 of AC 150/5300-13A for a discussion of the recommendation to limit runway crossings to the outer thirds of the runway.

SPAS-PC00066-1

Comment:

LAX needs a peoplemover which would link the central terminal area with the Green Line and the Crenshaw Line. LAX needs to work with Metro to make sure that the transfer is simple and painless. A cross-platform transfer would work best. People don't care about bureaucratic jurisdictions but they do want rail to the airport.

Response:

The commentor's support for an APM is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including linkages to the Green Line and the planned LAX/Crenshaw Transit Corridor, as well as LAWA's coordination with Metro on regional rail issues and the inclusion of APMs in the alternatives. Please also see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of the alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00067 Parks, Donna None Provided 8/27/2012

SPAS-PC00067-1

Comment:

I have friends and relatives who fly into John Wayne or Burbank to avoid the high costs of Ontario airport. Why ??? the airport was built to serve it serves no one- politics at its worst . Someone or LAWA should be accountable for the fact they have there residents and taxpayers going miles out of their way in order to get a "deal ". You can fly from Burbank to Vegas for $49.00 - out of Ontario a joke . Blatant disregard for public - need to revamp the whole LAWA system - starting at the top with the officials who seem to have their heads in the "clouds"

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA and the LAX Master Plan, of which SPAS is a part, support a regional approach to accommodating air travel demands in Southern California.

Comment:

Problems. The central terminal area design does not meet current airport security needs associated with vehicular access to airport facilities. The curb-front and access road system used for drop-off and pick-up of passengers in the terminal area was not built for today's level of traffic. best solution: Access remains the same as it is today The best design is right now for all it's services fly away congestion. Any normal company design knows this. The ITF should not be used much more dangerous than at 8 terminals. It is safe now and the the city is going broke and cannot carry more money going to bonds. the bond market is a bubble now. Note all the cities going bankrupt next door to lax. The ITF is not fair to the local scheduled service companies about 8 of them. This is a way of allowing the off shore monopolies company contracts to push the local companies out of the way and stop competition that keeps the public prices in check. The puc is against monopolies and so is the FAA. %10 of businesses must be small local business is an FAA rule. The local companies like Mickey's Space Ship Shuttle have taken hundreds of thousands of public passengers and they love us. Please do not put us out of business for this terrible design to stop the Clifton Moore design that works so well now. If you want to take only prime time and super shuttle out to the ITF do that but leave the scheduled service at the inter curb. Do not throw the baby out with the bath water on this. You have made a great mistake just designing the fly away bus company the local companies did this for free for 32 years and the way you are doing it is losing 40 million dollars and taking 60 million from local companies that would have made that money if it were not for this terrible design the fly away. Leave the valley schedule and maybe the down town but you have taken all this money over seas for the fly away company is over seas owned and bankrupt. Please have meetings with the local companies for we are left out of the whole planning and this is discrimination. thank you Michael S. Mitchell

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00073 Rosen, Stan None Provided 9/2/2012

SPAS-PC00073-1

Comment:

The effects of the impacts of these changes should be assessed over time. That is the developmental path to achieve each alternative will be different depending on the sequence of the implementation. For example busses could be used first on existing streets then on new roadways. This consideration will significantly affect the environmental impacts of each alternative.

Response:

The comment states that the effect of the changes proposed under each SPAS alternative would differ depending on the sequencing of the individual project elements. As discussed on page 2-8 of the SPAS Draft EIR, "The nine SPAS alternatives addressed within this Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. In general, however, it is anticipated that all of the improvements proposed under each alternative would be completed by 2025, with construction beginning in 2015." As further discussed on page 2-74 of the SPAS Draft EIR, "[d]epending on the outcome of the SPAS process, additional project-level CEQA review may be required for implementation of the improvements associated with the selected SPAS alternative." A similar programmatic approach was taken with the LAX Master Plan, with project level EIRs prepared for implementing projects, such as the Bradley West Project and the Crossfield Taxiway Project (CFTP).

Section 4.12.2.6 provides analysis of off-airport transportation impacts. Section 4.12.2.6.3 of the SPAS Draft EIR discusses potential construction impacts and applicable LAX Master Plan mitigation measures and commitments, consistent with the program-level analysis presented in the SPAS Draft EIR. As discussed in that section, "The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning." The SPAS Draft EIR analyzes the traffic impacts associated with the completion of each SPAS alternative relative to Existing (2010) conditions and Future (2025) without Alternatives conditions. Similar to the Bradley West Project, any subsequent project level activities will be reviewed in light of the SPAS Draft EIR to determine whether additional environmental documents must be prepared.

SPAS-PC00074-1

Comment:

MY MIX OF IMPROVEMENTS ARE AS FOLLOWS; #1 SAFETY- MOVE THE NORTH RUNWAY TO ADVOID OPERATION ISSUES. #2 REPLACE SOME OF CTA PARKING WITH CHECK IN TERMINALS- A TRUELY GRAND ENTRANCE TO LAX. #3 THIS CTA CENTRAL FACILITY NEED TO HAVE THE NORTH/SOUTH LIGHT RAIL STATION SERVING BOTH THE CRENSHAW GRENN LIGHT AND COAST LINES TO SANTA MONICA AND SOUTH TO TORRNACE. #4 A CONSOLIDATED RENTAL CAR FACILITY PLEASE ! (LIKE THE REST OF THE WORLD) #5 PEOPLE MOVER TO CONECT TERMINALS PARKING AND RENTAL CAR CENER. GET RID OF ALL THOSE

SHUTTLE BUSES. #6 BUILD BRADLEY 3 TO THE WESTOF THE CURRENT TERMINAL - ALSO CONECTED BY PEOPLE MOVER.

Response:

To the extent this comment expresses support for a particular alternative, the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The types of improvements suggested in the six points of the comment are generally reflected in the range of alternatives included and addressed in the SPAS Draft EIR. Regarding point #1, to move the north runway to avoid operational issues, SPAS Alternatives 1, 5, and 6 propose different options for moving Runway 6L/24R, each responding differently to the airfield operations needs of the north airfield, as addressed in the SPAS Draft EIR. Regarding point # 2, to replace some of the CTA parking with check-in terminals, this idea is generally consistent with the design of Alternative 3, although in that case all of the parking within the CTA would be replaced with terminal operations. Regarding point #3, to have a CTA transit station that provides a north-south connection to both the future Metro Crenshaw/LAX and Green Lines extending to Santa Monica to the north and Torrance to the south, all of the SPAS alternatives proposing ground transportation system improvements provide for a connection with the future Metro Crenshaw/LAX Transit Line station, with the exception of Alternative 4. Metro, not LAWA, is the lead agency for the route planning and development of the Green Line extension; the commentor is encouraged to submit comments to Metro regarding how and where that route should be extended. Regarding point #4 for a CONRAC, SPAS Alternatives 3, 4, 8, and 9 all include a proposed CONRAC. Regarding point #5 for a people mover to connect terminals parking and the rental car center (i.e., CONRAC), such a connection is proposed in Alternatives 1, 2, and 8 via an elevated/dedicated busway and Alternatives 3 and 9 via an automated people mover (APM). Regarding point #6, it is unclear as to what the commentor considers to be "Bradley 3 to the west of the current terminal"; however, in the event this refers to the future Midfield Satellite Concourse proposed west of the Tom Bradley International Terminal, that project, which is separate from SPAS, will include a connection to the CTA via an APM or other appropriate system as determined in the detailed planning for that facility. Please see page 5-18 in Chapter 5, Cumulative Impacts, for further discussion of the Midfield Satellite Concourse Program.

SPAS-PC00076 Davis, Christina V LAX Coastal Area Chamber of Commerce 9/6/2012

SPAS-PC00076-1

Comment:

On behalf of the LAX Coastal Area Chamber of Commerce, we request that an extension of the comment period be given regarding the LAX EIR.

We understand that you are anxious to complete the process, however, the future plans for LAX is not a decision to be taken lightly. In order to properly review these documents, we request that a 90 day extension be granted for public comment. Our intention is to carefully and methodically review the EIR and weigh in with educated comments that thoughtfully address the concerns of the LAX coastal area business community.

For the reasons above, we request an extension of the comment period.

Response:

The commentor's request for an extension of the public comment period for the SPAS Draft EIR is noted. LAWA provided a 75-day review period for the SPAS Draft EIR which ended on October 10, 2012. Section 21091(a) of the Public Resources Code requires that the review period for a Draft EIR that is submitted to the State Clearinghouse for review shall be at least 45 days. (See also State CEQA Guidelines Section 15105.) The review period for the SPAS Draft EIR provided an additional 30 days for public comment beyond the requirements of CEQA.

SPAS-PC00077 Shapiro, Lynne None Provided 9/6/2012

Comment:

I have lived in Marina del Rey in Silver Strand two blocks from the beach since 1987. At no time have I been disturbed by airplane noise until this summer. When I have taken a plane, it has always headed west, out over the ocean and then on to its northern or eastern direction. For the last three or four weeks, I have heard planes as if I lived next to the airport. At first, I was awakened three and four times a night by planes taking off on the half-hour. This week and possibly part of last week, the planes are heading north over the Main Channel and the Marina Peninsula and beach. Seven thousand of us residents are on the west side of the Marina (L.A. City statistics). The current routes are very disturbing. I don't know if the airport is experimenting or changing its fly zones, but I must protest this routing. As a homeowner and property tax payer, I do not want to hear airplanes zooming by every hour on the hour. This is supposed to be a tranquil, recreational community for its residents and for visitors from L.A. County and abroad. I hope that the airport will not make changes in the west-bound, over the Pacific, planes at LAX.

Response:

The comment primarily addresses existing conditions and does not address or comment on the analysis conducted in the SPAS Draft EIR. The content of this comment is similar to comment SPAS-PC00112-1; please refer to Response to Comment SPAS-PC00112-1.

SPAS-PC00078 Ryavec, Mark Venice Stakeholders Association 9/11/2012

SPAS-PC00078-1

Comment:

I am writing to provide comments on the LAX Specific Plan Amendment Study (SPAS) Draft Environmental Impact Report (EIR).

The EIR is deficient in meeting the objective of minimizing the environmental impacts on surrounding communities and in adequately exploring all alternatives to meet the objectives of the LAX SPAS process.

Response:

Consistent with the requirements of CEQA, the SPAS Draft EIR evaluated the potential environmental impacts associated with a broad range of nine alternatives. The Draft EIR delineates the previously identified LAX Master Plan commitments and mitigation measures that serve to reduce impacts of each alternative and identifies new mitigation measures for significant impacts that were not previously addressed in conjunction with the LAX Master Plan. Please see Response to Comment SPAS-PC00078-5 below regarding the additional alternative suggested by the commentor.

SPAS-PC00078-2

Comment:

These deficiencies are evident in both the lack of a thorough analysis of the potential to significantly expand air service at LAWA's Ontario airport and the degree to which such expansion could ameliorate the need for increased capacity at the Westchester facility.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the suggestion to consider and evaluate the expansion of LA/Ontario International Airport as an alternative to the LAX SPAS project.

SPAS-PC00078-3

Comment:

Further, the EIR does not explore to a significant degree alternative(s) that would significantly reduce existing negative impacts on nearby residents.

Response:

The SPAS Draft EIR provides a thorough analysis of nine alternatives, describes the impacts that would occur in areas nearby under each alternative, and recommends feasible mitigation measures for all significant impacts. The SPAS Draft EIR meets the requirements for alternatives analysis under State CEQA Guidelines Section 15126.6. Please see Response to Comment SPAS-PC00078-5 below regarding the additional alternative suggested by the commentor.

SPAS-PC00078-4

Comment:

In regards to Ontario, there does not appear be any analysis in the material presented to the public (as viewed on August 29, 2012 at the Proud Bird Restaurant) or in the written material provided to the public at that time of the potential for expansion at Ontario which could obviate and/or attenuate the

pace and/or degree of increase in annual passengers at LAX that drives the need for physical expansion, with all of its attendant negative effects on residents, traffic and local air quality.

Since expansion of the Ontario facility has the potential to greatly diminish the need for new capacity at LAX, it must be analyzed and presented to the public and decision-makers in the EIR process.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the suggestion to consider and evaluate the expansion of LA/Ontario International Airport as an alternative to the LAX SPAS project.

SPAS-PC00078-5

Comment:

The EIR also does not adequately explore the opportunity presented in Alternative 3 to significantly reduce the current noise impact of airport operations on residents to the north (Westchester) and northwest (Playa del Rey) by moving Runway 24 Left 340 feet to the south, along with the corresponding ability to modernize facilities by the re-construction of Terminals 1, 2 and 3.

I would suggest an Alternative 10 which combines moving Runway 24 Left 340 feet to the south with re-development and expansion of Terminals 1, 2 and 3, as envisioned in Alternative 3, utilizing some of their existing terminal footprint along with a portion of the land now occupied by the Central Terminal Area (CTA) internal access road and by parking structures in CTA just opposite from Terminals 1, 2 and 3. With the anticipated relocation of CTA long term parking capacity to Manchester Square, much of the CTA parking capacity will be redundant and a significant portion of the cleared land could be dedicated to terminal development. This would allow for the replacement - over time - of all gate capacity now provided at Terminals 1, 2 and 3 while providing completely modernized facilities to advance the goal of creating a world class airport at LAX.

One of the arguments advanced against Alternative 3's linear terminal design is that it would not provide for replacement of all gates currently provided at Terminals 1, 2 and 3. The use of a modest portion of land now used for the parking structures, along with relocation of the LAX access road southward within the CTA, would permit development of an equal number of gates at the new terminals.

Such a configuration would still allow for an internal access roadway, though narrower than the current one, dedicated to shuttles, buses, taxis, police and fire safety vehicles and possibly private vehicles for departures and arrivals and access to short term (hourly) parking, and also one (or two) linear trains or bus lines (instead of the proposed u-shaped design), similar to trains in many other airports - they do not turn-around but rather simply go back and forth on a relatively straight track.

Response:

The main feature of the alternative suggested in the comment is to essentially shift the existing configuration of Terminals 1, 2, and 3 southward in order to accommodate relocating Runway 6R/24L southward by 340 feet and not require the demolition of the concourses for Terminals 1, 2, and 3, as would otherwise occur under SPAS Alternative 3. This concept would allow the retention of more aircraft gates for Terminals 1, 2, and 3 and reduce the gate "imbalance" that would occur under Alternative 3 (i.e., the replacement of the pier concourses at Terminals 1, 2, and 3 with a linear concourse under Alternative 3 would result in substantially fewer gates on the north side of the CTA compared to the south side of the CTA, which, in turn, would require a lot more taxiing of aircraft between the north airfield and gates on the south side of the CTA than would otherwise occur if more gates were on the north side of the CTA). This alternative is considered infeasible for the following reasons. The ability to shift Terminals 1, 2, and 3, including the terminal functions, concourse areas, and airfield operations area (AOA including the gate apron/ramp areas and aircraft taxilanes between the concourses), southward is substantially limited by the presence of the existing key airport operations infrastructure, such as the air traffic control tower (ATCT) and the central utility plant (CUP), and the LAX Theme Building, a historic monument, located along the central east-west axis of the CTA. The distances between the southern edge of the buildings comprising Terminals 1, 2, and 3 to the aforementioned facilities are approximately 350 feet to the CUP, 400 feet to the ATCT, and 250 feet to

the Theme Building. These dimensions do not include the width of the upper (departures) and lower (arrivals) levels curbside roadways and main travel (through) lanes that front the terminals and collectively, including sidewalks and bus/shuttle passenger islands, extend approximately 125 feet southward. As such, the maximum distance that the terminal complex could be shifted southward without requiring demolition and/or relocation of one or more of the subject facilities is approximately 125 feet, which is only about one-third the distance needed to retain most, if not all, of the existing aircraft gates for Terminals 1, 2, and 3. This dimension assumes that future development of a linear bus or train system within the CTA, as suggested in the comment, would occur above the relocated upper and lower roadways, and not adjacent to them. The base of the terminals' lower level is approximately 15-20 feet below the elevation of the aircraft gate ramp/apron area, which means that a substantial amount of engineered fill would be required in order to extend the airfield operations area southward. In conjunction with shifting Terminals 1, 2, and 3 southward along with World Way North (the roadway that fronts the terminals), all of the major utilities located beneath World Way North would need to be relocated. Additionally, the southward realignment of World Way North, including both the upper level roadway and the lower level roadway, would require demolition and realignment/reconstruction of most, if not all, of the roadway ramps located to the east that connect with World Way North, including at Sepulveda Boulevard and Century Boulevard, and the airport return road. The basic nature and locations of the aforementioned improvements under this alternative occurring in the heart of the CTA suggest that construction would require numerous temporary closures of CTA facilities and roadways, and substantial disruptions to the day-to-day operation of the CTA.

Also, the environmental benefits associated with this alternative concept would be very limited compared to the impacts of other alternatives addressed in the SPAS Draft EIR, and those limited benefits would be more than offset by substantially greater construction impacts than under all other alternatives. Under CEQA, an EIR must focus on alternatives that can avoid or substantially lessen a project's significant environmental effects. (State CEQA Guidelines Section 15126.6(b)).

The environmental benefits of this alternative would be generally limited to reduced airfield-related operational air pollutant emissions, as compared to Alternative 3. As noted above, this concept would allow the retention of more aircraft gates for Terminals 1, 2, and 3 than would otherwise occur under Alternative 3 and would reduce the gate "imbalance." In so doing, the amount of aircraft taxiing required under this concept would be reduced, compared to Alternative 3, and could be generally comparable to that of Alternative 7, which relocates Runway 6R/24L 100 feet southward, but maintains Terminals 1, 2, and 3. As indicated in Table 4.2-13 of the SPAS Draft EIR, the airfield-related emissions associated with Alternative 7 would be less than those of Alternative 3, but generally greater than the emissions associated with Alternatives 1, 2, 5, and 6.

For these reasons, the commentor's suggested alternative was not evaluated in detail in the SPAS Draft EIR.

SPAS-PC00078-6

Comment:

With LAWA poised to spend billions of dollars on long overdue modernization, there should be more focus to assure that a significant priority is given in these expenditures to mitigating the current effects of operations on the long suffering residents living around LAX. The noise reductions from the relocation southward of Runway 24 Left would provide that palpable relief, especially to the Westchester and Playa del Rey communities. Expansion of the Ontario facility would slow the growth in ground and air traffic at LAX, again to the benefit of residents in the entire surrounding area.

Response:

While a southward relocation of Runway 6R/24L could provide some aircraft noise reduction in the areas of Westchester and Playa del Rey, the overall aircraft noise impacts would not be reduced, but rather would be shifted to the existing communities to the east, southeast, and south of the airport. As summarized in Table 1-16 of the SPAS Draft EIR, and further addressed in Section 4.9, Land Use and Planning, and Section 4.10.1, Aircraft Noise, of the SPAS Draft EIR, there would be more residential units newly exposed to 65 CNEL by moving Runway 6R/24L southward than would occur in moving Runway 6L/24R northward, and the total residential population newly exposed to 65 CNEL would be

lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to >65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) than for alternatives that move Runway 6L/24R northward (Alternatives 1, 5, and 6). Similarly, to the extent that there is a shift in aviation activity from LAX to Ontario International Airport, any associated reduction in aircraft noise impacts around LAX would be accompanied by a corresponding increase in aircraft noise impacts around Ontario International Airport, as discussed in Chapter 6, Evaluation of Amendments to the LAX Specific Plan, of the SPAS Draft EIR.

SPAS-PC00078-7

Comment:

My thanks to the Alliance for a Regional Solution to Airport Congestion for its June 17, 2008 Runway 24 Left Realignment Proposal, which is combined here with re-deployment of Central Terminal Area parking lands made available by expected development of the new long term parking facility at Manchester Square.

Thank you for consideration of my views on this matter.

Response:

Please see Response to Comment SPAS-PC00130-814 regarding LAWA's review of the ARSAC alternative concept.

Lesson # 86

What's wrong with underlining in briefs, contracts, and other legal documents?

ANSWER: Underlining is a holdover from the era of typewriters. It's crude and unsightly. Why else would you recoil from a published book that contained underlining? Admit it: you would. Any publisher that typeset a book with underlining would seem like a fly-by-night operation.

Underlining obscures part of some characters: the descenders on the lowercase letters g, j, p, q, and y. It also bumps into commas and semicolons. On the word-processors we use today, the underline is ridiculously close to the baseline of the type. And it's too thick --thicker than the strokes of most fonts we use for office documents.

All this is more than just bad aesthetics. Underlining hurts legibility: underlined text is noticeably harder to read, especially in big doses. The obscured letters and punctuation require more effort to see.

But if it's unsightly, doesn't that draw the eye and create emphasis? Well, it does that all right. But emphasis should not create negative attention.

While wonderful in their day, typewriters were limited to a single type, invariably roman. Instead of the elegant italics that typographers used as complementary fonts, typists had a key for underscoring. That was the only way (besides using all-caps) to show emphasis.

But those days are gone forever. So should be underlining.

Response:

This is not a comment on the contents of the Draft EIR.

SPAS-PC00080 Kurkowski, Yoshie The Sheppard 9/13/2012

SPAS-PC00080-1

Comment:

My name is Yoshie Kurkowski and I attended SPAS meeting back in Aug 28. I would like to know what is the name of a gentleman who talked about Olympics. If you can let me know who he was would be great. I went to spasvirtualmeeting website as well as laxspas.org but I could not figure out where the information I was looking for.

Response:

Lists that identify all of the commentors on the SPAS Draft EIR are provided in Chapter 4 of this Final EIR. The text of all comments received, including comments pertaining to the potential for the City of Los Angeles to host a future Olympics, is provided throughout this chapter of the Final EIR. In addition, copies of all of the comments received, in their original formats, are provided in Attachment 5. Videotaped comments were transcribed; this transcription is provided in Attachment 5.

SPAS-PC00081 Easwaran, Kenny University of Southern California 9/15/2012

SPAS-PC00081-1

Comment:

In studying the 9 proposed alternatives, it appears to me that only Alternative 3 fully addresses the ground transportation issues facing the airport. Given the increasing importance of public transportation in Los Angeles, and the increasing need for reduced reliance on personal automobiles for the world, as gasoline prices continue to increase and global warming advances, it seems more likely that travel by public transportation is more likely to exceed expectations in decades to come rather than fall short. This makes it essential to allow better connections to light rail stations and intermodal transportation centers than may be planned for.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. As noted in the topical response, all of the SPAS alternatives, except for Alternative 4, provide connectivity with regional transit.

SPAS-PC00081-2

Comment:

Although Alternatives 1, 2, 8, 9 all make some attempt to connect the new Metro station at Aviation/Century to the terminal area, only Alternative 3 improves the connection to the existing Green Line station at Aviation/LAX. Additionally, Alternative 3 places the intermodal transportation center close to the intersection of two major interstates, rather than at a great distance from them - this will allow for increased bus service, as demand grows.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Currently, free shuttle service, operated approximately every 12 to 15 minutes, 24 hours a day, is provided to assist travelers in getting from/to the Metro Green Line Aviation Station. This shuttle service would be discontinued under all of the SPAS alternatives, except Alternative 4. Under Alternative 3, a pedestrian connection would be constructed between the ITC and the Green Line Aviation Station. Under the other alternatives, connectivity to public transit would occur via the LAX dedicated busway or APM, with a stop/connection at the future Metro Aviation/Century Station. It should be noted that this stop would provide connectivity with the Metro Green Line, as the Metro Green Line will be extended to the north on a shared right-of-way with the Crenshaw/LAX Transit Corridor, Please also see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00081-3

Comment:

Alternative 9 additionally falls short in improvements for Green Line passengers, because it includes no busway, and thus passengers coming on the shuttle from the Green Line will have a substantially worse experience, and may be forced to drive personal cars instead.

Response:

The commentor's concerns about Alternative 9 are noted, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Alternative 9 would provide connectivity to Green Line passengers via the APM, which would stop at the future Metro Aviation/Century Station. Metro passengers would then be transported between the CTA and the future Metro station via an APM system, avoiding any roadway congestion entering the CTA. As noted in Response to Comment SPAS-PC00081-2, connectivity at the Metro Aviation/Century Station would serve Green Line passengers, as the Metro Green Line will be extended to the north on a shared right-of-way with the Crenshaw/LAX Transit Corridor. Please also see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00081-4

Comment:

I understand that Alternative 3 involves major changes to the runways, which necessitates a total restructuring of the terminal facilities, which is why private automobile access to the terminal area is eliminated. However, it seems to me that even without such a radical restructuring of the runways and terminal facilities, it may become important to reduce or eliminate private automobile access to the terminal area. Even on alternatives 1, 2, 8, or 9, it may be useful to consider imposing a congestion charge on all private vehicles that enter the terminal area, to help encourage people to use public transit or parking facilities, and pick up travelers at the transportation centers. At the moment, the worst aspect of the airport experience is in waiting for half an hour in the smoggy roadway, either waiting for a bus, or waiting in a car to exit the area. This experience can be greatly improved, with or without the radical restructuring of the airport involved in Alternative 3.

Response:

All of the SPAS alternatives seek to reduce the private automobile traffic (POV) in the Central Terminal Area (CTA) by providing: (1) kiss-and-ride facilities off-airport; (2) better connection to the CTA from facilities located outside the CTA using either a busway or an APM; and (3) additional parking outside the CTA that would encourage passengers to park in these facilities, with transport to the CTA using the busway or the APM. Please see Section 4.12.1 and 4.12.2 of the SPAS Draft EIR for a discussion of the impacts to on and off-airport traffic under each of the alternatives. As discussed on page 4-1100 in Section 4.12.1.7.2 of the SPAS Draft EIR, only 5 percent of the POV's were reassigned from the airport's CTA to kiss-and-ride facilities. Table 4.12.1-15 on page 4-1103 of the SPAS Draft EIR shows that the volume of kiss-and-ride passengers during the arrivals level peak hour is equal to 2.55 percent of the total passenger mode share, which represents, as discussed above, 5 percent of passengers that arrive at the airport via private vehicles. However, this percentage may be much greater as passengers recognize the higher level of convenience in using these facilities. The SPAS on- and off-airport transportation analyses made conservative assumptions in reassigning traffic to facilities located outside the CTA in order to present a worst-case scenario in the CTA.

Consideration was given to congestion pricing alternatives as part of the assessment of potential CTA access improvements presented in Option 1 on page 21 in Appendix E2-1 of the Preliminary LAX SPAS Report; however, additional delays caused by revenue collection were expected to result in increased congestion on CTA roadways and extending onto off-airport roadways. If congestion pricing were to be implemented, the on-airport roadway system would need to include sufficient space to accommodate queuing vehicles waiting to pay their toll, as well as escape routes for drivers unwilling to pay to access the CTA. Due to space constraints within the CTA, this is infeasible. While electronic toll collection would, in theory, improve the flow of traffic entering the CTA, it is unlikely that the vast majority of motorists would purchase a transponder for their vehicle to automatically deduct their entrance fee into the CTA, resulting in delays and increased vehicle congestion accessing the CTA. Dedicated conveyance systems, such as an elevated busway provided in Alternatives 1, 2, and 8, or an APM system provided in Alternatives 3 and 9, are intended to offer passengers more time-certain travel time options to the CTA. They also seek to incentivize passengers to use these facilities by choice based on convenience rather than by imposing penalties on use of CTA roadways.

As indicated in Section 4.12.1 of the SPAS Draft EIR, with implementation of the SPAS alternatives, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Alternatives 1, 2, 8, and 9 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not effect on-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-PC00081-5

Comment:

Thus, I strongly support Alternative 3 on the basis of the ground transportation features it includes. If this alternative is ruled out on the basis of other features, then I support a version of Alternatives 1, 2, or 8, with the addition of some sort of surcharge or other incentive for private automobiles to avoid the center terminal area. This is the best way to serve passengers coming from the Green Line as well as the future Crenshaw Line, and to improve access to the terminals for all passengers, and not just those who can afford to use a personal automobile in a future of ever-increasing gasoline prices.

Response:

The commentor's support for Alternative 3 or, secondarily, Alternatives 1, 2, or 8, is noted, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Response to Comment SPAS-PC00081-4 regarding reduction of private automobile traffic in the CTA under the SPAS alternatives and consideration of congestion pricing.

Lesson # 87

What are the rules on indenting?

ANSWER: The first rule of indenting is to change your word-processor's default tab setting.

Half-inch tabs are a sure sign of a dysfunctional layout. They jump out at you as soon as you pick up a document and see "A." half an inch from the left margin, followed by another half inch before the text begins. The problem builds when writers use cumulative indents, especially for headings. After a few levels of hierarchy we get a pile-up: lines of boldface heading crammed in toward the right margin followed by flush-left text. So start by setting your tab stops for a quarter of an inch.

The second rule is to learn how to create proper hanging indents for numbered and bulleted lists. The number or bullet is to the left of the copy (though not necessarily on the left margin--the whole list can itself be indented). Just to the right of the number or bullet is the text in the list, with all lines indented to the same point.

The third rule of indenting is to avoid cumulative indents by limiting the levels of hierarchy in your headings: two or three should do it. Even then, you can create a better-looking page by keeping all headings flush left and using other typographical elements to show the hierarchy--as demonstrated on pages 308-11 of The Winning Brief.

Response:

This is not a comment on the contents of the Draft EIR.

SPAS-PC00083 Klein, Ellen None Provided 9/17/2012

SPAS-PC00083-1

Comment:

I want to give my opinion on the SPAS EIR:
I would like to adopt Alternative 2, plus Alternative 9 with a realistic train service plan that includes all the terminals.

This position has been taken by the Neighborhood Council of Westchester/Playa and ARSAC (Alliance for a Regional Solution to Airport Congestion). I heartily support this position and strongly urge that you

also encourage its adoption. Alternative 2 does NOT move 24R closer to our communities and Alternative 9 includes a Consolidated Rental Auto Facility (CONRAC).

All the alternatives would enable LAX to handle the projected traffic in 2025: 78.9 Million Annual Passengers (MAP). Therefore, there would be no gain in passenger capacity from moving 24R North. The impact to the community is completely unnecessary both from a neighborhood view and an airport safety view.

Alt. 2 is the most economical, efficient, and environmentally sound choice. It is also the least intrusive into the neighborhoods. It does include realigning some taxiways as noted in the North Airfield Safety Study. Improvements and extensions to the east end of 24L are also included which would allow the New Larger Aircraft (such as the A380) easier take off from that runway.The North Airfield Safety Study concluded that the

The North Airfield is safe AS IT IS to handle the future estimated air traffic. The study did recommend taxiway realignment that is included in Alt. 2.

If 24R was moved as far north as LAWA actually wants to move it, the Delta building and probably the Paradise Building would have to be removed. A valid question is what market value was used in LAWA's estimates? LAWA has assumed that the In-N-Out and Parking Spot would not be in an FAA protective or buffer zone because pilots would land midway down 24R (which would be extended West to Pershing). Many pilots like to land as soon as their assigned runway is available, not midway down it.

If 24R were to be moved as far north as LAWA actually wants it moved, at least 500 jobs would be lost. Some businesses might also be lost. The business district only recently recovered from losing 10,000 customers from previous LAX expansions. Also, property values of good neighbors would go down. Many Westchester residents have been there for over 60 years and don't deserve this from our neighbor.

Modernizing the airport: improving the elevators, escalators, bathrooms, signage, roadways, etc. would provide more jobs that moving the runway. And it would greatly improve the passengers' experience of traveling through LAX.

There are some extremely expensive issues in moving the runway North:

- Filling in the Manchester Tunnel. This is the tunnel that was originally built to connect the North communities to the South, by tunneling underneath LAX. It was to be part of the never-authorized Laurel Canyon Freeway that was being considered back in the late 1950s and early 1960s. It starts. where Lincoln turns East, near the apartment complex, and runs South to within 50 ft of 24L. The last time it was inspected (after a very dry season) there was water in the tunnel. LAWA has recommended filling the tunnel with sand (a glorious recipe for sink holes!), or taking the top off the tunnel and filling it with dirt. (The tunnel is about 35 ft down and 4 to 6 lanes wide. We all remember how long Playa Vista had a huge mound of dirt to compress the ground.) This would mean closing both runwas for some time, putting an undue amount of traffic on the South Airfield. A recommendation from a worker familiar with tunnel problems is that the tunnel be filled in with a special foam that was developed to handle this problem of filling in a hole to withstand heavy weights landing over it. The cost could run into the millions, possibly billions.
- Moving affected sewers. Other city departments have stated that the sewers cannot be moved
- Property acquisition. As noted above.
- Enclosing the Argo Flood Control Channel. This channel is required as a drain for a flood control plain and, as such, should not be enclosed. It is under the jurisdiction of the Army Corps of Engineers and LAWA does not have any approval as of the DEIR date to make changes to the channel.

PLEASE DO NOT CONSIDER any Alternative that involves movin the runway. MODERNIZE, CONSOLIDATE, but don't EXPAND!!

SPAS-PC00084 Ward, Brian None Provided 9/18/2012

SPAS-PC00084-1

Comment:

There is an incredible amount of material available for study, and I will not pretend that I have reviewed it all. I have lived in Westchester in the past at the Park West apartments which border Northside Development land. I am also a stakeholder in this debate, as I work for one of the airlines at LAX. I am old enough and lived here long enough to remember when the city bought up land bordering the north field in the seventies, force majure, to create space for further expansion and/or a buffer zone. It is time that the city of LA cashes in on that investment, and use the land for the maximum benefit of LAX. This is not the time in history that groups like ARSEC and environmentalists should have the green, leftest luxury of stopping expansion when we have so much unemployment and stagnant economic conditions. The city needs the revenue and people need the jobs that LAX provides. Current Master Plan D reduction in size (gates) and senseless destruction of terminals 1,2, and 3 should absolutely not be implemented; what were people like Villaragosa, Rosendahl and the City Council thinking when they caved to the special interests of a small, vocal group of rebels in Westchester?! Absolute spineless weakness! Let me bring up an interesting historical perspective: westside middle-class communities like El Segundo and Westchester were practically built by the prosperity created by the aviation industry. Many of the whiners in these communities who fight against LAX expansion are ironically the sons and daughters of that aeronautical generation's workers and have had the lifestyle they have and ability to live here only because of Socal's aviation past! Let's get real with our current economic reality and provide jobs for construction now and aviation employees in the near future. Move 24R far enough north to build the center taxiway (for safety, capacity, traffic balance, large size category aircraft like the A380). Do NOT destroy current terminals 1,2, and 3. Follow through with the second phase of Bradley expansion for additional gates. Develop remaining northside properties with warehouse industry (preferably aviation related) for a noise buffer. And do whatever is necessary in the road access situation to hook into the metro train and external parking lots. Green considerations should be the last consideration. This airport is a huge, beneficial economic engine and should serve our citizens for decades to come. Ontario will come back on its own when the lingering effects of the real estate bubble/foreclosures wane. Palmdale is out of the question. LA residents (even SF Valley) have made it clear for years that nobody wants to go all the way out there to take a flight. Makes no sense for LAX's hub-and-spoke airlines to fragment traffic away from their hub business model and they are the 800 pound gorilla stakeholder customers who pay the bills. Top foreign airlines (eg transpacific) have no interest at all in serving satellite airports with widebodies either. MAN UP over there at LAWA and push the development through, force majure like in the past if necessary; we need it! We've spent enough precious taxpayer money already on studies. It's time to get it done. Have we become so paralyzed now that we can no longer complete major infrastructure projects without melting down internally? I watch chinese cities build entire airports in the time it takes us to perform a ridiculous environmental impact study!

Response:

The comment, including the commentor's support for alternatives that would move Runway 6L/24R to the north and provide for a centerfield taxiway (i.e., Alternatives 1, 5, and 6), is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of the alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Responses to Comments SPAS-PC00168-1 and SPAS-PH300015-1 regarding the LAX Northside Plan Update. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX and Topical Response TR-SPAS-REG-1 regarding the use of regional airports.

It should be noted that studies associated with LAX development plans, including SPAS and the SPAS Draft EIR, are funded by airport funds, not by general tax dollars.

SPAS-PC00085 Edelman, Lynn None Provided 9/19/2012

SPAS-PC00085-1

Comment:

Please STOP this project instead:

Adopt Alternative 2, plus Alternative 9 and a realistic train service plan that includes all the terminals

The reasons I am opposed to moving the north runway include:

* Any of the runway alternatives (1-7) would result in the same number of passengers that LAX can accommodate. All the alternatives would enable LAX to handle the projected traffic in 2025: 78.9 Million Annual Passengers (MAP). Therefore, there would be no gain in passenger capacity from moving 24R North.
* Alt. 2 is the most economical, efficient, and environmentally sound choice. It is also the least intrusive into the neighborhoods. It does include realigning some taxiways as noted in the North Airfield Safety Study. Improvements and extensions to the east end of 24L are also included which would allow the New Larger Aircraft (such as the A380) easier take off from that runway.
* The North Airfield Safety Study concluded that the North Airfield is safe AS IT IS to handle the future estimated air traffic. The study did recommend taxiway realignment that is included in Alt. 2.
* If 24R was moved as far north as LAWA actually wants to move it, the Delta building and probably the Paradise Building would have to be removed. A valid question is what market value was used in LAWA's estimates? (People who have plowed through the Acquisitions section say that it seems low.) LAWA has assumed that the In-N-Out and Parking Spot would not be in an FAA protective or buffer zone because pilots would land midway down 24R (which would be extended West to Pershing). Many pilots like to land as soon as their assigned runway is available, not midway down it.
* If 24R were to be moved as far north as LAWA actually wants it moved, at least 500 jobs would be lost. Some businesses might also be lost. The business district only recently recovered from losing 10,000 customers from previous LAX expansions.
* Modernizing the airport: improving the elevators, escalators, bathrooms, signage, roadways, etc. would provide more jobs that moving the runway. And it would greatly improve the passengers' experience of traveling through LAX.
* Adding a Centerfield taxiway (between the runways) does NOT create a Group 6 airfield. It does, however, decrease the space between the wings of aircraft on a runway and the Centerfield taxiway. (Group 6 refers to the class of New Larger Aircraft, such as the A380.)
* According to LAWA's figures, Group 6 aircraft in 2025 will be just 1.6% of total air traffic. It seems ridiculous to go through so much upheaval, not to mention cost, for such a small number. The Airbus A380 has been landing and taking off with no trouble.

There are some extremely expensive issues in moving the runway North:

* Filling in the Manchester Tunnel. This is the tunnel that was originally built to connect the North communities to the South, by tunneling underneath LAX. It was to be part of the never-authorized Laurel Canyon Freeway that was being considered back in the late 1950s and early 1960s. It starts. where Lincoln turns East, near the apartment complex, and runs South to within 50 ft of 24L. The last time it was inspected (after a very dry season) there was water in the tunnel. LAWA has recommended filling the tunnel with sand (a glorious recipe for sink holes!), or taking the top off the tunnel and filling it with dirt. (The tunnel is about 35 ft down and 4 to 6 lanes wide. We all remember how long Playa Vista had a huge mound of dirt to compress the ground.) This would mean closing both runwas for some time, putting an undue amount of traffic on the South Airfield. A recommendation from a worker familiar with tunnel problems is that the tunnel be filled in with a special foam that was developed to handle this

problem of filling in a hole to withstand heavy weights landing over it. The cost could run into the millions, possibly billions.
* Moving affected sewers. Other city departments have stated that the sewers cannot be moved.
Property acquisition. As noted above.
* Enclosing the Argo Flood Control Channel. This channel is required as a drain for a flood control plain and, as such, should not be enclosed. It is under the jurisdiction of the Army Corps of Engineers and LAWA does not have any approval as of the DEIR date to make changes to the channel.

The DEIR includes 7 alternatives that involve the runways and 2 alternatives that involve other issues such as the Consolidated Rental Auto Facility (CONRAC). (Analyses are from ARSAC.) Alt. 1: Moves 24R 260 ft North and 600 ft West. Moves 24L 1250 ft East. Adds a Centerfield Taxiway.
- Displaces businesses and homes
- Risky construction factors; could be very costly in time and delays
- Fixes little traffic or Central Terminal Access (CTA) - Impacts major underground utilities, sewer, and tunnel
Alt.2: Leaves Runways in current location. Reconfigures taxiways. Adds new terminal and extends Bradley and Mid-Course terminals North
- Most affordable. Most efficient. Most environmentally sound. Less impact to communities.
- Does little for CTA traffic and access Alt. 3: City approved Alt. D. Extends 24R 1495 ft West. Moves 24L 340 ft South and adds Centerfield taxiway. Ground Transportation Center in Manchester Square with a baggage tunnel to the CTA. CTA closed to car traffic. Integrated Transportation Center in Continental City (Aviation/Imperial).
- Not affordable. Cost has risen from $12 billion in 2004 to over $100 billion in 8 years
Alt. 4: Alt. D Green Light projects + 24R left as is. 24L moves 835 ft East. No Centerfield taxiway. Argo Flood Channel partially enclosed. CONRAC in Manchester Square. No terminal, taxiway, or taxilane changes.
- Does little for CTA traffic and access Alt. 5: Moves 24R 350 ft North and 604 ft West, and widens it to 200 ft. Adds Centerfield taxiway. Lincoln Blvd moved sub terrain & new Sepulveda connect. Fully encloses all 9857 ft of the Argo Channel. Compatible with ground access in Alts. 1, 2, 8 & 9.
- Greatest impacts to businesses and residents
- Major move of flight path North (heavily impacting Westchester and Inglewood)
- Risky construction factors, could be very costly in time and delays
- Does little for traffic and CTA access.
Alt. 6: Moves 24R 100 ft North. Moves 24L 1250 East. Adds Centerfield taxiway. Reconfigures taxiways & taxilanes. Lincoln Blvd moved sub terrain & new Sepulveda connect. -Does little for traffic and CTA access. Eliminates all remote gates. Compatible with ground access in Alts 1, 2, 8 & 9.
- Impacts businesses & residents Adds new terminal and extends Bradley and Mid-Course terminals North
- Moves flight path North
- Risky construction factors, could be very costly in time and delays Alt. 7: 24R no extension or widening. 24L moves 1250 ft East. Adds Centerfield taxiway. Reconfigures
taxiways & taxilanes. All remote gates eliminated. No business district impact. Adds new terminal and extends Bradley and Mid-Course terminals North. Compatible with ground access in Alts 1, 2, 8 & 9.
- Avoids construction risks of tunnel, roadways, sewers Alt. 8: Has CONRAC in Lot C with bus service into CTA. Parking moved to Manchester Square
- Only partially addresses CTA traffic
Alt. 9: Moves CONRAC to Manchester Square with a people mover that goes into CTA
- Creation of people mover that could service amount of people traffic and length required to transport from Manchester Square into CTA problematic.
- Once people mover in place, CTA traffic would be reduced.
Thank you for your attention to my objections.

SPAS-PC00086 Sandoval, Paula None Provided 9/19/2012

SPAS-PC00086-1

Comment:

As a 20+ year resident of Playa Del Rey and Westchester, I continue to have concerns on the effects LAWA proposed plans will have on our community. After a detailed review, we strongly support that you

Adopt Alternative 2, plus Alternative 9 and a realistic train service plan that includes all the terminals.

This position has been taken by the Neighborhood Council of Westchester/Playa and ARSAC (Alliance for a Regional Solution to Airport Congestion). I heartily support this position and strongly urge that you also encourage its adoption. Alternative 2 does NOT move 24R closer to our communities and Alternative 9 includes a Consolidated Rental Auto Facility (CONRAC).

Some grounds on why I am taking this position are noted below.

* Any of the runway alternatives (1-7) would result in the same number of passengers that LAX can accommodate. All the alternatives would enable LAX to handle the projected traffic in 2025: 78.9 Million Annual Passengers (MAP). Therefore, there would be no gain in passenger capacity from moving 24R North.
* Alt. 2 is the most economical, efficient, and environmentally sound choice. It is also the least intrusive into the neighborhoods. It does include realigning some taxiways as noted in the North Airfield Safety Study. Improvements and extensions to the east end of 24L are also included which would allow the New Larger Aircraft (such as the A380) easier take off from that runway.
* If 24R were to be moved as far north as LAWA actually wants it moved, at least 500 jobs would be lost. Some businesses might also be lost. The business district only recently recovered from losing 10,000 customers from previous LAX expansions.
* Modernizing the airport: improving the elevators, escalators, bathrooms, signage, roadways, etc. would provide more jobs that moving the runway. And it would greatly improve the passengers' experience of traveling through LAX.

There are some extremely expensive issues in moving the runway North that completely affect our community:

* Filling in the Manchester Tunnel. This is the tunnel that was originally built to connect the North communities to the South, by tunneling underneath LAX. It was to be part of the never-authorized Laurel Canyon Freeway that was being considered back in the late 1950s and early 1960s. It starts. where Lincoln turns East, near the apartment complex, and runs South to within 50 ft of 24L. The last time it was inspected (after a very dry season) there was water in the tunnel. LAWA has recommended filling the tunnel with sand (a glorious recipe for sink holes!), or taking the top off the tunnel and filling it with dirt. (The tunnel is about 35 ft down and 4 to 6 lanes wide. We all remember how long Playa Vista had a huge mound of dirt to compress the ground.) This would mean closing both runwas for some time, putting an undue amount of traffic on the South Airfield. A recommendation from a worker familiar with tunnel problems is that the tunnel be filled in with a special foam that was developed to handle this problem of filling in a hole to withstand heavy weights landing over it. The cost could run into the millions, possibly billions.
* Moving affected sewers. Other city departments have stated that the sewers cannot be moved.

* Property acquisition. As noted above.

* Enclosing the Argo Flood Control Channel. This channel is required as a drain for a flood control plain and, as such, should not be enclosed. It is under the jurisdiction of the Army Corps of Engineers and LAWA does not have any approval as of the DEIR date to make changes to the channel.

The DEIR includes 7 alternatives that involve the runways and 2 alternatives that involve other issues such as the Consolidated Rental Auto Facility (CONRAC). (Analyses are from ARSAC.)

Alt. 1: Moves 24R 260 ft North and 600 ft West. Moves 24L 1250 ft East. Adds a Centerfield Taxiway.

SPAS-PC00087 Dosch, Richard The LA Loop 9/19/2012

SPAS-PC00087-1

Comment:

Suggestions:

* Consistency for airline terminology on flight update screens from one airline/terminal to another
* More seats in baggage claim areas for terminals
* Food outlet in each terminal before security screening
* Prevent airport personnel vehicles from occupying passenger pick-up spaces along curb outside of baggage claim
* GET MORE CASHIERS IN THE LIMO AND BUS HOLDING LOT!!!!!!! Whoever is responsible for the lack of cashiers is a real jackass! Cars wind around within the lot and then overflow into a long line on the street. This is bullshit and shows a gross lack of concern on the part of the airport for the efficient service of those vehicles and their passengers - remember - you are charging them money and providing deplorable service!
* More obvious directions for passengers between T5, T6, T7 and T8 when flights land in one of those terminals and then the pax has to go to another terminal for luggage. Whatever is there is not adequate.
* Have cashiers at terminal parking garages say thank you when customers pay their fee. As of now less than 50% say thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00088 Dunagan, Bob None Provided 9/20/2012

SPAS-PC00088-1

Comment:

I simply cannot support this gross misuse of precious public resources.

I would like to issue a challenge to you folks on the other side. Allow our group to PAINT -on the ground and across the buildings that would be torn down or evacuated - a three foot wide RED stripe and allow the citizens to get the taste of what lawa wants to take. Then I would like to see an accurate, weighted by experience, budget of what this mess will cost, how all of the actions are going to be paid for and by whom, and why. I sincerely doubt that anyone on your side really knows.

You folks should be ashamed of yourselves, but somehow, I don't think you are.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). The property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. In addition, Table 4.9-5 in Section 4.9 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components only, although acquisition would be required for the ground access components with which these alternatives would be paired.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements. As indicated in that response, CEQA does not require purely social or economic impacts to be analyzed in an EIR. (State CEQA Guidelines Section 15064(e).) Nevertheless, rough-order-of-magnitude cost estimates for the alternatives were developed as part of SPAS. The cost estimates are discussed in Chapter 8 of the Preliminary LAX SPAS Report, with detailed information provided in Appendix G. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00089 Hench, Cyndi Neighborhood Council of Westchester Playa 9/4/2012

SPAS-PC00089-1

Comment:

The Neighborhood Council of Westchester/Playa supports a modern and revitalized LAX. After considering the Specific Plan Amendment Study Draft Environmental Impact Report ("SPAS" or "Study") that details the possible options for improvements at LAX we are excited to support a combination of Alternative 2 and Alternative 9 for the following reasons:

- Combining Alternative 2 and 9 fulfills SPAS goal to have airfield, terminal and transportation improvements.
- Alternatives 2 and 9 are the most affordable design options to ensure that LAX capacity needs are met to protect the economy and tourism.
- Independent evaluators have shown these alternatives to allow for safe operation of all aircraft at LAX.
- The analysis presented in the Study shows that Alternative 2 is superior to all others in airport operational efficiency.
- The analysis also shows that Alternatives 2 is clearly the environmentally superior alternative to the others when air quality and environmental impacts are considered.
- These alternatives will bring $10.5 billion dollars in investment to LAX and the City of Los Angeles.
- The combination of Alternative 2 and 9 provides permanent long-term job opportunities by creating a state-of-the-art passenger facility and transportation system that requires ongoing maintenance and support thus strengthening the Southern California economy.
- Funding for these upgrades will make this the largest project in Los Angeles history. Knowing that funding sources are limited, we encourage LAWA to invest in the infrastructure that will improve the passenger experience and address the transportation issues that surround LAX.

As the first line of welcome to travelers to Los Angeles, the Neighborhood Council of Westchester/Playa is excited to see improvements made to LAX that will modernize and revitalize the nation's #1 origination-destination and third busiest airport in the country. We believe that these alternatives will invest in Los Angeles' economy and build an airport that we can be proud of - that maintains and increases safety, efficiency, and community.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground

access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

It should be noted that the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report).

As discussed on pages 1-10 and 1-11 in Section 1.2.1 of the SPAS Draft EIR, one of the objectives associated with the completion of the SPAS process is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. This includes adding implementing improvements that are consistent with FAA design standards and providing sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft, among others. Table 4.7.2-16 in Section 4.7.2 provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield, and Table 1-2 in Chapter 1 provides a preliminary evaluation of how each alternative responds to the objectives of the SPAS. As indicated in Table 1-2, Alternative 2 would only partially meet this objective. All of the other airfield improvements alternatives would meet this objective to a greater extent than Alternative 2, with the exception of Alternative 4. Regarding the efficiency of the SPAS alternatives specifically, it is inaccurate to conclude that one alternative would be more efficient than another, because a number of variables are associated with assessing airfield efficiency. For example, as indicated in Table 17 of Appendix F-2 of the Preliminary LAX SPAS Report, Alternative 2 would have greater average all weather delay than would Alternative 1 (5.38 minutes per operation compared to 5.20 minutes per operation). However, Alternative 2 would have the lowest unimpeded taxi time among Alternatives 1 through 4, as well as the lowest total average all weather delay time. The differences between Alternatives 1 and 2 are very slight; the total average all weather delay plus unimpeded taxi time associated with Alternative 2 is only 3 seconds (0.05 minutes) less than that associated with Alternative 1. There are other measures of airfield efficiency besides delay and unimpeded taxi time, such as the ability to operate without operational restrictions, modifications of standards, and waivers from the Federal Aviation Administration (FAA); airfield geometry that provides more time and options for FAA air traffic controllers to handle aircraft exiting the runway; taxiways that are designed for the largest aircraft; and aircraft holding areas near the end of runways to improve the ability for sequencing departures. A summary of safety and efficiency enhancements to north airfield operations under each of the SPAS alternatives is provided in Table 4.7.2-16 on pages 4-569 and 4-570 of the SPAS Draft EIR. As indicated in the table, with the exception of Alternative 4, all of the alternatives would reduce the need for special operations restrictions, modifications of standards, and waivers from FAA. However, Alternative 2 is not superior to the other alternatives in this regard; only Alternative 5 would meet the minimum design requirements for a full Aircraft Design Group (ADG) VI north airfield. By not including a centerfield taxiway, Alternative 2 is the only airfield alternative, besides Alternative 4, that would only provide sufficient space to hold ADG IV aircraft or smaller on crossing taxiways, whereas the other alternatives would accommodate ADG V or VI aircraft. With the absence of a centerfield taxiway, Alternative 2 would also not provide FAA air traffic controllers with as many options for handling aircraft exiting the runway. Alternatives 3 and 5 are the only alternatives that would enable Taxilane D to accommodate ADG VI aircraft. All of the alternatives except for Alternative 4 would improve the ability to sequence departures.

Regarding safety associated with the alternatives, please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements, as well as the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield. As noted in that response, although the LAX north airfield is extremely safe under the current configuration, and would continue to be safe with the no runway separation configuration under Alternative 2, separation of the runways would substantially increase airfield safety and reduce the risk of a fatal runway collision.

As noted in Section 1.5 of the SPAS Draft EIR, and by the commentor, Alternative 2 is identified as the environmentally superior alternative in the SPAS Draft EIR. However, the commentor supports Alternative 2 combined with the ground access components of Alternative 9. The designation as the environmentally superior alternative does not apply when Alternative 2 is paired with the ground access elements of Alternative 9. While this combination of alternatives would have fewer impacts than other alternatives or combinations for some environmental topics (such as on-airport transportation impacts, where, as indicated in Table 4.12.1-43 and discussed on page 4-1171 of the SPAS Draft EIR, the ground access improvements associated with Alternative 9 would significantly impact fewer on-airport

roadway link than would Alternatives 1, 2, 4, and 8), the impacts would be greater for other environmental topics. For example, this combination (i.e., Alternatives 2 plus 9) would significantly impact more off-airport intersections than would all of the other ground access alternatives (with the exception of Alternative 8, whose significant impacts would be the same), and would have greater construction-related air quality impacts than some of the other alternatives, including greater construction-related impacts than Alternative 2 not in combination with Alternative 9. Operational emissions from Alternative 2, coupled with the ground access components of Alternative 9, would be environmentally superior in good weather conditions, but would not be the environmentally superior alternative in poor weather conditions. In addition, as indicated in Tables 1-17 and 1-18 of the SPAS Draft EIR, Alternative 2 would have the second highest impacts of all the alternatives relative both to population newly exposed to 65 CNEL and to population that would experience a 1.5 dBA CNEL increase over 65 CNEL due to aircraft noise.

Southern California Edison Company's rights-of-ways and fee-owned properties are purchased for the exclusive use of SCE to operate and maintain its present and future facilities. Any proposed use will be reviewed on a case-by-case basis by SCE's Operating Department. Approvals or denials will be in writing based upon review of the maps provided by the developer and compatibility with SCE right-of-way constraints and rights. In the event the project proposes to impact SCE facilities or its land related rights, please forward five (5) sets of project plans, and a PDF copy of the same, depicting SCE's facilities and its associated land rights to the following location for review as noted above:

Real Properties Department
Southern California Edison Company
2131 Walnut Grove Avenue
G.O.3 - Second Floor
Rosemead, CA 91770

Please be advised if development plans result in the need to build new or relocate existing SCE electrical facilities that operate at or above 50 kV, the SCE construction may have environmental consequences subject to CEQA review as required by the California Public Utilities Commission

(CPUC). If those environmental consequences are identified and addressed by the local agency in the CEQA process for the larger project, SCE may not be required to pursue a later, separate, mandatory CEQA review through the CPUC's General Order 131-D (GO 131-D) process. If the SCE facilities are not adequately addressed in the CEQA review for the larger project, and the new facilities could result in significant environmental impacts, the required additional CEQA review at the CPUC could delay approval of the SCE power line portion of the project for two years or longer.

Response:

This comment is noted. The SPAS Draft EIR is a programmatic document. Project-level impacts associated with the need to build new or relocate existing Southern California Edison electrical facilities will be assessed in future CEQA documents prepared for individual project components.

SPAS-PC00092 Hyde, Shaunta The Boeing Company 8/28/2012

SPAS-PC00092-1

Comment:

Boeing's Commercial Airplanes division manufactures the 747-8 the largest commercial aircraft built in the United States and the longest passenger aircraft in the world.

The 747-8 has a wingspan of 224 ft 7 in and is 250 ft 2 in long. This aircraft requires a Group VI airfield. Currently, Boeing customers have begun flying 747-8 into Los Angeles International Airport (LAX), which is not a Group VI airfield-nor is it even a Group V airfield in all weather conditions. Operating the 747-8 today at LAX requires special airfield operational accommodations.

We recently reviewed a report which stated that the Los Angeles International Airport generated $37.9 billion dollars in direct economic impact the Southern California economy. This underlies the importance of commercial aviation from international trade to passenger spending.

Given this background, we have a significant interest in the current Specific Plan Amendment Study Process (SPAS) underway at LAX and specifically the reconfiguration of the North Airfield. Boeing urges Los Angeles Airport and City Officials to select the necessary alternatives under SPAS to make LAX a Group V and Group VI airfield in all weather conditions.

We trust that the City will work to find a balance with these interests while ensuring that LAX doesn't lose its position as a major international airport able to accommodate the world's newest aircraft.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00094 Boxer, Aviva None Provided 9/10/2012

SPAS-PC00094-1

Comment:

My family lives on the top of the hill near Pershing and Manchester in Playa del Rey. I have lived here since 1980. I would like my concerns to be noted in the EIR.

Response:

The comment is noted. Please see Response to Comment SPAS-PC00094-2 below.

SPAS-PC00094-2

Comment:

I am concerned about the safety issue of the residents that live on the northwest side of the airport. As you expand your runway northwards we will be hemmed in during a natural disaster like an earthquake, tsunami or hurricane. We have no place to go and we are hemmed in if you take away Weschester Parkway. Presently we are hemmed in by the Pacific Ocean to the West, the liquifaction of Culver Blvd and Ballona Creek to the North, the Hyperion Treatment plant to the south, and the airport to the east. We have no place to escape in the event of an emergency. While we are a small community because the bulk of our community land has been purchased by the airport, we are human beings who deserve the same rights and protections as the rest of the Los Angeles residents. Please consider the other plan that uses the south runway as an option to preserve our lives in the case of some natural disaster. This emergency plan has not been considered in the documents I ave read. So if you could please address this concern, I would appreciate it. Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Impacts related to emergency response are addressed in Sections 4.7.3, 4.11.1, 4.11.2 of the SPAS Draft EIR. As discussed on page 4-597 in Section 4.7.3.6 of the SPAS Draft EIR, implementation of Alternatives 1, 2, 3, 4, 8, and 9 would alter ground access to, from, and around LAX. A lack of adequate access could impair the effective implementation of emergency response activities by impeding the movement of emergency vehicles. During construction, local roadway and/or lane closures would occur for varying periods; however, roadway access would be maintained through detours and diversions. Since local access would be adequately maintained, and emergency access would be coordinated and ensured through LAX Master Plan Commitments C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22, the implementation of emergency response activities would not be impaired, and impacts would be less than significant under Alternatives 1, 2, 3, 4, 8, and 9. As Alternatives 5 through 7 do not include proposed ground access improvements, there would be no impacts related to the impairment of the implementation of emergency response activities under these alternatives by themselves. Please see Response to Comment SPAS-PC00130-217 for further discussion of emergency response plans and services.

The potential for the SPAS alternatives to expose people or structures to hazards associated with geology and soils, including seismic-related hazards, was addressed in Section VI of the Initial Study included in the 2010 LAX SPAS EIR Notice of Preparation (NOP) provided as Appendix A of the SPAS Draft EIR. As explained therein, while the site is located within the seismically active southern California region, it is not located within an Alquist-Priolo Special Study Zone. Geotechnical literature indicates that the Charnock Fault, a potentially active fault, may be located near or through eastern portions of LAX property. However, as stated in Section 4.22 of the LAX Master Plan EIR, recent evaluation indicates that the Charnock Fault is considered to have low potential for surface rupture independently or in conjunction with movement on the Newport-Inglewood Fault Zone, which is located approximately three miles east of LAX. The Initial Study also indicates that the LAX site has a very low susceptibility to liquefaction. Therefore, impacts to people or structures resulting from rupture of a known earthquake fault are considered less than significant, and no mitigation measures are required. In accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, the potential for impacts associated with geology and soils, including seismic-related hazards, was not discussed in detail in the SPAS Draft EIR, as it was determined not to be significant.

As discussed on page 4-599 of the SPAS Draft EIR, as indicated in the 2010 LAX SPAS EIR NOP/Initial Study, the project site is located approximately one-half mile east of the Pacific Ocean and is not delineated as a potential inundation or tsunami impacted area in the City of Los Angeles Inundation and Tsunami Hazard Areas map. Mudflows are not a risk as the project site is located on, and is surrounded by, relatively level terrain and urban development. In accordance with Sections

15063(c)(3)(A) and 15128 of the State CEQA Guidelines, therefore, impacts related to inundation by seiche, tsunami, and mudflow were not discussed in detail in the SPAS Draft EIR, as no impacts would occur, and no mitigation measures are required.

Please see Response to Comment SPAS-PC00130-287 regarding property acquisition associated with the SPAS alternatives. None of the SPAS alternatives propose the removal or realignment of Westchester Parkway.

SPAS-PC00095 Klein, Lee The California Native 9/17/2012

SPAS-PC00095-1

Comment:

I want to give you my opinion on the SPAS EIR: I would like to adopt Alternative 2, plus Alternative 9 with a train service plan that includes all the terminals.

This position has been taken by the Neighborhood Council of Westchester/Playa and ARSAC (Alliance for a Regional Solution to Airport Congestion). I heartily support this position and strongly urge that you also encourage its adoption. Alternative 2 does NOT move 24R closer to our communities and Alternative 9 includes a Consolidated Rental Auto Facility (CONRAC).

All the alternatives would enable LAX to handle the projected traffic in 2025: 78.9 Million Annual Passengers (MAP). Therefore, there would be no gain in passenger capacity from moving 24R North. The impact to the community is completely unnecessary both from a neighborhood view and an airport safety view.

Alt. 2 is the most economical, efficient, and environmentally sound choice. It is also the least intrusive into the neighborhoods. It does include realigning some taxiways as noted in the North Airfield Safety Study. Improvements and extensions to the east end of 24L are also included which would allow the New Larger Aircraft (such as the A380) easier take off from that runway. The North Airfield Safety Study concluded that the

The North Airfield is safe AS IT IS to handle the future estimated air traffic. The study did recommend taxiway realignment that is included in Alt. 2.

If 24R was moved as far north as LAWA actually wants to move it, the Delta building and probably the Paradise Building would have to be removed. A valid question is what market value was used in LAWA's estimates? LAWA has assumed that the In-N-Out and Parking Spot would not be in an FAA protective or buffer zone because pilots would land midway down 24R (which would be extended West to Pershing). Many pilots like to land as soon as their assigned runway is available, not midway down it.

If 24R were to be moved as far north as LAWA actually wants it moved, at least 500 jobs would be lost. Some businesses might also be lost. The business district only recently
recovered from losing 10,000 customers from previous LAX expansions. Also, property values of good neighbors would go down. Many Westchester residents have been there for over 60 years and don't deserve this from our neighbor.

Modernizing the airport: improving the elevators, escalators, bathrooms, signage, roadways, etc. would provide more jobs that moving the runway. And it would greatly improve the passengers' experience of traveling through LAX.

There are some extremely expensive issues in moving the runway North:

Filling in the Manchester Tunnel. This is the tunnel that was originally built to connect the North communities to the South, by tunneling underneath LAX. It was to be part of the never-authorized Laurel Canyon Freeway that was being considered back in the late 1950s and early 1960s, It starts.

where Lincoln turns East, near the apartment complex, and runs South to within 50 ft of 24L. The last time it was inspected (after a very dry season) there was water in the tunnel. LAWA has recommended filling the tunnel with sand (a glorious recipe for sink holes!), or taking the top off the tunnel and filling it with dirt. (The tunnel is about 35 ft down and 4 to 6 lanes wide. We all remember how long Playa Vista had a huge mound of dirt to compress the ground.) This would mean closing both runways for some time, putting an undue amount of traffic on the South Airfield. A recommendation from a worker familiar with tunnel problems is that the tunnel be filled in with a special foam that was developed to handle this problem of filling in a hole to withstand heavy weights landing over it. The cost could run into the millions, possibly billions.
Moving affected sewers. Other city departments have stated that the sewers cannot be moved.
Property acquisition. As noted above.
Enclosing the Argo Flood Control Channel. This channel is required as a drain for a flood control plain and, as such, should not be enclosed. It is under the jurisdiction of the Army Corps of Engineers and LAWA does not have any approval as of the DEIR date to make changes to the channel.

PLEASE DO NOT CONSIDER any Alternative that involves movin the runway. MODERNIZE, CONSOLIDATE, but don't EXPAND!!

Response:

The contents of this comment are similar to comment SPAS-PC00128-2; please refer to Response to Comment SPAS-PC00128-2.

SPAS-PC00096 Wexler, Adelle The Guilded Cage 9/14/2012

SPAS-PC00096-1

Comment:

The Guilded Cage is a small boutique in Westchester staffed entirely by volunteers, and which is sponsored by a 501(c) (3) charity, the Westchester Mental Health Guild, which devotes all its net proceeds to the Airport Marina Counseling Service, which in turn provides low-cost mental health counseling to our community. The Guilded Cage has operated in Westchester for 37 years. As an entity affected by the alternatives proposed in the recent Draft Environmental Impact Report (DEIR) or the proposed Specific Plan Amendment Study at LAX (the SPAS), the Guilded Cage is providing comments on those alternatives.

Initially, we are dismayed that the expressed Project Objectives for the SPAS (pages 1-10 through 1-13) do not include the goal of regionalizing Southern California air traffic. Only an aggressive regional approach to air transportation will mitigate the safety concerns, noise, congestion and air pollution currently impacting Westchester and other communities near LAX, at the same time continuing the economic benefits of the airport for all of Southern California. Regionalization should have been one of the Project Objectives, and the DEIR should have discussed how each alternative will help to accomplish that objective.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California, and that it is not necessary or appropriate to include regionalization as a project objective for SPAS.

SPAS-PC00096-2

Comment:

Many of the alternatives discussed are prohibitively expensive and there is no discussion of the source of funding for them.

Response:

LAWA has determined that each of the alternatives discussed in the SPAS Draft EIR and Preliminary LAX SPAS Report is potentially feasible. (See State CEQA Guidelines Section 15126.6.) CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.)

Nevertheless, LAWA provided a detailed account of the financial requirements of each of the alternatives in the Preliminary LAX SPAS Report. Chapter 8 of the Preliminary LAX SPAS Report, which was published concurrent with, and distributed along with the SPAS Draft EIR, provides a financial analysis of each SPAS alternative. As indicated in Section 8.6 of that chapter, the proposed SPAS improvements would be funded with a combination of FAA Airport Improvement Program grants, TSA funds, passenger facility charges, general airport revenue bonds, and other state/federal grants. No general tax dollars would be used to pay for any of the proposed on-airport improvements. General airport revenue bonds are repaid from airport revenues generated from airport users. The bonds are guaranteed only by the revenues from the airport and are not backed by the City of Los Angeles or the State of California. The SPAS financial analysis addresses impacts relative to the estimated costs of each alternative affecting the existing and future bond debt of the airport and causing increases in the passenger airline cost per enplaned passenger. The analysis concluded that Alternative 4 would have the least financial impact and Alternative 3 would have the greatest financial impact.

SPAS-PC00096-3

Comment:

Although LAWA needs to modernize, we do not favor any expansion. It would make more sense to devote funds to developing facilities at Ontario and Palmdale that can relieve some of the burden of regional air transportation from this portion of Southern California. Given the possibilities of a terrorist attack on or a major earthquake near LAX, the economy of this region needs to have other airport facilities.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-REG-1 regarding the regionalization of air travel demand in Southern California, which includes a discussion of LA/Ontario International Airport and Palmdale Regional Airport.

SPAS-PC00096-4

Comment:

We favor a combination of Alternatives 2 and 9, which we believe would modernize the airport and improve the airfield and ground transportation without unduly harming Westchester and other nearby communities. Alternative 2 is recognized as the "environmentally superior alternative" (page 1-103). It also appears to us, particularly when combined with Alternative 9, to be the most affordable option.

We support the airfield improvements in Alternative 2, which does not relocate the north runways, but instead lengthens Runway 6R/ 24L, and modifies and improves taxiways. Alternative 2 is preferable given that the DEIR shows that larger Group 5 and 6 aircraft can be acceptably handled by these modifications to the airfield with no additional runway spacing (pages 4-514-515). A 2010 North Runway Safety Study (NASS) conducted by an expert panel under the auspices of the North Airfield Safety Advisory Committee unanimously concluded that the North Runway Complex is extremely safe, even with future projected traffic levels (pages 4-505). The NASS also recommended the taxiway realignment that is included in Alternative 2.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, Chapter 8 of the Preliminary LAX SPAS Report provides a financial analysis of each alternative. As identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative.

Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield. Please also see Responses to Comments SPAS-PC00130-3 and SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00130-68 regarding conclusions of the NASS relative to north airfield safety.

SPAS-PC00096-5

Comment:

In addition, we note that the DEIR does not explore all the other safety measures that could be taken to improve airfield safety. Therefore, please address the following items in the final EIR to determine whether they would be adequate to address any remaining perceived safety issues:

- Fully staffed tower and TRACON offices,
- Updated and efficient equipment installed in the tower,
- Improved communications between tower and cockpit,
- GPS ground-tracking system installed,
- More space between aircraft, and
- Compliance with the LAX preferential runway noise abatement plan.

Response:

The FAA and LAWA have worked together in recent years to deploy new technologies and enhanced training to improve airfield safety at LAX. Pages 4-501 and 4-502 of the SPAS Draft EIR, provides a summary of these recent and ongoing improvements, including the installation of runway status lights. Please note that the measures suggested in the comment are within the control and jurisdiction of the FAA, not LAWA. Additionally, while these measures may help enhance airfield safety at LAX, they do not directly address the safety problem identified and studied in the SPAS (i.e., that the current LAX airfield design is outdated and does not meet design standards for ADG V and ADG VI aircraft). As discussed on pages 1-10 and 1-11 in Section 1.2.1 of the SPAS Draft EIR, one of the SPAS project objectives is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. This includes adding improvements that are consistent with FAA design standards and providing sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft, among others. Table 4.7.2-16 in Section 4.7.2 provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield, and Table 1-2 in Chapter 1 provides a preliminary evaluation of how each alternative responds to the objectives of the SPAS.

An evaluation of airfield safety considerations associated with each of the airfield improvement options (i.e., Alternatives 1 through 7) is presented in Section 4.7.2, the results of which are summarized in Table 1-12 of the SPAS Draft EIR. The ultimate determination of whether to select one of the SPAS

alternatives and the rationale for such a determination is left to the decision-makers. This comment will be provided to them for their review prior to making a decision.

SPAS-PC00096-6

Comment:

Among other things, Alternative 2 would have the least impact on road traffic noise (page 4-942). Alternative 2 would not require modifications to Lincoln Boulevard or the Argo Drainage Channel that would be required under other options, so it should not take as long or be as expensive as the alternatives that would move the runways north.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment that Alternative 2 would not require modifications to Lincoln Boulevard or the Argo Drainage Channel and, therefore, would likely take less time to construct and would be less expensive than alternatives that would move Runway 6L/24R north is noted. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. It should be noted that impacts associated with road traffic noise would be the same under Alternatives 1 and 2. Impacts associated with road traffic noise under each alternative would vary by receptor. As indicated on page 4-942 of the SPAS Draft EIR, overall, Alternatives 1 and 2 would have the second lowest maximum road traffic increase in noise (1.6 dBA CNEL) of all of the alternatives, the lowest maximum increase being under Alternatives 8 and 9 (1.5 dBA CNEL).

SPAS-PC00096-7

Comment:

We support the combination of Alternatives 2 and 9 because we believe that the Consolidated Rental Car center project in Alternative 2 combined with the Automated People Mover (APM) from Alternative 9, would take rental car shuttles off the road, improve traffic, and provide a great convenience to the traveling public. We expect that the APM in Alternative 9 would prove to be less cumbersome for travelers than would the elevated bus way proposed in Alternative 8, for the simple reason that stepping onto an APM with one's luggage is simpler than getting onto a bus with luggage.

However, we are concerned with the drawings of the APM which suggests that it dead-ends at Terminal 7. We believe it should be a loop design that does not end, rather than having an endpoint.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Alternative 2 does not include a CONRAC; however, a CONRAC is a feature of Alternative 9. The APM proposed as a part of Alternative 9 is depicted and described in Chapter 2 of the SPAS Draft EIR, and has been evaluated in the SPAS Draft EIR at a program level of planning. Alternative 9 does not define the final APM system alignment or station locations within the CTA. Should Alternative 9 be selected for implementation, specific APM designs would be evaluated in project-level design and environmental review. Please also see SPAS-PC00183-3 regarding the convenience of a bus compared to an APM.

SPAS-PC00096-8

Comment:

We oppose the three alternatives that propose to move Runway 6L/24R north (Alternative 1: 260 feet north, Alternative 5: 350 feet north, Alternative 6: 100 feet north). It already has been demonstrated that further runway separation is unnecessary for safety (page 4-505). In negating the safety rationale for revisiting the separation distance of Runways 24-L and 24-R, the expert panel also negated any legitimate argument that Westchester and the other communities near LAX must simply tolerate all the adverse impacts of runway movement because of safety concerns.

Response:

The comment regarding opposition to Alternatives 1, 5, and 6 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. It has not been demonstrated that further runway separation is unnecessary for safety, as suggested in the comment. The commentor's citation to page 4-505 of the SPAS Draft EIR refers to the North Airfield Safety Study (NASS) completed in 2010, whereby an academic panel, in reviewing the results of the analysis completed by NASA Ames, offered their opinion that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield. The NASS did determine that improvements to, and reconfiguration of, the north airfield would reduce the risk of a fatal runway collision. The opinion of the academic panel is not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation. Additional discussion of the NASS and several other safety studies completed for the north airfield is provided in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00096-9

Comment:

Given that the DEIR predicts an increase in the size of the noise contour over Westchester from these runway movements (page 4-829 (Alt. 1); page 4-881-2 (Alt. 5); page 4-897 (Alt. 6)), we oppose them because it appears that the primary reason to expand LAX in these ways would be to increase the capacity of the airport. Particularly when the NASS concluded that the existing configuration would not unduly impact operational efficiency at LAX, it is unnecessary to adopt any of these plans to move the north runways. We relied upon the promise of Mayor Villaraigosa to work to increase regionalization of air travel in Southern California, and all of these proposals are inconsistent with that promise and would be extremely disruptive to our Westchester community.

Response:

The commentor's opposition to Alternatives 1, 5, and 6 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-328 regarding the fact that the airfield improvements proposed under the SPAS alternatives are intended and designed to address the problems associated with the current outdated design of the airfield. Please refer to Response to Comment PC00130-168 regarding the NASS and the opinion of the academic panel involved in that study.

Airfield capacity is not identified as a problem in either the Preliminary LAX SPAS Report or the SPAS Draft EIR, and none of the airfield improvements are proposed to increase the capacity of the airport. The SPAS alternatives provide potential modernizations and improvements designed for a practical capacity of 78.9 MAP. 78.9 MAP is a conservative growth assumption consistent with the Southern California Association of Governments 2012 Regional Transportation Plan/Sustainable Communities Strategy. (See footnote 670 on page 4-1048 of the SPAS Draft EIR.) Therefore, based upon the SCAG RTP/SCS, growth in airport use would naturally grow to 78.9 MAP, with or without any improvements. The SPAS alternatives are designed to provide improvements that will accommodate this increase in passengers, not to promote further growth. Additionally, as provided in Section 1.1.2 of the SPAS Draft EIR, the SPAS amendments are designed to create conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA.

SPAS-PC00096-10

Comment:

The DEIR says that impacts associated with the change of uses within the Runway Protection Zones (RPZ) under these three alternatives can be considered "less than significant" (page 1-77) when it is clear that Westchester businesses not currently located within an RPZ would be located within it and may need to be destroyed (see, for example, page 4-516). In at least some of these maps, our store falls within the RPZ. LAWA appears to assume that very little of the existing Westchester business district would not have to be purchased by the airport even though much of it would fall into the RPZ because it is assumed that pilots will land mid-runway on Runway 24R. However, there is no guarantee that pilots will land mid-runway or that the FAA will agree that telling them to do so is an adequate protection for the businesses that will be within the RPZ. It is our understanding that the FAA will no longer "grandfather" existing structures, but instead will insist that they be cleared not only from the Runway Safety Area (RSA) but also from the RPZ. The DEIR recognizes these as incompatible uses under FAA design recommendations (page 4-522), and recognizes that FAA may require that these structures be removed. Where would you have us relocate and who would bear the expense of such relocation?

Response:

The contents of this comment pertain to the same concerns expressed in comment SPAS-AL00007-26; please refer to Response to Comment SPAS-AL00007-26.

SPAS-PC00096-11

Comment:

In addition, these three alternatives also would be prohibitively expensive. The DEIR seems to assume that the FAA would not require that these businesses would be destroyed or relocated, but we did not see any guarantee that the FAA would allow them to remain where they are. Do you have such a guarantee? In addition, it is not at all clear that these businesses should remain in the RPZ. Please explain how our shop and the nearby businesses would be safe if we remain in the RPZ.

Response:

As discussed on page 4-512 in Section 4.7.2.6.1 of the SPAS Draft EIR, there are various potential options for dealing with incompatible structures or land uses within an RPZ including: (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification.

Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526, addresses changes in the potential secondary or indirect impacts associated with the modification or removal of structures or uses within the RPZ, if required in the future. The subject analysis includes discussion of potential measures to reduce impacts. Given that neither the need for, or nature of, actions to modify or remove existing structures or uses have been determined and will not be known until sometime in the future, it would be premature and speculative to reach a final significance conclusion at this time. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144-15145.)

SPAS-PC00096-12

Comment:

We did not find cost estimates in the DEIR for the purchase of the properties within the Westchester Central Business District along Sepulveda Boulevard south of La Tijera Boulevard. Precisely which businesses in the Westchester Business District would need to be relocated, and what buildings demolished?

Do the cost estimates included in the DEIR for this alternative include the cost of purchasing the very profitable properties that likely would need to be purchased at great expense to LAWA and Los Angeles? How was the market value determined for this analysis?

Response:

Please see Response to Comment SPAS-AL00007-28 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District.

SPAS-PC00096-13

Comment:

In addition, moving the runway north would require astronomically expensive modifications to the Argo Drainage Channel, the Manchester Tunnel and Lincoln Boulevard. In addition, sewer lines may have to be moved. Where does the DEIR analyze these impacts of each of these alternatives?

Response:

The content of this comment is similar to Comment SPAS-PC00130-568; please see Response to Comment SPAS-PC00130-568. The impacts associated with modifications to the Argo Drainage Channel and Lincoln Boulevard are evaluated throughout the SPAS Draft EIR. Please see Topical Response TR-SPAS-LR-1 regarding realignment of Lincoln Boulevard. As indicated in the topical response, realignment of Lincoln Boulevard is not anticipated to interfere with the major outfall sewers that run beneath LAX. Please see Response to Comment SPAS-PC00130-579 regarding the north airfield abandoned tunnel segment (referred to by the commentor as the Manchester Tunnel). There would be no impacts associated with filling this tunnel segment.

SPAS-PC00096-14

Comment:

We do not see an adequate discussion in the DEIR of the following questions:

- Realistic costs for all proposals should take into account negotiations over the purchase of businesses, as well as potential litigation.

Response:

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs associated with project implementation. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, as noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. Therefore, there would be no costs associated with purchase, demolition, or relocation of land uses within Westchester, or litigation related to same.

SPAS-PC00096-15

Comment:

- What would be the amounts lost to the City from the loss of this tax base and purchasing capability of dislocated businesses and residences?

Response:

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs associated with project implementation. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, as noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District. Therefore, there would be no impacts to the tax base or purchasing capability of dislocated business or residences within Westchester.

SPAS-PC00096-16

Comment:

- How many employees would lose jobs under each proposal due to destruction of the business district?

Response:

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester Business District, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

CEQA does not require job losses to be analyzed in an EIR, as these are economic rather than physical environmental impacts. (State CEQA Guidelines Section 15064(e).) Nevertheless, it is not proposed or certain that business would be displaced or jobs lost due to changes in RPZs. As discussed in Section 4.7.2.6.1 of the SPAS Draft EIR, there are various potential options for dealing with incompatible structures or land uses within an RPZ including: (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

In the event that it is determined in the future that relocation of an existing business is necessary, impacts associated with acquisition of the property and relocation of the business would be addressed in future project-specific CEQA documents, and by LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measure MM-RBR-1.

SPAS-PC00096-17

Comment:

- What would it cost to soundproof the homes, schools, and businesses impacted by the new noise contours?

Response:

CEQA does not require analysis of purely economic impacts in an EIR. (See State CEQA Guidelines Sections 15131(a) and 15064(e) ["Economic or social effects of a project shall not be treated as significant effects on the environment."].) As summarized in Section 4.9.7 of the SPAS Draft EIR, those residential and non-residential noise-sensitive facilities newly exposed to noise levels of 65 CNEL or higher would be eligible for sound insulation under the ANMP and through implementation of LAX Master Plan Mitigation Measure MM-LU-1. Commercial uses are not considered noise-sensitive under the ANMP and therefore would not be eligible for sound proofing. The costs of soundproofing homes and schools varies, depends on the size of the structure, the number of window and door openings, the type of ventilation, and, for certain schools, individual agreements with affected school districts. Please see Response to Comment SPAS-PC00130-730 for additional details regarding the treatment of economic conditions in an EIR, which includes costs of project-related improvements such as mitigation.

SPAS-PC00096-18

Comment:

- Under each alternative, what would be the cost of filling in the tunnels under the North Airfield and addressing the seepage problems from the natural aquifer which causes sink holes, and what would be a reasonable schedule to accomplish these tasks?

Response:

Please see Response to Comment SPAS-PC00130-568 regarding the cost to fill the north airfield abandoned tunnel segment and Response to Comment SPAS-PC00130-51 regarding sink holes. Relative to the schedule for project implementation, as stated on page 2-8 of the SPAS Draft EIR, the nine SPAS alternatives addressed within the SPAS Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. Please see Responses to Comments SPAS-PC00130-142 and SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00096-19

Comment:

- Under each alternative, what would be the costs for relocating/realigning/reinforcing Lincoln and Sepulveda Boulevards, including the Sepulveda Tunnel? Because these endeavors would involve other agencies such as Caltrans, what do you expect will be a realistic schedule?

Response:

Please see Response to Comment SPAS-PC00130-568 regarding the costs associated with the realignment of Lincoln Boulevard. Sepulveda Boulevard and the Sepulveda tunnel would not be relocated, realigned, or reinforced under the SPAS alternatives. Relative to the schedule for project implementation of the Lincoln Boulevard realignment, please see Response to Comment SPAS-PC00096-18.

SPAS-PC00096-20

Comment:

- Who would pay for the costs associated with the various proposals for reconfiguration?

Response:

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00096-21

Comment:

We also oppose Alternative 3 because it unnecessarily proposes to move Run 6R/24L 340 feet south, at what would necessarily be an astronomical expense, including demolition of three terminals and extensive central terminal construction, because, as discussed above, the separation of the North runways by this amount of distance is simply unnecessary for either airfield safety or efficiency. In any event, there does not seem to be a cost analysis for the displacement of the newly included businesses that would be located within the Alternative 3 RPZ.

Response:

The commentor's opposition to Alternative 3 and the reasons for that opposition are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Regarding the comment that the SPAS Draft EIR does not include a cost analysis for displacement of businesses newly included in an RPZ, no acquisition of property located within RPZ areas is proposed as part of the SPAS project nor is it certain that acquisition of such property would be required in the future.

As discussed in Section 4.7.2.6.1 of the SPAS Draft EIR, there are various potential options for dealing with incompatible structures or land uses within an RPZ including: (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144-15145.)

SPAS-PC00096-22

Comment:

We do not think Alternative 7, which proposes a 100 foot southward movement for Runway 6R/24L, is as problematic as some of the other alternatives, in that it seems to accomplish the same airfield changes as Alternative 3, but in a much less costly manner. The DEIR states that Alternative 7 will increase runway separation from 700 to 800 feet, while Alternative 3 will increase it to 1040 feet. In both cases, the changes would not affect the existing abilities relative to simultaneous arrivals and departures (page 4-533 and page 4-563). However, given that Alternative 2 is the "environmentally superior" alternative and accomplishes the project objectives, we see no reason for the additional costs that Alternative 7 would be likely to entail.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00096-23

Comment:

We have no objection to Alternative 4, which represents what would happen if all non-yellow light improvements identified in the Alt. D Master Plan were implemented, but we do not consider it preferable to Alternative 2. Alternative 4 proposes the same extension of Runway 6R/24L and Taxiway E as Alternative 2, coupled with a Consolidated Rental Car facility and new parking lot. However, because Alternative 4 would not meet design standards for Group 5 and 6 aircraft or reduce the need for FAA waivers, it does not appear to us to accomplish as many of LAWA's goals as would Alternative 2.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00096-24

Comment:

We appreciate the need to modernize LAX. Modernizing the airport, including such things as improving the upper roadway, the signage, the elevators, and restrooms will accomplish more to improve the travelling public's experience with LAX than will moving the north runway.

In the end, however, we believe that these Alternatives are in fact all piecemeal solutions that never will result in our city having the world-class airport that we all desire. If LAWA truly desires the airport we all deserve, the city must realize that LAX is not the location for it, because of the geographic constraints here. The best alternative is for Los Angeles to develop an airport where there is space for such an airport, and at the same time, build mass transit from downtown that goes directly into that airport.

Please let us know if you have any questions regarding our position on these matters.

Response:

The commentor's acknowledgement that improvements such as related to the CTA upper level roadway, signage, elevators, and restrooms will accomplish more to improve the traveling public's experience with LAX than will moving the north runway is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Section 2.3.2.1 of the SPAS Draft EIR considered and rejected as infeasible the concept of an alternative location. The SPAS Draft EIR does not evaluate in detail an alternative calling for the development of an airport at a location with the space to avoid geographic constraints such as those at LAX and building mass transit from downtown that goes directly into that airport because such an alternative would not respond to the project objectives presented in Section 2.2 of the SPAS Draft EIR. Also, it is reasonable to anticipate that the development of such a replacement system would take many years, if not decades. The operation of LAX would continue while such a replacement system is pursued and developed, and the need to address the problems at LAX that are addressed in the project objectives would remain. Again, implementation of the suggested alternative would not respond to the project objectives of SPAS. Notwithstanding, the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00097 Cunningham, Kim G None Provided 9/24/2012

SPAS-PC00097-1

Comment:

As residents of Playa del Rey for more than 20 years, this will confirm our support of Alternatives #2 and #9 contained in the SPAS Draft EIR.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00097-2

Comment:

We are already acutely aware of the noise, pollution and congestion issues that occur on a day-to-day basis.

Response:

This comment is noted. The Draft EIR addresses noise impacts in Section 4.10, Noise, and Section 4.9 Land Use and Planning; air quality impacts in Section 4.2, Air Quality, and Section 4.6, Greenhouse Gases; and traffic impacts in Section 4.12.1, On-Airport Transportation, and 4.12.2, Off-Airport Transportation. Supporting technical data and analyses are provided in Appendix C, Appendix F, Appendix G1, Appendix I, Appendix J1, Appendix J2, Appendix J3, Appendix K1, and Appendix K2 of the Draft EIR.

SPAS-PC00097-3

Comment:

We are in favor of the above Alternatives as the only viable solution to these issues from an environmental, economic, and efficiency standpoint.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The combination of Alternatives 2 and 9 is not the only viable solution to addressing environmental, economic, and efficiency issues. LAWA has identified and comprehensively evaluated nine alternatives that each respond differently to environmental and airfield safety and efficiency issues, as presented throughout Chapter 4 of the SPAS Draft EIR, and to cost issues, as presented in Chapter 8 of the Preliminary LAX SPAS Report. The commentor provides no basis for concluding that the combination of Alternatives 2 and 9 is the only viable solution to addressing these issues.

The SPAS Draft EIR identifies a comprehensive set of applicable LAX Master Plan commitments and mitigation measures, as well as SPAS-specific mitigation measures, that would reduce or eliminate significant impacts associated with all of the SPAS alternatives. Therefore, all of the alternatives are viable from an environmental standpoint. Moreover, as noted in Chapter 8 of the Preliminary LAX SPAS Report, all of the SPAS alternatives are viable from an economic standpoint. Regarding enhancements to the efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to efficiency; the degree to which efficiency is enhanced varies between the alternatives.

SPAS-PC00098-1

Comment:

Lesson #88

What are the rules on initial capitals?

ANSWER: Most of the first letters of words in the titles of books, articles, songs, etc. are capitalized. The exceptions are articles or prepositions of four or fewer letters (unless they begin the title). So The Great Escape and Much Ado About Nothing, but Hope Is the Thing with Feathers.

Proper names are always capitalized. People's titles and ranks are usually treated as ordinary nouns and capitalized as proper nouns only when they accompany a person's name (Justice Ruth Bader Ginsburg) or are used as a direct form of address ("If I may say so, Judge, my opponent's statement is misleading"). Other proper nouns and adjectives are used in those of businesses (Purity Bakery, Inc.), trademarked business products (Kleenex; Mountain Dew); educational institutions (Matlock High School; the University of Arizona); government bodies and agencies (Department of Motor Vehicles; Homeland Security); public or private organizations (Peoria Chamber of Commerce; Lowell Street Coffee Klatch). Adjectives derived from proper nouns, such as nationalities, languages, or religions, are also capitalized (Australian-rules football; Hindi songbook; Jewish holiday).

Legal writers follow some additional rules. Constitution is capitalized when referring to the United States Constitution or even to a particular state constitution (but the adjective constitutional is lowercase). So revered is our Constitution that its parts, when written out in full, are capitalized: Article, Section, and Amendment (as well as Due Process Clause). But when abbreviated, such terms usually aren't capitalized (eg., art. III); consult the Bluebook or your local style guide.

A prosecuting entity's name such as State or People is capitalized when used as part of or as a shortened form of a full name: State of New Mexico, People of New York. When referring to a prosecuting entity, State or People may be used as the short form of reference, e.g.: "The State claimed that Martin was driving the car"; "Livingston objected that the People's evidence was insufficient."

SPAS-PC00099 Leiweke, Timothy J AEG 8/27/2012

SPAS-PC00099-1

Comment:

AEG would like to applaud your efforts to "Fix LAX Now" and modernize the most important gateway to our city.

AEG proudly hosts over 15 million attendees at sporting events and concerts in Los Angeles each year and many of those attendees are visitors who fly into LAX. We appreciate the improvements being made at the airport today, but so much more needs to be done and we know that the major modernization plans will not be started until the Specific Plan Amendment process is completed and a decision is made on the configuration of the north airfield.

We urge you to act expediently and plan for the next 50 years. It has been 28 years since LAX was a showplace for the 84 Olympics and it needs to be that again.

Thank you for your dedication to building a better airport for our citizens and visitors.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00100 Garner, Bryan A LawProse Inc. 10/2/2012

SPAS-PC00100-1

Comment:

Lesson #89
When should all-caps text be used?

ANSWER: When you need to emphasize particularly important information in text, all-caps will do the job, but you should never use all-caps for more than just a few words, as in a title: THE OLD MAN AND THE SEA, for example, on a billboard.

Less defensible is the quasi-shouting notice that says, "This product is sold AS IS, and comes with NO WARRANTY."

In dialogue or a quotation, a word or sentence in all-caps shows that the speaker's tone was vehement or angry, or that the speaker is ranting: "I demand JUSTICE for the deceased! JUSTICE for the family! JUSTICE for the community!" But using all-caps for less-important speech dilutes its effectiveness.

In a document with section headings, all-caps may help the headings stand out above the text, but only if the headings are short. For instance: CONDITIONS FOR PAROLE is easy to read. But THE STATE REQUIRES THE PETITIONER TO MEET FOUR CONDITIONS BEFORE PAROLE MAY BE GRANTED is not. And because good point headings in a brief often contain 15 to 35 words, all-caps text is highly inadvisable for them.

Finally, all-caps is acceptable for acronyms and intialisms, such as NASA and SUV. But if the acronym or initialism is one that has become an ordinary word, then don't use all-caps (as with radar and scuba).

SPAS-PC00101 Shapiro, Lynne None Provided 9/28/2012

SPAS-PC00101-1

Comment:

I attended the Westchester Neighborhood Council community meeting last night. I hope that your DEIR and subsequent EIR's include the environmental impact
of airplanes in the sky over the Marina Peninsula. I have lived here for twenty-five years. This summer LAX flights are not going out to sea but rather going north

over Ballona, the Main Channel and the Marina Peninsula. Thousands of us live here in apartments, condos and single family homes. The noise degradation is
measurable and increasing. This has an impact on birds and humans. I have twenty minutes or so of peace, and then the flights start in and are constant for
some thirty to forty minutes. The planes fly low and are close to our homes, and their noise is insufferable. Although I have always appreciated LAX, I oppose
your three mile expansion plan and feel it will be extremely detrimental to Westchester, Playa del Rey and, with respect to flight noise, Marina del Rey.

Response:

Flight tracks under existing conditions are provided in SPAS Draft EIR Appendix J1-1 (Figure 1) of the SPAS Draft EIR. As shown therein, flights generally do not go over the main channel in Marina del Rey. The commentor appears to be referring to high aircraft noise levels resulting from early turns over the Marina. Please see Response to Comment SPAS-PC00112-1 regarding early turns.

Regarding other noise impacts on noise-sensitive uses associated with exposure to existing or future high noise levels of 65 CNEL or greater, these impacts were analyzed in Sections 4.9 and 4.10.1 of the SPAS Draft EIR. As shown in Figure 4.10.1-12 of the SPAS Draft EIR, the Marina Peninsula is not located within areas of existing high noise levels as designated by the 65 CNEL noise contour. As also depicted in Figures 4.9-7, 4.9-8, 4.9-9, 4.9-10, 4.9-11, 4.9-12, and 4.9-13 of the SPAS Draft EIR, the Marina Peninsula would not be newly exposed to high noise levels under Alternatives 1 through 7. Furthermore as shown in Figures 4.10.1-13, 4.10.1-16, 4.10.1-19, 4.10.1-22, 4.10.1-27, 4.10.1-30, and 4.10.1-33 of the SPAS Draft EIR, the Marina Peninsula would not be exposed to high single event aircraft noise levels associated with nighttime awakening under existing or as a result of the SPAS project. However, please see Response to Comment SPAS-PC00008-1 regarding current measures underway to address aircraft noise. Please also see Responses to Comments SPAS-PC00042-5 and SPAS-PC00130-938 regarding the effects of noise on humans.

Potential noise impacts on birds resulting from aircraft noise were analyzed in Section 4.3.6 of the SPAS Draft EIR. As concluded therein, aircraft noise impacts on birds under Alternatives 1 through 7 would be less than significant.

The comment also suggests LAWA has a "three mile expansion plan." Some improvements--including Runway 6L/24R and Lincoln Boulevard--would be located up to several hundred feet closer to communities that are located north of the airport, but there would be no northerly movement of the existing airport property line. As described in Section 2.3.1.11 of the SPAS Draft EIR and illustrated in Figures 2-11 through 2-14, acquisition would be limited to parcels near the Century Boulevard corridor and would vary with each alternative. The acquisition areas are located adjacent to existing airport property and do not represent a change in the property line of more than 1,500 feet. Furthermore, as stated on page 1-13 of the SPAS Draft EIR, the project would not change the potential for passenger growth at LAX; rather, future passenger activity is forecast to reach 78.9 MAP at LAX with or without the SPAS alternatives.

SPAS-PC00102-1

Comment:

Hi Madeline,
The general consensus is to adopt alternative 2 &/or 9.
Modernize - No Expansion
There is another meeting on Monday October 1 - 7-9pm
@ LA TIJERA United Methodist Church
7400 Osage Ave, in Westchester.

You can see the different alternatives online at http://www.laxspas.org/LAX_Solutions.aspx
You can submit comments until October 10th at spaseircomments@lawa.org
There were two cameras recording; but, I didn't get which websites they would posted at.
I just looked thru youtube and didn't find anything; but, it does take a long while to record a long 2 hour video
like that. Probably a couple of days.
Ciao,
Marco

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. It is noted that a town hall meeting held by the Neighborhood Council of Westchester/Playa (NCWP) to discuss the SPAS Draft EIR was held at the Westchester Enriched Sciences Magnets School on Thursday, September 27, 2012. In addition to presentations provided by representatives of community groups, at the invitation of the NCWP, LAWA staff were present at this town hall meeting and gave a presentation providing an overview of the SPAS project and associated Draft EIR.

SPAS-PC00102-2

Comment:

Thanks for invite. I was not able to attend. Is anyone available to put out an e-mail summary of the meeting? Madeline Wright

Response:

The comment in noted. Please see Response to Comment SPAS-PC00102-1 above regarding the September 27, 2010 town hall meeting on the SPAS Draft EIR held by NCWP.

Comment:

Don't forget!
Airport Expansion Town Hall
Thursday, September 27th between 7 & 9 PM, at Westchester High School.
Councilman Bill Rosendahl & Congress Woman Maxine Waters are going to be there. Plus, I have invited Congressional Candidate Bob Flores to be there!

Response:

The comment is noted. Please see Response to Comment SPAS-PC00102-1 above regarding the September 27, 2010 town hall meeting on the SPAS Draft EIR held by NCWP.

SPAS-PC00102-4

Comment:

Some of you know that I majored in Airport Planning & Management; and, I'd like to share with you some of my thoughts and suggestions for the Airport "Modernization":

First Problem
Inside Terminal Congestion - The terminals are too small and aren't big enough. They are no match against the ever larger aircraft being used. They were built and designed during the 707 & DC-8 Days. They've been too small ever since 747's came out.
Real Estate is at a premium. We won't be getting any more of it.
Solution: Create multi-level terminals.
Separate arrival passengers from departure passengers, possibly even add a business class & first class levels?

Response:

Terminal improvement plans for LAX take into account larger aircraft that are within the current and anticipated aircraft fleet mix for LAX. For example, the new concourses and gates currently under construction in the Bradley West Project at LAX include several new gates, boarding bridges, and passenger holdrooms designed to accommodate Aircraft Design Group (ADG) VI aircraft, such as the Airbus A380. Existing and planned terminal improvements at LAX are multi-level, with the lower level(s) being used to accommodate arriving passengers and the upper level(s) being used to accommodate departing passengers. That is also the case relative to the upper and lower level roadways within the CTA.

Please see Chapter 2 of the SPAS Draft EIR for a description of how these concepts are built into the SPAS alternatives.

SPAS-PC00102-5

Comment:

Second Problem
Outside Terminal & Traffic Congestion - In some of my airport planning classes, the general consensus was to adopt the Orlando Airport model, for vehicle traffic; which consists of 4 levels; but, their passenger levels are much lower than LAX; and highly dependent on rental car traffic.
LAX currently has 2 levels for vehicles - arrival & departures; and that's it. How can anyone say it's adequate with a straight face? I actually heard the head of the taxi-cabs say so.
The Orlando MCO Airport divides vehicle traffic into 4 levels, and to add to that, I was thinking of possibly even exploring 5 levels, by combining the Orlando Model WITH the LAX Model.
a) Level for taxis & limousines - possibly directly serving a first class & business class level?
b) Level for busses & vans
c) Level for rental cars
d) Level for arrival passengers being picked up by private cars
e) Level for departure passengers being picked up by private cars

Response:

Given the highly developed and constrained nature of the area within the CTA and areas immediately east of the CTA, where there are ramps and connections between the CTA roadways and surrounding roadways such as Century Boulevard and Sepulveda Boulevard, it is not logistically feasible to construct a four- or five-level roadway system as suggested by the commentor, and such construction would likely have costs out of proportion to any benefit potentially achieved. In addition to the infeasibility of constructing such a roadway system, it is also logistically infeasible to modify all of the terminals within the CTA to add two or three additional levels in order to meet/match the elevation of each roadway level. Moreover, such a multi-level roadway system is not needed to avoid or substantially reduce significant environmental impacts, nor is there any evidence that it would do so. The SPAS Draft EIR analysis of the on-airport transportation system presented in Section 4.12.1 concludes that with the exception of one intersection under future cumulative conditions and one to five roadway links (depending on the alternative) under future cumulative conditions, implementation of the SPAS alternatives would not result in significant impacts to the on-airport transportation system. For these reasons, the commentor's suggested alternative was not evaluated in detail in the SPAS Draft EIR.

SPAS-PC00102-6

Comment:

Third Problem
Connecting Flights & Terminal Transfers - Right now, if you land at LAX on a Southwest Airlines Flight and then need to transfer to the Tom Bradley Terminal for an international flight, all anyone can say is "Good Luck". If we adopt an "Arrival Level", in the terminals, I was thinking that this level should be

equipped with moving walk-ways; and, then moving walk-ways should connect all of the terminals. This way, it would much easier for passengers to go from Terminal 1 to Terminal 6 or vice-versa.
Hope to see you there and submit your comments.
Marco

Response:

As indicated in Response to Comment SPAS-PC00102-4, LAX is already multi-level with arrivals on the lower level and departures on the upper level. Regarding connecting flights and terminal transfers, most airlines provide the gates nearby within the same terminals for connecting flights scheduled through that same airlines. In the event that a connecting flight requires a passenger to transfer to another terminal, LAWA provides free shuttle buses that run on a regular and frequent basis throughout the CTA stopping at each terminal. This existing system is considered to be far more effective and efficient than moving walkways in transporting passengers between terminals, especially in a situation like the example given by the commentor (i.e., transporting a passenger from Terminal 1, where Southwest Airlines operates, to Tom Bradley International Terminal (TBIT) at the other end of the CTA). In looking closer at this example, the distance between Terminal 1 and TBIT is 0.5 mile. A high-speed moving walkway such as that currently employed at Pearson International Airport in Toronto, Canada operates at a passenger entrance/exit speed of 1.2 miles per hour (mph) and accelerates to 4.3 mph. A moving walkway between Terminal 1 and TBIT would actually be three separate segments, with each segment beginning and ending at each intervening terminal (i.e., one segment between Terminals 1 and 2, a second segment between Terminals 2 and 3, and the third segment between Terminal 3 and TBIT), given that passengers would have to exit one segment and walk across to board the next segment. Assuming an average travel speed of 3 mph, it would take approximately 10 minutes to travel by moving walkway between Terminal 1 and TBIT. This does not include any additional time that would be required for passengers to gather luggage and walk through any crowds in front of terminals when transferring from one walkway segment to the next. On the other hand, boarding a free shuttle bus at Terminal 1 and traveling at an average speed of 15-20 mph to TBIT, with one-minute stops at Terminals 2 and 3 on the way, would take less than half that amount of time (i.e., approximately 4-5 minutes). Also, the handling of luggage taking a shuttle would occur only twice; once when boarding the shuttle and once when alighting from the shuttle, as opposed to handling luggage six times when entering and exiting three segments of a moving walkway. In addition to the operational disadvantages of a moving walkway compared to a shuttle, there would be the adverse impacts associated with constructing a moving walkway system within the CTA, which would require several temporary closures and narrowing of existing walkways within the CTA during construction. In light of the reasons above, the commentor's suggested alternative was not evaluated in detail in the SPAS Draft EIR.

SPAS-PC00103 Wicks, Douglas None Provided 10/4/2012

SPAS-PC00103-1

Comment:

It is a no- brainer that LAX needs to be modernized. Every time I visit another city with a contemporary and efficient airport, I always rue my eventual return to ours. Alternatives 2 (taxiway reconfiguration/terminal and ground transport improvements) and 9 (ground transport improvements) provide jobs and benefit the local economy. As a Westchester resident, I am not against improving a vital engine to our local economy. But, I am opposed to the unnamed advocates (airline industry? LAWA Exec. Director Gina Marie Lindsey?) of moving the north runway. The suggestion that it would decrease noise pollution is laughable. And, we know from the Nasa-Ames study, that runway safety would not improve. Expanding the runways to accommodate hugh air busses serves the interests of the airlines. It does not serve the interests of OUR COMMUNITY.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative,

which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

As indicated in Section 4.9 of the SPAS Draft EIR, all of the SPAS alternatives would result in increased aircraft noise compared to baseline conditions. This is due to increases in aircraft operations over time, which would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR. However, when comparing impacts in 2025, alternatives that would move Runway 6L/24R northward would reduce exposure to noise impacts compared to alternatives that do not move this runway. Please see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities. As indicated in that response, while it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. Overall, the alternatives that would relocate Runway 6L/24R north would result in the lowest residential population exposed to a 1.5 CNEL increase above 65 CNEL and, along with Alternative 3, would result in the lowest number of people newly exposed to 65 CNEL. For a figure that illustrates the noise contours associated with Alternatives 1 and 5 (which would relocate Runway 6L/24R to the north) and Alternative 2, please see Response to Comment SPAS-PC00128-2. Please also see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield.

SPAS-PC00104 Kesting, Rachel None Provided 10/1/2012

SPAS-PC00104-1

Comment:

COMMENT- RESIDENT-Westchester
I am concerned for the particulate matter and emissions in all alternatives, as stated in the report.

My concern:
Qualified health organizations, such as the AMerican Lung Association, AAAAI.org-Assoc. of Allergy, Asthma
and Immunology, have NOT reviewed the LAX SPAS Alternative report.

If this is false, can you direct me to the organizations, regarding lung disease or COPD, that have reviewed the LAX expansion alternatives?

The document EIR states that
"during project operations all of the alternatives would result in significant emissions of sulfur dioxide and
particulate matter (i.e. PM10 and PM2.5)."

"during operations all of the SPAS alternatives would result in significant air pollutant concentrations for nitrogen dioxide and particulate matter (i.e. PM10 and PM2.5)."

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment PC00130-358 regarding the extensive efforts LAWA undertook to make the public, including public organizations, aware of the availability of the SPAS Draft EIR for review and comment. LAWA has no way of knowing what organizations have actually reviewed the SPAS Draft EIR or Preliminary LAX SPAS Report.

SPAS-PC00105 Camino, Julie None Provided 10/2/2012

SPAS-PC00105-1

Comment:

I am a concerned resident of Westchester and I am very interested in your plans for renovating LAX.

I understand that there are many options presented in the Specific Plan Amendment Study and I wonder which Alternative LAWA favors? What is LAWA gaining from their favored Alternative? Why is this plan better than the other Alternatives? How will residents of Westchester/El Segundo/Playa del Rey be impacted by this favored Alternative? Specifically what are the environmental impacts, including noise pollution and air pollution, for these areas?

Response:

Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, which includes an APM. Chapter 2 identifies the environmental impacts, including those associated with noise and air pollution, associated with the LAWA Staff-Recommended Alternative.

SPAS-PC00105-2

Comment:

Should any Alternative move forward and there are expected detriments to the surrounding community, how will the community be compensated for these detriments? Noise pollution? Air pollution? Property values decreasing? Quality of life decreasing?

Response:

Table 1-6 in Chapter 1 of the SPAS Draft EIR presents the existing LAX Master Plan commitments and mitigation measures, as well as proposed SPAS-specific mitigation measures that would reduce or avoid environmental impacts in surrounding communities, including air quality and noise impacts. Pursuant to Public Resources Code Section 21081.6(a), LAWA would adopt a mitigation monitoring and reporting program (MMRP) in connection with the approval of any of the SPAS alternatives. The MMRP would define what agency is responsible for each adopted mitigation measure and commitment, when that measure or commitment would be implemented, and what criteria would be used to determine whether the measure or commitment is being implemented and is effective. The MMRP is a means to ensure compliance with mitigation measures and commitments during project implementation.

Regarding property value impacts, CEQA does not require property value impacts or other purely social or economic impacts to be analyzed in an EIR (CEQA Guidelines Section 15064(e)). Please see Response to Comment SPAS-PC00189-4 for further discussion about impacts on property values.

CEQA does not require that impacts on "quality of life" be assessed, since "quality of life" is a subjective social issue. The SPAS Draft EIR does however evaluate physical impacts on the environment associated with over 20 topical issues and how such impacts affect residents in surrounding communities.

SPAS-PC00105-3

Comment:

I recently learned that in the earlier stages of LAX's renovation, there was a lawsuit brought against LAWA by the community and eventually there was a settlement. In that settlement LAWA was required to do certain things in the community that are still outstanding. When will these things be completed?

How can this community in good faith work with LAWA if there is no follow thru on previously agreed terms?

Response:

Although not specifically stated, it appears that the commentor is referring to the LAX Master Plan Stipulated Settlement. The comment does not indicate what "certain things in the community are still outstanding" therefore, it is not possible to provide a specific response. Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00105-4

Comment:

In closing, I'd like to join the community in a compromise with LAWA and support Alternative #2 in conjunction with Alternative #9. I understand that LAWA has objectives with LAX and I can only hope that "Minimizing Environmental Impacts on Surrounding Communities" is the top priority while achieving all other objectives.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-AL00007-54 regarding the SPAS project objective of minimizing environmental impacts on surrounding communities.

SPAS-PC00105-5

Comment:

I look forward to hearing back from you and reviewing your responses to my questions.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00105-1 through SPAS-PC00105-4 above. Responses to comments will be included in the Final EIR consistent with State CEQA Guidelines Sections 15088 and 15132.

SPAS-PC00106 Owens, John None Provided 10/4/2012

SPAS-PC00106-1

Comment:

We have resided in Westchester 46 years and observed LAX outgrow its limited location years ago to the detriment of the surrounding area and the citizenry. It should have been relocated to Ontario at a time it could have been practical. It is now beyond that for all practical purposes,

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required

because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00106-2

Comment:

but now LAX is attempting to further expand its footprint by moving runway 6L/24R North of its present location to cause more noise and dirt pollution as well as general inconvenience to the residents and business establishments in Westchester. Enough already!

Response:

The comment noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Relocation of Runway 6L/24R to the north would not result in an expansion of the airport boundary. Relocation of the runway and the related realignment of Lincoln Boulevard would require the relocation of the perimeter fence; however, this would occur entirely within airport property and would not affect any homes or businesses.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5)

would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-PC00106-3

Comment:

We attended the informational meeting at Proud Bird and collected the handouts including the SPAS study. We do not agree with any of the alternatives to move 6L/24R any distance North of its present location. Just because the North boundary fence is not moved per some speaking representative of an airport service company does not mean that the footprint is not enlarged to the further detriment of the community. A combination of alternatives 2 and 9 would seem to take care of the LAX needs at a decent price.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00106-4

Comment:

As an aside, you should figure out a way to keep all the livery, hotel,car rental vans, buses,etc off the central terminal area and provide common shuttle service to the intermodal facility. Leave the central terminal area and garages as is for private vehicles and taxis.

Response:

As indicated in Section 2.3, Project Characteristics, of the SPAS Draft EIR, arriving passengers for those alternatives that include the ITF (i.e., Alternatives 1, 2, 8, and 9) would travel from the CTA to the ITF to board door-to-door shuttles or scheduled buses. This would reduce the amount of shuttle and bus traffic within the CTA, although departing passengers using such transportation would continue to be brought into the CTA. Additionally, under Alternatives 8 and 9, which propose a CONRAC, the amount of rental car company shuttle traffic within the CTA would be reduced, given that the CONRAC would utilized a single consolidated shuttle system. Under Alternative 3, the CTA would be closed to all vehicles except the LAWA FlyAway buses, airport security and operations vehicles, and other authorized vehicles. Under Alternative 4, all shuttles and buses would continue to have access to and from the CTA. The commentors' suggestion that all the livery, hotel, car rental vans, buses, etc. be kept out of the CTA, and access be allowed only for private vehicles and taxis, is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00107 Walker, Robert W United 7/27/2012

SPAS-PC00107-1

Comment:

As you are aware, United has worked closely with LAWA and other carriers operating at Los Angeles International Airport (LAX) regarding the airport's efforts to improve performance and operational efficiency at LAX in the most cost-effective manner. We support LAWA's efforts to date and we will continue to work closely together towards achieving this mutually-beneficial goal.

Though we can specifically state that we are opposed to the Master Plan Alternative D for the North Airfield in that it is not a cost-effective approach to developing the North Airfield, we are aligned on the concept of replacement or rehabilitation of the North Airfield runways and taxiways to meet current FAA design standards.

We look forward to reviewing the Specific Plan Amendment Study and working with your team and the other LAX carriers to better understand the North Airfield options. We anticipate that this collaborative effort will ultimately yield a consensus agreement on the best approach to the North Airfield development.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00108 Haythorn, Joseph D None Provided 9/20/2012

SPAS-PC00108-1

Comment:

From the outset of the process to explore development of the facility at LAX, it appears that LAWA has been acting in a duplicitous manner toward the citizens of Westchester and Playa del Rey. Inglewood has been treated in similar way. The idea that the northernmost runway could be moved further north without much significant community resistance is so preposterous that it can only be taken as a negotiating position. Obviously, if LAWA were to pursue moving the runway, an additional group of houses, condominiums, apartments, schools, and businesses would need to be condemned. Any remaining outside the condemned area would surely bring actions for diminished value. The violation of the consent decree from the last condemnation would serve as the basis of the action, but even without that the property owners would be successful in stopping the development resulting in no activity or, at worst, delaying any construction for years and ultimately receiving compensation forcing the costs of the project far beyond LAWA's predictions.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-636 regarding property acquisition in Westchester. No property acquisition is anticipated as a result of the relocation of Runway 6L/24R to the north. Please see Response to Comment SPAS-PC00189-4 regarding impacts to property values; property values impacts are purely economic impacts not required to be analyzed under CEQA. (State CEQA Guidelines Section

15064(e).). It is speculative to predict whether lawsuits would be filed if a SPAS alternative involving moving the north runway further north is selected for implementation, and whether such lawsuits if filed would result in project delays and cost increases.

SPAS-PC00108-2

Comment:

The recent charade of the Northside development project meetings and "negotiations" are a further indication that LAWA is either not serious about the alternatives which involve moving runways north, or intending to lull the neighbors into a false sense of security. Neither reflects well as to whether LAWA is a trustworthy party in this project. As LAWA proves again inept and untrustworthy, it is difficult to understand whether the entire process of proposing alternatives is a sham.

Response:

Section 15083 of the State CEQA Guidelines provides that a lead agency may consult with persons or organizations who may be concerned with the environmental effects of a project prior to completing the draft environmental impact report. LAWA has exceeded the requirements of CEQA with the public outreach conducted for the LAX Northside Plan Update. In 2007 and 2008, a broad range of local community members participated in planning workshops regarding the LAX Northside properties. In November 2011, an open house was held that gave participants an opportunity to review project exhibits and discuss ideas with LAWA staff and consultants. In February 2012, targeted outreach was conducted with residents north of the LAX Northside area to discuss design concepts. Formal public scoping meetings were held on April 18 and 21, 2012 to obtain input on the scope of the Draft EIR. In June 2012, two workshops were conducted to further refine urban design concepts. Finally, smaller-scale meetings have been held with community leaders and organizations throughout the process to share ideas and receive input.

The LAX Northside Plan Update will be consistent with, and take into account as necessary, the SPAS study, as well as any other concurrent LAWA projects. For example, the LAX Northside Plan Update will take into account the most restrictive SPAS options for the north airfield, and will be consistent with any potential future changes considered for the airport.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00108-3

Comment:

Community partners have demonstrated that the safety claims are so exaggerated they may be dismissed. The statement that noise would not be worse if the runways are moved may be technically true but the noise would be closer to the residences, schools, and businesses so louder there. To actually claim otherwise again demonstrates that LAWA is not dealing seriously.

So I am left to speculate as to whether LAWA is lying or inept. In either case, my only alternative at this point is to seek counsel unless LAWA begins to address this business honestly with a clear understanding of the consequences of their actions.

Response:

Please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield and explanations of the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities. Please also see Sections 4.7.2 and 4.10 of the SPAS Draft EIR for the safety and noise analyses for the SPAS alternatives, respectively.

Also, please note that the comment presents personal opinions about safety and noise impacts that are not supported by facts or evidence.

SPAS-PC00108-4

Comment:

I still believe that the best alternative has not been considered, to close the interior parking and access roads, construct two or three north-south terminals with access by passengers from a subterranean mall, as at the airports in Atlanta or Denver. Passengers would enter the facility east of the airport at Manchester Square or the area now with derelict warehouses between the two points.

Response:

The key features in the alternative recommended by the commentor are, for the most part, comparable to those in SPAS Alternative 3, whereby the CTA would be closed to private vehicles and parking, the existing CTA parking structures would be replaced by terminal/passenger processing facilities, and the main public entrance to LAX would be through the Ground Transportation Center at Manchester Square and, to a lesser extent, the Intermodal Transportation Center at Continental City. The main difference between the commentor's alternative and SPAS Alternative 3 would be that an aboveground Automated People Mover (APM) system would transport passengers to and from the CTA instead of them taking access through a subterranean mall. Constructing such a subterranean mall for passenger access between the LAX CTA and Manchester Square would be logistically infeasible because it would require the demolition/removal of numerous major hotels, a major office building, parking structures, and other uses along the one-mile-long stretch of Century Boulevard and 98th Street between Manchester Square and Sepulveda Boulevard, it would require the excavation and export of approximately 4 million cubic yards of earth to create a single-level subsurface cavity approximately one mile long, 1,000 feet wide and 20 feet deep, and it would require relocation of all underground utilities within that area, and construction of new uses underground. Further, a subterranean mall would have significant construction-related air quality impacts, and would not provide as quick and efficient transport of passengers as an APM. Specifically, a passenger traveling between Manchester Square and the CTA would take approximately 20-30+ minutes to walk non-stop through a mile-long underground mall at an average walking speed of 2-3 miles per hour, compared to approximately 4-5 minutes to travel that same distance by elevated bus or APM at 20-25+ miles per hour with a short stop at the ITF, as proposed under all SPAS alternatives except Alternative 4.

SPAS-PC00108-5

Comment:

Otherwise I agree with the Neighborhood Council of Westchester Playa that alternatives 2 and 9 appear to be the only reasonable ones. The other would receive such opposition as to block all construction. If LAWA is actually intent on ignoring their prior consent agreements, there is really no reason to bother negotiating.

I further agree with the Neighborhood Council of Westchester Playa that we do support intelligent development of LAX, it is a shame any development is relegated to the abilities of the existing management of LAWA.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. The comment regarding LAWA's compliance with "prior consent agreements" requires legal conclusions that are beyond the scope of what is required by CEQA.

SPAS-PC00109 Inamoto, Sharon None Provided 10/5/2012

SPAS-PC00109-1

Comment:

I have been a resident of Playa del Rey and Westchester for over 20 years and LOVE our community. Please don't ruin our neighborhood by making the noise any worse than it is and not to mention the detriment to our health. You would also lower the value of our property. Please don't make me move from my community!

Response:

The comment noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As

indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Related to health concerns, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Regarding concerns related to property values, please see Response to Comment SPAS-PC00189-4; note that property value impacts are purely economic impacts that are not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e)). No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00110 Cassman, Mary Ellen None Provided 10/7/2012

SPAS-PC00110-1

Comment:

I heartily support the position of the Westchester Neighborhood Council, and countless other community groups, that LAX adopt Alternatives 2 and 9, with a realistic train service plan that includes all the Terminals.

Thank you for your consideration.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the

selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00111 Chesney, Tom Westchester Neighbors Association 10/8/2012

SPAS-PC00111-1

Comment:

Our neighborhood organization represents the Westchester Community in the 90045 area. Our focus is on maintaining and improving the quality of life for those who live and work in the community. As an organization we support modernizing the airport and turning it into a world class destination for the global community. Our position is let's upgrade the terminals, do the taxiway fixes, and complete the installation of the runway status lights. This direction will provide the improvements we need and provide long term jobs for many. Also, it has been conclusively shown that LAX's current geometry provides more than adequate safety and moving runways will be extremely expensive and not accomplish what really needs to be done.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please see Response to Comment SPAS-PC00130-168 regarding various safety studies related to the north airfield, including the North Airfield Safety Study. Also, please see Section 4.7.2 of the SPAS Draft EIR. Section 4.7.2 discusses safety impacts of the proposed alternatives, including the "no-project" alternative, Alternative 3.

SPAS-PC00111-2

Comment:

After thoroughly reviewing the report we find it is inadequate in fully addressing the key issues and uses old and flawed data to draw conclusions. These include:

Response:

The comment is noted, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00111-3 through SPAS-PC00111-7 below regarding how the EIR addresses specific issues identified by the commentor. The commentor does not identify any specific "old and flawed data" that the SPAS Draft EIR allegedly used to draw conclusions.

The SPAS Draft EIR provides a thorough analysis of nine alternatives, describes the impacts that would occur at the airport and in areas nearby under each alternative, and recommends feasible mitigation measures for significant impacts. The SPAS Draft EIR meets the requirements of CEQA.

SPAS-PC00111-3

Comment:

- Inadequate resolution of traffic congestion within the Central Terminal Area and adjacent communities.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The impacts to on-airport traffic are analyzed in Section 4.12.1 of the SPAS Draft EIR. The commentor does not provide any factual basis for the conclusion that there is an inadequate resolution of traffic congestion; therefore, no response can be formulated and no further response is required.

SPAS-PC00111-4

Comment:

- Failure to fix traveler ability to navigate LAX with the terminals or between terminals when transferring flights.

Response:

Improvements to travelers' ability to navigate LAX within or between terminals is not a problem that the Yellow Light Projects were designed to address and, thus, is not one of the objectives of the SPAS project. Additionally, this comment addresses alleged issues with existing conditions and does not comment on the analysis provided in the SPAS Draft EIR. Further, while terminal facility improvements are discussed at a program level in the SPAS Draft EIR, specific facility improvements are not yet know, but would be analyzed in further detail in a future project-level environmental review. (See Section 2.3.1 and 2.3.1.10 of the SPAS Draft EIR.)

The ground access improvements proposed under SPAS Alternatives 1, 2, 3, 8, and 9 are designed to reduce traffic congestion within the CTA and provide means to directly access the CTA from facilities outside the CTA (i.e., from the ITF, GTC, or ITC) via a dedicated/elevated busway or an APM system. Implementation of these ground access improvements is intended to improve passengers ability to get to and from terminals within the CTA. In terms of assisting travelers' ability to navigate between terminals when transferring flights, that is largely a matter of how airlines and ticketholder schedule the connecting flights. Such connecting flights are most easily navigated when they are operated by the same airline using the same terminal for both flights, or through alliance airlines with gates and facilities nearby to each other. In terms of what LAWA can do to assist in such navigation between terminals, LAWA personnel in each terminal assist where possible and LAWA has intra-terminal shuttle buses that operate on a frequent and regular basis throughout the day. The commentor's concern about fixing travelers' ability to navigate LAX with the terminals or between terminals when transferring flights is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00111-5

Comment:

- Concentrates air commerce into LAX, thereby increasing LA Area traffic instead of diffusing traffic.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. Traffic impacts associated with the SPAS alternatives are addressed in Section 4.12 of the SPAS Draft EIR.

SPAS-PC00111-6

Comment:

- Failure to designate a single, preferred alternative with general details for review and direct response

Response:

Please see Response to Comment SPAS-AL00007-6 regarding the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project.

SPAS-PC00111-7

Comment:

- No resolution to the substantial customer base changes to our business district plus the considerable construction impacts that would occur during a protracted rerouting of Lincoln and Sepulveda Boulevards. This one DEIR inadequacy, alone, dictates that our businesses operate to survive rather than for growth and prosperity.

Response:

The commentor provides no explanation or supporting evidence regarding where or how the proposed realignment of Lincoln Boulevard under SPAS Alternatives 1, 5, and 6 would affect the Westchester business district. As shown in Figures 2-1, 2-5, and 2-6 of the SPAS Draft EIR, which delineate the proposed realignment of Lincoln Boulevard under the aforementioned alternatives, the affected segment of Lincoln Boulevard begins over 500 feet west of its intersection with Sepulveda Boulevard (i.e., contrary to the statement in the comment, Sepulveda Boulevard would not be rerouted) and ends just west of its interchange with Westchester Parkway. The entirety of the area surrounding the affected segment of Lincoln Boulevard, both as it exists today and as proposed to be realigned, is vacant land within the LAX Northside area owned by LAWA. There are no Westchester businesses located along the affected segment, nor do any rely on direct access to the affected segment.

Please see Topical Response TR-SPAS-LR-1 for additional discussion regarding other concerns expressed about the proposed realignment of Lincoln Boulevard under Alternatives 1, 5, and 6.

SPAS-PC00111-8

Comment:

We encourage LAWA to adopt as the preferred alternative the environmentally superior plan, Alternative 2 with a Consolidated Rental Car Facility in Manchester Square (Alternative 9) supported by some form of rail mass transit which allows for connection into our business district. This plan, according to DEIR evaluations, addresses the necessary airfield operational efficiency and safety concerns without a centerline taxiway, fixes the taxiways, provides the least calculated time to get to the terminal after landing, presents the least intrusive impacts on local communities, and, at the same time provides the lowest construction cost and construction risks.

We look forward to working with LAWA to improve LAX which is the Los Angeles gateway to the world.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Please see Response to Comment SPAS-PC00089-1 for an explanation of why Alternative 2 coupled with the ground access components of Alternative 9 is not the environmentally superior alternative.

Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that Alternatives 2 and 9 would present the least intrusive impact on local communities and provide the lowest construction cost and construction risk.

SPAS-PC00112 Shapiro, Lynne None Provided

SPAS-PC00112-1

Comment:

I have lived in the same location in Marina del Rey for twenty-five years. For twenty-five years I have enjoyed the proximity of LAX. No more! This summer the peace and quiet of the Marina Peninsula (which I overlook) has been replaced by the roaring din of planes taking off and heading north over the Main Channel and the Peninsula and flying at low levels. Sometimes I see as many as 4-6 planes in the air.

The planes used to fly out to sea, make their turns and continue at a higher altitude. Why has this route been changed? It is very disturbing for thirty to forty minutes of every hour. I would appreciate your responding to my question. I have written many office holders without a response.

For me and my neighbors this environmental degradation is very disturbing. Since the ocean is at your disposal, why fly low close to our homes (thousands of apartments, condos and single residences within earshot of these flights)?

If this correspondence is part of any EIR studies, please include it. Again, I would like to know why so many planes are allowed to fly north and if this is to be a permanent change.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Note that the comment addresses existing conditions and does not address or comment on the analysis conducted in the SPAS Draft EIR. LAWA regularly monitors "early turns," when an aircraft on a westerly departure from any of the four LAX runways initiates a turn prior to reaching the shoreline that results in the aircraft flying over the community to either the north or south of the airport. The Federal Aviation Administration (FAA) Air Traffic Control does have the authority to instruct pilots to turn early to ensure the safe operation of the aircraft. The commenter's complaint of regularly occurring "early turns" will be forwarded to the Noise Management Office.

Additional information on LAWA's Early Turn Notification Program can be found on LAWA's website at the following address: http://www.lawa.org/LAXEarlyTurnMR.aspx.

Section 4.10.1.5 of the SPAS Draft EIR addresses "early turn" operations and the preferential runway use policy. The SPAS Draft EIR assumes that pilots of all aircraft departing toward the west shall fly straight until they are past the shoreline before beginning any turns, except for safety reasons as described above. For a more detailed description of the assumptions used for future airspace operating procedures please refer to Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-PC00113 McArtor, T. Allan Airbus Americas, Inc. 10/8/2012

SPAS-PC00113-1

Comment:

Airbus, a leading aircraft manufacturer, is pleased to provide comments and background on the Specific Plan Amendment Study (SPAS) Draft Environmental Impact Report (EIR).

Airbus has designed the A380, the world's largest commercial airplane, primarily for airports like Los Angeles International (LAX) that need to optimize the usage of constrained resources and to find solutions to reduce noise and carbon footprints.

The A380 has a wingspan of 261 ft 8 in and falls into the Airplane Design Group (ADG)-VI as defined by the FAA. LAX airfield - in particular the north airfield complex - does not comply with ADG-VI standards, while deviations from ADG-V standards even remain. Under the current operational plan at LAX, applicable to all ADG-VI airplanes, A380 flights are primarily handled on the north side of the airfield. The operational plan requires special and time-consuming procedures and accommodations that result from the existing geometrical limitations on the airfield and on the terminal aprons.

Four Airbus customers have started A380 service into LAX, and a fifth one will commence soon. Airbus customers have plans to deploy more A380s into LAX in the immediate and near-term future. As an example, the number of daily A380 flights to and from LAX may grow from the current ten to twenty six by the end of 2015, according to Airbus forecasts. The latter figure only accounts for existing A380 customer airlines.

Further, Airbus' Global Market Forecast calls for a significant and steady increase in the number of very large airplanes that will serve LAX in the next twenty years. It ranks LAX as the top A380 airport in North America in terms of operations.

These plans and forecast will materialize only if LAX modernization incorporates a greater compatibility for ADG-VI airplanes on the north airfield and provides more ADG-VI gates than what is currently or will be provided at the Bradley West terminal.

Airbus is expressing strong concerns that the planning assumptions considered in the Draft EIR underestimate the level and intensity of ADG-VI operations at LAX, with the planning horizon (2025) considering merely an equivalence to Airbus A380 daily operations forecast for 2015.

More broadly, Airbus recommends that the Los Angeles World Airports devise and implement a plan that will remedy operational deficiencies on the north airfield and increase compliance with ADG-VI standards in all weather conditions. Airbus emphasizes the need for such level of compliance on the area located between the Central Terminal Area and runway 06R/24L that includes taxilane/taxiway D, taxiway E and the vehicle service road.

All of the above will result in safer and smoother operations for all operators involved.

We trust the City of Los Angeles will seize this unique opportunity, not only to make necessary improvements to LAX but also to prepare it for the future.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS Draft EIR makes reasonable assumptions about the level of ADG VI aircraft operating at LAX in 2025. The 2025 projections, which forecast 78.9 MAP at LAX in 2025, are based upon and consistent with the Southern California Association of Government's Regional Transportation Plan/Sustainable Communities Strategy. (see footnote 670 on page 4-1048 of the SPAS Draft EIR.) Using these projections, a Design

Day Flight Schedule (DDFS) was developed for 2025. (Appendix F-1 of the Preliminary LAX SPAS Report.) The 2025 DDFS was based upon reasonable assumptions, which are provided in Appendix F-1 of the Preliminary LAX SPAS Report, about aircraft fleet mix, load factors, and seating capacity. (See Section 4 of Appendix F-1 of the Preliminary LAX SPAS Report.) As can be seen in comparing Tables 8 and 12 in Appendix F-1, the number of A380 operations at LAX is anticipated to increase from 2 per day in 2009 to 27 per day in 2025. The information presented in Appendix F-1 was developed for the 2025 planning horizon year in the SPAS analysis (i.e., 78.9 MAP in 2025), including the number of A380 operations in 2025, and is not "merely an equivalence to" the daily operations forecast for 2015.

SPAS-PC00114 Lebon, Lucia None Provided 10/8/2012

SPAS-PC00114-1

Comment:

We want to voice our objection to the proposed expansion at Los Angeles International Airport, expanding the Northernmost runway approximately 340 feet closer to Playa Del Rey and our property. This expansion presents health, safety, and environmental risks such as incremental noise, pollution, and traffic; as well as financial implications which will adversely affect the value of property to the residents of Playa Del Rey.

LAWA needs to be concerned with the above-mentioned safety, financial, environmental, and quality of life issues that face the residents of Playa Del Rey and neighboring communities if this expansion goes ahead, rather than with special interest groups that stand to gain from this expansion. Our health and environment is already affected by the pollution from jet fuel that is present on our roofs and patios, which will be increased if the Runway is moved closer. Safety and efficiency at LAX can be achieved without imparting greater impact on local communities such as Playa Del Rey.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Regarding concerns related to property values, please see Response to Comment SPAS-PC00189-4; note that property value impacts are purely economic impacts that are not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e)).

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9 focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Related to health concerns, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Section 4.7.2 of the SPAS Draft EIR addresses impacts related to aviation safety and efficiency. As addressed in that section, and summarized in Table 4.7.2-16, each of the seven SPAS alternatives that involve airfield improvements responds differently to the various safety and efficiency factors analyzed in the section.

With respect to the "jet fuel that is present on our roofs and patios," it is assumed that the commentor is referring to "deposition," (i.e., the gravitational fallout of material (both solid and liquid) from the atmosphere). Commonly, this material, called particulate matter, consists of dust and soot that can form deposits or cause discoloration on outdoor surfaces (i.e., building materials, motor vehicles, small water bodies, etc.). Please see Response to Comment SPAS-PC00043-2 regarding pollutant deposition. As indicated in Response to Comment SPAS-PC00043-2, to date, the research results indicate that aircraft do not contribute substantially to deposition.

SPAS-PC00115	**Duckworth, Donald R**	**Westchester Town Center Business Improvement District**	**9/29/2012**

SPAS-PC00115-1

Comment:

Our Westchester Town Center Business Improvement District (WTC BID) represents all of the commercial property and businesses owners north of LAX to Manchester Avenue along Sepulveda Boulevard from Sepulveda Westway to Sepulveda Eastway. Our customer base includes the Westchester-Playa Del Rey communities, LAX employees, and the millions of Los Angeles travelers that arrive or depart from the airport. We recognize the symbiotic relationship between the WTC BID and LAX. We enthusiastically support LAX modernization and improvements to the Central Terminal Area and access routes which are long overdue.

We encourage LAWA to adopt the project that ensures the most rapid completion of LAX modernization. Alternative 2 with a Consolidated Rental Car Facility in Manchester Square supported by some form of rail mass transit which allows for connection into our business district should be our preferred alternative. Such a plan, according to DEIR evaluations, would address needed airfield operational efficiency and safety concerns, present the least intrusive impact on the local communities, and, at the same time, provide the lowest construction cost and associated risk.

Response:

The commentor's support for Alternative 2 with a CONRAC in Manchester Square and rail mass transit (i.e., Alternatives 2 and 9) is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-168 regarding conclusions of the NASS relative to north airfield safety. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

The commentor's assertion that Alternatives 2 and 9 would present the least intrusive impact on the local communities and provide the lowest construction cost is not accurate. As indicated in Tables 1-17 and 1-18 of the SPAS Draft EIR, Alternative 2 would have the second highest impacts of all the alternatives relative to both population newly exposed to 65 CNEL and to population that would experience a 1.5 dBA CNEL increase over 65 CNEL. In addition, the ground access components of this combination would affect more off-airport intersections than would all of the other ground access alternatives (with the exception of Alternative 8, whose impacts would be the same).

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding.

(State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, Chapter 8 of the Preliminary LAX SPAS Report provides a financial analysis of each alternative. As identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative.

The commentor does not identify any risks involved with construction of the SPAS alternatives nor is there any indication as to what constitutes a construction risk; hence, there is no evidence to support the claim that the combination of Alternatives 2 and 9 would have the lowest construction risk.

SPAS-PC00115-2

Comment:

We do not believe that the proposed north runway expansion impacts are adequately addressed in the SPAS DEIR, however. This inadequacy alone deprives WTC BID property and businesses owners of the ability to effectively plan for their future. Therefore, any project alternative that moves the north runway to the north is unacceptable.

Response:

The SPAS Draft EIR provides a thorough analysis of nine alternatives, including those that propose north runway modifications, describes the impacts that would occur at the airport and in areas nearby under each alternative, and recommends feasible mitigation measures for significant impacts. The SPAS Draft EIR meets the requirements of CEQA. The comment does not identify any specific deficiencies in the SPAS Draft EIR analysis of north runway modification impacts.

The commentor's opposition to any alternative moving the north runway to the north is noted, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00115-3

Comment:

Any planned movement of LAX runways north will clearly encroach upon the WTC BID and, at the least, continue this uncertainty for our properties and businesses for years to come.

Response:

Please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931 regarding the potential for property acquisition and changes in the RPZ to have an impact on the Westchester Business District.

SPAS-PC00115-4

Comment:

Moreover, adverse construction impacts attendant to any runway movement north could substantially degrade our customer base and traffic circulation upon which we critically depend. Such construction impacts would occur during a protracted rerouting of Lincoln and Sepulveda Boulevards and are a major concern.

Response:

As stated on page 2-55 in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 5, and 6 would require the realignment of Lincoln Boulevard between Sepulveda Boulevard and the Lincoln Boulevard/Westchester Parkway interchange. As part of the realignment, approximately 540 feet of roadway would be covered and below grade under Alternative 1, approximately 765 feet under Alternative 5, and approximately 252 feet under Alternative 6. This improvement is not expected to affect the overall north/south through traffic capacity on Lincoln Boulevard nor on Sepulveda Boulevard after construction is complete.

As discussed in Section 4.12.2.6.3 (Construction Impacts) of the SPAS Draft EIR, implementation of any of the SPAS alternatives would result in temporary significant construction-related traffic impacts. There are a number of LAX Master Plan commitments and a mitigation measure specifically designed to reduce such impacts; however, it cannot be concluded at this time that all construction-related traffic impacts would be reduced to a level that is less than significant. As such, construction-related traffic could, at times, result in temporary significant and unavoidable impacts on the streets surrounding LAX. Given the fact that Lincoln Boulevard and Sepulveda Boulevard south of Lincoln Boulevard are controlled by Caltrans (SR-1), construction of this facility is expected to follow the techniques specified in the Caltrans Construction Manual, as well as City requirements, to ensure the safe passage of traffic through and around construction with as little inconvenience and delay as possible and would require coordination between LAWA, Caltrans, the Los Angeles Department of Transportation, the contractor, and California Highway Patrol (CHP). Input from the local City Council office would also be taken into consideration when developing the construction phasing plans. Traffic control plans would include detour routing, changeable message signs, signal timing/phasing changes, a public information campaign regarding the construction, etc.

SPAS-PC00115-5

Comment:

We have experienced such negative impacts from LAX in the past. In the late 1960's, when the north runway (24 Right) was built, thousands of homes and many businesses were removed by LAX, which had a devastating effect. Many major stores and local businesses were forced out of the business district or subsequently left. It took more than 25 years to recover the business base.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00115-6

Comment:

Finally, we have not seen a total project phasing and funding plan. We encourage LAWA to release this information as soon as possible, and suggest that project phasing should express preferences for improving the LAX passenger experience, reducing local traffic gridlock, addressing urgent maintenance projects, and completing taxiway improvements before any runway changes are contemplated.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore, no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). The SPAS Draft EIR is a programmatic document, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. Please see Response to Comment SPAS-PC00130-41 regarding phasing, Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements, and Response to Comment SPAS-PC00130-725 regarding the benefits of terminal improvements versus runway improvements.

SPAS-PC00115-7

Comment:

We look forward to working with LAWA to improve LAX, Los Angeles' "window to the world."

Response:

The comment is noted.

SPAS-PC00116 Hughes, Laurie Gateway to LA Business Improvement District 10/3/2012

SPAS-PC00116-1

Comment:

Attached is the EIR Comment Letter from Gateway to L.A..

Thank you for considering our comments and concerns.

We look forward to working with you and your staff to make the LAX area a first-class experience to travelers and workers alike.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00116-2 through SPAS-PC00116-7 below.

SPAS-PC00116-2

Comment:

I am writing to you today on behalf of the Gateway to L A Business Improvement District (Gateway to LA BID) to provide comment on issues raised in the Specific Plan Amendment Study (SPAS) Draft Environmental Impact Report (EIR) currently in circulation.

Gateway to LA BID represents the hotels and businesses that are the literal gateway to Los Angeles - for many the first experience they have of our city. For that reason we have worked hard to create a sense of identity and place and to ensure that the millions of visitors who stay, work and play in and around LAX have the ability to enjoy our city and experience a clean, safe, and easy to navigate environment.

We appreciate the ongoing engagement and inclusion of a wide variety of stakeholders in the SPAS effort and our members continue to eagerly await the outcome of this very important process.

Specific to the SPAS Draft EIR, we support the following proposals under consideration:

Coordination of transportation - While there are many alternatives for "Stand Alone Ground Transportation Improvements", we believe the most successful and impactful alternative is one that fully integrates ground, light rail, parking, consolidation of shuttle services, and an automated people-mover.

- Alternative 9, which includes the build-out of the Consolidated Rental Car facility (CONRAC) and Employee Parking at Manchester Square will have the most positive impact on the airport, businesses and hotels in and around the area. Connectivity with the Metro Crenshaw/LAX and Green Line stations through the use of APM technology is essential and support location of the Metro Crenshaw/LAX Crenshaw/LAX and Green Line stations at the northeast corner of Century and Aviation Blvds.

We do not support the concept currently under consideration for a bus-way, which would incorporate rubber tire articulated buses versus an elevated fixed rail system. While we understand the cost

differential involved in choosing an APM over buses, we believe an asset as valuable as LAX must support long-term thinking and investment in visionary infrastructure upgrades.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00116-3

Comment:

- Focus on Traffic Impacts - The Draft EIR identifies 39 intersections which will be negatively impacted by growth in and around the LAX community. Mitigation measures, which we presume will include multi-modal public transportation options as identified above and consolidation of off and on-airport transportation, must continue to be a priority. Transit-Oriented Development, even in the build-out of projects like the CONRAC and in Metro-sponsored bus facilities, must be a high priority and ongoing interagency coordination and cooperation is crucial. Resources must be prioritized to address these issues as project development moves forward.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00116-4

Comment:

Projects like the proposed Century Corridor Streetscape Plan must also be considered and incorporated into LAWA's development efforts.

Response:

LAWA initiated the Century Corridor Streetscape Plan and prepared a draft development plan. However, FAA determined that funding for this project could not be provided using airport funds unless it could be demonstrated that the project met the requirements for use of airport revenue.1 Other projects of this type that have a direct nexus to LAX will be considered on their merits and eligibility as they occur.

1. U.S. Department of Transportation, Federal Aviation Administration, Letter from William C. Withycombe, Regional Administrator, to Lydia Kennard, Executive Director, Los Angeles World Airports, August 24, 2006.

SPAS-PC00116-5

Comment:

- Enhanced Central Terminal Area Circulation - We are supportive of the efforts outlined in the Draft EIR to improve and better manage circulation into and around the Central Terminal Area and to link satellite terminals to the central airport facilities. Any efforts to better manage CTA impacts should be advanced through the SPAS process. Better circulation within the airport will have a positive impact on the ingress

and access points, which will have a meaningful trickle-down impact on the Century corridor and surrounding communities.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR provide and analysis of the on-airport and off-airport traffic impacts associated with the SPAS alternatives, respectively.

SPAS-PC00116-6

Comment:

- Parking Issues are Key - We believe strongly that a highly functioning airport must include a mix of alternatives for short-term, long-term and employee parking. Many stakeholders have invested significantly in efforts to provide the traveling public with affordable options for off-airport parking, with a strong emphasis on customer service, ease of access, and reliability. As such, we believe the SPAS process must clearly delineate parking responsibilities of LAWA such as employee parking being provided at Manchester Square, from other parking changes, such as NOT moving parking lots B and C. Ensuring an appropriate mix of parking alternatives is key to maximizing options for all LAX stakeholders.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00116-7

Comment:

Nothing is more important to the health and vitality of our region than continued investment in LAX. The importance of the jobs, tourism, positive trade and economic development impacts and the impetus for continued growth of Los Angeles in the world's marketplace depends on a highly functional airport and a thoughtfully developed community to support that engine. The SPAS process is the next step forward in helping to develop a "world-class" airport facility and to create an asset for the 21s1 century.

Gateway to LA is proud to be a partner in this effort and we look forward to the next steps in the modernization and improvement of LAX. Thank you for your consideration of our views.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

SPAS-PC00118	**Van Valkenburg, Peter**	**Enterprise Holdings, Inc.**	**10/8/2012**

SPAS-PC00118-1

Comment:

Thank you for taking the time to review with us the LAX Specific Plan Amendment Study ("SPAS") during our meeting at LAX on September 21, 2012.

Please accept this e-mail as formal "Written Comments" on SPAS from the Enterprise, Alamo and National car rental concessions at LAX.

We appreciate being given the opportunity to submit our comments on these potential amendments to the LAX Specific Plan.

The rental car companies ("RACS") have been meeting with LAWA Staff for several years discussing a possible consolidated rental car facility ("ConRAC") at LAX. The two threshold questions we always face with any proposed ConRac project are 1) Is there a viable/feasible location for the proposed ConRac, and 2) Is there a viable/feasible plan of finance for designing, constructing, and operating the proposed ConRac project.

Regarding a viable/feasible location for a proposed ConRac at LAX, we have identified several fatal flaws with the proposed "Lot C" location. In a nutshell, these fatal flaws with the "Lot C" location include: 1) onerous building height restrictions, 2) a bifurcated site (Arbor Vitae runs right through site), and 3) increased construction and operating costs. In turn, we do NOT support locating any proposed future ConRac at the "Lot C" site, and we do NOT support the two SPAS Alternatives (Alternatives' 3 and 4) that include the proposed "Lot C" ConRac site.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00118-2

Comment:

At some point in the future, a ConRac will likely be necessary. For example, once LAX reaches the maximum 78.9 MAP level, a proposed CFC (fully-funded) ConRac project at a viable/feasible location would likely 1) help reduce congestion at the terminal, and 2) provide a better customer service experience for the traveling public at LAX. Assuming LAX reaches maximum capacity and a viable ConRac plan of finance can be identified, we believe that the preferred location for any necessary future ConRac is the Manchester Square site. The Manchester Square site is a preferred location because it does not have any of "Lot C's" fatal flaws, and it has better access to the freeway system. Accordingly, under the aforementioned circumstances, we would expressly support the two SPAS Alternatives (Alternatives' 8 and 9) that include the proposed Manchester Square ConRac site.

Response:

The SPAS Draft EIR analyzed a number of alternatives, including those that proposed construction of a CONRAC, for the impacts at a practical capacity of 78.9 MAP. The results of the analyses related to transportation (i.e., on-airport transportation and off-airport transportation), for those alternatives that include and those that do not include a CONRAC, are discussed in detail in Sections 4.12.1 and 4.12.2.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not provide any factual basis or substantial evidence to support its conclusion that congestion would improve with the addition of a CONRAC. As provided above, the alternatives that include a CONRAC are discussed throughout the SPAS Draft EIR.

SPAS-PC00118-3

Comment:

In summary, our position on the proposed ConRac locations in the proposed SPAS Alternatives is as follows:

-We do not support (under any circumstances) the proposed "Lot C" location (SPAS Alternatives' 3 and 4) for any future ConRac project; and

-We support the proposed Manchester Square location (SPAS Alternatives' 8 and 9) for any necessary, CFC fully-funded, future ConRac project.

Please let me know if you have any questions.

(Please also confirm receipt of these Written Comments.)

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00118-1 and SPAS-PC00118-2 above regarding location of the proposed CONRAC facility. It is acknowledged that the comment letter was received on October 8, 2012, prior to the close of the public comment period on the SPAS Draft EIR (October 10, 2012).

SPAS-PC00119 Lay, Al LAX-Area Democratic Club 10/8/2012

SPAS-PC00119-1

Comment:

Regarding SPAS 2012 and the 9 Alternatives:

I strongly urge you to adopt:

1. Alternative 2
2. Alternative 9 (with a realistic train service plan that includes all the terminals)

I believe that these options represent the most reasonable course of action.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00120 Sirotich, Stephanie D None Provided 10/8/2012

SPAS-PC00120-1

Comment:

I want to voice my objection to the proposed expansion at Los Angeles International Airport, expanding the Northernmost runway approximately 340 feet closer to Playa Del Rey and my property. This expansion presents health, safety, and environmental risks such as incremental noise, pollution, and traffic; as well as financial implications which will adversely affect the value of property to the residents of Playa Del Rey.

LAWA needs to be concerned with the above-mentioned safety, financial, environmental, and quality of life issues that face the residents of Playa Del Rey and neighboring communities if this expansion goes ahead, Rather than with special interest groups that stand to gain from this expansion. My health along with other residents and the environment is already affected by the pollution from jet fuel that is present on our roofs and patios, which will be increased if the Runway is moved closer. Safety and efficiency at LAX can be achieved without imparting greater impact on local communities such as Playa Del Rey.

Response:

The content of this comment is essentially the same as comment SPAS-PC00114-1; please refer to Response to Comment SPAS-PC00114-1.

SPAS-PC00121 Murray, Donna None Provided 10/8/2012

SPAS-PC00121-1

Comment:

I have reviewed the proposed changes to LAX and feel that Alternative 2 with Alternative 9 supporting it should be the preferred plan. These plans improve airside safety by moving and improving taxiways, are the least expensive and quickest to implement, and do the least damage to our community.

Please listen to the public involved, our elected officials and our Neighborhood council. I currently have airport approved windows and insulation and cannot hear my television when planes go over. The quality of life in Westchester will be adversely affected during the implementations of the other Alternatives for both the short-term and long-term.

Alternatives 2 and 9 will meet the capacity needs for LAX providing airfield and transportation improvements.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding.

(State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, it should be noted that the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report). Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that Alternatives 2 and 9 would do the least damage to local communities. It is acknowledged that all of the alternatives would result in increased aircraft noise impacts to areas immediately north and northeast of the airport. Please see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities. As indicated in that response, while it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. Overall, the alternatives that would relocate Runway 6L/24R north would result in the lowest residential population exposed to a 1.5 CNEL increase above 65 CNEL and, along with Alternative 3, would result in the lowest number of people newly exposed to 65 CNEL.

Regarding impacts on quality of life, CEQA does not require purely social or economic impacts to be analyzed in an EIR. (CEQA Guidelines Section 15064(e)). As required by CEQA, the SPAS Draft EIR evaluates physical impacts on the environment associated with over 20 topical issues and how such impacts have the potential to affect residents in surrounding communities.

SPAS-PC00122 Schnabl, Val None Provided 10/8/2012

SPAS-PC00122-1

Comment:

We live in a house on Rindge Ave. in Playa del Rey about one block north of the LAX property. We strongly oppose moving the north runways further north. Instead, we support the 2012 SPAS Alternatives 2 & 9 which would have a tolerable impact on nearby LAX neighbors. I (Val) have lived in Playa del Rey since 1967 (45 years) and my wife has lived in PDR for 31 years. We like it here and want to continue to have an amiable relationship with LAX.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00123 Garner, Bryan LawProse Inc. 10/9/2012

SPAS-PC00123-1

Comment:

Lesson #90

Is it correct to refer to an attorney general or solicitor general as "General So-and-So"?

ANSWER: Not really. The trend has been to address attorneys general and solicitors general as if they were military officers, as in "General Starr, when will the report be available to the public?" Despite its prevalence, this is strictly speaking incorrect. In titles such as attorney general, the word general is not a noun, but a postpositive adjective -- an adjective that follows rather than precedes the noun it modifies. Attorney general and solicitor general are two examples. Other examples include court-martial and

notary public. But no one calls a notary public simply "public." The word general in attorney general is every bit as much adjectival as it is in general counsel.

The practice of using general as a title appears to have been popularized by then-Justice William Rehnquist, who was otherwise known as a stickler for grammar. He used the term in this way as early as 1980. Meanwhile, the Chief Justice in that era, Warren Burger, fastidiously addressed the Solicitor General as "Mr. Solicitor General." But from the outset of his chiefship, Chief Justice Rehnquist used general as a title, undoubtedly helping to spread the linguistic innovation. Lamentably the practice has continued with Chief Justice Rehnquist's successor and has been adopted by other members of the Court as well. Even transcript references to the Solicitor General now simply state "General Clement," "General Kneedler," and "General Verrilli." Although the practice of militarizing high legal offices will likely persist, the sticklers will abstain (correctly) from using "General" in this way.

Incidentally, the Surgeon General is a uniformed officer of the Public Health Service Commissioned Corps -- not a general, though, but a vice admiral.

On the other hand, if Supreme Court justices are saying it, perhaps it's correct de jure, though not de facto. As Justice Robert H. Jackson once declared: "We are not final because we are infallible, but we are infallible only because we are final."

Postscript: The rhetorical term for Jackson's figure of speech there -- reversing parallel words in adjoining clauses -- is chiasmus.

SPAS-PC00124	**Alpern, M.D., Kenneth S**	**None Provided**	**10/9/2012**

SPAS-PC00124-1

Comment:

The following comments do not represent either the opinion or stated support of either the CD11 Transportation Advisory Committee, The Transit Coalition, The Sierra Club, The Mar Vista Community Council or Friends of the Green Line, of which I affiliate with. Although my experience and affiliation with those entities have certainly affected my held views, these views are entirely my own.

Simply put, Alternatives 2 and 9 are the best alternatives for LA and LAX to move into the 21st Century and they merit our collective support.

Simply put, demolishing, relocating and rebuilding the northern airline terminal structures is inevitably more expensive, disruptive and environmentally-impacting than is a refurbishing and modernization of the existing structures, and that latter alternative (part of Alternative 2), merits our collective support.

Simply put, relocation of the northern airfield to the north, and accompanying destruction and razing of the adjacent portion of the commercial district of adjacent Westchester, results in a permanent loss of City revenue and is more expensive, disruptive and environmentally-impacting than is a relocation and modernization of our existing northern runway, and that latter alternative (part of Alternative 2), merits our collective support.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

Alternatives that would include the northerly relocation of Runway 6L/24R would not require the demolition of the north airfield terminals. Demolition of the Terminal 1, 2, and 3 concourses is only associated with Alternative 3. Under Alternatives 1, 2, 5, 6, and 7, a small portion of the Terminal 1 concourse would be demolished. In addition, all of these alternatives would involve the demolition and relocation of the Terminal 3 concourse to the west. As noted in Response to Comment SPAS-PC00130-931, no acquisition is proposed within the Westchester Business District under any of the SPAS alternatives. Therefore, there would not be a permanent loss of City revenue associated with a loss of businesses within Westchester.

The commentor is not specific in the comment that relocation of the northern airfield to the north is more environmentally impacting than Alternative 2. Please see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities. As indicated in that response, while it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. Overall, the alternatives that would relocate Runway 6L/24R north would result in the lowest residential population exposed to a 1.5 CNEL increase above 65 CNEL and, along with Alternative 3, would result in the lowest number of people newly exposed to 65 CNEL.

SPAS-PC00124-2

Comment:

Simply put, a Consolidated Rental Car Facility with an adjacent Green/Crenshaw Line rail station at/near Century/Aviation is more efficient, cost-effective and more amenable to high-capacity, heavily-utilized car/train/rail/bus/pedestrian intermodal transportation connections than is our current arrangement with car rental and transit connections that aren't pedestrian-friendly and easily accessible, and that former alternative (Alternative 9) merits our collective support.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

SPAS-PC00124-3

Comment:

Simply put, a connecting LAX People Mover that is a rail alternative to link the Green/Crenshaw MetroRail Lines, the latter of which just received a $545.9 million loan from the federal government to expedite its construction and lower construction costs, with the Central Terminal Area is the modern, compatible, and commuter-preferred alternative (Alternative 9), and merits our collective support.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

SPAS-PC00124-4

Comment:

Simply put, a bus route to connect MetroRail to the Central Terminal Area might have lower capital costs for LAWA, but much higher operating costs as an Automated People Mover rail service need have no drivers and fewer vehicles to pay for and maintain after the initial capital costs (which may come from Metro, should Measure J or other funding measures occur) are accommodated.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00124-5

Comment:

Simply put, the $200 million that County Transportation Measure R (the half-cent sales tax approved by county voters in 2008) assigns to a Green Line connection to LAX was meant only as seed money to properly study and prepare for the next steps of the MetroRail to LAX project that the entire county needs as part of a 21st Century transportation network. Planning and funding efforts to build a comprehensive rail network linkage to LAX merits our collective support.

Simply put, County Transportation Measure J absolutely DOES allow funding and fast-tracking of the Green Line and Crenshaw Line connections to LAX from the Westside, Mid-City and South Bay regions, in addition to fast-tracking and lessening construction costs of other Measure R projects, and it merits our support.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options to LAX.

SPAS-PC00124-6

Comment:

Simply put, comments by LAWA Executive Director Gina Marie Lindsey that openly support a bus service over a rail Automated People Mover are entirely inappropriate, in that all Alternatives are to be considered and evaluated as to a Locally Preferred Alternative, and based on community input rather than a top-down bias from the LAWA Board and leadership. Ms. Lindsey has the right to state her personal opinion, but should recognize that the voters who chose to tax themselves with Measure R (and who might vote in favor of Measure J as well), and those who weigh in on the LAX SPAS EIR, are the ones who determine any Locally Preferred Alternative.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The Board of Airport Commissioners has the responsibility for considering selection and approval of a SPAS alternative, including the ground access components of the selected alternative. The SPAS alternatives were presented and evaluated in a manner that fosters informed decision-making and public participation. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00124-7

Comment:

It is my strongly-held belief that Alternatives 2 and 9 represent the Locally Preferred Alternatives that are most cost-effective for the long-term benefit of LA World Airports and the City and County of Los Angeles.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

SPAS-PC00125	**Hetz, Matthew**	**Los Angeles Council District 11 Transportation Advisory Committee**	**10/9/2012**

SPAS-PC00125-1

Comment:

I live in Westchester, and I support Alternatives 2 and 9. In Westchester we have suffered enough with the past removal of homes and business and a school to accommodate LAX expansion. This is seen by the various vacant lots around the airport along Westchester Parkway, Pershing Ave and Vista del Mar. There is no need to take more homes and businesses in Westchester. Ontario Airport needs to be let go by LAWA and let the Inland Empire increase capacity to take some strain from LAX.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9.

A discussion of property acquisition that could occur under the SPAS alternatives is provided in Sections 2.3.1.11 and 4.9.6 of the SPAS Draft EIR. Specifically, the property acquisition that would be required under Alternatives 1, 2, 3, 4, 8, and 9 is shown in Figures 2-11, 2-12, 2-13, and 2-14 and listed in Table 2-4 and Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR. As indicated in these figures and tables, no residential acquisition or acquisition within Westchester is proposed.

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport.

SPAS-PC00125-2

Comment:

We suffer from the noise and pollution from the airport itself twenty-four hours a day, seven days a week. This includes the annoying and sleep disrupting noise in the middle of the night from jets engines warming up at LAX. I hear this, and I live a little more than one mile north of the airport. Moving the north runway further north would be a disaster to any kind of remaining decent way of life in Westchester.

Response:

The comment noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR addresses impacts associated with aircraft noise, road traffic noise, and construction traffic and equipment noise in Sections 4.10.1, 4.10.2, and 4.10.3, respectively. The impacts associated with each of these categories of noise are summarized below.

As indicated in Section 4.10.1 of the SPAS Draft EIR, Alternatives 1 through 7 would result in some residential uses and non-residential noise-sensitive facilities being newly exposed to noise levels of 65 CNEL or higher or increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. With implementation of LAX Master Plan mitigation measures, these impacts would be less than significant. However, interim impacts prior to the completion of mitigation, impacts on residential uses with outdoor habitable areas, and impacts on parks would remain significant and unavoidable. Alternatives 8 and 9

focus on ground access improvements that, in themselves, would not result in aircraft noise exposure but would be coupled with the airfield improvements proposed under Alternatives 1, 2, 5, 6, or 7, the impacts of which are summarized above. None of the alternatives would result in a significant impact relative to sleep awakenings.

Concerning road traffic noise, as indicated in Section 4.10.2 of the SPAS Draft EIR, impacts related to ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant as the incremental changes in road traffic noise levels under each of these alternatives would be less than a 3 dBA increase in CNEL. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Regarding construction traffic and equipment noise, as indicated in Section 4.10.3 of the SPAS Draft EIR, due to the periodic nature and limited incremental increase on area roadways, none of the alternatives would result in significant impacts related to construction traffic noise. However, all of the alternatives would result in significant impacts from construction equipment noise with the potential to effect sensitive receptors such as residential and school uses. The sources of those impacts differ by alternative, but can be generally characterized as temporary impacts associated with airfield improvements, ground access system improvements, and construction staging areas. While LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with all of the SPAS alternatives, it cannot be definitively concluded that all construction equipment noise impacts would be reduced to levels that are less than significant and these impacts are considered to be significant and unavoidable.

The SPAS Draft EIR addresses air quality impacts associated with the SPAS alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R, in Sections 4.2. As indicated therein, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-PC00125-3

Comment:

We also must contend with airport traffic, which clogs the streets and leaves behind traffic noise and vehicle exhaust fumes. COPD is attributed to vehicle exhaust, and Westchester with the airport traffic and the 405 Freeway does not need more traffic.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the

ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above. Please see Response to Comment SPAS-PC00125-2 above regarding traffic-related noise and air quality impacts.

Related to health concerns, as indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

SPAS-PC00125-4

Comment:

Moreover, the studies clearly show Alt. 2 is much less costly and disruptive than the other alternatives, some of which would require massive road and utility relocation construction, have much higher costs. With government sinking in debt, careful and wise spending of tax payer money is required.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment that Alternative 2 would be less costly than other alternatives and that some of the other alternatives would require roadway relocation is also noted. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6, including utility lines in the vicinity of the Lincoln Boulevard realignment. Utility systems that would be affected by the SPAS alternatives have not been determined at this level of planning. Project-level impacts associated with implementation of individual SPAS components will be assessed in future CEQA documents, including impacts associated with utility systems. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS Project. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. As noted in that response, no general tax dollars would be used to pay for any of the proposed on-airport improvements.

SPAS-PC00125-5

Comment:

The expansion of LAX should not have the subtext of a jobs bill, this should not be placed on the backs of the people of Westchester, we have paid enough through past airport deeds and current operations.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The objectives of SPAS are delineated in Section 2.2 of the SPAS Draft EIR. As noted in that section, there are seven primary objectives for SPAS, only one of which, Objective 3, includes supporting the economic growth and vitality of the Los Angeles region.

SPAS-PC00125-6

Comment:

The north runway has been operating safely for the past years, with the double-deck A380 Airbus jets in daily use. Incorporating the most up-to-date technology for runway safety and reconfiguring runway taxi lanes will further increase safety at LAX.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As discussed in Section 2.2 of the SPAS Draft EIR, one of the project objectives of SPAS is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX, including improvements that are consistent with FAA design standards for the largest aircraft currently in service and anticipated for the future at LAX. As described on pages 4-501 and 4-502 of the SPAS Draft EIR, LAX currently employs many of the existing technologies for runway safety and LAWA and the FAA continue to coordinate on the evaluation and implementation of additional technologies.

SPAS-PC00125-7

Comment:

For Alt. 9, a rail line into LAX is long, long overdue. A number of smaller airport throughout the U.S. have rails to the airport, and for LAX to not have it is disgraceful. I am a transit rider since 1992, and light rail is far superior to buses in rider comfort, speed, ease of boarding and disembarking and carrying capacity.

Response:

The commentor's support for Alternative 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00128 Cope, Danna None Provided 10/9/2012

SPAS-PC00128-1

Comment:

Please find attached my comments on the LAX SPAS DEIR.

I look forward to reviewing the Final EIR when it becomes available. However, I note that there is no public review period listed in the LAWA brochure; after the responses to comments/preparation of the Final EIR, the next phase goes directly to BOAC and local approvals. Please clarify this issue: there should be a public review period included.

Thank you.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Unlike a Draft EIR, CEQA does not require a public review period for a Final EIR. However, the lead agency, in this case LAWA, must provide written proposed responses to public agencies on comments made by those public agencies at least 10 days prior to certifying the Final EIR (Public Resources Code Section 21092.5).

In preparing the SPAS Final EIR, LAWA has reviewed all of the comments received, has carefully considered the responses to these comments, and has made a number of revisions to the Draft EIR in response to public comments (see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR). LAWA will post the Final EIR on laxspas.org.

SPAS-PC00128-2

Comment:

After studying the DEIR, my conclusion is that no convincing argument was made in the document to move the northernmost runway (24R) on the North Airfield. Therefore, I earnestly advise that the following action be taken:

Adopt Alternative 2, plus Alternative 9 with a realistic train service plan that includes all the terminals.

This position has been taken by many people and organizations, including the Neighborhood Council of Westchester/Playa.

Questions that are raised by the DEIR and must be fully investigated in the Final EIR include:
- Why go to the expense of moving 24R north, when any of the runway alternatives (1-7) would result in the same number of passengers that LAX can accommodate? All the alternatives would enable LAX to handle the projected traffic in 2025: 78.9 Million Annual Passengers (MAP). Therefore, there would be no gain in passenger capacity from moving 24R North.
- Why is Alt. 2 not the preferred alternative when (by statements in the DEIR) it is the most economical, efficient, and environmentally sound choice? It does include realigning some taxiways as noted in the North Airfield Safety Study (NASS). Improvements and extensions to the east end of 24L and 24R are also incorporated which would allow the New Larger Aircraft (such as the A380) easier operations on the North Airfield. A new terminal at the east end (roughly where the Park One lot currently is located) is included, which will help ease aircraft movement on the North Airfield.
- Why, when the accredited and fully accepted safety report, the North Airfield Safety Study (NASS), concluded that the North Airfield is safe AS IT IS to handle the future estimated air traffic, are expansion alternatives being proposed? The study did recommend taxiway realignment that is included in Alt. 2.
- Why propose so many alternatives, when Alt. 2 is also the least intrusive into the neighborhoods? Alt. 2 would not move flight paths, or increase noise and air pollution into Westchester/Playa del Rey.
- What market value was used in LAWA's estimates for purchasing properties that would be affected by moving 24R as far north as LAWA actually wants to move it (at least 350 feet)? The Delta and Paradise Buildings, as well as all the businesses up to Ralph's in the Westchester Business District would have to be removed. Figures that were listed in the Acquisitions Section are very low.
- Why did LAWA make the erroneous assumption that the In-N-Out and Parking Spot would not be in an FAA protective, safety, or buffer zone because pilots would land midway down 24R (which would be extended West to Pershing)? Most pilots like to land (and do land) as soon as their assigned runway is available, not wait until they are midway down the runway.
- Why wasn't the loss of at least 500 permanent jobs taken into account in discussions of moving 24R north? The business district only recently recovered from losing 10,000 customers and many employees from previous LAX expansions.
- Why didn't the DEIR discuss spending funds on modernizing the airport: improving the terminals, roadways, elevators, escalators, bathrooms, signage, etc., all of which would provide more jobs that moving the runway? Modernizing LAX would greatly improve the passengers' experience of traveling through the airport.
- Why add a Centerline taxiway (between the runways) when it does NOT create a Group 6 airfield and does create safety hazards? A Centerline Taxiway (CLT) decreases the space between the wings of an aircraft on a runway and an aircraft on the CLT. More aircraft would be exposed to the contrail "blast effect" off of the wings of a New Larger Aircraft (NLA) if a CLT were to be jammed into the North Airfield.

In addition, the reduction of incursions on the South Airfield after the addition of a CLT could be credited to the installation of the Runway Status Lights.
- Why go to exorbitant expense of moving 24R, citing the wish to create a Group 6 Airfield, when, according to LAWA's figures, Group 6 aircraft in 2025 will be just 1.6% of total LAX air traffic? This 1.6% figure is based on the original "buy" orders - but very few of the airlines are actually buying their full, original orders. It seems ridiculous to go through so much upheaval, not to mention cost, for such a small number.
- Why blame the NLAs for extensive, expensive changes when the Airbus A380 has been landing and taking off with no trouble on the North Airfield? As noted above, Alt. 2 would extend Runways 24L and 24R to the east, which would ease aircraft traffic on the North Airfield.
- Where were the cost estimates and evaluation of the impact on the South Airfield while the North Airfield is closed for projects that would move the runways?

There are some extremely expensive matters caused by moving the runway North which were not adequately addressed in the DEIR. These items must be completely examined in the Final EIR:
- Filling in the Manchester Tunnel. This is the tunnel that was originally built to connect the North communities to the South. It was to be part of the never-authorized Laurel Canyon Freeway that was being considered back in the late 1950s and early 1960s. It starts where Lincoln turns East, near the Park West apartment complex, and tunnels South under LAX to within 50 feet of 24L. The last time it was inspected (after a very dry season) there was water in the tunnel. LAWA has recommended filling the tunnel with sand (a glorious recipe for sink holes!), or taking the top off the tunnel and filling it with dirt. The tunnel is about 35 ft down and 4 to 6 lanes wide, and 750 feet long. Using 20 feet for the height, 55 feet for the width (5 lanes x 11 ft/lane), and 750 feet for the length, the area to be filled comes to 825,000 cubic feet (20 x 55 x 750=825,000) if just the tunnel is filled with foam. If the ground over the tunnel is also removed, the number jumps to 1,443,750 cubic feet (35 x 55 x 750 = 1,443,750). Filling the space with dirt would require a lengthy compression period. This would mean closing both runways 24L and 24R for some time, putting an undue amount of traffic on the South Airfield. A recommendation from a person who is familiar with tunnel problems is that the tunnel be filled with a special foam that was developed to handle filling in a space so it can withstand heavy weights. The cost could run into the millions, possibly billions. The actual cost of filling the tunnel with dirt or with foam, plus the downtime for the North Airfield must be included in the Final EIR. Impact on the South Airfield from the closure must also be included.
- Moving affected sewers. Other city departments have stated that the sewers cannot be moved. How would LAWA propose to a) protect the sewers and b) protect aircraft from cave-ins?
- Property acquisition. As noted above.
- Enclosing the Argo Flood Control Channel. This channel is required as a drain for the flood control plain and, as such, should not be enclosed. It is under the jurisdiction of the Army Corps of Engineers and LAWA does not have any approval as of the DEIR date to make changes to the channel. Covering the channel with a permeable substance is not practical: no known permeable substance would withstand the weight and impact of aircraft landing or taking off.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

Regarding the comment that Alternative 2 is the most economical alternative, as identified in Table 8-2 of the Preliminary LAX SPAS Report, the combination of Alternatives 2 and 9 is not the lowest cost alternative. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Regarding the comment that Alternative 2 is the most efficient and environmentally sound choice, please see Response to Comment PC00089-1.

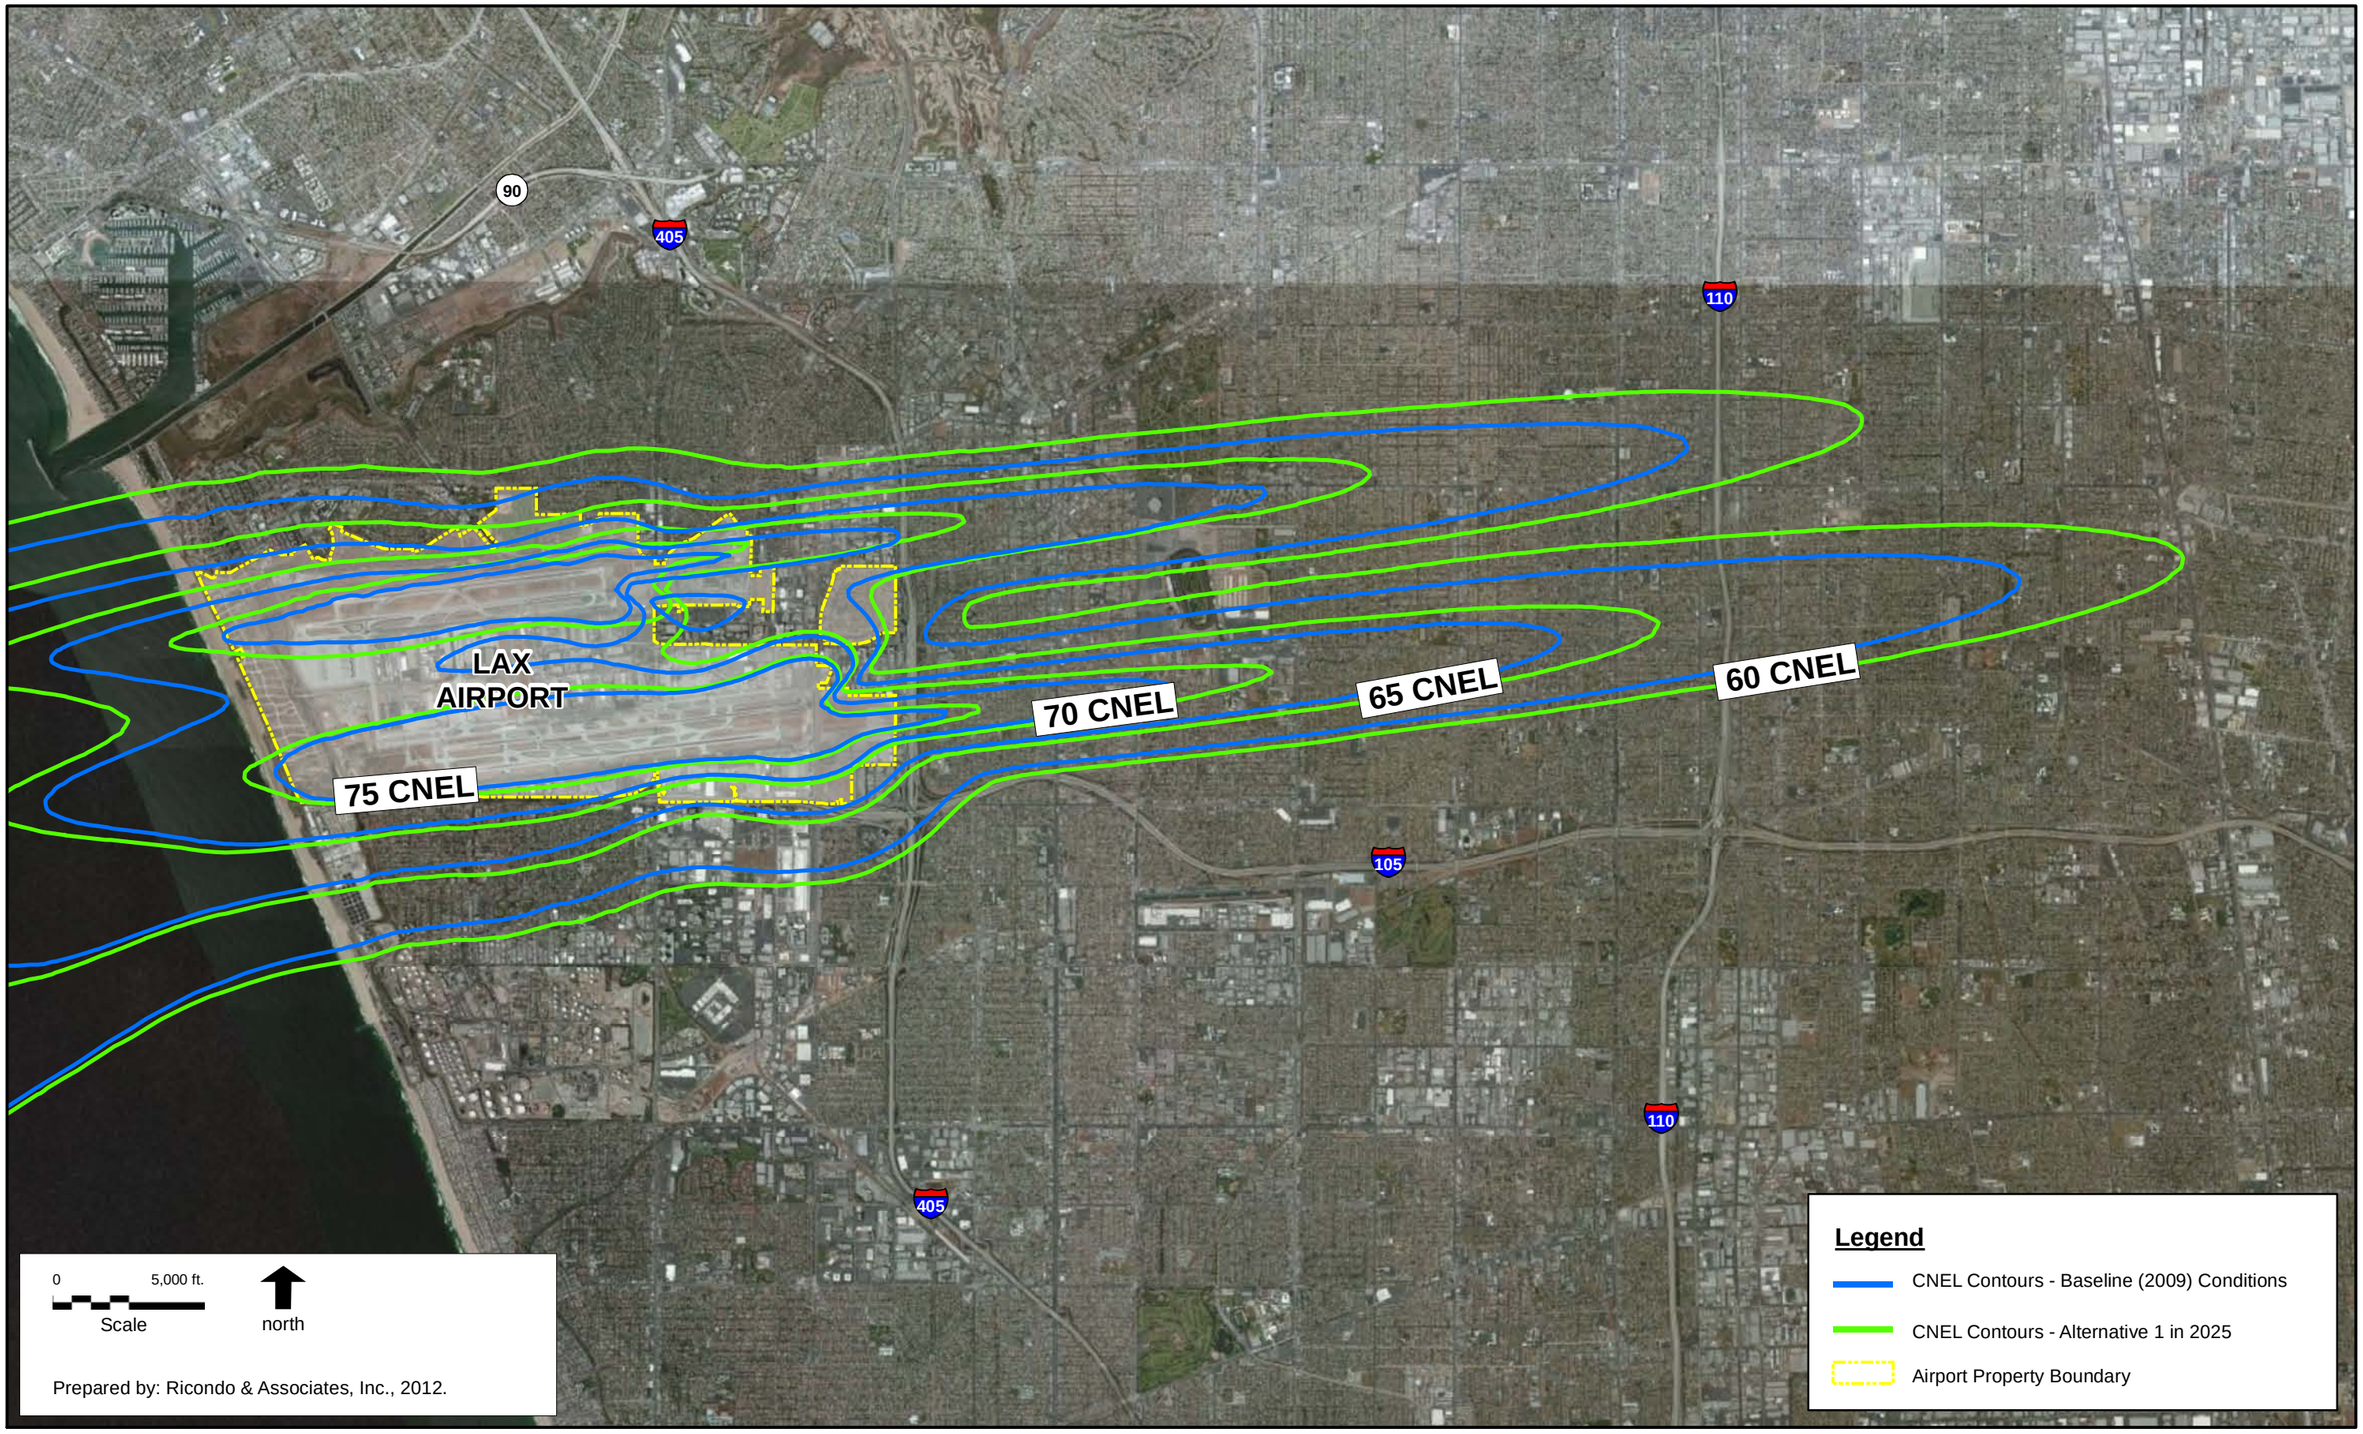
Please see Response to Comment SPAS-PC00149-2 regarding a summary of the project objectives associated with the north airfield improvements. As noted in that response, and in Section 1.2.1 of the SPAS Draft EIR, there are a number of objectives associated with the north airfield improvements, all of which are unrelated to passenger capacity. In addition, Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00149-2 regarding the conclusions of NASS relative to the safety enhancements associated with reconfiguration of the north airfield.

Please see Section 2.2 of this Final EIR for a discussion of the reasons why LAWA staff recommend implementation of the airfield and terminal improvements associated with Alternative 1, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The assertion that Alternatives 2 and 9 would present the least intrusive impact on the local communities is not accurate. As indicated in Tables 1-17 and 1-18 of the SPAS Draft EIR, Alternative 2 would have the second highest impacts of all the alternatives relative to both population newly exposed to 65 CNEL and to population that would experience a 1.5 dBA CNEL increase over 65 CNEL. In addition, the ground access components of this combination would affect more off-airport intersections than would all of the other ground access alternatives (with the exception of Alternative 8, whose impacts would be the same). Regarding the statement that Alternative 2 would not increase noise in Westchester/Playa del Rey, as indicated on pages 4-710 through 4-716, and illustrated in Figure 4.9-8 of the SPAS Draft EIR, Alternative 2 would result in noise impacts in Westchester and Playa del Rey. This is due to increases in aircraft operations over time, which would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR. However, the differences in the noise contour associated with Alternative 2 and the contours associated with the alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) occur to the northeast and east of the airport. Differences in the contours in Playa del Rey and the western portion of Westchester are very slight, as can be seen in comparing the areas newly exposed to 65dB CNEL in Figure 4.9-8 of the SPAS Draft EIR with Figures 4.9-7, 4.9-11, and 4.9-12. A composite illustration of the differences in the noise contours associated with Alternatives 1, 2, and 5 is provided in Figure 1. Please also see Response to Comment SPAS-PC00149-2 regarding the SPAS Draft EIR findings relative to aircraft noise impacts on surrounding communities.

Regarding the statement that Alternative 2 would not increase air pollution in Westchester/Playa del Rey, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities associated with all of the SPAS alternatives, including Alternative 2, would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under Alternative 2, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 2, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable. Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under Alternative 2. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under Alternative 2.

Regarding analysis of property acquisition impacts on the Westchester Business District, please see Response to Comment SPAS-PC00130-931. As noted in that response, no acquisition is proposed north of LAX or within the Westchester Business District, therefore, there would be no loss of permanent jobs in the district. It is unclear what the commentor is referring to by the statement that "figures that were listed in the acquisitions section are very low." The SPAS Draft EIR identifies properties that would be acquired under each alternative in Section 2.3.1.11, however, no costs associated with acquisition are provided in this section. Rough-order-of-magnitude costs associated with land acquisition under the alternatives were included in the financial analysis prepared as part of the Preliminary LAX SPAS Report (see Section 8.5 of that report). If these are the figures referred to by the commentor, no substantiation is provided for the claim that these estimates are very low.



LAX Specific Plan Amendment Study Final EIR	**CNEL Contours Overview Baseline (2009) Conditions and Alternative 1 in 2025**	**Figure 1**

This page intentionally left blank.

Regarding analysis of property acquisition impacts on the Westchester Business District specific to the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. The commentor is mistaken in stating that LAWA assumed that In-N-Out and the Parking Spot structure would no longer be located within the approach RPZ of Runway 24R under the SPAS alternatives. As shown in Figure 4.7.2-4 in Section 4.7.2.6.1 of the SPAS Draft EIR, the parcel of land on which In-N-Out and the Parking Spot are located (west of Sepulveda Boulevard and south of Westchester Parkway) is clearly located inside the Runway 24R approach RPZ and would remain within the RPZ under all of the SPAS airfield alternatives (see Figures 4.7.2-7, 4.7.2-9, 4.7.2-11, 4.7.2-13, 4.7.2-15, 4.7.2-17, and 4.7.2-19 of the SPAS Draft EIR). Regarding the statement that the SPAS Draft EIR assumed that "pilots would land midway down 24R," the SPAS Draft EIR does not provide any indication that pilots would land "midway down 24R." Pilots rely on runway thresholds to land. As indicated on page 1-14 of the SPAS Draft EIR, a displaced threshold is a threshold that is located on a point on the runway other than the designated beginning of the runway to satisfy approach surface criteria and/or RSA length requirements. In other words, a displaced threshold shifts the beginning of that portion of the runway available for landing to a point on the runway beyond the beginning of the runway. (In this context, "threshold" always refers to landing, not the start of takeoff.) Under Alternatives 1, 5, and 6, a displaced landing threshold of 604 feet would be applied to landings on Runway 24R. This landing threshold is not "midway down 24R," which would have a total landing distance available (LDA) of 8,925 feet (see Table 4.7.2-4 of the SPAS Draft EIR). The displaced threshold would apply to all landings on Runway 24R, and would not be at the discretion of the pilot. Please also see Response to Comment SPAS-PC00130-758 regarding the Runway 24R displaced threshold.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) However, Chapter 8 of the Preliminary LAX SPAS Report provides estimated costs and an approximation of funding sources for the SPAS alternatives. The analysis considers estimated costs associated with the SPAS alternatives, as well as costs associated with LAX Base Development Projects, which include capital improvements projects planned for LAX between fiscal year 2012 and fiscal year 2025. Please see Response to Comment SPAS-PC00130-725 regarding the economic benefits of terminal improvements versus runway improvements.

Please see Response to Comment SPAS-PC00135-2 regarding the benefits of a centerfield taxiway, including enhanced safety, and Response to Comment SPAS-PC00130-183 regarding a discussion of the SPAS alternative taxiways, which includes a discussion of the standard separations between the runways and the centerfield taxiway. These airfield design separations are based on FAA standards which are meant to preclude the issues listed by the commentor, including issues related to the space between wingtips and contrail blast effects. Please refer to Responses to Comments SPAS-PC00130-160, SPAS-PC00130-446, SPAS-PC00130-1047, and SPAS-PC00130-1048 regarding incursions on the south airfield. Please also see Responses to Comments SPAS-PC00130-259 and SPAS-PC00130-489 regarding runway-taxiway separation standards meant to comply with the FAA's runway incursion mitigation requirements. The commentor did not provide any specific information that would support the claim that the reduction of incursions on the south airfield following the addition of the centerfield taxiway could be credited to the installation of the Runway Status Lights.

The commentor's statement that moving Runway 6L/24R would be an "exorbitant expense" and "seems ridiculous" presents a personal opinion about costs associated with selected alternatives that is unsupported by facts or evidence. Please refer to Response to Comment SPAS-PC00143-2 regarding the need to plan for a north airfield to meet ADG VI standards and Response to Comment SPAS-PC00149-2 for a summary of the project objectives associated with the north airfield improvements. The commentor is incorrect in stating that the projected number of ADG VI aircraft in 2025 was based on "original buy orders." Please refer to Response to Comment SPAS-PC00159-12 regarding ADG VI fleet mix assumptions developed for the SPAS Draft EIR analyses.

The SPAS Draft EIR does not "blame the NLAs for extensive, expensive changes" as stated by the commentor. As discussed in Section 4.7.2.3 of the SPAS Draft EIR and in Response to Comment SPAS-PC00143-2, the current north airfield does not meet FAA design standards for ADG V or VI aircraft. The airfield improvements proposed under SPAS Alternative 2 would not remedy the fact that

certain ADG V and all ADG VI operations are non-standard on the north airfield. It is critical to plan for a north airfield that would meet FAA design standards of safety as the number of ADG V and VI operations increases over time. The A380 is not the only ADG VI aircraft expected to operate at LAX in the future; the Boeing 747-800 is also expected to operate at LAX.

Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements. As noted in that response, construction phasing plans have not yet been developed for the SPAS alternatives; therefore, information regarding necessary runway closures has not been determined.

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester Tunnel). Please see Response to Comment SPAS-PC00130-348 and Topical Response TR-SPAS-LR-1 regarding sewers that lie beneath LAX and Response to Comment SPAS-PC00130-51 regarding sink holes.

Please see Response to Comment SPAS-PC00130-169 regarding ability of the Argo Drainage Channel to continue to convey stormwater following implementation of improvements proposed under Alternatives 1, 5, and 6 and Response to Comment SPAS-PC00130-201 regarding USACOE jurisdiction over the channel. Regarding the commentor's statement that covering the channel with a permeable substance is not practical, the SPAS Draft EIR does not make such a recommendation.

SPAS-PC00128-3

Comment:

What coordination with other agencies will be completed so that time lines and true cost estimates are accurate in the Final EIR for all Alternatives?
- Other agencies include: The Army Corps of Engineers (Argo Flood Control Channel), Caltrans (the CTA upper roadway, Lincoln Blvd, Sepulveda Blvd, and Sepulveda Tunnel), LA Public Works Dept. (sewers and storm drains), LA Water and Power (utility lines, water mains), FAA (tower and TRACON staffing, flight paths and Runway Protection, Safety, and Buffer Zones - and FAA enforcement of these zones).

Response:

Agencies that are expected to be involved with various aspects of SPAS implementation are identified in Section 2.4 (pages 2-74 through 2-77) of the SPAS Draft EIR. As indicated in the SPAS Draft EIR, these agencies may include the Federal Aviation Administration (FAA), Transportation Security Administration (TSA), U.S. Army Corps of Engineers (USACOE), California Air Resources Board (CARB), California Department of Transportation (Caltrans), California Coastal Commission (CCC), California State Historic Preservation Officer (SHPO), State Water Resources Control Board (SWRCB) South Coast Air Quality Management District (SCAQMD), the County of Los Angeles Airport Land Use Commission (ALUC), and various City of Los Angeles departments.

LAWA provided a detailed account of the financial requirements of each of the alternatives in Chapter 8 of the Preliminary LAX SPAS Report, with backup information included in Appendix G. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements.

SPAS-PC00128-4

Comment:

Why were the following items (which were listed in comments on the NOP) not addressed in the DEIR? These issues would do more for safety on the airfield than moving 24R would. Some of these items would require interfacing with the FAA. Was this done? Or at least attempted? If so, what was the outcome?
- Improve communications between tower and cockpit
- Fully staff tower and TRACON offices
- Install modern and efficient equipment in the tower
- Install and implement the GPS ground-tracking system

- Complete the installation and implementation of Runway Status Lights in the whole North Airfield

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00096-5; please refer to Response to Comment SPAS-PC00096-5.

SPAS-PC00128-5

Comment:

The DEIR includes 7 alternatives that involve the runways and 2 alternatives that involve other issues such as the Consolidated Rental Auto Facility (CONRAC). Below is an analysis of these alternatives and the issues they raise (or solve).
Alt. 1 (Moves 24R 260 ft North and 600 ft West. Moves 24L 1250 ft East. Adds a Centerfield Taxiway).
- Displaces businesses and homes
- Risky construction factors; could be very costly in time and delays
- Fixes little traffic or Central Terminal Access (CTA)
- Impacts major underground utilities, sewer, and tunnel
- Very costly, not affordable

Alt.2 (Leaves Runways in current location. Reconfigures taxiways. Adds new terminal and extends Bradley and Mid-Course terminals North)
- Most affordable
- Most efficient
- Most environmentally sound
- Less impact to communities

Alt. 3 (City approved Alt. D. Extends 24R 1495 ft West. Moves 24L 340 ft South and adds Centerfield taxiway. Ground Transportation Center in Manchester Square with a baggage tunnel to the CTA. CTA closed to car traffic. Integrated Transportation Center in Continental City at Aviation/Imperial)
- Not affordable. Cost has risen from $12 billion in 2004 to over $100 billion in 8 years
- Baggage tunnel safety, viability, and efficiency is questionable

Alt. 4 (Alt. D Green Light projects +. 24R left as is. 24L moves 835 ft East. No Centerfield taxiway. Argo Flood Channel partially enclosed. CONRAC in Manchester Square. No terminal, taxiway, or taxilane changes)
- Does little for CTA traffic and access
- Questionable viability and stability in covering the Flood Channel

Alt. 5 (Moves 24R 350 ft North and 604 ft West, and widens it to 200 ft. Adds Centerfield taxiway. Lincoln Blvd moved sub terrain & new Sepulveda connect. Fully encloses all 9857 ft of the Argo Channel. Compatible with ground access in Alts. 1, 2, 8 & 9)
- Greatest impacts to businesses and residents
- Major move of flight path North (heavily impacting Westchester and Inglewood)
- Risky construction factors, could be very costly in time and delays
- Does little for traffic and CTA access
- Not affordable (have the airlines indicated agreement to paying the astronomical landing fees that would be imposed?)

Alt. 6 (Moves 24R 100 ft North. Moves 24L 1250 East. Adds Centerfield taxiway. Reconfigures taxiways & taxilanes. Lincoln Blvd moved sub terrain & new Sepulveda connect. - Does little for traffic and CTA access. Eliminates all remote gates. Compatible with ground access in Alts 1, 2, 8 & 9)
- Impacts businesses & residents
- Adds new terminal and extends Bradley and Mid-Course terminals North
- Moves flight path North
- Risky construction factors, could be very costly in time and delays

Alt. 7 (24R no extension or widening. 24L moves 1250 ft East. Adds Centerfield taxiway. Reconfigures taxiways & taxilanes. All remote gates eliminated. No business district impact. Adds new terminal and extends Bradley and Mid-Course terminals North. Compatible with ground access in Alts 1, 2, 8 & 9.)
- Avoids construction risks of tunnel, roadways, sewers
- May involve extensive or complete remodeling of Terminals 1, 2, and 3
- Costly, airlines could be charged much higher landing fees

Alt. 8 (Has CONRAC in Lot C with bus service into CTA. Parking moved to Manchester Square)
- Only partially addresses CTA traffic

- Does not include train service into CTA
Alt. 9 (Moves CONRAC to Manchester Square with a people mover that goes into CTA)
- Creation of people mover that could service amount of people traffic and length required to transport from Manchester Square into CTA is problematic
- Once people mover in place, CTA traffic would be reduced

The only acceptable alternative is Alt. 2. It has the least cost, yet is safe, efficient, and has the least impact on the communities surrounding LAX.

Other alternatives would involve massive cost. In addtion to the disruption on the North, the South Airfield would be significantly impacted by the extended North Airfield down time to accomplish the Alt. 1, 3, 4, 5, 6, and 7 projects.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR.

The content of this comment is similar to comment SPAS-PC00130-46, which made a number of the same assertions regarding each alternative; please refer to Response to Comment SPAS-PC00130-46. Portions of this comment raise issues that are not addressed in Response to Comment SPAS-PC00130-46; responses to these issues are provided herein.

The commentor's statements that Alternatives 1 and 5 are not affordable, that Alternative 7 is costly, and that alternatives other than Alternative 2 would involve massive costs, are personal opinions that are unsupported by facts or evidence. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) However, Chapter 8 of the Preliminary LAX SPAS Report provides estimated costs and an approximation of funding sources for the SPAS alternatives and demonstrates how each alternative would be funded. As noted in Response to Comment SPAS-PC00130-46, Alternative 2 is not the most affordable alternative; Alternative 4 would have lower costs than Alternative 2.

Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR documents the efficiency of the airfield under each alternative. As indicated in that table, the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

The commentor's assertion that Alternative 2 would have less impact on local communities is not accurate. As indicated in Tables 1-17 and 1-18 of the SPAS Draft EIR, Alternative 2 would have the second highest impacts of all the alternatives relative to both population newly exposed to 65 CNEL and to population that would experience a 1.5 dBA CNEL increase over 65 CNEL.
The commentor's statement that the baggage tunnel proposed as one option under Alternative 3 is questionable in terms of safety, viability, and efficiency is a personal opinion that is unsupported by facts or evidence.

The statement that Alternative 7 may involve extensive or complete remodeling of Terminals 1, 2, and 3 is incorrect. Terminal improvements associated with Alternative 7 are described in Section 2.3.1.7.1 of the SPAS Draft EIR and illustrated in Figure 2-7. As demonstrated in Table 2-2 of the SPAS Draft EIR, terminal improvements associated with Alternative 7 would involve partial demolition of the Terminal 1 concourse (to the same extent required under Alternatives 1, 2, 5, and 6); no demolition of Terminal 2; and reconfiguration of the entire Alternative 3 concourse (to the same extent proposed under Alternatives 1, 2, 5, and 6). Similar to Alternatives 1, 2, 5, and 6, Alternative 7 includes the addition of

Terminal 0 as well as an extension to the Bradley West concourse and the MSC, although to a lesser extent than under Alternatives 1, 2, 5, and 6.

The statement that creation of an APM under Alternative 9 is problematic is a personal opinion that is unsupported by facts or evidence.

Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements. As noted in that response, construction phasing plans have not yet been developed for the SPAS alternatives; therefore, information regarding necessary runway closures has not been determined.

SPAS-PC00129 Tallarico, Lorraine M Avis Budget Car Rental, LLC 10/9/2012

SPAS-PC00129-1

Comment:

Mr. Alvarez, please see our attached letter. Please confirm your receipt of these comments within the stated time period.

Response:

It is noted that the comment letter from Avis Budget Car Rental, LLC was received on October 9, 2012, one day before the close of the public comment period on the SPAS Draft EIR (October 10, 2012). Please see Responses to Comments SPAS-PC00129-2 through SPAS-PC00129-7 below.

SPAS-PC00129-2

Comment:

The following comments represent the position of Avis Budget Car Rental, LLC, ("Avis") which has operated its rental car companies at Los Angeles International Airport ("LAX") for over 35 years. As such, we have a unique vantage point with respect to the planning at LAX, particularly with respect to ground transportation. We take no position on the various alternatives in SPAS with respect to runway changes. Many, if not all, aviation alternatives set forth in SPAS can be matched with one of the alternatives pertaining to the ground transportation. Therefore, any of the alternatives which expands the passenger capacity of the airport, improves overall efficiency, or increases the safety at LAX, receives our support.

Most importantly, Avis supports Alternatives I and 2, which do not include the construction of any Consolidated Rental Car Facility ("CRCF"). In addition, Avis supports Alternatives 8 and 9. Avis only supports Alternatives 8 and 9 in the event LAWA decides, notwithstanding all evidence in SPAS to the contrary, that a Consolidated Rental Car Facility is even necessary. The cost/benefit of a Consolidated Rental Car Facility in Los Angeles simply does not add up.

We are pleased that LAWA took the time to carefully review the Master Plan that has been in place for almost a decade. Many things have changed in the area of technology, and the general public's habits with respect to travel. These changes must be considered before LAWA moves forward with major construction such as a Consolidated Rental Car Facility, or Ground Transportation Centers, or even new public parking lots. We applaud the thorough job reviewing all of these changes, as well as challenging old perceptions that were driving early decisions. These perceptions and assumptions may no longer be accurate, if they ever were, regarding rental car activities.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00129-3

Comment:

The SPAS report findings, particularly in the traffic study data, that he conclusion that the construction of an estimated $750 million-$1billion dollar Consolidated Rental Car Facility will not significantly improve either traffic congestion or air quality, the two key drivers for the inclusion of a CRCF in the Master Plan for LAX. SPAS data indicates the minimal positive impact resulting from a CRCF is insufficient to justify the cost. We agree.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please note that the Preliminary LAX SPAS Report and SPAS Draft EIR do not analyze the CONRAC individually, but rather as a component of some SPAS alternatives. Sections 4.12 and 4.2 of the SPAS Draft EIR, Transportation and Air Quality, respectively, analyze and discuss the impacts from the various alternatives, including those that include a CONRAC.

SPAS-PC00129-4

Comment:

All the rental car companies operating on-airport at LAX now utilize the newest in clean burning CNG fuel efficient buses. The CO2 and other NOX emissions are virtually zero now. As such, even a 40% reduction in the total buses that might result if a CRCF were constructed will have an insignificant impact of overall air quality in the area. In other words, technology alone has solved one of the first targeted problems the CRCF plan was intended to solve.

Response:

The comment implies that pollutant emissions from the CNG rental car shuttle buses are negligible; thus, a consolidated rental car facility (CONRAC) is no longer warranted. In fact, emissions of nitrogen oxides (NOx) and methane (CH4, a greenhouse gas) from CNG vehicles are measurable and still contribute to the pollutant burden in the South Coast Air Basin. Emissions of NOx contribute to the formation of ozone and PM2.5, both nonattainment pollutants in the South Coast Air Basin. Table 4.2-13 of the SPAS Draft EIR indicates that the addition of a CONRAC at Manchester Square with a dedicated busway (Alternative 8) provides an additional reduction of over 400 lbs/day of NOx from roadways and parking lots when compared to Alternatives 1 and 2. Note that Alternatives 1 and 2 also have a dedicated busway to Manchester Square, but no CONRAC. The addition of the CONRAC, and the reduction in vehicle miles traveled (VMT) that is associated with it would also reduce emissions of carbon monoxide, volatile organic compounds, and particulate matter.

The SPAS Draft EIR determined that operational impacts of NOx and particulate matter, among other pollutants, will be significant and unavoidable as shown in Table 4.2-17 (page 4-156).

SPAS-PC00129-5

Comment:

Secondly, SPAS also concluded that the overall traffic impacts in the LAX surrounding area resulting from rental car buses, or rental vehicle fleet movement, will not significantly change. In fact, the concentration of the rental car industry traffic at certain affected intersections will deteriorate if all

vehicles are moving in and out of a single location as compared to the existing locations that disperse the traffic among various routes.

Utilizing the millions of dollars paid by rental car customers for facility improvements for roadway changes, such as an elevated and dedicated roadway in and out of LAX will be far more effective in improving traffic than one, enormous building sitting at the corners of several key intersections.

Improvement to the vertical circulation at each terminal, and modifications to the Central Terminal Roadway system will have a much more significant impact improving traffic than a single destination CRCF. In fact, changes to the CTR that enable the companies to all utilize a single level for pick up and drop off will cut the rental car shuttle bus traffic by 50% immediately. The Industry has advocated for this change for many years. It will be much more effective and far less costly than a CRCF that few, if anyone, in the rental car industry wants to see build. Rental car customers have already contributed $150 million dollars that can be properly used to fund these roadway projects.

Response:

As described in Section 2.3 and depicted in Figures 2-3, 2-4, 2-8, and 2-9 of the SPAS Draft EIR, a CONRAC would be constructed at Parking Lot C under Alternatives 3 and 4, and at Manchester Square under Alternatives 8 and 9. The SPAS Draft EIR is intended to identify the program-level magnitude of the traffic impacts associated with each SPAS alternative and has included mitigation measures, where feasible, to address the significant traffic impacts associated with each alternative. Should LAWA approve one of the SPAS alternatives, separate project-level environmental studies would be initiated to identify the potential localized traffic impacts associated with major program elements, such as the CONRAC, and feasible mitigation measures would be identified to avoid or minimize the associated traffic impacts.

The commentor states that "SPAS also concluded that the overall traffic impacts in the LAX surrounding area resulting from rental car buses, or rental vehicle fleet movement, will not significantly change." Contrary to the language in the comment, the SPAS alternatives had different impacts in the off-airport surface transportation analysis. For a summary of these impacts please see Tables 4.12.2-13 and 4.12.2.19 of the SPAS Draft EIR.

The comment also states that "an elevated and dedicated roadway in and out of LAX will be far more effective in improving traffic than one, enormous building sitting at the corners of several key intersections." The comment does not specify the nature of the dedication contemplated in the comment; however, the SPAS Draft EIR analyzed Alternatives 1, 2, and 8 which include a dedicated busway and Alternatives 3 and 9 which include an elevated Automated People Mover (APM).

The commentor also recommends "changes to the CTR [Central Terminal Roadway system] that enable the companies to all utilize a single level for pick up and drop off…" SPAS Mitigation Measure MM-ST(OA) (SPAS)-2, presented on page 4-1178 of the SPAS Draft EIR, provides for the type of circulation system change suggested by the commentor.

As acknowledged by LAWA page 1-12 of the SPAS Draft EIR, curbside demand is unevenly distributed especially during peak periods. This is why LAWA has proposed numerous alternatives which change the internal airport circulation system, through the construction of a dedicated busway, an APM, an Intermodal Transportation Center, a Consolidated Rental Car Facility, and through the closure of the CTA to private vehicles. The SPAS Draft EIR has provided a reasonable range of alternatives which address on-airport surface transportation impacts. The results of this analysis are provided in Section 4.12.1 of the SPAS Draft EIR.

SPAS-PC00129-6

Comment:

Notwithstanding the above factors, we do understand it's possible that some may still advocate for a CRCF to be approved for construction. In that case, it would be an utter disaster for a CRCF to be built on, or about, Lot C. Alternatives 3 and 4 are 100% unacceptable. The only possible location for a CRCF of sufficient size and design is Manchester Square, or a portion thereof. Lot C has been studied by the

industry and a team of planners and architects. All agree Lot C is not a suitable site. The Lot C location is too small oddly configured, divided by a Westchester and other city streets, encumbered by aviation/runway easements that restrict design and utility.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please note that the comment expresses an opinion that Lot C is not suitable for the CONRAC without any factual basis or substantial evidence to support this conclusion.

SPAS-PC00129-7

Comment:

We will not support any use of Lot C for a CRCF. It would be a tremendous error in judgment for LAWA to think a CRCF at Lot C is in the best interest of the traveling public, the community, the industry, or the City. The rental car industry looks forward to a clear direction from LAWA on these matters soon. Uncertainty has, in the past, prevented the industry from modernizing its existing facilities in a manner that reflects LAX as a world-class airport.

Accordingly, we urge LAWA to recognize the strong position of the rental car industry and either abandon all plans for a CRCF and modernize LAX in a manner that is in the best interests of the public, or, adopt Alternative 8 or 9 only, with respect to ground transportation.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130 Schneider, Denny ARSAC 10/9/2012

SPAS-PC00130-1

Comment:

On behalf of the Alliance for a Regional Solution for Airport Congestion (ARSAC), we provide these comments on the Draft Subsequent Environmental Impact Report (DEIR) prepared for the Specific Plan Amendment Study ("SPAS" or "Project") at Los Angeles International Airport (LAX).

The SPAS Project DEIR assesses numerous potential alterations to LAX, including runway relocations and realignments, the relocation of Lincoln Boulevard, reconfiguration of central terminal area roadways, and relocation and construction of various terminals, security implements, and transportation facilities. The DEIR discusses 9 separate alternatives, the components of which can be configured into 25 separate possible projects. This "mix and match" approach renders the Project a moving target. As the SPAS DEIR fails to specify LAWA's preferred project it is unclear what LAWA's plans for the airport actually are, and which environmental impacts would be expected to result. ARSAC and the public are thus unable to focus their comments on LAWA's preferred project, and important concerns about potential impacts are likely to be lost in the mass of comments that will be generated by the many SPAS Alternative permutation projects. More importantly, the EIR's failure to designate a preferred project

precludes satisfaction of two of the goals sought by the California Environmental Quality Act (CEQA) - public involvement and informed decision making.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-2 through SPAS-PC00130-1051 below for a response to all comments on the SPAS Draft EIR submitted by the commentor.

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3 and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternative. As indicated in these responses, Section 2.3.1 of the SPAS Draft EIR provides a thorough description of each of the nine alternatives that is accurate, stable, and finite. Although a preferred alternative was not identified in the SPAS Draft EIR, the environmental impacts of each alternative are fully evaluated. Despite the commentor's claim that "important concerns about potential impacts are likely to be lost in the mass of comments that will be generated," in accordance with State CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments received on the SPAS Draft EIR during the public review period. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations. As seen throughout the SPAS Draft EIR, the SPAS alternatives were presented and evaluated in a manner that fosters informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(f)). Please see Response to Comment SPAS-PC00048-5 regarding the extensive public participation program undertaken for SPAS. As reported to the Board of Airport Commissioners on December 3, 2012, over 370 unique individuals signed in to the three public meetings and 101 attendees provided oral comments (including attendees who commented at more than one public meeting). In total, 251 unique commentors provided oral testimony, comment letters, emailed comments, or comments via LAWA's project website or virtual meeting site; many of these commentors provided more than one set of comments (e.g., provided oral testimony as well as a written comment letter).

SPAS-PC00130-2

Comment:

I. Preliminary Statement About the Background of the SPAS Process.

ARSAC is a public interest community organization composed of area residents and business owners with many years of experience collaborating with LAWA on issues related to LAX expansion. In accordance with the February 2006 Stipulated Settlement with the City of Los Angeles calling for significant revisions to the 2005 LAX Master Plan, ARSAC has been a member of the SPAS Advisory Committee and has been extensively involved with the development of the SPAS Study. Even so, it appears that LAWA has disregarded ARSAC's carefully considered alternatives for runway alignment, terminal configurations, and ground transportation facilities. ARSAC is adamantly opposed to expanding LAX into the surrounding communities, and especially to any alternative that would relocate Runway 24 Right further north. As with all of its submissions during this process, ARSAC provides these comments with the hope that LAWA will revise the SPAS Project DEIR to remove northward runway movements to reach consistency with both the Settlement Agreement and community needs.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. It should be noted that the Stipulated Settlement does not call for significant revisions to the 2005 LAX Master Plan. Rather, the Stipulated Settlement requires LAWA to, among other things, study potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 MAP. The Stipulated Settlement does not preclude study of configurations that include northward runway movements. LAWA has carefully considered a wide range of alternative designs

during the SPAS process, as documented in Chapter 5 of the Preliminary LAX SPAS Report. Nine alternatives, eight of which provide alternative designs, technologies, and configurations for the LAX Master Plan Program, were analyzed in detail in the SPAS Draft EIR, including alternatives that were raised by members of the SPAS Advisory Committee.

SPAS-PC00130-3

Comment:

The Settlement Agreement contemplated that LAWA would "focus the LAX Specific Plan Amendment Study on . . . . Potential alternative designs, technologies, and configurations for the LAX master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers. . . [and] Potential environmental impacts that could result from replacement of the Yellow Light projects with the Alternatives Projects, and potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects in the LAX Master Plan Program EIR." (Settlement Agreement, p. 9, Section V.D.)

Instead of fulfilling this intent of the Settlement Agreement, the DEIR emphasizes north runway movement, while failing to adequately address traffic and other consequences, calling them generally unmitigable. We are therefore surprised that, despite its many flaws, the DEIR correctly acknowledges, "Compliance with FAA Airport Design Standards - the larger aircraft are more acceptably handled by Alternative 2, no additional runway spacing." (Table 4.7-2-8.) In view of the fact that Alternative 2 is also designated the "Environmentally Superior Alternative," the decision to choose this alternative as the preferred project should be clear. Once a preferred alternative is chosen, the DEIR must be recirculated to allow informed and meaningful public review and comment.

Response:

The commentor's support for Alternative 2 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. The SPAS Draft EIR identifies a comprehensive set of applicable LAX Master Plan Commitments and mitigation measures, as well as SPAS-specific mitigation measures, that would reduce or eliminate significant impacts associated with the SPAS alternatives.

Table 4.7.2-8 of the SPAS Draft EIR acknowledges that under Alternative 2 (as well as under Alternatives 1, 5, 6, and 7) the ability of large aircraft (ADG V and ADG VI) to taxi to/from runways would improve, although the SPAS Draft EIR does not state that "the larger aircraft are more acceptably handled by Alternative 2," as claimed by the commentor. However as indicated in Table 1-3 of the SPAS Draft EIR, without runway relocation and increased separation, under Alternative 2, the north airfield would continue to require non-standard operating procedures for ADG V and ADG VI aircraft (i.e., would not meet FAA design standards). Please also see Table 4.7.2-16 in Section 4.7.2 of the SPAS Draft EIR which provides a summary of safety and efficiency enhancements to the north airfield operations under each of the seven SPAS alternatives (Alternatives 1 through 7) that involve airfield improvements. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives.

The identification of a recommended alternative by LAWA does not require recirculation of the SPAS Draft EIR, as the impacts of all of the SPAS alternatives were fully analyzed and disclosed in the SPAS Draft EIR. Identification of a recommended alternative does not meet any of the criteria for recirculation outlined in Section 15088.5 of the State CEQA Guidelines, as further explained in Chapter 2 of this Final EIR.

SPAS-PC00130-4

Comment:

The DEIR improperly characterizes the bulk of the Project's impacts as resulting from the projected increase in aircraft operations and passenger growth instead of from the project components. Several of the SPAS Alternatives propose relocating airport runways north, nearer to homes and businesses in Westchester and Playa del Rey, which would have significant and unmitigable environmental impacts attributable to noise, vibration, air and water pollution, and aircraft safety hazards.

Response:

The commentor's statement that "the DEIR improperly characterizes the bulk of the Project's impacts as resulting from the projected increase in aircraft operations and passenger growth instead of from the project components" is incorrect and is not supported by substantial evidence. The SPAS Draft EIR does correctly acknowledge that some of the impacts of the project are attributable to the projected increase in aircraft operations and passenger growth. This is the case for some impacts that are associated with operations, such as aircraft noise, air quality, and traffic, but is not the case for impacts that would result from construction activities or from changes in airport facilities, such as construction traffic and equipment noise, biological resources, and hydrology and water quality. As indicated on page 1-13 of the SPAS Draft EIR, the increase in passenger activity over time would occur with or without the SPAS alternatives. That is to say, the project would not change the potential for growth at LAX; rather, future passenger activity is forecast to reach 78.9 MAP at LAX by the planning horizon year of 2025 with or without the SPAS alternatives.

As evidenced in Table 4.2-13 of the SPAS Draft EIR, which presents the incremental project operational emissions in 2025 compared to baseline (2009) emissions, the predominant source of air pollutant emissions is aircraft operations, which increase under all alternatives, including Alternative 4, which proposes no airfield improvements other than runway safety area compliance improvements that do not affect daily operations. Given that there are no material changes to the existing airfield under Alternative 4, the estimated increase in air pollutant emissions in 2025 compared to 2009 baseline conditions is attributable to projected growth in airport activity levels by 2025 that would occur irrespective of SPAS. As even more apparent in Table 4.2-14 of the SPAS Draft EIR, which compares the future (2025) emissions of the SPAS alternatives that propose airfield improvements (i.e., Alternatives 1, 2, 3, 5, 6, and 7) to Alternative 4, which proposes no airfield improvements that affect operations, implementation of the SPAS-related airfield improvements would actually decrease future air pollutant emissions from aircraft operations compared to aircraft emissions that would occur in leaving the north airfield in its existing configuration.

Regarding air quality, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities, which are not related to the projected increase in aircraft operations and passenger growth, would result in significant and unavoidable air quality impacts under all of the alternatives, including Alternatives 1, 5, and 6 which propose a northward relocation of Runway 6L/24R. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable. Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

Increases in aircraft noise are attributable to increases in passenger activity over time, as well as changes in the north airfield configuration, which affect the use of the north and south airfields and the location of the noise contour relative to off-airport land uses. As indicated in Table 4.10.1-55 on page 4-926 of the SPAS Draft EIR, all of the SPAS alternatives, including Alternative 4, would increase the

population and dwellings within to 65 CNEL or higher noise exposure contour when compared to baseline (2009) conditions as a result of increased operations. However, implementation of the SPAS-related airfield improvements associated with Alternatives 1, 2, 3, 5, 6, and 7 would result in the exposure of fewer dwellings and less population to 65 CNEL or higher noise levels than would Alternative 4, which is the result of the airfield configuration associated with each alternative. As indicated in Table 4.10.1-56 on page 4-927 of the SPAS Draft EIR, implementation of the SPAS-related airfield improvements would decrease the number of dwellings subject to an increase in 1.5 CNEL within the 65 CNEL and higher noise exposure contour under Alternatives 1, 3, 5, and 6 in comparison to Alternative 4, which proposes no airfield improvements that affect operations, but would increase the number of dwellings under Alternatives 2 and 7 in comparison to Alternative 4. Please also see Responses to Comments SPAS-PC00152-2 and SPAS-PC00149-2 regarding the SPAS Draft EIR analysis and conclusions relative to aircraft noise impacts on surrounding communities.

As shown in Table 4.7.2-16 on pages 4-569 and 4-570 of the SPAS Draft EIR, the alternatives that propose comprehensive airfield improvements (Alternatives 1, 2, 3, 5, 6, and 7) would increase safety and efficiency of the north airfield compared to Alternative 4, which proposes minimal airfield improvements. Please also see Response to Comment SPAS-PC00149-2 regarding safety related to the north airfield. As indicated on page 4-571 in Section 4.7.2 of the SPAS Draft EIR, none of the SPAS alternatives, including Alternatives 1, 5, and 6, which would relocate Runway 6L/24R north, would result in a significant impact with respect to safety.

Impacts associated with transit-related vibration, which are addressed in Section 4.10.4 of the SPAS Draft EIR, are not characterized as resulting from the projected increase in aircraft operations and passenger growth. These impacts are correctly attributed to the dedicated busway associated with Alternatives 1, 2, and 8, or the APM associated with Alternatives 3 and 9. Please see Response to Comment SPAS-PC00038-3 regarding vibration impacts associated with aircraft operations.

Similarly, impacts to hydrology and water quality, which are addressed in Section 4.8 of the SPAS Draft EIR, are not characterized as resulting from the projected increase in aircraft operations and passenger growth but, rather, are correctly attributed to changes in impervious surfaces and pollutant loads associated with SPAS-related facilities and activities. As indicated on page 4-639 of the SPAS Draft EIR, implementation of Mitigation Measure MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, would reduce the hydrology and water quality impacts associated with Alternatives 1, 2, and 4 through 9 to a level that is less than significant. Compliance with the Conceptual Drainage Plan, developed in accordance with LAX Master Plan Commitment HWQ-1, would ensure that impacts to hydrology and water quality associated with Alternative 3 would be less than significant. Therefore, no mitigation specific to SPAS is required for this alternative.

SPAS-PC00130-5

Comment:

Northward runway extension would also require northward expansion of the FAA-mandated runway protection zone to include additional homes and businesses, which would ultimately be vacated and demolished. As Westchester and Playa del Rey have already lost many homes and businesses to past airport expansion, the cumulative community impacts of additional losses would be great, and must be avoided.

Response:

Potential impacts associated with changes in the Runway Protection Zone (RPZ) for the SPAS alternatives are addressed in Section 4.7.2 of the SPAS Draft EIR. Please refer to Response to Comment PC00096-11 regarding the fact that several options would be considered for how to address substantial safety hazards, if any, associated with existing structures or uses within an RPZ, which may or may not include removal of such structures or uses. Regarding the commentor's indication that a northward move of the runway would result in additional homes being included in the RPZ, that statement is inaccurate. As described in Chapter 2 and Section 4.7.2 of the SPAS Draft EIR, Alternatives 1, 5, and 6 all move Runway 6L/24R northward, but also include a westerly shift in runway displaced threshold, in which case the RPZ would also move westward beyond where the homes are

located -- the existing homes located within the current RPZ would no longer be within the RPZ under those alternatives.

SPAS-PC00130-6

Comment:

Significant impacts would also be expected to affect communities located east of LAX, if proposed changes to the approach pattern are adopted.

Response:

A discussion of potentially significant impacts to cities and communities east of LAX, including the City of Inglewood and the communities of Lennox and Athens (in the County of Los Angeles) and South Los Angeles (in the City of Los Angeles) is provided, where applicable, in Chapter 4 of the SPAS Draft EIR. As summarized in Section 1.4 of the SPAS Draft EIR, and analyzed in detail in Chapter 4 of the SPAS Draft EIR, some or all of the SPAS alternatives would result in significant impacts after mitigation to portions of some of these communities for the environmental topics of air quality, greenhouse gases, aircraft noise exposure, construction equipment noise, and off-airport transportation.

SPAS-PC00130-7

Comment:

Runway movement would also require relocation and potential tunneling of busy Lincoln Boulevard (California State Highway 1), which would undoubtedly have significant traffic impacts on all of western Los Angeles County.

Response:

The comment is noted. Please see Response to Comment SPAS-PC00160-15 regarding the impacts to the off-airport transportation system associated with the realignment of Lincoln Boulevard.

SPAS-PC00130-8

Comment:

Such tunneling would also require re-routing of wastewater treatment lines, and identification and mitigation of possible water seepage issues.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-9

Comment:

Sensitive biological resources, including the endangered El Segundo blue butterfly, could be impacted by relocation of navigational aids, needed to support relocated runways.

Response:

Impacts to sensitive biological resources associated with the relocation of navigational aids, including impacts to the El Segundo blue butterfly, are addressed in Section 4.3 of the SPAS Draft EIR. This section includes mitigation for significant impacts to habitat and sensitive species associated with the relocation of navigational aids under Alternatives 1 through 7, including mitigation for El Segundo blue butterfly. With implementation of these mitigation measures, impacts to all biological resources affected by relocation of navigational aids, including impacts to El Segundo blue butterfly, would be less than significant.

SPAS-PC00130-10

Comment:

Even unrelated to runway relocation, the SPAS Alternatives may have significant impacts on air pollution, traffic congestion, hazardous materials, and safety.

Response:

As indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

As indicated in Section 4.12.1 of the SPAS Draft EIR, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, 4, 8, and 9. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Alternatives 1, 2, 8, and 9 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. No on-airport traffic impacts would occur under Alternative 3 because, under that scenario, the CTA would be closed to private vehicles. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect on-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

Impacts related to hazardous materials are addressed in Section 4.7.3 of the SPAS Draft EIR. As indicated on page 4-597 of that section, implementation of LAX Master Plan Commitment HM-1, and compliance with the Procedure for the Management of Contaminated Materials Encountered During Construction, developed in accordance with LAX Master Plan Commitment HM-2, would ensure that impacts related to hazardous materials associated with Alternatives 1 through 9 would be less than significant.

Regarding safety, as indicated on pages 4-569 through 4-571 of the SPAS Draft EIR, implementation of Alternatives 1, 2, 3, 4, 5, 6, and 7 would enhance the safety and efficiency of aircraft operating in the north airfield, compared to baseline conditions (2010) and contrary to the statement by the commentor, none of the SPAS alternatives would result in a significant impact related to safety. Table 4.7.2 16 provides a summary of the safety and efficiency enhancements to the north airfield operations that would occur with implementation of airfield improvements under Alternatives 1, 2, 3, 4, 5, 6, and 7.

SPAS-PC00130-11

Comment:

As discussed further in the comments below and attached, the SPAS DEIR fails to adequately disclose and mitigate the Project's potential environmental impacts. Accordingly, the document must be revised and recirculated before approval by LAWA.

Response:

Please see Responses to Comments PC00130-1 through PC00130-10 and Responses to Comments PC00130-12 through PC00130-1051 for detailed responses to all of the comments that are provided in, and attached to, the commentor's letter.

The SPAS Draft EIR is complete, adequate, and meets the requirements of CEQA. LAWA has carefully reviewed all of the comments submitted on the SPAS Draft EIR and prepared written responses, supported by substantial evidence, for all of those comments. Because no "significant new information" as defined in State CEQA Guidelines Section 15088.5 has been added to the SPAS Draft EIR, recirculation of the Draft EIR is not required.

SPAS-PC00130-12

Comment:

II. LAWA's SPAS Review Process Has Been Procedurally Defective.

ARSAC believes the public's ability to fully participate in the environmental review process and the decision makers' ability to fully understand the project and its impacts has been hindered by the DEIR's failure to provide an adequate project description and its use of tiering without sufficiently summarizing or providing access to necessary documents.

Response:

The comment introduces concerns that are more fully described in the eight comments that follow; please refer to Responses to Comments SPAS-PC00130-13 through SPAS-PC00130-20.

SPAS-PC00130-13

Comment:

A. The DEIR's Project Description Fails to Identify the Proposed Project.

"The term 'project' refers to the activity which is being approved." CEQA Guidelines §15378(c). The DEIR fails to accurately identify this activity. The Project Description states the project is merely to conduct a study of alternative designs for the LAX Master Plan: "The project is to complete a Specific Plan Amendment Study (SPAS)." (DEIR 1:17-18.) However, the study is not the activity that would be approved. Rather, the proposed activity is the selection of a Specific Plan amendment that would implement changes to the LAX Master Plan.

The DEIR describes nine different alternatives, seven of which have interchangeable runway, terminal and ground access components, resulting in at least 25 different configurations. (DEIR 1:17-18.) While identifying alternatives is required under CEQA, the DEIR does not indicate a preferred alternative among these various options. Failing to identify a defined project by not selecting a preferred alternative violates CEQA's requirement for an adequate project description and fails to inform decision makers and the public of the activity under consideration.

CEQA mandates that the EIR identify a single proposed project. The EIR must include "[a]lternatives to the proposed project." (Pub. Res. Code §21100(b)(4).) Since statutes should be interpreted according to their plain and unambiguous wording (Sutton v. Industrial Acc. Com. (1956) 46 Cal.2d 791, 797), this

statute demonstrates that there must be "the proposed project," which is singular, and alternatives to the proposed project, which are plural. In contrast, the SPAS DEIR fails to provide one, defined proposed project, and provides instead numerous potential projects LAWA has labeled "alternatives."

The requirement to identify a single project is present throughout CEQA and the CEQA Guidelines. For example, pursuant to CEQA, an EIR must contain a detailed statement of "all significant effects on the environment of the proposed project." (Pub. Res. Code §21100(b)(1), emphasis added.) The CEQA Guidelines also provide that a project description shall include "[t]he precise location and boundaries of the proposed project . . . ." (CEQA Guidelines §15124(a), emphasis added.) Provisions of statutes should be interpreted consistently with the apparent purpose and intention of the legislature. (DeYoung v. City of San Diego (1983) 147 Cal.App.3d 11, 18; see also United Business Com. v. City of San Diego (1979) 91 Cal.App.3d 156, 170.) The legislature refers to "the proposed project" in the singular. The Legislature's intention that a single project be identified and evaluated in an EIR, compared to feasible alternatives, and modified in response to environmental information received was thwarted as this EIR obscures the true proposal under review.

The importance of a single, defined project description has been discussed repeatedly by the courts.

[A]n accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR. The defined project and not some different project must be the EIR's bona fide subject. [Citation.]

(Mira Monte Homeowners Assn. v. County of Ventura (1985) 165 Cal.App.3d 357, 365, emphasis added.)

Courts have explained the consequences of failing to provide an adequate project description:

A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance.

(County of Inyo v. City of Los Angeles (1977) 71 Cal.App.3d 185, 192-93.) The Inyo court added that an "enigmatic, or unstable project description draws a red herring across the path of public input." Id. at 197-198.

Contrary to CEQA's requirement to identify a single project, the EIR purports to analyze nine different potential projects with a myriad of different combinations. By failing to describe a specific proposed project, the DEIR violates CEQA. Even if LAWA's description of numerous potential projects, in place of a project description, was not clearly prohibited, which ARSAC disputes, such a technique violates CEQA because the description of numerous alternatives frustrates the CEQA's twin goals of public participation and informing the public and decision makers of a project's environmental impacts. For example, the matrix prepared to show potential traffic impacts of the Project describes in detail the changes that would be made to each subarea for each alternative, as well as the pros and cons of each element. However, because the DEIR never reveals the preferred Project alternative, it fails to disclose the potential traffic impacts of the Project.

Response:

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3, and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. In accordance with CEQA, for each of the nine alternatives evaluated, the SPAS Draft EIR identifies the precise location and boundaries of the alternatives, and identifies all of the alternatives' significant effects on the environment. As indicated in Response to Comment SPAS-AL00007-6, Section 2.3.1 of the SPAS Draft EIR provides a thorough description of each of the nine alternatives that is accurate, stable, and finite and is not curtailed or distorted. The SPAS alternatives were presented and evaluated in a manner that fosters informed decision-making and public participation.

Please see Response to Comment SPAS-PC00130-1, which demonstrates that the analysis of nine alternatives did not "frustrate" public participation.

SPAS-PC00130-14

Comment:

B. The DEIR Improperly Uses Incorporation by Reference Without Adequate Descriptions of the Incorporated Material.

The DEIR incorporates by reference the LAX Specific Plan. (See DEIR 1-105.) CEQA Guidelines require that certain requirements be met in order to use incorporation by reference:

Where an EIR or Negative Declaration uses incorporation by reference, the incorporated part of the referenced document shall be briefly summarized where possible or briefly described if the data or information cannot be summarized. The relationship between the incorporated part of the referenced document and the EIR shall be described.

(CEQA Guidelines § 15150(c).)

However, several sections of the DEIR fail to specifically identify the "incorporated part of the referenced document," in this case the specific sections of the LAX Specific Plan EIR it is incorporating. For example, the DEIR states:

...the analysis of indirect effects from light emissions, air pollutant emissions, and noise is based upon the evaluation contained within the LAX Master Plan EIR [citation to entire Master Plan EIR], which is incorporated by reference into this EIR. Baseline conditions relative to light emissions, air pollutant emissions, and noise are not markedly different from those that existed at the time of the LAX Master Plan EIR. Therefore, conclusions regarding potential impacts associated with baseline conditions at that time are considered to apply to current baseline conditions.

(DEIR 4-99.) By not providing citations to the portions of the document being incorporated, the general public and decision makers are unable to determine what portions of the LAX Specific Plan EIR are being incorporated or how to locate them.

Even when the DEIR references a particular document within the LAX Master Plan EIR, it fails to provide the page numbers where the portion of the document being incorporated is located. When discussing hydrology, the DEIR states:

The rationale for the selection of pollutants of concern is presented in Technical Report 6, Hydrology and Water Quality Technical Report, and Technical Report S-5, Supplemental Hydrology and Water Quality Technical Report, of the LAX Master Plan Final EIR, which is incorporated by reference...

(DEIR 4-603.) These two technical reports consist of 137 pages in total. To expect members of the public and decision makers to read these entire reports to locate the relevant portions of these documents places an extreme and undue burden on them.

Courts have explained that the presentation of the information in the EIR is extremely important:

The data in an EIR ... must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. "[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis.'" [Citation.]

(Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 442.) The information that was incorporated by reference in the DEIR fails to adequately inform the public and decision makers.

Also, the DEIR should not use incorporation by reference for its substantive analysis of environmental impacts. The CEQA Guidelines state, "Incorporation by reference is most appropriate for including long, descriptive, or technical materials that provide general background but do not contribute directly to the analysis of the problem at hand." (Guidelines § 15150(f), emphasis added.) Nonetheless, the "analysis of the problem at hand" from the LAX Master Plan EIR is incorporated into the DEIR. An example of this is the DEIR's analysis of effects from light, air pollution, and noise. "[T]he analysis of indirect effects from light emissions, air pollutant emissions, and noise is based upon the evaluation contained within the LAX Master Plan EIR..." (DEIR 4¬99.) The DEIR did not use incorporation by reference to properly provide general background information, but rather to improperly support its analysis of these substantive issues.

Response:

The commentor selectively quotes language from page 4-199 of the SPAS Draft EIR (not page 4-99, as referenced in the comment) and suggests that the SPAS Draft EIR does not describe "[t]he relationship between the incorporated part of the referenced document and the EIR…" The missing language from the commentor's quote (underlined below) provides additional cross references and page citations: "*As indicated in Section 4.3.2.3*, the analysis of indirect effects from light emissions, air pollutant emissions, and noise is based upon the evaluation contained within the LAX Master Plan EIR, which is incorporated by referenced into this EIR… *The LAX Master Plan EIR concluded that, based on the success of vegetation restoration efforts within the Los Angeles/El Segundo Dunes, which have been accompanied by substantial increases in populations of the El Segundo blue butterfly, flora and fauna at LAX are not adversely affected by existing air quality*." This SPAS Draft EIR text cites two footnotes: Footnote 205 (City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004) and Footnote 206 (City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004, pp 4-882 and 4-883). Additional page references to the LAX Master Plan Final EIR are also provided in the footnotes on page 4-200 of the SPAS Draft EIR. Section 4.3.2.3 of the SPAS Draft EIR also references Section 4.10.2 of the LAX Master Plan EIR.

The relationship between the LAX Master Plan Final EIR and the SPAS Draft EIR is explained in Sections 1.1.1 and 1.7 of the SPAS Draft EIR. The more specific relationship of this incorporated document was used to show consistency between the two documents in regards to biological resource methodology. As discussed in Section 4.3.2.3 of the SPAS Draft EIR (a subsection of the Biological Resources "Methodology" discussion), "[t]he analysis follows the approach used in the LAX Master Plan EIR, which was substantiated with the findings of published literature." Additional discussion of the methodology is provided in Sections 4.3.2.3 and 4.3.3.3 of the SPAS Draft EIR.

The commentor quotes further language from page 4-199 of the SPAS Draft EIR (not page 4-99, as referenced in the comment) and suggests that the language is used to replace "substantive analysis of environmental impacts." The commentor takes the language out of context. The quoted language is contained more broadly in the discussion of existing conditions in Section 4.3.3 of the SPAS Draft EIR and was used to provide discussion of the environmental setting related to biological resources and their sensitivities to light, noise, and air pollutants (i.e., "existing Effects from Light, Air Quality, and Noise"). Analyses of impacts to biological resources, including indirect impacts, from the SPAS alternatives is provided in the impacts analysis section, Section 4.3.6, of the SPAS Draft EIR. For example the analysis for Alternative 1 (provided in Section 4.3.6.1 of the SPAS Draft EIR) discusses biological resources impacts associated with noise, air quality (deposition), and light emissions (see pages 4-223 through 4-224 of the SPAS Draft EIR). As also discussed in the SPAS Draft EIR, indirect impacts to El Segundo blue butterfly associated with light emissions and noise are not expected to occur. The minimal increases in light emissions would occur at night, but this species is diurnal and does not exhibit flight to light behavior (see page 4-223 of the SPAS Draft EIR). The species does not have an auditory organ and therefore no sense of hearing (see page 4-173 of the SPAS Draft EIR). Nevertheless, the quoted language has been revised to clarify the language. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

The commentor also suggests that the SPAS Draft EIR does not comply with CEQA because it does not provide page numbers for LAX Master Plan Final EIR Technical Report 6, Hydrology and Water Quality Technical Report and Technical Report S-5, Supplemental Hydrology and Water Quality

Technical Report. The commentor also suggests that the current presentation in the SPAS Draft EIR does not "adequately inform the public and decision makers…" There is no requirement in Section 15150(c) of the State CEQA Guidelines to identify specific pages of a document incorporated by reference. In fact, Section 15150(c) requires discussion of "[t]he relationship between the incorporated part of the referenced document and the EIR." As indicated on page 4-603 of the SPAS Draft EIR, the relationship between these two documents was to provide "[t]he rationale for selection of pollutants of concern." Additional details regarding the relationship of these two documents is provided in Sections 1.1.1 and 1.7 of the SPAS Draft EIR. Unlike the information "buried" in an appendix in the referenced Vineyard case, the SPAS Draft EIR discussed this information in detail, starting on page 4-602, explaining, "[t]he pollutants of concern evaluated in the analysis were based upon studies of the Santa Monica Bay, the primary receiving water body for runoff from LAX…19 pollutants of concern have been identified for the Santa Monica Bay…[t]en of these pollutants were selected for analysis based on the reasonable likelihood that they would be present in storm water runoff from LAX. These pollutants include total suspended solids, phosphorus, total Kjedahl nitrogen, copper, lead, zinc, biochemical oxygen demand, chemical oxygen demand, oil and grease, and pathogenic bacteria…the specific types of pathogenic bacteria chosen for analysis were fecal coliform, fecal enterococcus, and total coliform bacteria. In addition, ammonia, a component of total Kjedahl nitrogen, was analyzed." The information requested by the commentor can be found in Section 3.2.2.2 (pages 21-23) of LAX Master Plan Final EIR, Technical Report 6, Hydrology and Water Quality Technical Report.1 This information can also be found in Section 3.3 (pages 3-4) of LAX Master Plan Final EIR Technical Report S-5, Supplemental Hydrology and Water Quality Technical Report.2

For the reasons described above, the SPAS Draft EIR properly incorporated by reference portions of other documents, including portions of the LAX Master Plan Final EIR, which is a publically-available document. As noted on page 1-105 of the SPAS Draft EIR, the documents incorporated by reference were available for public review at Los Angeles World Airports, Capital Programming and Planning Division (formerly Facilities Planning Division), One World Way, Los Angeles, CA 90045, and are also accessible via the internet at laxspas.org.

SPAS-PC00130-15

Comment:

C. Components of the Airport Revitalization Project are Improperly Segmented into Separate Review Processes.

LAWA has undertaken study of maintenance facility separate from the SPAS EIR. This facility should have been included in the DEIR and its impacts, both project specific and cumulative, analyzed. A scoping meeting about this project is scheduled for October 4, with comments due on October 15.

As reported in the Daily Breeze newspaper "Los Angeles World Airports, which operates LAX, says the maintenance complex is needed so that existing facilities in the center of the airport can make way for new terminals and airport access projects." (http://www.dailybreeze.com/news/ci_21621901/lax-begin-enviromnental-studies-proposed-aircraft-maintenance-compound?source=rss)

One of the features of this project at the west end of LAX (southeast corner of Pershing and World Way West) is a Ground Run-up Enclosure (GRE). The GRE is where aircraft are parked and the engines are turned on for testing. The proposed run-up enclosure will have three sides and no roof. This GRE could cause noise problems for El Segundo and Playa del Rey residents. There are GRE's that are fully enclosed like an aircraft hangar. This GRE should be fully enclosed GRE and have restrictions on

operating times. There will also be Group VI size aircraft hangars at this location. Who will be the tenant? Will it be Qantas Airways?

Another feature that could adversely affect Playa del Rey, Westchester and Inglewood with fugitive dust is the contractor staging yard. Quote from the ourlax.org website: "In addition, as part of the proposed Project, existing contractor staging yards and associated infrastructure equipment on the Project site would be relocated to existing LAX staging areas located to the south of Westchester Parkway and west of Lincoln Boulevard. Stockpiled materials (consisting of uncharacterized soil and construction rubble) currently existing within and immediately adjacent to the Project site, would be re-used on-site as backfill material and/or exported off-site to permitted landfills." Therefore, the cumulative dust pollution impact of this project and others contemplated must be identified and analyzed in the EIR.

Response:

LAWA published a Notice of Preparation and Initial Study for the West Aircraft Maintenance Area Project in September 2012. The West Aircraft Maintenance Area Project is identified as a cumulative airfield-related project on page 5-17 in Section 5.3.1 of the SPAS Draft EIR, and the cumulative impacts of this project, in conjunction with SPAS and other cumulative projects, are analyzed in Chapter 5 at a level of detail appropriate for a cumulative impact analysis. When the cumulative projects list for the SPAS Draft EIR was prepared, the West Aircraft Maintenance Area Project was anticipated to encompass approximately 60 acres. However, during the project planning phase, the project was expanded to include the westerly extension of Taxiway B to the western limits of the project site in order to provide primary egress from the project area. Inclusion of the Taxiway B extension in the West Aircraft Maintenance Area Project would not alter the cumulative impacts analysis provided in the SPAS Draft EIR. The West Aircraft Maintenance Area Project was addressed in the analysis of cumulative impacts to aesthetics, archaeological resources, and hydrology and water quality. Regarding aesthetics, as the taxiway extension would involve the addition of pavement adjacent to other portions of paved area associated with the West Aircraft Maintenance Area Project, and would not add any features that could affect views, no changes in cumulative aesthetic impacts would occur. Similarly, the potential for cumulative impacts to archaeological resources would be the same with the added taxiway extension as the added acreage would not result in any new cumulative impacts. The cumulative analysis of hydrology and water quality is not a quantified analysis based on acreage; therefore, the additional area associated with the West Aircraft Maintenance Area Project would not change the cumulative impact analysis. As indicated in Section 5.5.8 of the SPAS Draft EIR, implementation of the SPAS alternatives would require the Conceptual Drainage Plan (CDP) to be updated to account for changes in conditions at LAX, including changes associated with the selected SPAS alternative as well as other existing or proposed improvement projects at LAX. The CDP update would address the totality of the Western Aircraft Maintenance Area Project, including the added acreage associated with the extension of Taxiway B.

As stated in the Initial Study, the intent of the proposed West Aircraft Maintenance Area Project is to consolidate, relocate, and modernize existing aircraft maintenance facilities at LAX, particularly those that need to be replaced in conjunction with LAX Master Plan improvements. The consolidation, relocation, and modernization of these facilities would allow for more efficient and effective maintenance of existing aircraft at the airport, including Aircraft Design Group (ADG) VI aircraft (Airbus A380s and Boeing 747-8s). The comments concerning specific features and environmental effects of the West Aircraft Maintenance Area Project, including comments regarding the proposed ground run-up enclosure and questions about future tenants are beyond this scope of the SPAS EIR but may be raised during the public comment period for the West Aircraft Maintenance Area Project Draft EIR.

The area located south of Westchester Parkway and west of Lincoln Boulevard is an existing LAX construction staging area. Use of this area for construction staging associated with the SPAS alternatives is proposed in the SPAS Draft EIR. As indicated in Section 2.3.1.12 of the SPAS Draft EIR, this area is SPAS Construction Staging Area A. Environmental impacts associated with use of Construction Staging Area A are evaluated throughout the SPAS Draft EIR.

SPAS-PC00130-16

Comment:

Another project not included in the SPAS EIR is the "LAX Runway 7L/25R Runway Safety Area (RSA) Project & Associated Improvements." LAWA has issued a Notice of Availability on September 28, 2012 for the Draft Environmental Assessment with comments due by November 13, 2012. The 7L/25R runway project is listed under NEPA. Why is this project also not considered under CEQA? If Runway 7L/25R is closed for construction, then this will alter the normal air traffic pattern of aircraft landing on the outboard runways 24 Right and 25 Left and takeoffs occurring on Runways 24 Left and 25 Right. Where are the impacts of a Runway 7L/25R closure, even if for limited time periods, covered in the SPAS DEIR?

Response:

The Runway 7L/25R Runway Safety Areas project and Runway 7L/25R East End Reconstruction project are both identified as cumulative airfield-related projects on page 5-17 in Section 5.3.1 of the SPAS Draft EIR. These projects were subsequently combined and named the Proposed Runway 7L/25R Runway Safety Area Project and Associated Improvements. An Environmental Assessment for the project, prepared pursuant to NEPA, was published jointly by FAA and LAWA in September 2012. A Notice of Preparation announcing the preparation of an EIR pursuant to CEQA was published by LAWA in October 2012.

As indicated on page 3-25 of the Initial Study prepared for the Proposed Runway 7L/25R Runway Safety Area Project and Associated Improvements, which was published in conjunction with the NOP, the proposed construction sequencing for the Runway 25R reconstruction would require an approximate three-month closure of the runway. As the runway is the primary departure runway on the south airfield, the proposed closure would require shifting aircraft traffic from this runway to other runways at LAX for the duration of construction. The shift in aircraft flight patterns during the three-month period has the potential to result in significant airport noise exposure changes, causing noise levels to exceed airport noise standards in some noise-sensitive areas. The Initial Study indicates that resulting aircraft noise exposure effects will be evaluated further in the Runway 7L/25R Runway Safety Area Project and Associated Improvements Project EIR.

As stated in Section 2.8 of the Proposed Runway 7L/25R Runway Safety Area Project and Associated Improvements Initial Study, construction of the proposed project is expected to be completed within two years. As indicated on page 2-8 of the SPAS Draft EIR, construction of the SPAS improvements is not anticipated to begin until 2015. Therefore, the temporary, construction-related runway closure would not overlap with construction of any SPAS improvements, and no cumulative noise impacts would occur.

Concerns and questions regarding specific features and environmental effects of the Proposed Runway 7L/25R Runway Safety Area Project and Associated Improvements are beyond the scope of the SPAS EIR and may be raised during the public review process for that proposed project.

SPAS-PC00130-17

Comment:

D. LAWA Should Have Consulted with Public Agencies Potentially Affected By Anticipated Changes.

As lead agency, LAWA is required to consult with responsible and trustee agency with jurisdiction over resources that might be affected by LAWA's proposal. (Public Resources Code 21153(a) [lead shall consult with responsible agency]; Public Resources Code 21080.4(a) [shall send NOP to responsible agency].)

We have learned that LAWA failed to consult with, or even to notify, the Bureau of Sanitation that its sewer lines might be affected by the movement of a runway north and tunneling of Lincoln Boulevard. Denise Chow, an Environmental Engineering Associate in the Wastewater Engineering Services

Division of the Bureau of Sanitation of the City of Los Angeles confirmed on September 5, 2012 that her division had not yet received a request to review the SPAS project. Subsequent to an ARSAC request for clarification, LA Sanitation contacted LAWA Planning and confirmed that LAWA understands that the outfall sewers cannot be moved. How that knowledge impacts the rerouting of Lincoln or Sepulveda Boulevards is an unanswered question. In the Specific Plan Amendment Report Appendix G, program level cost estimates are provided, but appear to be severely underestimated given the magnitude of the work that would be involved in relocating wastewater lines.

Response:

LAWA provided a copy of the SPAS Draft EIR to the City of Los Angeles Department of Public Works, Bureau of Sanitation, for their review and received a response letter in return (SPAS-AL00002). The Bureau of Sanitation, Wastewater Engineering Services Division, had no comments regarding wastewater facilities, including sewers. Also note that the Bureau of Sanitation, Wastewater Engineering Services Division is not a Responsible Agency for the SPAS EIR.

Please see Response to Comment SPAS-PC00130-348 and Topical Response TR-SPAS-LR-1 regarding the relationship between sewer lines and the north airfield improvements and Lincoln Boulevard realignment, respectively. As indicated in those responses, none of the outfall sewers that lie beneath LAX would be affected by the SPAS alternatives. Please also see Topical Response TR-SPAS-LR-1 concerning allowances in the Lincoln Boulevard rough-order-of-magnitude (ROM) cost estimates for utility relocations.

SPAS-PC00130-18

Comment:

Additionally, there is an FAA radar site on Lincoln and McConnell. McConnell is a short street that connects Lincoln to Westchester Parkway. In Alternatives 1, 5 and 6 (DEIR pages 4-693, 4-739 and 4-749, respectively), this radar site would need to be moved to allow for Lincoln to be pushed closer to Westchester Parkway. Therefore, FAA should have to be consulted about this possible relocation.

Response:

Following approval of a SPAS alternative by the Los Angeles City Council, FAA will review the SPAS project pursuant to the National Environmental Policy Act (NEPA). Such review would include all aspects of the SPAS project, including the need to relocate navigational aids such as the radar facility referred to by the commentor. The requirement for FAA to approve this relocation is noted on page 2-74 in Section 2.4.1 of the SPAS Draft EIR. In the event that an alternative is selected that would require relocation of the FAA radar facility, FAA would have responsibility for relocation of the radar. However, the FAA is not a responsible agency for the purposes of State CEQA. (See State CEQA Guidelines Sections 15381 and 15379.)

SPAS-PC00130-19

Comment:

Was the California Department of Transportation (Caltrans) given the opportunity to review and comment on the potential need to realign by more than a mile and tunnelize California State Route 1? This would not be a minor modification or improvement to the state highway system but rather a major change.

Response:

Caltrans received a copy of the SPAS Draft EIR for review during the comment period for the Draft EIR. No comments from Caltrans were received. The need for Caltrans review and approval of the potential realignment of Lincoln Boulevard is noted on page 2-75 in Section 2.4.2 of the SPAS Draft EIR.

SPAS-PC00130-20

Comment:

E. LAWA Has Not Fully Complied with the Terms of the 2006

Settlement

In a series of communications with LAWA including Public Records Act requests, the most recent being dated July 16, 2012, we expressed concern about, and detailed how, LAWA was not complying with the terms of the 2006 Settlement agreement.

(Enclosure.) LAWA failed to consult with Petitioners even during SPAS update meetings prior to the release of the DEIR. Instead, LAWA chose to unilaterally present some, but not all, information about its plans without responding to feedback from ARSAC and others about such issues as the choice and assignments of security consultants, possible tunnelization of Lincoln Boulevard, and air quality impacts to the surrounding communities. We had hoped some of the questions and issues raised in prior correspondence would be addressed in the SPAS DEIR but find that they have not. Therefore, we renew our requests for the information below.

1. We Requested All Correspondence and Documents Related to Tunnel Projects Contemplated by LAWA.

It is our understanding that LAWA has been studying at least two tunnel locations: the Manchester Tunnel, a north-south tunnel behind the Bradley Terminal and discontiguous to under Runway 24 Right to the Argo Ditch, and a proposed tunnel on a re-aligned Lincoln Boulevard. We requested all writings regarding these tunnels within the past five years. Specifically, but not exclusively, we requested any inspection reports, test reports, memos, correspondence, drawings, plans, maps, photos and videos. As noted by ARSAC, if tunnelization of Lincoln Boulevard is proposed, those plans must be fully disclosed as part of the EIR so that they are reviewable by the public and public agencies. What inspection reports, test reports, memos, correspondence, drawings, plans, maps, photos and videos have been prepared for potential tunnelization of Lincoln Boulevard?

2. We Requested All Correspondence Between LAWA and FAA in the Past Year.

We requested all writings that LAWA received from, or sent to, FAA in the past year. We anticipated that the response to this request should include but not be limited to correspondence related to draft Advisory Circular No. 150/5300-13A. A copy of this document is posted at http://www.faa.gov/documentLibrary/media/Advisory_Circular/draft 150_5300_13a.pdf. It is our understanding the FAA is redesigning the airspace over LAX. That airspace redesign should have been fully explained in the EIR. How has FAA been proposing to redesign the airspace over LAX, and how does that affect LAWA's various proposals?

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement and the Public Records Act require legal conclusions that are beyond the scope of what is required by CEQA. With respect to the Public Records Act request, LAWA has provided numerous documents in response to the referenced request, the scope of which has been modified through ongoing discussions and correspondence with ARSAC counsel.

Notwithstanding the above, please see Response to Comment SPAS-PC00130-1012 regarding what the commentor refers to as "the Manchester Tunnel."

Although Section 2.3 of the SPAS Draft EIR indicates that a portion of Lincoln Boulevard, as realigned under Alternatives 1, 5, and 6, would need to be below grade in order to meet FAA runway safety requirements for the northward realignment of Runway 6L/24R, there are no design plans for this concept as suggested by the commentor. The potential realignment of Lincoln Boulevard under these particular alternatives is currently at a conceptual level of planning and consideration. Should one of

those alternatives be selected through the SPAS process, further planning, design, and engineering would occur and more specific information would be available when project-specific CEQA documents are prepared. Please see Topical Response TR-SPAS-LR-1 for further discussion regarding the realignment of Lincoln Boulevard.

Regarding the commentor's reference to potential "airspace redesign," please see Response to Comment SPAS-PC00130-301.

SPAS-PC00130-21

Comment:

III. Attached Comments Prepared by ARSAC Members Identify Numerous Areas in Which Vital Information is Incorrect, Omitted, or Requires Further Clarification.

We are submitting herewith comments on the DEIR prepared by ARSAC and we request a response to each point raised in them. The comments and questions identify significant areas where vital information is missing. These areas include but are not limited to questions and comments about the following areas: project description; intended uses of the EIR; aesthetics, public health, air quality, traffic circulation and parking, hydrology and water quality, biological resources, hazardous materials, land use planning, wastewater, solid waste, public safety, and cultural resources impacts; and the alternatives analysis.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-22 through SPAS-PC00130-1051 below. In accordance with CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments on environmental issues received on the SPAS Draft EIR during the public review period, including all comments submitted by ARSAC and other local community members. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations.

SPAS-PC00130-22

Comment:

Significant impacts such as air quality impacts and significant traffic impacts to nine or more intersections are not unavoidable. They could be reduced or eliminated by an emphasis on regionalization including greater service at Ontario Airport to meet anticipated future demand instead of building up LAX with expanded facilities to try to provide all services.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport, which is assumed within the regionalism of air travel demand.

Also, please note that the comment presents no facts or evidence showing that great service at Ontario would mitigate significant air quality and traffic impacts of the SPAS alternatives. As described in Section 6.2 of the SPAS Draft EIR, shifting LAX aviation activity to other airports could cause significant air quality and traffic impacts at those airports.

SPAS-PC00130-23

Comment:

"There must be good faith, reasoned analysis in response [to comments received]. Conclusory statements unsupported by factual information will not suffice." (CEQA Guidelines § 15088(c).) This requirement for good faith, reasoned analysis "ensures that stubborn problems or serious criticism are not swept under the rug." (Santa Clarita Organization for Planning the Environment v. County of Los Angeles (2003) 106 Cal. App. 4th 715, 732.) Inadequate responses to comments alone can be grounds for voiding a project approval. (Env. Protection Information Center. v. Johnson (1985) 170 Cal. App. 3d 604, 627.) The level of detail of responses to comments must be commensurate with the detail of the comments. (Friends of the Eel River v. Sonoma County Water Agency (2003) 108 Cal.App.4th 859, 878 ["the determination of the sufficiency of the agency's responses to comments on the draft EIR turns upon the detail required in the responses."])

Though these comments may appear detailed and comprehensive, in view of the length of the EIR, the limited time that has been allowed to reviofew it, and the difficulties accessing the documents, they represent ARSAC's best effort to provide timely comments before the October 10 deadline. Public Resources Code section 21092(b)(1) requires the City to provide "the address where copies of . . . all documents referenced in the draft environmental impact report . . . are available for review." CEQA Guidelines section 15087(c)(5) contains a similar requirement. LAWA did not make copies of the DEIR available at libraries immediately upon its release, and the electronic disc copy of the DEIR was not searchable. Additionally, documents referenced in the DEIR were not available. There are many references in general to the Alternative D EIR which is not readily available. Many of the footnoted documents were not made available. Documents that were available were not only unsearchable, but not susceptible to bookmarking, annotation or extracting pages which are all important in doing an effective review.

ARSAC may submit further comments as more information is made available or clarified. We request that these comments and questions be reviewed by LAWA and addressed. Once the information is supplied or corrected in the EIR, and a preferred alternative is chosen as the proposed project, the DEIR must be recirculated for at least 90 days to provide sufficient time for public review.

Response:

The comment is noted. In accordance with CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments received on the SPAS Draft EIR, including all comments submitted by ARSAC. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations.

Please see Response to Comment SPAS-AL00007-59 regarding the length of the public review period for the SPAS Draft EIR.

LAWA compiled copies of the references used in the preparation of the SPAS Draft EIR pursuant to Public Resources Code Section 21092(b)(1) and Section 15087(c)(5) of the State CEQA Guidelines, including references that were cited in footnotes to the SPAS Draft EIR. These documents were available for review at LAWA's Administrative offices during the public comment period and continue to be available for review upon request. As part of this compilation, the LAX Master Plan Final EIS/EIR, which includes an analysis of Alternative D, is available at LAWA's Administrative offices. It should be noted that electronic and hard copies of the LAX Master Plan EIS/EIR were widely distributed when the document was published; the commentor received copies of this document as part of this distribution. In addition, the document is available at www.ourlax.org and at www.laxspas.org.

The SPAS Draft EIR was available at www.laxspas.org on July 27, 2012, the first day of its release. Although not required by CEQA, copies of the SPAS Draft EIR were distributed to six area libraries. All of the libraries received discs with electronic files of the SPAS Draft EIR on or before Monday, July 30, with the exception of Hawthorne Library, which is closed on Mondays and received the electronic file on Tuesday, July 31. All of the libraries received hard copies of the SPAS Draft EIR on or before Tuesday, July 31.

The electronic version of the SPAS Draft EIR provided via disk and on www.laxspas.org is a searchable file. CEQA does not require a lead agency to provide electronic files that can be bookmarked, annotated, or otherwise manipulated.

In preparing the SPAS Final EIR, LAWA has reviewed all of the comments received, and has carefully considered the responses to these comments and other information provided in the SPAS Final EIR. None of the information provided in the SPAS Final EIR meets the criteria for recirculation of an EIR as outlined in Section 15088.5 of the State CEQA Guidelines. The identification of a preferred alternative by LAWA does not require recirculation, as the impacts of all of the SPAS alternatives were fully analyzed and disclosed in the SPAS Draft EIR. Selection of a preferred alternative does not meet any of the criteria for recirculation outlined in Section 15088.5 of the State CEQA Guidelines.

SPAS-PC00130-24

Comment:

CONCLUSION

For all of the reasons set forth above and delineated in the attached comments, the current SPAS DEIR is inadequate. The document must be revised and recirculated. Additionally, the Project cannot be approved as proposed because feasible mitigation measures and alternatives exist. As mentioned above, the Settlement Agreement is based on a good faith effort, and ARSAC is disappointed with the results of that agreement thus far. Even so, ARSAC remains committed to working with LAWA to improve and modernize LAX. Thank you for your time and consideration in this matter.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-23 above and SPAS-PC00130-25 through SPAS-PC00130-1051 below which include responses that address additional mitigation measures and alternatives suggested by the commentor. In particular, please see Responses to Comments SPAS-PC00130-736, 800, 814, 815, 816, 843, 848, 849, and 969 which address alternatives suggested by the commentor. Please see Response to Comment SPAS-PC00130-23 regarding recirculation.

SPAS-PC00130-25

Comment:

Re: Second Request for Documents and Information to Be Provided in Compliance with February 16, 2006 Settlement Agreement in County of Riverside Case No. RIC 426822, City of El Segundo v. City of Los Angeles, and Pursuant to the Public Records Act

Dear Ms. Tracy and Mr. Haig:

Thank you for sending your letter of June 7, 2012 and providing certain documents. For clarity's sake we list out the documents we received from LAWA in response to our letter:

1. Letter dated June 7, 2012 from Los Angeles City Attorney to Chatten-Brown & Carstens
2. Req for St Lighting May 20 2009 (rec'd on 6-7-12, email from Brian Haig)
3. SPAS Advisory Committee Meeting Presentation 03-12-2012 (rec'd on 6-7-12 in email from Brian Haig)
4. Airport Regional Strategic Plan 2009 (rec'd on 6-7-12 in email from Brian Haig)
5. Airport Regional Strategic Plan 2007 (rec'd on 6-7-12 in email from Brian Haig)
6. 1st Mtg Agenda 10-12 SCRAA (rec'd on 6-7-12) in email from Brian Haig)
7. SCRAA Mailing List (rec'd on 6-7-12 in email from Brian Haig)
8. SCRAA Minutes 10 12 06 (rec'd on 6-7-12 in email from Brian Haig)
9. SCRAA PUBLIC MEETING NOTICE 101206 (rec'd on 6-7-12 in email from Brian Haig)
10. REGIONALIZATION UPDATE 12-15-11 BOAC (rec'd on 6-7-12 in email from Brian Haig)

11. 2008 REGIONALIZATION UPDATE NON-BOAC (rec'd on 6-7-12 in email from Brian Haig)
12. 2007 BOAC regionalization update (rec'd on 6-7-12 in email from Brian Haig)
13. FAA Response Letter Dated 10 2 09 Street Lights (rec'd on 6-7-12)
14. Board Report for amendmentl (rec'd on 5-29-12)
15. Board report (rec'd on 5-29-12)
16. CONTRACT CAMP DRESSER AND MCKEE INC (rec'd on 5-29-12)
17. First amendment camp dresser and mckee inc (rec'd on 5-29-12)
18. 2008_LAX_Metro_Green_Line_Task_Force_Record_Proceedings_Part5 (rec'd on 5-29-12)
19. 2008_LAX_Metro_Green_Line_Task_Force_Record_Proceedings_Part4
20. 2008_LAX_Metro_Green_Line_Task_Force_Record_Proceedings_Part3
21. 2008_LAX_Metro_Green_Line_Task_Force_Record_Proceedings_Part2
22. 2008_LAX_Metro_Green_Line_Task_Force_Record_Proceedings_Part1 (rec'd on 5-29-12)
23. Response to Chatten-Brown & Carstens-May 24, 2012 (rec'd on 5-24-12)

Please advise us if you believe LAWA sent other documents that we have not listed.

We do not believe these documents show that LAWA has complied with the Settlement Agreement. Therefore, we are both requesting further writings, and look forward to discussing with you what can be done to meet the terms of the agreement. While we appreciate LAWA's attempts to achieve compliance with the agreement, we do not intend for our comments and further requests about certain items to imply that we are satisfied that LAWA has complied with the Settlement Agreement with regard to all of its provisions. Instead, at this time we are still conducting our review of documents and considering how to obtain more complete compliance with the Agreement. Part of our hope is that the Draft Environmental Impact Report and Specific Plan Amendment Study Report whose existence was first referenced in the June 28 SPAS meeting and promised to be released simultaneously and include costing information, when they are released later in July as has been anticipated, will supply necessary information though much of it should have been made available earlier.

A. We Requested the Air Quality Apportionment Study Supporting Data, an Update on Its Status, and All Annual Contractor Progress Reports.

We note that the links to the Air Quality Apportionment Study that you provided were not provided to ARSAC until Brian Haig's email in response to our letter in June 2012. This obviously was not conducted in consultation with all Petitioners.

The links that were provided with the study do not have any data or set of conclusions from the first two and a half phases of the three phase study. We request all writings that are related to the Air Source Apportionment Study, including but not limited to the Phase I and II data and "preliminary emissions inventory" as noted on the website.

B. We Requested Documents Regarding Traffic Analysis.

Regarding traffic analysis, thank you for the lists of intersections that were added. We were not aware of other intersections that had been identified until you sent the lists contained in emails from other Petitioners. We note that lists of intersections were provided to LAWA in 2008, but these lists were not provided to all ARSAC until Brian Haig's email in response to our letter. We look forward to reviewing the SPAS DEIR's analysis of traffic issues including time phased estimated traffic counts entering the CTA from each of the three directions which were promised in several SPAS meetings from 2008 on.

C. Security Consultation Requirements Were Not Adequately Met.

We continue to disagree that security consultation with Petitioners has been adequately undertaken. LAWA has not answered the questions posed about the content, selection process, and other issues raised in ARSAC's prior letters. Slides 15-17 at the March 12 SPAS meeting do not address the scope of the security study. Slide 16 states "TranSecure may provide programmatic recommendations" but there is no more detailed information (and none provided verbally in the meeting).

D. We Requested Documents or Information Identified in Various Other Provisions of the Settlement Agreement.

You noted the provision of the "Airport Layout Plan" is pending. We look forward to reviewing that when it is made available.

With regard to our request for documents about the Regional Airport Working Group (Section VII of the Settlement Agreement), LAWA noted that SCRAA disbanded. However, SCRAA is not the only activity LAWA could or should undertake to promote regionalization. As noted, and requested, below, LAWA must also develop a regional strategic planning initiative each year to analyze potential opportunities to utilize under-utilized airports. LAWA appears to have extended one invitation and then nothing more when that did not work out.

With regard to Regional Strategic Planning (Settlement Agreement Section VIII), LAWA responded with a link and statement that the most recent report was Dec. 15, 2011 sent by Brian Haig.

It is our understanding that the initial regional strategic plan was "withdrawn" by LAWA and cancelled. LAWA has not held a regionalization meeting with petitioners for several years despite requests to do so. The BOAC presentations (2007 and 2008 BOAC regionalization updates) were status reports of LAWA efforts; they did not provide documentary back up and they did not provide specifics. We request all writings related to Regional Strategic Planning.

We requested documentation showing compliance with the requirement to operate at least eight FlyAway sites before 2015 and implement a public outreach program. LAWA responded that compliance is not required until 2015. While full compliance is not due until 2015, has there been any progress on this settlement term to date? We request all writings related to FlyAway sites.

We requested information about the conversion of LAWA and tenant GSE to low emission technology by 2015. LAWA responded that compliance is not required until 2015. While full compliance is not due until 2015, has there been any progress on this settlement term to date? We request all writings related to conversion of LAWA and tenant GSE to low emission technology.

Regarding electrification of passenger gates, LAWA responded with a list of gates in the attachment to the letter. The total number of gates listed was 133, not 158. It was our impression that there is a cap of 158 gates and that there are 158 gates at LAX. Please confirm that there are only 133 gates, or provide writings related to electrification of the other 25.

Regarding LAWA's attempt to establish a fund of $1 million to participate in street lighting projects affecting residential neighborhoods adjacent to the northern boundary of LAX, LAWA sent a copy of FAA's letter rejecting LAWA's request. After we asked, LAWA sent a copy of the letter requesting the funding. The letter did not make it clear which streets were the subject of the lighting request.

E. We Requested Information Regarding Projects LAWA Considers Not Covered By the Settlement Agreement.

LAWA did not provide any list of projects it considers to be outside the scope of the settlement agreement in response to our request. Please provide us a copy of all notices pursuant to Public Resources section 21092.2 and the Public Records Act for all projects conducted or planned by LAWA since 2006. We request such documents whether they are related to the Settlement Agreement or not.

F. We Request All Correspondence and Documents Related to Tunnel Projects Contemplated by LAWA.

It is our understanding that LAWA has been studying at least three tunnel locations: on Manchester Boulevard, a north-south tunnel behind the Bradley Terminal, and on Lincoln. We request all writings regarding these tunnels within the past five years. Specifically, but not exclusively, we request any inspection reports, test reports, memos, correspondence, drawings, plans, maps, photos and videos.

G, We Request All Correspondence Between LAWA and FAA in the Past Year.

We request all writings that LAWA received from or sent to FAA in the past year. We anticipate that the response to this request should include but not be limited to correspondence related to draft Advisory Circular No. 150/5300-13A. A copy of this document is posted at

http://wwvv.faa. gov/documentLibrary/media/Advisory_Circular/draft_150_5300_13a.pdf.

CONCLUSION

Please let us know if you would like to discuss our requests, and the schedule for supplying the requested information if it will not be possible to provide all documents within 10 days as required by the Public Records Act.

If documents are provided after July 30, we ask that you transmit them by email, or provide them to us at our new office location at 2200 Pacific Coast Highway, Suite 218, Hermosa Beach, CA 90254.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement and the Public Records Act require legal conclusions that are beyond the scope of what is required by CEQA. LAWA has provided numerous documents in response to the referenced Public Records Act request, the scope of which has been modified through ongoing discussions and correspondence with ARSAC counsel. Production has extended well beyond those documents listed in the July 2012 correspondence attached to the comment, including several boxes of documents made available for review on-site at LAX.

SPAS-PC00130-26

Comment:

We continue to want to work with you in creating the world class LAX airport that the City of Los Angeles and the region deserves.

The close of the DEIR comment period should have been a momentum building milestone in the SPAS process. Instead we are left with almost as many questions after the documents are released as before.

Many of the issues raised over the past six years remain unaddressed including those in our 2008 and 2010 Notice of Preparation comments. The response period for this DEIR has been so short that we have concentrated our efforts on the DEIR to preserve all of our legal options. The 6,000 page SPAS Report included with the DEIR release and, the Stipulated Settlement activities conduct in general, will be addressed much more comprehensively after the DEIR comment period has expired.

Response:

The comment is noted. It is acknowledged that copies of ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR are included as part of the comment package on the SPAS Draft EIR submitted by ARSAC. Copies of ARSAC's comment letters on the 2008 and 2010 SPAS Draft EIR NOPs are provided in the first part of Appendix A (pages 79 through 214) and the second part of Appendix A of the SPAS Draft EIR (pages 151 through 230), respectively. The comments in both NOP comment letters were considered and addressed in the SPAS Draft EIR. In addition, please see Responses to Comments SPAS-PC00130-729 through SPAS-PC00130-970 below which address each separate comment, and the issues raised, in ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR.

Regarding the length of the public review period, LAWA provided a 75-day review period for the SPAS Draft EIR. Public Resources Code Section 20191(a) requires that the review period for a Draft EIR that is submitted to the State Clearinghouse for review shall be at least 45 days. The review period for the SPAS Draft EIR provided an additional 30 days for public comment.

SPAS-PC00130-27

Comment:

ARSAC has difficulties with the much delayed SPAS implementation process and presented assessment but we want to facilitate the modernization of LAX as quickly as possible. To this end, we support implementation of SPAS DEIR Alternative 2 with the incorporation of Alternative 9 to reaffirm the consolidated rental car facility in Manchester Square along with a rail type connection into LAX.

We encourage LAWA to designate this combination the preferred alternative. In our opinion, this action is a "no brainer" because it meets the stated goals introduced in the DEIR and is a benefit to all stakeholders. Alternative 2 is referred to as "the Environmentally Superior Alternative," is assessed to have the most efficient times from runway to gate, lowest cost, least construction cost and schedule risks, least impact on surrounding communities, and includes the taxiway changes that provide safe operations.

Although LAWA has not yet committed to phasing or scheduling of project elements, we encourage you to start with the landside and taxiway projects which impact visitor and tourist experience while creating the greater number of much needed, permanent jobs. We ask that these projects be done first to ensure that LAWA will not run out of money or credit before the critical landside projects are completed.

Response:

The commentor's support for Alternatives 2 and 9 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

Regarding delays in the completion of SPAS, please see Response to Comment SPAS-PC00130-1018. Regarding the extent to which Alternatives 2 and 9 meet the SPAS project objectives, Table 1-2 in Chapter 1 of the SPAS Draft EIR provides a preliminary evaluation of how each alternative responds to the objectives of the SPAS. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on page 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please also see Response to Comment SPAS-PC00089-1 regarding efficiency associated with Alternative 2 compared to other airfield alternatives. Please see Response to Comment SPAS-PC00115-1 regarding the commentor's assertion that Alternatives 2 and 9 would present the least intrusive impact on local communities and provide the lowest construction cost and construction risk.

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. As noted in that response, CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, the combination of Alternatives 2 and 9 is not the lowest cost design option (see Table 8-2 in Chapter 8 of the Preliminary LAX SPAS Report).

Please see Response to Comment SPAS-PC00130-41 regarding phasing, Response to Comment SPAS-PC00130-725 regarding the economic benefits of landside improvements versus runway improvements, and Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00130-28

Comment:

Less than seventy-five days ago LAWA released the DEIR and a SPAS Report consisting of over 12,000 pages causing struggle to complete a comprehensive review. LAWA chose not to facilitate our review by withholding detailed information prior to the formal release. LAWA also hindered the process

by releasing restricted use PDF document files that precluded cutting, pasting, bookmarking and extracting pages.

Response:

Please see Response to Comment SPAS-AL00007-59 regarding the length of the public review period for the SPAS Draft EIR. It should be noted that the text of the SPAS Draft EIR is approximately 1,800 pages in length. Printed appendices total approximately 3,000 pages, much of which consists of model output data sheets. Appendix K2-6, which includes intersection level of service worksheets, is provided in electronic format only and is approximately 3,000 pages in length. The text of the Preliminary LAX SPAS Report is 259 pages. Appendices to the Preliminary LAX SPAS Report are approximately 2,900 pages in length.

LAWA met with the Advisory Committee on June 28, 2012 prior to release of the SPAS Draft EIR. At this meeting, LAWA outlined the methodologies and key assumptions used in the SPAS Draft EIR, presented the preliminary analytical results, and reviewed the plans for public outreach related to the release of the SPAS Draft EIR. A Power Point presentation from this Advisory Committee meeting is provided in Appendix D-2 of the Preliminary LAX SPAS Report.

The electronic version of the SPAS Draft EIR provided via disk and on www.laxspas.org is a searchable file. CEQA does not require a lead agency to provide electronic files that can be bookmarked or from which text can be extracted. It should be noted that Councilman Bill Rosendahl requested a searchable file of the SPAS Draft EIR, which was provided to him.

SPAS-PC00130-29

Comment:

There are several major issues which we want to highlight to you and by including this letter in our DEIR Comments request responses for the final EIR.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-30 through SPAS-PC00130-44 below.

SPAS-PC00130-30

Comment:

The Master Plan Vision is Incomplete.
Many of our community leaders predate the current round of program planning and the establishment of LAX Specific Plan whereas the present LAWA management team is "relatively new." We fear that LAWA corporate knowledge continuity of promises made to the community has been lost. Perhaps LAWA is unaware that the overriding purpose of the 2006 Stipulated Settlement is to develop a total Master Plan for LAX which revises Alternative D with elements that are of no greater impact on the surrounding communities. That intent is thwarted within the current DEIR and preliminary report that is neither comprehensive nor fully accurate.
- Nowhere in any of the SPAS DEIR is a Master Plan that provides the total vision for the future of LAX. In fact, several new elements are referred to in the documents as being out of the scope of the DEIR such as terminals 1.5 and terminals 2.5, and passenger support areas in the CTA such as tearing down parking structures P3 and P4 to build a Tom Bradley International passenger processing area. Further, elements such as the recently released NOP for the West Aircraft Maintenance Area are not even included in the overall program level plan discussions. Master Plan Alternative D contains two taxiways to connect the north and south runway complexes, R and S, but only S has been constructed. We understand that taxiway R will be built sometime in the future using some unrevealed trigger condition but that the evaluations assume both are in place. Your staff likely has more examples since we are not privy to LAWA future construction planning such as Belford Square which LAWA now owns but whose purpose has not been revealed.

Response:

As stated in Section V.D of the Stipulated Settlement, and restated on page 1-9 of the SPAS Draft EIR, LAWA is required to focus the LAX Specific Plan Amendment Study on the following:

1. Potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 MAP (the Alternative Projects).
2. Security, traffic, and aviation activity of such alternative designs, technologies, and configurations for the Alternative Projects.
3. Potential environmental impacts that could result from replacement of the Yellow Light Projects with the Alternative Projects, and potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects in the LAX Master Plan Program EIR.

Consistent with the provisions of the Stipulated Settlement, the purpose of SPAS is to focus on the Yellow Light Projects, not to develop a "total Master Plan for LAX." If one of the SPAS alternatives, other than Alternative 3, is approved by BOAC and the City Council, then the LAX Specific Plan would be amended to reflect the projects associated with that alternative. Other applicable, adopted plans would be amended, as necessary, to ensure precise consistency among applicable plans. Amendments to ensure plan consistency are summarized on page 1-82 in Chapter 1 of the SPAS Draft EIR. The Stipulated Settlement does not state that Alternative D is to be revised with "elements that are of no greater impact on the surrounding communities." Rather, as noted above, Section V.D.3 requires LAWA to study "potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects in the LAX Master Plan Program EIR." Section V.C requires LAWA to identify Specific Plan amendments in a manner that includes minimizing environmental impacts on the surrounding communities. Consistent with this provision of the Stipulated Settlement, the SPAS Draft EIR addresses the environmental impacts associated with the alternatives and identifies mitigation that minimizes adverse environmental effects.

Although non-Yellow Light Master Plan projects and non-Master Plan projects are not the subject of the SPAS Draft EIR, the EIR does consider all past, present, and reasonably foreseeable projects as cumulative projects subject to analysis in the SPAS Draft EIR in Chapter 5. Please see Response to Comment SPAS-AL00007-44 concerning airfield- and terminal-related cumulative projects. Specifically, page 5-18 of the SPAS Draft EIR identifies both the North Terminals Improvements, also referred to as Terminals 1.5 and 2.5, and the Midfield Satellite Concourse Program, including the new passenger processor within the CTA, as cumulative projects. As noted in Response to Comment SPAS-AL00007-44, these cumulative projects, as well as other airfield- and terminal-related projects, were assumed in the simulation analysis of future conditions with implementation of the SPAS alternatives. Therefore, the simulation analysis represents future conditions with the airfield and terminal changes associated with each of the SPAS alternatives as well as changes associated with these cumulative projects. The West Aircraft Maintenance Project is also included in the cumulative projects list (see page 5-17 of the SPAS Draft EIR), as are the north-south taxiways Taxiways S and T (also on page 5-17 of the SPAS Draft EIR), which are located immediately west of the Bradley West Project and will replace the former Taxiways Q and S, which previously existed immediately west of TBIT. (It should be noted that Taxiway R, formerly referred to as the Crossfield Taxiway Project, was completed in 2010.) Please see Response to Comment SPAS-PC00130-15 regarding the cumulative analysis pertaining to the West Aircraft Maintenance Area Project. No future land uses are assumed for the Belford area in the SPAS Draft EIR as LAWA has no development plans at this time for this property; any assumptions regarding future land uses would be purely speculative. A comprehensive list of all past, present, and reasonably-foreseeable future LAWA projects is provided in Section 5.3 of the SPAS Draft EIR.

By considering all past, present, and reasonably foreseeable airport and non-airport projects in the analysis of cumulative impacts, the SPAS Draft EIR is complete and accurate with regards to cumulative impacts.

SPAS-PC00130-31

Comment:

- For us to have provided more effective solution suggestions, it would have been helpful for us to have LAWA planned major maintenance ideas of the magnitude of the Central Utilities Plant or identified, but not fully scoped upper roadway repairs.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As noted in Response to Comment SPAS-PC00130-30, Section 5.3 of the SPAS Draft EIR includes a comprehensive list of past, present, and reasonably foreseeable cumulative development projects at LAX, including the Central Utility Plant, the CTA Second Level Roadway Expansion Joint and Deck Repairs, and many other LAX airfield, terminal, infrastructure, security, land development, and miscellaneous projects.

SPAS-PC00130-32

Comment:

- The Settlement presents a list of the Yellow Light projects. It was expected (and requested by ARSAC numerous times over the past six years) that LAWA identify and quantify the specific parameters that the Yellow Light Projects had resolved so that we could ensure that the updated Master Plan properly addressed them. This was not intended to be a carte blanche for LAWA to create a new set of goals for Master Planning and to ignore the requirement not to be more intrusive on local communities.

Response:

The problems the Yellow Light Projects were designed to address were identified in the 2008 SPAS NOP and the 2010 SPAS NOP. The SPAS Draft EIR discusses, in detail, the specific problems that the Yellow Light Projects were designed to address. (Section 2.3 of the SPAS Draft EIR.) However, identification of the problems the Yellow Light Projects were designed to address does not absolve LAWA from developing objectives for the SPAS alternatives and, LAWA is obligated under CEQA to provide a statement of objectives sought by the SPAS alternatives. (See Section 15124(b) of the State CEQA Guidelines.) Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. However, LAWA has not ignored the requirement in Section V.C of the Stipulated Settlement to plan for modernization and improvement of LAX while minimizing environmental impacts on the surrounding communities. For instance, as provided in Section 2.2 of the SPAS Draft EIR, a SPAS project objective is to minimize environmental impacts on surrounding communities. The SPAS Draft EIR identifies a comprehensive set of applicable LAX Master Plan commitments and mitigation measures, as well as SPAS-specific mitigation measures, that would reduce or eliminate significant impacts, many of which are directed at managing environmental impacts on surrounding communities. The extent to which each SPAS alternative would provide solutions to the problems the Yellow Light Projects were designed to address is addressed in Chapter 6 of the Preliminary LAX SPAS Report.

SPAS-PC00130-33

Comment:

The SPAS Matrix of Projects fails to provide a unique project for comments and questions.
The mix and match approach doesn't focus on only one vision. As such, we are unable to determine the interrelationship of the elements within the environmental assessments made by LAWA. In order to present specific questions we are forced to make several assumptions about what LAWA has included in its detailed analyses. The assumptions made at the sub element level are not directly specified in the detail appendices.

Response:

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3, and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single

proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. The commentor does not identify any specific assumptions that the commentor had to make regarding the analysis presented in the SPAS Draft EIR. Methodologies and assumptions used in the various analyses are identified in Chapter 4 of the SPAS Draft EIR, with details provided in the appendices.

SPAS-PC00130-34

Comment:

Inadequate Solutions are Evaluated and it appears SPAS generated suggestions were ignored.
Throughout the document LAWA has indicated that there are significant and unavoidable impacts which are driven by the projected increase in LAX passenger use or aircraft operation assumptions. LAWA in many cases didn't even address cargo increase impacts. LAWA appears to have used the increased use of LAX and its attendant overwhelming impacts as a reason to not change basic approaches. In the traffic section and appendices, for instance, LAWA created matrices of scenarios for various sub elements and then analyzed the pros and cons of each approach. Which elements were assumed in the evaluation calculations, however was never highlighted.
- Never is there any mention of the extensive traffic discussions held in the SPAS meetings which provided innovative impact solutions. One example is the diversion of traffic from the 96th Street bridge into the Park One area and creating paths for allowing Terminal One passenger vehicles to leave the area directly onto Sepulveda without going through the CTA loop. This is known as the "Front Door Terminal Concept." Another is the traffic flow changes recommended by the Petitioners in the drawings made by HNTB for us and given to LAWA. Yet another was the rerouting of traffic from the 405 to the underutilized LaCienega Boulevard which runs parallel to the 405 beyond Manchester Avenue to Century.

Response:

Vehicle trips associated with cargo operations at LAX were included in the SPAS Draft EIR traffic analysis. As indicated in Table 4.12.2-9 of the SPAS Draft EIR, a growth factor of approximately 146 percent was assumed for cargo operations for future (2025) conditions, compared to baseline (2009) conditions. As correctly noted by the commentor, this growth in cargo activity is anticipated to occur irrespective of the SPAS alternatives.

The traffic analyses in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR include a number of tables comparing the traffic impacts of the SPAS alternatives; presumably, these are the "matrices" the commentor references. The traffic analyses presented therein address the impacts associated with the ground transportation system improvements specific to each SPAS alternative, as explained in the methodology discussion subsection of each section. The specific elements of the ground transportation system improvements proposed under each alternative are delineated in the project description (Section 2.3 of the SPAS Draft EIR), and are carried forth throughout the entire impact analysis.

As explained in Chapters 4 and 5 of the Preliminary LAX SPAS Report, LAWA did review and consider the input received from the public and the SPAS Advisory Committee during formulation of the SPAS concept alternatives. Regarding what the commentor refers to as the "Front Door Terminal Concept" please see Response to Comment SPAS-PC00130-93 for the reasons why such a concept would not provide a feasible and effective means of improving traffic conditions within the CTA, and, if anything, could adversely affect traffic on Sepulveda Boulevard. Regarding potential traffic flow changes, such as suggested to occur under the ARSAC alternative concept calling for an elevated roadway system serving LAX, please see Response to Comment SPAS-PC00130-814.

Access from Interstate 405 (I-405) onto La Cienega Boulevard is already available through several existing interchanges in the vicinity of LAX including from southbound lanes of the I-405 just north of Florence Avenue, as well as near 97th Place, and between Century Boulevard and 104th Street. Northbound traffic on the I-405 near LAX can access La Cienega Boulevard by traveling west from the exits at El Segundo Boulevard, Imperial Highway, and Century Boulevard. With regard to the commentor's specific recommendation to reroute traffic from the I-405 to La Cienega Boulevard at the interchange north of Manchester Boulevard, there is currently an informational guide sign on the southbound I-405 indicating "LAX Airport Next 2 Exits." The first of those two subject exits is the

Florence Avenue/Manchester Boulevard exit that links directly to La Cienega Boulevard, and there are way-finding signs along the route to guide drivers to LAX. The subject informational sign is located on the west side of the freeway approximately 100 feet north of the overhead sign that indicates "Inglewood NEXT EXIT." It should be noted that the subject sign was installed by Caltrans in 2006 to replace the previous freeway informational guide sign that was located farther north and indicated "LAX Airport Next 5 Exits." The replacement/relocation of the freeway informational guide sign for LAX was initiated in response to concerns expressed by several residents in Westchester, including the commentor, that felt the then existing guide sign caused airport-bound traffic to travel south on Sepulveda Boulevard through Westchester in lieu of traveling on Century Boulevard.1 The current freeway informational guide sign informs drivers of alternative routes to LAX and directs airport-bound traffic from the I-405 and on to La Cienega Boulevard, especially if/when there is congestion on the southbound I-405 near LAX (i.e., airport-bound drivers are more likely to exit the freeway and take the subject alternate route).

1. E-mail correspondence on March 16, 2006 from Yunus Ghausi, Senior Transportation Engineer, Caltrans Office of Traffic Investigations to Patrick Tomcheck and Michael Doucette of LAWA.

SPAS-PC00130-35

Comment:

Northern Runway Movement impacts not fully evaluated or disclosed.
The DEIR states in general terms that movements of Lincoln Boulevard, changes to the ARGO Flood Control Channel, and removal of a decommissioned 740' Manchester Tunnel that extended Lincoln Boulevard to approximately where Runway 24L exists would be required if a runway is moved north. The DEIR assumed that the Runway Protection Zone areas would not be fully enforced. It never addressed the upcoming changes in the FAA Advisory Circular 150/5300-13A Airports Design to be released at the end of September 2012 or the FAA airspace redesign efforts in process.

Response:

Section 4.7.2 of the SPAS Draft EIR addresses impacts associated with changes in the RPZ boundaries under the SPAS alternatives. The comment is unclear as to how or why it is felt that "The DEIR assumed that the Runway Protection Zone areas would not be fully enforced" as there is no such statement or implication within the SPAS Draft EIR. The SPAS Draft EIR delineates the nature and location of existing uses within the RPZs for each alternative, notes the potential safety implications of such uses within the RPZ, and describes potential options for addressing substantial safety hazards, if any, of incompatible structures or uses within the RPZ. While the SPAS planning and analysis is only at the program level at this time, the SPAS Draft EIR discussion of FAA design standards is based on the current standards. The detailed design of airport improvements, which would occur in the future, would be based on the FAA standards in effect at that that time. Although FAA is currently considering certain amendments to FAA Advisory Circular 150/5300, many of those amendments are still in the preliminary stages and have not been adopted. Relative to land uses within an RPZ, the FAA is currently developing a new guidance document for the Regional Office (RO) and Airport District Office (ADO) staff that is anticipated to clarify FAA's policy for existing and proposed uses within an RPZ and is slated for publication in 2013.1 In the meantime, FAA RO and ADO staff are to continue working with airport sponsors (i.e., airport operators such as LAWA) to remove or mitigate the risk of any existing incompatible land uses in the RPZ as practical.

1. Federal Aviation Administration, Interim Guidance on Land Uses Within a Runway Protection Zone, September 27, 2012, Available: http://www.faa.gov/airports/planning_capacity/media/interimLandUseRPZGuidance.pdf, accessed November 3, 2012.

SPAS-PC00130-36

Comment:

Air Quality studies in process for the past five years were ignored.

The overdue Air Quality and Apportionment Study that is currently three years in arrears is not even mentioned in the air quality evaluation sections of the DEIR. Since LAWA is now saying that the last phase of the comprehensive study would be complete in the first quarter of 2013 there should have been some useful data available.

Response:

LAWA has committed to conduct a study to determine and quantify LAX's contribution to air pollutant impacts on neighborhoods surrounding the airport by conducting the LAX Air Quality and Source Apportionment Study (AQSAS), pursuant to the Community Benefits Agreement, Section VII. The study is not tied to any specific LAX project, since the timing of the study could be affected by events outside of LAWA's control (such as the events of 9/11 which delayed the original study implementation). In addition, the LAX AQSAS uses methodologies and techniques that are research oriented, state-of-the-art, and, sometimes different than USEPA-approved methods for analyzing pollutant concentrations for comparison to ambient air quality standards.

The LAX AQSAS is overseen by the study's Technical Working Group. The Technical Working Group provides oversight of the technical quality of the AQSAS and is comprised of air quality scientists, researchers, and engineers from the U.S. Environmental Protection Agency (U.S. EPA), California Air Resources Board (CARB), South Coast Air Quality Management District (SCAQMD), State of California Office of Environmental Health Hazard Assessment (OEHHA), Federal Aviation Administration (FAA), and community organizations.

The LAX AQSAS is currently in its third and final phase, including monitoring at numerous locations in the communities around the airport, conducting laboratory analyses, applying receptor modeling techniques to the monitored data, interpreting the results, and preparing the final report. LAWA has committed to publish the study final report in the spring of 2013. The project status can be viewed at: http://www.lawa.org/welcome_LAX.aspx?id=1066.

SPAS-PC00130-37

Comment:

Cost Estimates for various protects are questionable.
Although not normally a part of the DEIR, this important issue was included in the SPAS Report and therefore relevant to this discussion.
- In 2008 LAWA started to provide cost estimates. That effort was suspended and not restarted when we pointed out to LAWA that the estimates demonstrated that it was more expensive to "not move a runway at all" than to pour concrete, move utilities, and to implement all of the other necessary changes.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As noted by the commentor, cost estimates are not normally part of a Draft EIR. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements. As noted in that response, CEQA does not require an analysis of cost or project funding. (CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, cost estimates were prepared during SPAS and are provided in Chapter 8 of the Preliminary LAX SPAS Report, with details included in Appendix G.

SPAS-PC00130-38

Comment:

- The current report has a cost chart that is used extensively in all of the presentations made by LAWA. In the June 28, 2012 SPAS meeting with the Petitioners LAWA presented this chart and, after questions, admitted that several major cost factors were not included that should have been to provide a comprehensive picture. Despite knowing the inadequacies LAWA continues to present this same

chart without noting limitations at presentations to BOAC, formal SPAS DEIR comment hearings and the recent Neighborhood Council Westchester-Playa Town hall.

Response:

An EIR shall inform decision-makers and the public about the potential significant environmental effects of the proposed project and identify means to reduce, avoid, or mitigate environmental damage. (State CEQA Guidelines Section 15002(a).) The comment does not raise any environmental issue or address the adequacy of the environmental analysis included in the SPAS Draft EIR. It raises funding and economic questions, which need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.) However, rough-order-of-magnitude cost estimates were prepared during the SPAS process and are provided in Chapter 8 of the Preliminary LAX SPAS Report, with detailed information provided in Appendix G. Preliminary costs associated with all of the SPAS alternatives were presented to the Board of Airport Commissioners on June 18, 2012 and to the SPAS Advisory Committee at a meeting on June 28, 2012. At the Advisory Committee meeting, LAWA noted that the costs that had been presented to BOAC were still being refined at the time of the presentation as part of completion of the SPAS process, and that the costs associated with Alternative 9 (which included SPAS-related land acquisition) had been revised slightly upward since the BOAC presentation. These refinements were completed prior to the Advisory Committee meeting, at which time the updated cost estimates for Alternative 9 were presented. The costs for Alternative 9 presented to BOAC were slightly less than $2,000,000,000, whereas the costs presented to the Advisory Committee for this alternative were slightly higher than $2,000,000,000. The costs presented to the Advisory Committee are consistent with the costs presented in the Preliminary LAX SPAS Report. As indicated in Table 8-2 of the Preliminary LAX SPAS Report, estimated costs associated with the ground access improvements and land acquisition under Alternative 9 (rows c through f) total $2,315,434 in escalated dollars. The cost estimates have not been revised since the version presented to the Advisory Committee on June 28th. Moreover, the cost estimates presented to BOAC on June 18 have not been used in subsequent presentations by LAWA.

SPAS-PC00130-39

Comment:

- We are including lots of cost comment questions to the DEIR questions to clarify assumptions made and to get a better picture of the cost impact differences of the various runway movement amounts. This includes the impacts of underground utilities including sewers (both movable and those too expensive to move), gas lines, power lines, water channels, tunnels, etc.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment discusses funding and economic issues, which are not significant environmental impacts under CEQA. CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, LAWA has provided responses to comments concerning cost estimates and funding for informational purposes. Other comments pertaining to cost included in this comment letter include, but are not necessarily limited to, SPAS-PC00130-37, SPAS-PC00130-38, SPAS-PC00130-77, SPAS-PC00130-500, SPAS-PC00130-507, SPAS-PC00130-517, SPAS-PC00130-572, SPAS-PC00130-582, SPAS-PC00130-751, and SPAS-PC00130-1012.

SPAS-PC00130-40

Comment:

- We know that the costs needed to bring LAX up to "World Class" will be substantial.

Although it is not a CEQA requirement, it is important for decision makers to have this information. Will there be enough money to complete all of the tasks? We are concerned that even with FAA grants the cost to implement the needed changes are tremendous and work could be limited by available credit.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). As noted by the commentor, considerations of cost and financing are not normally part of a Draft EIR. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) The EIR provides a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences of the project. (State CEQA Guidelines Section 15151.) Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements. Nevertheless, LAWA provided a detailed account of the financial requirements of each of the alternatives in Chapter 8 of the Preliminary LAX SPAS Report, with backup information included in Appendix G. If assumed funding sources are not available in the future, certain projects would be deferred until funds become available. (Section 8.6 of the Preliminary LAX SPAS Report.) A more detailed discussion of the funding assumptions for the project is provided in Section 8 of the Preliminary LAX SPAS Report. Please also see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00130-41

Comment:

We understand that time phasing is not normally a requirement of a DEIR, but again this is critical to decision makers. Even if not part of the DEIR, please present as part of SPAS a time phasing of how LAWA would complete its projects. As you heard often at the hearings and town hall we encourage LAWA to start with landside and critical taxiway improvements before going to any risky construction projects associated with moving runways.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore, no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, the discussion below is provided for informational purposes.

As stated on page 2-8 of the SPAS Draft EIR, the nine SPAS alternatives addressed within the SPAS Draft EIR were formulated at a programmatic level of conceptual planning. At this level of planning, detailed information about the SPAS alternatives, including construction phasing plans, sequencing of projects, and construction scheduling, has not yet been determined, nor are such details required in order to analyze the environmental impacts of the SPAS alternatives. In general, however, it is anticipated that all of the improvements proposed under each alternative would be completed by 2025, with construction beginning in 2015. LAWA will determine the phasing of SPAS projects based on a number of factors, including operational needs, facility requirements, construction sequencing, financing, and other factors. Please see Responses to Comments SPAS-PC00130-142 and SPAS-PC00130-235 for a discussion of the programmatic review conducted for the SPAS project. As indicated in that response, generally speaking, program EIRs analyze broad environmental effects of the program. (State CEQA Guidelines Section 15168.) An EIR is not required to speculate about the environmental consequences of future development that is unspecified or uncertain, and such an analysis should be done when future actions are sufficiently well-defined that it is feasible to evaluate their potential impacts. (Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502.) LAWA's preparation of a programmatic analysis of the SPAS project was appropriate and consistent with the level of detail currently known about the various SPAS alternatives.

The commentor provides no substantiation of the statement that relocation of runways would constitute a "risky construction project." Please see Response to Comment SPAS-PC00130-725 regarding the benefits of terminal improvements versus runway improvements.

SPAS-PC00130-42

Comment:

General impacts not fully disclosed.
What assumptions has LAWA made about runway protection zones implementation? How much residential and business areas will be impacted with removal? How much residential and business area will be in the RPZ but remain with aircraft landing and taking off over or just adjacent to them?

Response:

Section 4.7.2 of the SPAS Draft EIR addresses the direct impacts from changes in the RPZ under each SPAS alternative, as well as the potential secondary or indirect impacts associated with measures to address potential airspace obstructions or incompatible structures/uses within RPZ areas. Figures 4.7.2-3 and 4.7.2-4 delineate the RPZ boundaries for baseline (2010) conditions and the nature and location of land uses therein, and Figures 4.7.2-6 through 4.7.2-19 provide such information for each alternative (i.e., Alternatives 1 through 7). Included in those figures is a clear delineation of the runway relocations and improvements proposed under each alternative, which provides the reader with an understanding of the physical relationship between the runway and the land uses nearby (i.e., so that the reader can approximate the location of aircraft landing or taking off relative to uses in the general vicinity).

SPAS-PC00130-43

Comment:

If Lincoln is moved and lowered to some level in avoidance of the outfall sewers that can't be moved how will that impact the Sepulveda Business District?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-44

Comment:

The Regionalization Component of the LAX Master Plan has been ignored.
A tenant of the entire process to update the LAX Master Plan is to incorporate LAX into a regional network of airports to improve capacity, and drive down the impacts of air commerce. The idea is to create alternatives to having just one vulnerable airport handle the majority of the air commerce (as is the case with LAX currently) and to expedite an effective back up plan. To date the best candidates to foster regionalization, LA/Ontario and LA/Palmdale have been far less than genuine. The alternatives considered as part of this DEIR did not include a regionalization component. For that reason we have pushed for the local control of these airports.

While it is bad enough to ignore regionalization, it is a flagrant violation to work in direct opposition to a term of the Settlement Agreement. LAWA listed "SPAS Project Goal 3" as enhancing LAX capacity.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. The topical response also explains why regionalization was not considered as a SPAS objective, but was considered as part of the SPAS alternatives themselves, as

well as in the context of potential revisions to Section 7H of the LAX Specific Plan. Also provided therein are discussions related to LA/Ontario International Airport, Palmdale Regional Airport, and LAWA's direct involvement in efforts regarding regionalization. Also, please note that this comment does not raise any new significant environmental issues or address the adequacy of the analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15205(a)).

It is unclear as to what the commentor is referring to in indicating that "LAWA listed 'SPAS Project Goal 3' as enhancing LAX capacity" as no such statement or inference is contained in Project Objective 3 or in any other project objective presented in Section 2.2 of the SPAS Draft EIR.

SPAS-PC00130-45

Comment:

The questions in this letter are requested to be addressed as part of the DEIR process. Additional questions are also attached in the ARSAC submittal with this letter for LAWA to address before moving forward into the approval process.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-44 above and SPAS-PC00130-46 through SPAS-PC00130-1051 below. In accordance with State CEQA Guidelines Section 15088, LAWA has prepared written responses to all comments received on the SPAS Draft EIR during the public review period, including all comments submitted by ARSAC. The written responses are thorough, detailed, and provide good faith, reasoned analyses. These responses are provided herein as part of this Final EIR. The responses to comments on the SPAS Draft EIR will be considered by the decision-makers during project deliberations.

SPAS-PC00130-46

Comment:

Summary of the LAX Specific Plan Amendment Alternatives in the 8-2012 DEIR (ARSAC Generated www.RegionalSolution.org)

Alt #	Alternative Name/Comments	Characteristics
1	**LAWA Mgmt Preferred "Fully Integrated" Alternative** - *Displaces businesses and homes - Risky construction factors; could be very costly in time and delays - Fixes little traffic or CTA access -Major underground utilities, sewer, and tunnel impacts*	**Moves Runway 24R (outboard)-260' N and 600' W (width to 200'), Moves Runway 24L (inboard)-1250' E,** **Adds Centerfield Taxiway** **Reconfigures taxiways and taxilanes to accommodate bigger aircraft** **Moves Terminal 3 40' W, Adds Terminal 0 and extends TB IT and Mid Concourse Terminals N** **Argo Flood Channel enclosed** **Eliminated ConRAC** **Lincoln Blvd repositioned to sub terrain or tunnel and new Sepulveda interface** **Impacts business district and homes** **Redesigned 96th St. Entrance into Park One**
2	**No Runway Movement "Fully Integrated" Alternative** *-Most affordable* *-Does little for traffic and CTA access*	**Leaves Runways in current location** **Reconfigures taxiways and taxilanes to accommodate bigger aircraft Adds Terminal 0 and extends TB IT and Mid Concourse Terminals N No ConRAC** **Redesigned 96th St. Entrance into Park One** **Lincoln Blvd/Sepulveda Blvd interface intact**

3	**City Approved Alt D** **"Fully Integrated" Alternative** *-NOT AFFORDABLE. Cost has risen from $12B 2004 approval time estimate at to over $100* ***B*** *in eight years*	**Extends Runway 24R (outboard) 1,495 feet west** **Moves Runway 24L (inboard) 340' S and adds Centerfield taxiway** **Reconfigures taxiways and taxilanes to accommodate bigger aircraft** **ConRAC in Lot C** **Ground Transportation Center in Manchester Square with baggage tunnel to Central Terminal Area** **Central Terminal Area Closed to traffic** **Integrated Transportation Center in Continental City** **Lincoln Blvd/Sepulveda Blvd interface intact**
4	**Alt D Green light projects w misc. projects; No yellow** **"Fully Integrated" Alternative** *-Limited runway movement* *-No runway movement North* *-Least impacts or cost* *-Does little for traffic and CTA access*	**Leaves Runway 24R in current location** **Move Runway 24L (inboard)- 835 ' E** **No Centerfield taxiway** **Argo Flood Channel partially enclosed** **Linclon Blvd/Sepulveda Blvd interface left intact** **ConRAC in Manchester Square** **No Taxiways or taxilanes reconfigured** **No Terminal Changes** **Lincoln Blvd/Sepulveda Blvd interface intact**
5	**Airfield Mod 350' N** **"Airfield Change Alternative"** *-Greatest impacts north businesses and residents/major move of flight path north* *-Risky construction factors; could be very costly in time and delays* *-Does little for traffic and CTA access*	**Move Runway 24R (outboard)-350' N and 604' W (increase to 200' wide)** **Move Runway 24L (inboard)- 1250 ' E** **Adds Centerfield Taxiway** **Moves Terminal 3 40' W, Adds Terminal 0 and extends TB IT and Mid Concourse Terminals N** **Argo Flood Channel enclosed (9857')** **Lincoln Blvd sub terrain and moved/new Sepulveda connect** **Impacts business district and homes**

		All west remote gates eliminated **Compatible with ground access in Alts 1,2,8, & 9**
6	**Airfield Mod 100' N** **"Airfield Change Alternative"** - *Impacts north businesses and residents/major move of flight path north* *-Risky construction factors; could be very costly in time and delays* *-Does little for traffic and CTA access*	**Move Runway 24R (outboard)-100' N (no extension or widening) Move Runway 24L (inboard)- 1250 ' E** **Adds Centerfield Taxiway** **Reconfigures taxiways and taxilanes to accommodate bigger aircraft Argo Flood Channel partially enclosed (1400')** **Lincoln Blvd sub terrain and moved/new Sepulveda connect Impacts business district and homes** **Adds Terminal 0 and extends TB IT and Mid Concourse Terminals N All west remote gates eliminated** **Compatible with ground access in Alts 1,2,8, & 9**
7	**Airfield Mod 100' S** **"Airfield Change Alternative"** - *Avoids construction risks of tunnel, roadway moves, sewers*	**Runway 24R (outboard)- no extension or widening** **Move Runway 24L (inboard)- 100' S and extend 1250 ' E (widen to 200')** **Adds Centerfield Taxiway** **Reconfigures taxiways and taxilanes to accommodate bigger aircraft** **All west remote gates eliminated** **No Business district or home impact** **Adds Terminal 0 and extends TB IT and Mid Concourse Terminals N** **Compatible with ground access in Alts 1,2,8, & 9**
8	**Consolidated Rental Car - bus** **"Ground Alternative"** *-fails to reduce CTA traffic - collected $ reimbursement req'd*	**Removes ConRAC** **Places Parking in Manchester Square** **(must be combined with others to establish full Master Plan)**

9	**Consolidated Rental Car - peo mov "Ground Alternative"** - *reduces CTA traffic*	**Moves ConRAC to Manchester Square from Lot C (as approved in Alt D) (must be combined with others to establish full Master Plan)**

Response:

This comment provides a summary of the SPAS alternatives prepared by the commentor. This response addresses inaccuracies in this summary.

Regarding the comments pertaining to Alternative 1, this alternative was not designated as the preferred alternative of LAWA Management in the SPAS Draft EIR. In fact, the SPAS Draft EIR did not designate a preferred alternative. However, after publication of the SPAS Draft EIR, a staff-recommended alternative was identified. Please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including a discussion of the rationale behind the selection of these alternatives over the other alternatives evaluated in the SPAS Draft EIR. Property acquisition associated with Alternative 1 is identified in Tables 2-4 and 2-5 and Figures 2-11 and 2-12 of the SPAS Draft EIR. While Alternative 1 would require the acquisition of several businesses located east of the CTA, no homes would be displaced. Alternative 1 would not require any more business acquisition than any other alternative. Please see Response to Comment SPAS-PC00130-636 regarding property acquisition in Westchester. No property acquisition is anticipated as a result of the relocation of Runway 6L/24R to the north. The commentor does not provide substantial evidence to support the claims that Alternative 1 would involve risky construction factors, and would be costly in time and delays. Traffic impacts associated with Alternative 1 are addressed in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR. As indicated in Section 4.12.1 of the SPAS Draft EIR, under Alternative 1, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant. However, a significant and unavoidable impact would occur related to the volume to capacity level at one intersection within the CTA. Alternative 1 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternative 1; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur. Alternative 1 would improve access to the CTA by adding the ITF and providing a dedicated busway from the ITF and from parking facilities in Manchester Square to the CTA. In addition, Alternative 1 would provide connectivity to regional transit, which would further improve access to the CTA. Please see Topical Response TR-SPAS-LR-1 regarding impacts to subsurface utilities. As indicated in the topical response, Alternative 1 would not result in major impacts to underground utilities, sewers, or tunnels.

Regarding the commentor's characterization of Alternative 1, please see Section 2.3.1.1 of the SPAS Draft EIR for a discussion of the improvements and characteristics of Alternative 1. As noted in that discussion, Runway 6L/24R would be extended 604 feet to the west (not 600 feet as stated in the comment). This alternative does not include a new Lincoln Boulevard/Sepulveda Boulevard interface. The intersection would remain in its current configuration, although there may need to be a minor modification of the right turn move from southbound Sepulveda Boulevard to westbound Lincoln Boulevard. As noted above, there would be no acquisition within, or impacts to, the Westchester Business District and no homes would be acquired.

Regarding the comments pertaining to Alternative 2, and the comment that Alternative 2 is the most affordable, Alternative 4 would have lower costs than Alternative 2. Please see Tables 8-1 and 8-2 of the Preliminary LAX SPAS Report regarding the estimated costs associated with each of the SPAS alternatives. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. Traffic impacts associated with Alternative 2 are addressed in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR. As indicated in Section 4.12.1 of the SPAS Draft EIR, under Alternative 2, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant. However, a significant and unavoidable impact would occur related to the volume to capacity level at one intersection within the CTA. Alternative 2 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternative 2; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur. Alternative 2 would improve access to the CTA by adding the ITF and providing a dedicated busway from the ITF and from parking facilities in

Manchester Square to the CTA. In addition, Alternative 2 would provide connectivity to regional transit, which would further improve access to the CTA.

The commentor provides no substantiation for the claim that costs associated with the approved LAX Master Plan (i.e., Alternative 3) have grown to over $100 billion. The estimated costs of Alternative 3 are provided in Table 8-1 of the Preliminary LAX SPAS Report. It should be noted that, as described on page 3-77 in Chapter 3 of the LAX Master Plan Final EIR, a baggage tunnel connecting the GTC to the CTA is one option for the secure transport of baggage to and from the GTC.

Regarding the characterization of Alternative 4, as indicated on page 2-25 of the SPAS Draft EIR, Taxiway E would be extended 535 feet east to support the easterly extension of Runway 6R/24L and to provide additional hold area for departing aircraft. The commentor does not provided any facts or evidence that support the comments pertaining to traffic and CTA access. Please see the SPAS Draft EIR for analysis of the impacts of Alternative 4, and specifically the discussion of traffic impacts in Section 4.12 of the SPAS Draft EIR.

Regarding the comments pertaining to Alternative 5, no property acquisition is directly associated with this alternative. Acquisition of some businesses located east of the CTA would occur in conjunction with the ground access alternative with which Alternative 5 is paired. Please see Response to Comment SPAS-PC00130-636 regarding property acquisition in Westchester. No property acquisition is anticipated as a result of the relocation of Runway 6L/24R 350 feet to the north. Moreover, any impacts associated with the movement of the runway north, including aircraft noise and safety impacts, are evaluated in Section 4.10.1.6.6, Aircraft Noise, and 4.7.2.6.6, Safety, of the SPAS Draft EIR. The commentor does not identify what constitutes a risky construction factor and does not provide substantial evidence to support the claims that Alternative 5 would involve risky construction factors, and would be costly in time and delays. Alternative 5 focuses on airfield improvements. Impacts to traffic and CTA access would depend upon the ground access alternative with which Alternative 5 is paired. It should be noted that all of the alternatives with which Alternative 5 could be paired (i.e., Alternatives 1, 2, 8, or 9) would improve access to the CTA. Please see the analysis of the transportation impacts of Alternatives 1, 2, 8, and 9 in Section 4.12 of the SPAS Draft EIR.

Regarding the commentor's characterization of Alternative 5, this alternative does not include a new Lincoln Boulevard/Sepulveda Boulevard interface. Please see Section 2.3.1.5 of the SPAS Draft EIR for a discussion of the improvements and characteristics associated with Alternative 5. The intersection would remain in its current configuration, although there may need to be a minor modification of the right turn move from southbound Sepulveda Boulevard to westbound Lincoln Boulevard. As noted above, there would be no acquisition within, or impacts to, the Westchester Business District and no homes would be acquired.

Regarding the comments pertaining to Alternative 6, no property acquisition is directly associated with this alternative. Acquisition of some businesses located east of the CTA would occur in conjunction with the ground access alternative with which Alternative 6 is paired. Please see Response to Comment SPAS-PC00130-636 regarding property acquisition in Westchester. No property acquisition is anticipated as a result of the relocation of Runway 6L/24R 100 feet to the north. Any possible impacts associated with the movement of the runway north, as proposed in Alternative 6, including noise and safety impacts, are discussed in Section 4.10.1.6.7, Aircraft Noise, and Section 4.7.2.6.7, Safety, of the SPAS Draft EIR. The commentor does not provide substantial evidence to support the claims that Alternative 6 would involve risky construction factors, and would be costly in time and delays. Traffic impacts associated with Alternative 6 are addressed in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR. As indicated in Section 4.12.1 of the SPAS Draft EIR, under Alternative 6, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant. However, a significant and unavoidable impact would occur related to the volume to capacity level at one intersection within the CTA. Alternative 6 would also result in significant and unavoidable construction-related impacts to the on-airport transportation system. Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternative 6; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur. Alternative 6 would improve access to the CTA by adding the ITF and providing a dedicated busway from the ITF and from parking facilities in

Manchester Square to the CTA. In addition, Alternative 6 would provide connectivity to regional transit, which would further improve access to the CTA.

Regarding the characterization of Alternative 6, contrary to the comments provided, Alternative 6 includes a 604-foot westerly extension of Runway 6L/24R; in addition, the runway would be widened to 200 feet. This alternative does not include a new Lincoln Boulevard/Sepulveda Boulevard interface. The intersection would remain in its current configuration, although there may need to be a minor modification of the right turn move from southbound Sepulveda Boulevard to westbound Lincoln Boulevard. As noted above, there would be no acquisition within, or impacts to, the Westchester Business District and no homes would be acquired.

Regarding the comments and characterization pertaining to Alternative 8, this alternative includes a CONRAC in Manchester Square. Addition of a CONRAC and an ITF, and a dedicated busway from these facilities to the CTA, would reduce access within the CTA by reducing the number of shuttles. In addition, Alternative 8 would provide connectivity to regional transit, which has the potential to further improve traffic in the CTA. As this alternative does include a CONRAC, no reimbursement of CFCs would be required.

SPAS-PC00130-47

Comment:

Attachment of Detail Comments and Questions for LAWA to address as part of the final release of the SPAS DEIR due 10/10/2012

Los Angeles International Airport -- LAX Specific Plan Amendment Study Draft EIR July 2012

General comment: These comments are by no means comprehensive as we have been given inadequate time to fully evaluate the statements and studies presented in the 12,000 pages (6000 DEIR, supporting 6000 SPAS Report).

These comments were prepared by many readers. Many, but not all, have specified a specific section in the DEIR. Comments are in regular text and Questions are in italics. These are supplemental to the general issues and questions raised in the basic letter, ARSAC position letter with questions, and other attachments where questions are asked.

Response:

The comment is noted. Please see Responses to Comments SPAS-PC00130-48 through SPAS-PC00130-386 below. LAWA provided a 75-day review period for the SPAS Draft EIR. Public Resources Code Section 20191(a) requires that the review period for a Draft EIR that is submitted to the State Clearinghouse for review shall be at least 45 days. The review period for the SPAS Draft EIR provided an additional 30 days for public comment.

The comment inaccurately describes the length of the SPAS Draft EIR and the Preliminary LAX SPAS Report. The text of the SPAS Draft EIR is approximately 1,800 pages in length. Printed appendices total approximately 3,000 pages, much of which consists of model output data sheets. Appendix K2-6, which includes intersection level of service worksheets, is provided in electronic format only and is approximately 3,000 pages in length. As authorized by State CEQA Guidelines Section 15147, Draft EIR appendices present highly technical and specialized analyses, and the text of the SPAS Draft EIR contains sufficient information to permit full assessment of significant environmental impacts by reviewing agencies and the public. The text of the Preliminary LAX SPAS Report is 259 pages. Appendices to the Preliminary LAX SPAS Report are approximately 2,900 pages in length.

SPAS-PC00130-48

Comment:

The newly referenced check in for a midfield terminal, for instance, is noted as non-spas and is not in the existing Master Plan. Question: What is the basis for LAWA interpretation of SPAS project relevancy for inclusions in this DEIR? Doesn't inclusion of this have a ripple impact on CTA parking?

Response:

As described in Chapter 1 of the SPAS Draft EIR, the primary focus of the SPAS is on potential alternatives to the LAX Master Plan improvements defined in the Stipulated Settlement as the Yellow Light Projects. The Yellow Light Projects are listed in Section 2.3.1 of the SPAS Draft EIR. While the focus of SPAS is on alternatives to the Yellow Light Projects, such as the GTC and its associated roadways and one of the two APM systems proposed under the LAX Master Plan, the SPAS alternatives also take into consideration key non-Yellow Light projects and include proposed modifications to, or proposed deletion of, these non-Yellow Light projects.

Chapter 5 of the SPAS Draft EIR analyzes the cumulative impacts of the alternatives and related projects. The cumulative impacts analysis presented in the SPAS Draft EIR considers, among other things, specific projects at and near LAX, including those that would be carried out or approved by LAWA, as well as those outside LAWA's control. The Midfield Satellite Concourse (MSC) fits this criterion for inclusion in the SPAS Draft EIR as a cumulative project. The MSC was a component of Alternative D and was addressed in the program-level LAX Master Plan EIR. The MSC, including the concourse and gates, associated taxiways, and passenger processing facilities, will be subject to a project-level EIR when the project is proposed for implementation. As explained in Section 3 of Appendix F-2 of the Preliminary LAX SPAS Report, several cumulative projects, including the MSC, were assumed in the simulation analysis of future conditions with implementation of the SPAS alternatives. Therefore, the simulation analysis represents future conditions with the airfield and terminal changes associated with each of the SPAS alternatives as well as changes associated with cumulative airfield-related projects. Please see Response to Comment SPAS-AL00007-44 for a listing of the other cumulative projects included in the simulation analysis of future conditions.

SPAS-PC00130-49

Comment:

The way that the alternatives are presented makes it nearly impossible to ensure we understand what was evaluated in any particular circumstance. Question: How can we determine what is assumed in each evaluation? How does LAWA justify the tearing and reference to Alt D EIR without specificity?

Response:

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3, and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. Methodologies and assumptions used in the various analyses are identified in Chapter 4 of the SPAS Draft EIR, with details provided in the appendices. The commentor does not provide any specific examples of instances where the commentor was unable to understand what was evaluated in the Draft EIR; therefore, no specific response can be provided. Similarly, the comment regarding tiering (which was not used for preparation of the SPAS Draft EIR) and the reference to Alternative D are not specific enough to provide a response. Please see Response to Comment SPAS-PC00130-14 regarding the incorporation of portions of the LAX Master Plan Final EIR by reference.

SPAS-PC00130-50

Comment:

The 2006 Stipulated Settlement calls for reworking the Master Plan to include potential alternative designs, technologies, and configurations that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers (the "Alternative Projects"). Question: How has LAWA determined which projects are part of SPAS and how is it finishing the task to incorporate the entire package of projects into a coherent, comprehensive group of projects into a Master Plan?

Response:

The five LAX Master Plan components required to be addressed in SPAS--the GTC, APM2 from the GTC to the CTA, demolition of CTA Terminals 1 through 3, north runway reconfiguration, and onsite road improvements associated with the GTC and APM2--are identified in Section 7.H.1 of the LAX Specific Plan, as amended, which requires LAWA to initiate a complete LAX Specific Plan Amendment Study prior to seeking an LAX Plan Compliance determination for any one of these Yellow Light Projects. These projects are also defined in the Stipulated Settlement. Although these projects have independent utility from other LAX Master Plan projects, the SPAS improvements, together with the non-Yellow Light Master Plan projects that have already been implemented or are planned for future implementation, would provide a comprehensive set of improvements to LAX.

SPAS-PC00130-51

Comment:

Hydrology can impact long term viability of the north airfield from impacts of an unknown water source that can flood areas, distribute pollution, and has caused sink holes. We note that LAWA is making changes to the Argo Ditch Flood Channel as noted in Hydrology tech reports 6 and S-5. Question: On what basis has LAWA confirmed that projects won't change underground water pathways causing problems? How has LAWA analyzed past sink hole occurrences? By what authority have they redesigned the Argo ditch without coordinating with the design authority?

Response:

Sink holes are not a common occurrence at LAX although very isolated sink holes have occurred. During construction of the North Outfall Replacement Sewer, which was completed in 1993, a sink hole occurred in an area of sandy soils to the south of Taxiway E. Another sink hole occurred between Runways 6L/24R and 6R/24L in 2002. More recently, two sink holes occurred in the vicinity of Taxiway R as a result of construction activity associated with the water deluge system. The sink holes were not caused by an unknown water source. The recent sink holes and the sink hole in 1993 were isolated incidents related to construction activities or failed equipment. The cause of the sink hole in 2002 was unrelated to construction activity but there is no evidence to suggest that it was caused by an unknown water source. In all of these cases, the sink holes were filled immediately. No damage to people or equipment, including aircraft, occurred and no active runways or taxiways were compromised. The isolated sink holes at LAX have not resulted in impacts to aviation safety. If sink holes were to occur in the future, similar remedial actions would be implemented to fill the sink hole and prevent further damage. As a result, no environmental impacts would result from unexpected sink holes. The commentor provides no substantiation of the claim that there is an unknown water source at the airport that could result in flooding, distribute pollution, or cause sink holes. As noted on page A-8 of the 2008 SPAS NOP, the depth to groundwater at LAX is generally greater than 90 feet and perched groundwater conditions have been noted in the upper 20 to 60 feet at some locations at the airport. Perched groundwater is a small, isolated area of groundwater that is perched above and separated from the main water table by an aquiclude, which is a saturated geologic unit that is incapable of transmitting significant quantities of water under ordinary hydraulic gradients. Due to its isolated nature, perched groundwater does not distribute pollution or contribute to flooding. There is no evidence to suggest that perched groundwater is responsible for any sink holes at LAX. As noted above, three of the four sink holes that have occurred at LAX over the past 20 years have resulted from improper construction practices. As discussed in Section 2.3.1 of the SPAS Draft EIR, the SPAS Draft EIR is a programmatic document, thus no design or engineering plans are currently available. An EIR is not

required to speculate about the environmental consequences of future development that is unspecified or uncertain. (Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502.) However, if an alternative is selected, detailed analysis associated with individual project components would be conducted during engineering design to verify that there would be no impacts to groundwater prior to construction. Also, as discussed in Section 4.8.7 of the SPAS Draft EIR, Mitigation Measure MM-HWQ (SPAS)-1 would ensure that impacts to hydrology and water quality would be less than significant.

Regarding the commentor's reference to the "design authority," it is assumed that the commentor is referring to the U.S. Army Corps of Engineers (USACOE). The Argo Drainage Channel is not under control of USACOE, although USACOE has regulatory authority over jurisdictional areas associated with the Argo Drainage Channel and mitigation for impacts. Please see Response to Comment SPAS-PC00130-201 regarding USACOE jurisdiction.

SPAS-PC00130-52

Comment:

Question: IF NOP was released in 2010 shouldn't data used in analyses be from then forward? Is there a table of data periods used for the various analyses and the period covered by the data? Why must LAWA choose, in some cases year old data instead of from NOP inception for twelve months since monthly values are frequently available?

Response:

As explained on pages 4-4 and 4-5 of the SPAS Draft EIR, where possible, October 2010 was used as the baseline date for characterizing existing conditions in the environmental analysis. Where existing conditions data specific to October 2010 were not available or where October 2010, by itself, was not an appropriate representation of baseline conditions, the various sections of the SPAS Draft EIR identify this fact, explain what data were used to determine existing conditions, and provide evidence of why this information is representative of baseline conditions. For example, in some cases, available reports and other documentation were only available for timeframes preceding 2010. For those topics which relied upon site surveys, such information was collected during preparation of the Draft EIR, typically in 2011. Due to the highly developed nature of LAX and the surrounding communities, and the lack of economic growth in recent years, site conditions at and around LAX have not materially changed. Therefore, the available information in 2009 or 2011 that was used to characterize baseline conditions is considered to be generally representative of 2010 conditions.

For certain analyses, a full year's worth of data was considered necessary and appropriate to characterize existing baseline conditions. Such is the case relative to existing aircraft noise, existing aircraft-related criteria and toxic air pollutant emissions (the latter of which was used as the basis for the human health risk assessment), and existing airport traffic generation, whereby the variability in airport operations throughout the year, especially seasonal variations, results in "existing" conditions for those topics being very different depending on time of year. Similar to the approach used in the LAX Master Plan Final EIR, airport operations data for the prior calendar year, which in the case of the SPAS EIR NOP is 2009, were used to define existing baseline conditions for those topics. It was necessary to assess a full year of data, in order to first identify a peak month in the year and, second, identify an average day in the peak month, to derive peak month average day (PMAD) activity characteristics, which are required for modeling purposes. The peak month within the 2009 calendar year was August 2009, from which a PMAD was identified and used in the design day flight schedule (DDFS) analysis for the SPAS Draft EIR.

It is customary for operational analyses to be based upon a calendar year (i.e., January to December), although a PMAD can be calculated based on a rolling sum of 12 months of data. Had a rolling 12 months been used for the SPAS DDFS, the time period that would have been evaluated would have been June 2009 through May 2010, as May 2010 was the most recent monthly data set available at the time the operational analysis was initiated. In that time period, the peak month was March 2010. However, it is known that, historically, the busiest months at LAX in terms of both operations and passenger volumes are the summer months (June, July, or August). In order to provide an analysis that is reflective of conditions at LAX, it was important to select a PMAD in the summer months to reflect the

schedule practices of the airlines during the summer time period. Schedule practices vary by season, and affect such characteristics as city pairs, time of operations, fleet mix, frequencies, and other factors. As noted above, the peak month with the highest number of monthly operations in the period of June 2009 through May 2010 was March 2010, with 48,899 operations, representing 8.8 percent of the total 12-month operations. The PMAD number of operations would have been 1,577 in an average day in March 2010 (48,899 divided by 31 days). However, if one were to select a peak summer month within that time period, that month would have been August 2009, the same month that was used in the SPAS DDFS analysis. With 48,448 operations, August 2009 represented 8.7 percent of the total 12-month operations, and yielded a PMAD number of operations at 1,563. The difference between the PMADs in March 2010 and August 2009 is only 14 operations (1,577 vs. 1,563), i.e., seven aircraft. Considering this minimal difference, selecting the month of August 2009 instead of March 2010 as a peak month would be preferable in order to ensure that the baseline DDFS reflected typical peak passenger and operation volumes as well as summer air carrier scheduling practices. Therefore, an average day in August 2009 would have been selected as the PMAD even if a rolling time period had been used instead of the 2009 calendar year time period.

SPAS-PC00130-53

Comment:

Reference to the Alt D EIR is generally used as justification for not studying something yet specifics are not included in this DEIR document (ie archeology, hydrology issues). Question: Please create a list of each element that is not being freshly studied.

Response:

As described on page 7-6 in Section 7.7 of the SPAS Draft EIR, the Initial Study included in the October 2010 LAX SPAS EIR Notice of Preparation, provided as Appendix A of the SPAS Draft EIR, determined, for the reasons explained therein, that effects on the following resource areas would result in no impact, or less than significant impacts, and were therefore not addressed in the SPAS Draft EIR: agricultural resources, geology and soils, mineral resources, population/housing, and recreation.

In addition, as explained on page 4-2 of the SPAS Draft EIR, the text under the heading of "Introduction" for each of the 13 sections in the environmental impacts analysis chapter (Chapter 4) briefly describes the issues addressed in the analysis and identifies related topics. The Introduction also identifies any specific issue area of the topic that is not being addressed as part of the SPAS Draft EIR and provides a discussion explaining the reasons why. In many cases, the 2010 LAX SPAS EIR Notice of Preparation/Initial Study determined impacts to specific issue areas would to be less than significant. In accordance with Sections 15063(c)(3)(A) and 15128 of the State CEQA Guidelines, further analysis of specific issue areas where impacts were determined to be less than significant in the Initial Study is not required and was not provided. The specific issue areas where it was determined, in accordance with the State CEQA Guidelines, that further analysis was not required in the SPAS Draft EIR, and the specific pages of the SPAS Draft EIR which explain the reasons for such determinations, are as follows:

- paleontological resources (see page 4-337 in Section 4.5.1);
- risk of upset related to facilities that handle large volumes of toxic or flammable materials which include the Central Utility Plant (CUP), Liquefied Natural Gas (LNG)/Compressed Natural Gas (CNG) facilities, and LAXFUEL Fuel Farm (see page 4-483 in Section 4.7.2.1);
- risks associated with exposing people or structures to wildland fires (see page 4-573 in Section 4.7.3.1);
- potential for accidental releases of a hazardous material or substance to occur from the routine use, transport, and disposal of potentially hazardous materials or substances (see page 4-573 in Section 4.7.3.1);
- groundwater supply and recharge (see page 4-599 in Section 4.8.1);
- impacts related to inundation by seiche, tsunami, and mudflow (see page 4-599 in Section 4.8.1);
- potential for impacts related to dividing an established community (see page 4-641 in Section 4.9.1);
- employment and visitor-related demand for parkland, libraries, and schools (see page 4-993 in Section 4.11);
- inert solid waste disposal (see page 4-1353 in Section 4.13.2.1); and

- reclaimed water use (see page 4-1379 in Section 4.13.4.1).

Please note that potential impacts to archaeological resources and hydrology/water quality from implementation of the SPAS alternatives are addressed in Sections 4.5 and 4.8 of the SPAS Draft EIR, respectively.

Lastly, as discussed on page 1-105 in Section 1.7 of the SPAS Draft EIR, portions of the SPAS Draft EIR incorporate by reference information from other documents that are available to the public. In such cases, the document being incorporated by reference is identified by name and the information from that document is summarized in the relevant SPAS Draft EIR discussion. In particular, portions of the following documents were incorporated by reference in the SPAS Draft EIR:

- LAX Master Plan Final EIR (December 2004); and
- LAX Master Plan Alternative D Mitigation Monitoring and Reporting Program (MMRP) (September 2004).

The documents listed above are available for public review at Los Angeles World Airports, Capital Programming and Planning Division, One World Way, Los Angeles, CA 90045, and are also accessible via the internet at www.ourlax.org.

SPAS-PC00130-54

Comment:

Alternative 7 includes moving runway 24R 100' south. It seems to be a hybrid of ARSAC submittal and the LAWA fatal flaw versions. Question: How was the included version of 100'S determined? Where is this documented? Could this version be tweaked to improve taxiway changes or improve the gate availability of a new Terminal 0?

Response:

Chapter 5 of the Preliminary LAX SPAS Report describes the SPAS concept development process, including how each of the nine alternatives addressed in the SPAS Draft EIR were formulated, refined, and advanced into the Draft EIR analysis. This discussion includes Alternative 7, which would relocate Runway 6R/24L 100 feet southward.

The commentor provides no information describing what are identified as the "ARSAC submittal" and the "LAWA fatal flaw versions" nor is there any indication as to how or why the taxiway changes and Terminal 0 gating associated with Alternative 7 are in need of improvement. As such, it is not possible or necessary to provide a well-reasoned response to the comment.

SPAS-PC00130-55

Comment:

Safety is the political reason given for runway expansion. The Academic Panel/NASA study (NASS) is referenced in the DEIR as equivalent to several less rigorous studies. LAWA also included an FAA response letter to the NASS and called it "a study." Question: When establishing safety needs and status why didn't LAWA include the Academic response to the FAA letter? Why were none of the NTSB concerns with FAA design criteria not included in the discussions of runway safety? What other studies of runway safety have been conducted that are relevant to the design issues at LAX? How has LAWA reviewed actual data? Has LAWA kept incursion and excursion data for LAX since it stopped posting it on it's website? When the FAA fails to post incident data for extended periods of time after an event does LAWA keep track status or ask why it has not been presented?

Response:

Section 2.2 of the SPAS Draft EIR describes the many problems associated with the current outdated design of the north airfield and presents the project objectives that are intended to address those problems. Enhanced safety is one of several reasons for the airfield improvements, along with other

reasons such as improving the efficiency of airfield operations, accommodating a greater percentage of departing aircraft, and minimizing or eliminating the extent to which Runway Protection Zones overlay residential areas.

The academic panel's responses to the FAA letter regarding the draft North Airfield Safety Study (NASS) is included in Appendix H-6 of the Preliminary LAX SPAS Report. (See pages 195 through 215 of the 276-page PDF of Appendix H-6.)

The commentor provides no description or citation of what "NTSB concerns with FAA design criteria" are of concern.

In addition to a summary of the NASS, Section 4.7.2 of the SPAS Draft EIR summarizes six other safety studies pertaining to the north airfield.

Table 4.7.2-7 of the SPAS Draft EIR presents runway incursion/incident data for LAX from 2001 through 2011, based on information both from the FAA and from LAWA records as indicated in the sources description in the table.

SPAS-PC00130-56

Comment:

The comments below are for the Main Document of the DEIR.

Page 1-1 1. INTRODUCTION AND EXECUTIVE SUMMARY
General Question: Overview includes reference to Palmdale airport. Has LAWA officially given up LA/Palmdale operational certificate and therefore all responsibility?
Page 1-1 to 1-2 1.1.1 LAX Master Plan and EIR

Response:

As described in Topical Response TR-SPAS-REG-1, LAWA expended substantial effort to help develop air service at Palmdale Regional Airport (PMD). Efforts began with LAWA working cooperatively with the "Wheels-Up Palmdale Coalition" to apply for federal grants that would support the establishment of air service at PMD. Those efforts culminated in the award of a FAA grant in August of 2006 that would provide operating subsidies to an air carrier that offered service from PMD, and subsequently to the launch of a new flight operated by United Airlines between PMD and SFO in June of 2007. After 18 months in which LAWA, the U.S. Department of Transportation, and the City of Palmdale spent more than $238 per passenger to subsidize air service at PMD, United Airlines discontinued flights and LAWA transferred the airport operating certificate to the City of Palmdale.

SPAS-PC00130-57

Comment:

In December 2004, the Los Angeles City Council approved the LAX Master Plan2 and related entitlements for the future development of LAX. The LAX Master Plan provides the first major new facilities for, and improvements to, the airport since 1984, and plans to accommodate projected growth in passengers and cargo at LAX through the year 2015. The LAX Master Plan serves as a broad policy statement regarding the conceptual strategic planning framework for future improvements at LAX and working guidelines to be consulted by LAWA as it formulates and processes site-specific projects under the LAX Master Plan program.

Environmental Review and Approval (Phase III): Phase III of the LAX Master Plan Study included a thorough evaluation of the potential environmental effects associated with the four build alternatives,..

Questions:
1. Since they reference the phases, does LAWA have to review the assumptions to see if their assumptions still justify disregarding ideas?
2. Must this also only go to 2015 or could it be required to go to 2020 or beyond?

Response:

The subject text from pages 1-1 and 1-2 of the SPAS Draft EIR summarizes the history and background of the LAX Master Plan, particularly with regard to the formulation and evaluation of the five alternatives addressed in the LAX Master Plan EIR, leading to Alternative D being ultimately selected for approval. The discussion's reference to the three study phases associated with the LAX Master Plan simply provides a breakdown of the major steps over the 10-year planning and approval process for the LAX Master Plan, and does not suggest or require that the assumptions associated with the LAX Master Plan process need to be re-evaluated.

While the planning horizon year for the LAX Master Plan was 2015, the SPAS planning horizon year is 2025; however, both planning frameworks are based on the same future passenger activity level of 78.9 MAP. As provided in footnote 13 on page 1-47 of the SPAS Draft EIR, 78.9 MAP is consistent with the regional growth projections adopted in the 2012 SCAG Regional Transportation Plan. Alternative D, the LAX Master Plan alternative that was approved in 2004, was designed with a maximum of 153 gates to provide a practical capacity of 78.9 MAP at LAX in 2015 and all of the SPAS alternatives also reflect that 153-gate limitation and future activity level of 78.9 MAP. While the future passenger activity level of 78.9 MAP was held constant between the LAX Master Plan and SPAS, all other aspects of the SPAS analysis account for the planning horizon year being 10 years later than assumed for the LAX Master Plan, including future regional surface traffic projected for 2025 and air quality emission factors projected for 2025.

SPAS-PC00130-58

Comment:

Figure 1-2 shows the existing airport and the Argo drainage channel just north and east of 24R to west of 24R. Will there be a chart that shows the utilities underground such as the major sewer lines and tunnels in the area so that construction impacts are assessable? If included, where is it? if not included, why not?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion as to why detailed utility plans are not required to be provided in a program-level EIR.

SPAS-PC00130-59

Comment:

Page 1-9 1.1.2 The Stipulated Settlement
In January 2005, the City of El Segundo, the City of Inglewood, the City of Culver City, the County of Los Angeles, and the Alliance for a Regional Solution to Airport Congestion (Petitioners) filed petitions challenging the approval of the LAX Master Plan Program. In early 2006, the City of Los Angeles and Petitioners agreed to, and the court approved, a Stipulated Settlement of the subject lawsuits (Stipulated Settlement) "... is designed for a practical capacity of 78.9 MAP while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region,..."

Question: How does LAWA interpret this statement of minimizing environmental impacts? Is the best performing environmentally preferred since it minimizes impacts? What specific conditions are used by LAWA to create conditions that encourage airlines to go to other airports?

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. As presented throughout Chapter 4 of the SPAS Draft EIR and summarized in Table 1-6, numerous LAX Master Plan commitments and mitigation measures are delineated for each of the SPAS alternatives to minimize environmental impacts. Please

refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California.

SPAS-PC00130-60

Comment:

Page 1-10 1.2 Summary of Proposed Project
The proposed project is the LAX SPAS. As noted above, the SPAS process involves the identification and evaluation of potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address.

Question: Where is the table of problems that the Yellow Light Projects were designed to address and what quantifiable numbers are assigned to these problems so that we can assess if the solutions are adequate or in the case of multiple solutions which more closely matches the solution of the Yellow Light Project?

Response:

The problems that the Yellow Light Projects were designed to address, and to which the SPAS alternatives would provide solutions, are identified in Section 2.3.1 of the SPAS Draft EIR and in Chapter 3 of the Preliminary LAX SPAS Report. The subject discussions of those problems are presented in the context of describing the various options for addressing the problems by way of the different alternatives being considered by LAWA. Given that SPAS Alternative 3 reflects the improvements proposed in the LAX Master Plan Yellow Light Projects, the analysis of each of the SPAS alternatives presented throughout the SPAS Draft EIR provides a reasonable and meaningful basis of comparison between alternatives. This is particularly evident in the detailed tables within Chapter 4 and the summary tables in Chapter 1, which provide side-by-side comparisons of the SPAS alternatives, including Alternative 3, which represents the Yellow Light Projects.

SPAS-PC00130-61

Comment:

Page 1-10 1.2.1 Project Objectives
1. Provide North Airfield Improvements that Support the Safe and Efficient Movement of Aircraft at LAX...
Existing problems associated with the outdated airfield design include, but are not limited to, the following:
- LAX does not have an airfield, in either the north complex or the south complex, that is fully designed for the largest aircraft types currently in service (i.e., Aircraft Design Group (ADG) V aircraft, such as the Boeing 747-400, and ADG VI aircraft, such as the Airbus A380).
- The north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase aircraft delay.

Question: 1.2.1 bullet 1
LAWA states that neither of the airfield complexes meet Grp V or Grp VI but the basis for the SAIP was that it would. Are the designs contemplated supposed to meet the requirements in place at the time Alt D was passed, requirements current at NOP release, or current/future requirements in the draft AC 150/5300-13A approved last month?

Is it the LAWA position that all standards MUST be met without waiver or is there some standards of practicality and cost involved? What are those factors?

Question: 1.2.1 bullet 2
If the north airfield configuration is not "...optimal for safety and increase aircraft delay." What condition is acceptable for safety and aircraft times and how was it determined? What assumptions in airfield conditions are made? What would be the time phasing of implementation of the design changes? Is the

answer that LAWA is to provide safety based on total project implementation? What technical improvements and signage marking improvements are assumed? What about staffing and work load? What other factors has LAWA included in its assumptions?

Response:

The runway-taxiway separation standards in FAA Advisory Circular (AC) 150/5300-13 Airport Design used by LAWA for the preparation of the SPAS Draft EIR do not differ from the runway-taxiway separation standards provided in FAA AC 150/5300-13A Airport Design

The SPAS Draft EIR does not require that all standards be met without waiver. As discussed in Section 1.2.1 of the SPAS Draft EIR, Project Objectives, SPAS is designed to provide north airfield improvements that, among other things, minimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service. The SPAS process sought to identify potential amendments that plan for the modernization and improvement of LAX, specifically while enhancing safety and security, minimizing environmental impacts on surrounding communities, and creating conditions that encourage airlines to go to other airports in the region. (See Section 1.1.2 of the SPAS Draft EIR.) The SPAS alternatives represent a reasonable range of alternatives that would attain most of the basic objectives of the project, including the objective discussed above, sufficient to allow informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).)

As described in Section 4.7.2 of the SPAS Draft EIR, the specific airfield design associated with each of the seven airfield improvement alternatives responds differently to the objective of meeting FAA design standards without waivers and to other safety considerations evaluated in that section. Those differences are summarized in Table 4.7.2-16 of that section. Similarly, Appendix F-2 of the Preliminary LAX SPAS Report provides a detailed discussion of aircraft taxi times and other efficiency-related considerations. The analysis included in that appendix discusses the relevant assumptions. The LAWA Board of Airport Commissioners (BOAC) will take those differences into account along with many other considerations related to the alternatives, such as costs, environmental impacts, responsiveness to project objectives, public input, and other factors in deciding which, if any, alternative to approve.

The SPAS Draft EIR is a programmatic document. Therefore, the certainty, timing, nature, and extent of, and the approach to the modifications discussed therein, have not been determined at this programmatic level of conceptual planning. More specific project details would be developed, and project-level environmental review would occur, prior to implementation of any specific component of a SPAS alternative.

SPAS-PC00130-62

Comment:

Page 1-11
- The primary north airfield departure runway (6R/24L) is too short for certain larger aircraft (e.g., fully loaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield, resulting in less efficient operations and disproportionate environmental impacts.

Question: Although ARSAC has acknowledged support for extending 24L east, how many flights per year are not acceptable for assignment to the current north runway? Is this based on a decision made by a carrier or is it related to the aircraft and weather conditions? How is this decision made? Please quantify the number of aircraft involved and where they originated for the past years and show how this can be extrapolated to the future. What is the time taxiing penalty for aircraft moving from one complex to the other?

Response:

A Takeoff Length Analysis for heavy aircraft, those with a maximum certificated takeoff weight (MTOW) of 255,000 pounds or more, was prepared for Runway 6R/24L. The analysis used the airplane manufacturers' airport planning manuals to identify the MTOW of each aircraft included in the 2020 No Yellow Light Project flight schedule. This analysis can be found in Appendix E1-5 of the Preliminary LAX SPAS Report. As presented on the histogram of Table 1A (vertical blue dashed line), the analysis

states that when using the 2020 No Yellow Light Project flight schedule, approximately 54.1 percent of departures can be accommodated, leaving 45.9 percent of heavy aircraft departures at MTOW that cannot be accommodated on Runway 6R/24L when the temperature is 59°F. As presented on the histogram of Table 1B (vertical blue dashed line), at 86°F, 36.6 percent of departures can be accommodated, leaving 63.4 percent of heavy aircraft departures at MTOW that cannot be accommodated on Runway 6R/24L.

There are many factors that influence actual required runway length for individual aircraft. These factors include aircraft and engine type, actual aircraft takeoff weight, aircraft flap settings, airport elevation, temperature, wind speed and direction, runway surface conditions, and runway grade. The decision of whether a specific runway is acceptable to an aircraft is ultimately made by the air carrier and aircraft pilots.

The time taxiing from one airport complex (airfield) to the other is variable and depends on a number of factors including taxi route distance, aircraft taxi speed, other taxiing traffic, and Air Traffic Control instructions.

SPAS-PC00130-63

Comment:

- The outdated airfield design creates a situation where aircraft are at increased risk of hazards. Those hazards include potential collisions with other aircraft, such as when a landing aircraft might move in the path of a departing aircraft (incursion). 7 Other potential hazards include, but are not limited to, insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways and aircraft on nearby taxiways. Such hazards contribute to the potential for conflicts between taxiing aircraft and ground vehicles on runways, taxiways, and nearby service roads

Question: The reference to incursions says that it is based on inadequate spacing between runways and taxiways. Every one of the designs submitted by LAWA to move north which includes a center line taxiway leaves a condition where an aircraft on the taxiway is closer to an adjoining runway than is currently the condition between the two runways. What is the basis for which LAWA has determined that this is acceptable?

Response:

There are various FAA separation guidelines for aircraft operations on runway and taxiway surfaces. These separation guidelines vary depending whether a runway is next to a runway or a runway is next to taxiway or a taxiway is next to a taxiway. Tables 3-6 and 3-7 of FAA Advisory Circular (AC) 150/5300-13A Airport Design identifies all the required separation standards for runway to taxiway for all types of aircraft. Section 316 of AC 150/5300-13A discusses the parallel runway separation requirements (i.e., the distance required between parallel runways). According to Section 321(a)(2) of AC 150/5300-13A, the standards for separation of runway to taxiway are determined by landing and takeoff flight path profiles and physical characteristics of aircraft. Because there is no centerfield taxiway on the north airfield, runway-to-runway separations apply to current conditions. Runway-to-taxiway separation guidelines would apply with the addition of a centerfield taxiway.

SPAS-PC00130-64

Comment:

- With one exception, the north airfield configuration does not comply with FAA Runway Safety Area (RSA) requirements.

Question: If the RSA requirements are not met, how does LAWA justify or explain that these RSA would not have changed in previous approved Master Plans or the FAA Record of Decision? Will LAWA explain and list all of the requirements which will NOW be required to be met, but were acceptable to be grandfathered as is before?

Response:

Section 4.7.2 of the SPAS Draft EIR outlines existing Runway Safety Area (RSA) dimensions and proposed RSA dimensions for the north airfield alternatives. U.S. statutory requirements for compliance with all current RSA requirements by December 31, 2015, are also addressed in this section.

SPAS-PC00130-65

Comment:

- The north airfield high-speed taxiways are not in compliance with FAA Engineering Brief No. 75.

Question: "The north airfield high-speed taxiways are not in compliance..." LAWA is not required to meet every Engineering Brief as these are advisory. Has LAWA performed studies or reviewed any FAA studies to show that these must be required? Past history on the south complex was that high speed turnoffs (hst) were ADDED for safety and then it was recently changed for the SAIP which removed hst's. How do we know that the requirement will not change back to hst's before the north is reconfigured?

Response:

As noted in FAA Engineering Brief (EB) No. 75, published in 2007, "Key elements of this Engineering Brief will be incorporated into the new comprehensive revisions to Advisory Circular 150/5300-13..." The current version of FAA Advisory Circular (AC) 150/5300-13A Airport Design includes the design strategies which were recommended in EB No. 75. Page 11 of EB No. 75, for example, provides that high-speed exit taxiways that provide a direct route across a parallel runway are problematic. Likewise, Section 411(b) of AC 150/5300-13A states "Do not provide direct access from a high speed exit to another runway."

Due to the acceptance of Airport Improvement Program (AIP) funding and Passenger Facility Charge (PFC) funds, LAWA is required to adhere to current FAA guidance for airport design standards incorporated in the FAA Advisory Circulars. LAWA cannot predict what changes to future ACs may be and is only able to design based on current ACs until new revisions are released. The north airfield does not meet current AC 150/5300-13A standards for high-speed exit taxiways.

The South Airfield Improvement Project (SAIP) removed high-speed exit taxiways that provided direct access to another runway. However, with the addition of the midfield parallel taxiway, high-speed exit taxiways were included that terminate at the taxiway and do not cross other runways.

SPAS-PC00130-66

Comment:

- The north airfield does not provide sufficient areas at the end of the runways for holding arriving flights and sequencing departing aircraft.

Question: What requirement is not met to specify that the "north airfield does not provide sufficient areas... for holding ...flights..." Since this study is to address items fixed by yellow light projects, what specifically changed in Alt D to justify this?

Response:

Under Section V.D of the Stipulated Settlement, LAWA is to focus the SPAS on, among other things, potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address. Section 2.2 of the Preliminary LAX SPAS Report and Section 2.2 of the SPAS Draft EIR set forth the SPAS project objectives and the problems that the Yellow Light Projects were designed to address. As stated therein, one of the SPAS objectives is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX, and one of the problems associated with the outdated airfield design that prevents achievement of this goal under existing conditions is that the north airfield does not provide sufficient areas at the end of the runways for holding arriving flights and sequencing

departing aircraft. This condition is existing and is not triggered by any change in the previously approved LAX Master Plan (Alternative D).

As identified on page 2-18 of the SPAS Draft EIR, the LAX Master Plan Alternative D (which is SPAS Alternative 3), included a 1,280-foot easterly extension to the Runway 24L end as well as a 980-foot extension of Taxiway E to support this runway extension. The taxiway extension would provide additional taxiway length for departure aircraft queuing. Similarly, each of the remaining north airfield alternatives in the SPAS Draft EIR proposes an extension to the Runway 24L end. In addition to providing additional runway length for departing aircraft, the associated taxiway extension to reach the proposed Runway 24L threshold would provide an additional portion of taxiway for departure aircraft queuing. Under Alternatives 1, 2, and 5 through 7, Taxiway E would be extended 950 feet to the east; under Alternative 4, Taxiway E would be extended 535 feet east. Table 1-12 in Chapter 1 of the SPAS Draft EIR provides a summary of safety and efficiency enhancements of each alternative, including which alternatives provide increased separation between runways and taxiways, which better enables taxiing and holding aircraft to stay clear of arriving and departing aircraft, as well as improvements that provide more holding areas near the end of runways thereby improving the ability to sequence departures.

The extension of both the runway and taxiway would allow air traffic control more flexibility in queuing departing aircraft. It would have the added benefit of moving the departure queue east, away from the taxiways immediately in front of the terminal areas where at peak departure times, queued departure aircraft currently hinder the ability for air traffic control to efficiently move aircraft in and out of those terminal areas. Additionally, this extra taxiway area would enhance air traffic control's flexibility in holding arriving aircraft while awaiting their gate assignments.

SPAS-PC00130-67

Comment:

- The existing Runway Protection Zone (RPZ) associated with Runway 6L/24R includes residential uses.

Question: If "existing Runway Protection Zone (RPZ) ...includes residential uses" what changes are in the yellow light project that fixed this or caused it to be worse? The RPZ was approved by the FAA in its Record of Decision.

Response:

The LAX Master Plan (Alternative D) Yellow Light Project at issue is the north airfield reconfiguration. Both existing conditions and the LAX Master Plan north runway reconfiguration include residential parcels within the north airfield RPZ. As shown in Table 4.7.2-3 in the SPAS Draft EIR, there are a total of 9 residential parcels within the north airfield RPZ under baseline conditions. As shown in Table 4.7.2-11 in the SPAS Draft EIR, there would also be a total of 9 residential parcels within the north airfield RPZ under Alternative 3 (i.e., LAX Master Plan Alternative D). As stated on page 4-534 of the SPAS Draft EIR, under Alternative 3, "[t]here would be no notable change in the runway safety areas at the eastern end of Runway 6L/24R, including the RPZ which currently encompasses numerous businesses and residences in Westchester." The same is true under Alternatives 2, 4, and 7. Alternatives 1, 5, and 6 would reduce the number of residential parcels within the RPZ from 9 to 0 (see Tables 4.7.2-9, 4.7.2-13, and 4.7.2-14, respectively of the SPAS Draft EIR).

SPAS-PC00130-68

Comment:

Page 1-11
In identifying and evaluating alternatives to the north airfield improvements called for in the LAX Master Plan, LAWA is seeking to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX; specifically, such improvements:
- Are consistent with FAA design standards for the largest aircraft types currently in service and anticipated for the future (ADG V and VI aircraft) for all weather conditions;

- Minimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service;
- Reduce the potential for airfield hazards, including incursions, and enhance the overall safety of airfield operations through runway and taxiway design;
- Accommodate a greater percentage of departing aircraft, thereby increasing airfield efficiency;
- Provide sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft; and
- Minimize or eliminate the extent to which Runway Protection Zones overlay residential areas.

Question: the six bullets state LAWA north airfield improvement technical goals, but LAWA will never have unlimited funds. Please identify associated costs to relate these goals.

Response:

Costs for objectives or goals cannot be estimated, as different physical improvements may achieve the same goals. However, costs can be estimated for specific improvements. Rough-order-of magnitude cost estimates were developed for the improvements associated with the SPAS alternatives, and are included in Appendix G of the Preliminary LAX SPAS Report. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00130-69

Comment:

Going back to the purpose of this study, however,--to identify the issues Alt D addressed which of these were directly accomplished in Alt D? What numerical improvements did (do) they achieve?

Response:

The purpose of the SPAS is not, as the commentor suggests, to identify the issues addressed by the approved LAX Master Plan (Alternative D). To clarify, under Section V.D of the Stipulated Settlement, LAWA is to focus the SPAS on, among other things, potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address. Section 2.2 of the Preliminary LAX SPAS Report and Section 2.2 of the SPAS Draft EIR set forth the SPAS project objectives and the problems that the Yellow Light Projects were designed to address. The bullet points referenced in the comment are not intended to represent problems that the Yellow Light Projects were designed to achieve but instead represent the north airfield improvements LAWA is seeking to provide that support the safe and efficient movement of aircraft at LAX, as explained in both the SPAS Draft EIR and the Preliminary LAX SPAS Report. This is consistent with the purpose of the Stipulated Settlement and with CEQA. Under Section V.E of the Stipulated Settlement, LAWA has discretion to determine an appropriate methodology to conduct the LAX SPAS, which includes the identification of project objectives.

It is not clear what types of "numerical improvements" the commentor is seeking to identify. The SPAS Draft EIR and Preliminary LAX SPAS Report identify how and to what extent Alternative 3, and all of the SPAS alternatives, provide solutions to the problems that the Yellow Light Projects were designed to achieve. For more information, please see Section 2.3.1 of the SPAS Draft EIR and Section 6.3 of the Preliminary LAX SPAS Report.

SPAS-PC00130-70

Comment:

2. improve the Ground Access System at LAX to Better Accommodate Airport-Related Traffic, Especially as Related to the Central Terminal Area
Page 1-11 Travelers, visitors, employees, vendors, and others utilizing the commercial passenger terminal at LAX, defined by the CTA, have various ground access options including private vehicles, transportation service providers (i.e., taxis, shuttles, limousines, etc.), and public transit. Ground access within the CTA, where departing and arriving passengers are dropped off and picked up at curbside or can park their vehicles, is provided by an upper-level roadway and a lower-level roadway that loop

around the center of the CTA and connect with surface streets on the east side of the CTA. The subject roadway system poses a number of concerns relative to traffic flows including, but not limited to, the following:
- CTA roadway system design currently creates queuing, weaving, and conflict points at various locations that impede traffic flow;
- During peak travel times, inbound airport traffic currently extends out of the CTA roadways onto public streets and may worsen as airport activity returns and grows;

Question: 1.2.1 Topic 2 - Improve Ground Access
What were the Alt D ground access improvements? Numerically, how many more people could get to their gates? Again, all of the bullets describe more of the "problems" with the current rather than what improvements were accomplished that need to be addressed. Since virtually no significant changes are imposed on CTA traffic by the LAWA alternatives what does LAWA believe should be done to improve traffic? Is this objective considered lower priority? How can these improvements be combined with the serious capital improvement and refurbishment projects that LAWA must entertain just to keep LAX open?

Response:

SPAS Alternative 3 proposes the ground access improvements associated with Alternative D of the LAX Master Plan. Those improvements are described in Section 2.3.1.3.3 of the SPAS Draft EIR. Relative to "Numerically, how many more people could get to their gates?" it is unclear as to how exactly the question pertains to the traffic flow discussion on page 1-11 of the SPAS Draft EIR, as cited in the comment; however, in general terms, traffic flow characteristics do not determine the number of people that reach their intended gates, but do have an influence on whether they reach their gates on-time or not.

Section 2.2 of the SPAS Draft EIR presents the SPAS project objectives, including those related to ground access within the CTA. As described therein, LAWA is seeking to improve the ground access system at LAX to better accommodate airport-related traffic, especially within the CTA. In particular, LAWA is seeking to:
- Design CTA roadway segments and curbside areas that reduce traffic "bottlenecks" and congestion;
- Reduce the volume of private vehicles accessing the CTA by reconfiguring and developing airport facilities that allow for alternative drop off and pick up of passengers outside the CTA;
- Reduce roadway congestion and improve performance and reliability of the airport ground transportation system by providing a grade-separated/dedicated transportation system that connects airport and transit facilities to the CTA; and
- Integrate LAWA's ground access system improvements with regional transit facilities nearby, including the recently approved Metro Crenshaw/LAX Transit Corridor and Station.

The objective of reducing traffic at LAX, specifically the CTA, was not a "lesser" objective. In fact, as described in Section 2.3 of the SPAS Draft EIR, the SPAS alternatives provide numerous options for ground access improvements, including, among other things, constructing an automated people mover to link to the CTA (Alternatives 3 and 9), adding new curbside space with the addition of Terminal 0 (Alternatives 1, 2, 5, 6, and 7), and development of an elevated/dedicated busway (Alternative 8). As indicated in Section 2.2 of the SPAS Draft EIR, these improvements are designed to improve the ground access system at LAX and better accommodate airport related traffic, especially related to the CTA.

Should the LAWA Board of Airport Commissioners (BOAC) select and approve a SPAS alternative, implementation of the ground access improvements proposed under that alternative would be integrated as appropriate with other ongoing capital improvement projects at LAX. Such integration would be further assessed and coordinated in conjunction with more detailed design and construction level planning of the approved SPAS improvements.

SPAS-PC00130-71

Comment:

Page 1-12 3. Maintain LAX's Position as the Premier International Gateway in Supporting and Advancing the Economic Growth and Vitality of the Los Angeles Region
LAX serves a key role in the region's economy, particularly as related to LAX's position as the international gateway for the western United States. According to a study completed in 2007 by the Los Angeles Economic Development Corporation (LAEDC), over the course of 2006 an average transoceanic flight traveling round-trip from LAX everyday added $623 million in economic output and sustained 3,120 direct and indirect jobs in Southern California with $156 million in wages. 8 Given the continued growth in, and reliance on, new large aircraft such as the Airbus A380 by major airlines operating on those long distance international routes, it is important that LAX be able to effectively accommodate those aircraft. LAX is a major employer on both a local level and a regional level. According to the LAX Master Plan Final EIS/EIR, on-airport employment at LAX provided almost 59,000 jobs and, on a larger-scale, LAX related regional employment provided over 400,000 jobs and $60 billion in economic output.

Question: Although air commerce is tied strongly to our regional economy, where does LAWA prove that the amount of economic benefits couldn't be provided by having the same amount of economic activity disbursed around the region. How is this objective consistent with fixing the problems which Alt D fixed? Are the numbers quoted based on LAWA'S dominant position with 75% of all activity? A prior 1968 LAX Master Plan EIR recognized the importance of regionalization. Is this objective lost by the current LAWA administration?

Response:

The discussion cited from page 1-12 of the SPAS Draft EIR provides economic and employment data specific to LAX, as taken into consideration in formulating the SPAS project objectives. Note that economic/social impacts, such as employment and distribution of economic activity, are not required to be evaluated under CEQA. (State CEQA Guidelines Section 15064(e).) The SPAS project objectives appropriately pertain to improvements and activities at LAX. Objective 3, to which commentor refers, is a general comment which the improvements and modifications contained in Alternative D sought to promote. Relative to the relationship between SPAS improvements proposed at LAX and the regionalization of air travel demand in Southern California, please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California.

SPAS-PC00130-72

Comment:

It also talks about job growth. Since there's not unlimited funds, has LAWA done an evaluation of job/economic impacts of the various types of jobs? We understand that landside projects provide twice the job creation of airside ones and 8X more economic benefits. What has LAWA's studies shown?

Response:

The content of this comment is similar to comment SPAS-PC00130-725; please refer to Response to Comment SPAS-PC00130-725.

SPAS-PC00130-73

Comment:

Page 1-12 10Los Angeles Economic Development Corporation, Economic Impact Analysis - LAX Airfield and Terminal Construction Projects, 2011.

Question: LAWA appears to be relying on this LAEDC analysis. Where in the document pile is this analysis? If not included, please make it available.

Response:

LAWA compiled copies of the references used in the preparation of the SPAS Draft EIR pursuant to Public Resources Code Section 21092(b)(1) and Section 15087(c)(5) of the State CEQA Guidelines, including the report by the Los Angeles Economic Development Corporation identified in this comment. These documents were available for review at LAWA's Administrative offices during the public comment period and continue to be available for review upon request.

SPAS-PC00130-74

Comment:

Page1-13 4.Plan Improvements That Do Not Result in More Than 153 Passenger Gates at 78.9 MAP In identifying and evaluating alternatives to the demolition of Terminals 1, 2, and 3, LAWA is seeking to maintain consistency with the LAX Master Plan design for a total of 153 passenger gates, which was based on a future passenger activity level of 78.9 MAP at LAX in 2015

Question: No more than 153 gates? What schedule for phase out of gates has LAWA created or assumed when evaluating their alternatives? Is there a plan to remove the remote gates? Separate projects like the AA gates in the southeast portion of LAX are apparently not part of this study since a separate NOP and negdec was used. What other gate related projects are contemplated?

Response:

Please see Response to Comment SPAS-PC00130-170 with respect to the phasing out of the west remote gates, and Response to Comment SPAS-PC00130-173 regarding the fact that the American Airlines commuter facility was included in the 153 gates. The only other gate-related projects currently being contemplated for LAX are the Bradley West Project, currently under construction, the future Midfield Satellite Concourse, and the Passenger Boarding Bridge Replacements/Improvements. All of these projects are identified in Section 5.3 of the SPAS Draft EIR and accounted for in the cumulative impacts analysis in Chapter 5 of the SPAS Draft EIR.

SPAS-PC00130-75

Comment:

Page 1-13 5. Enhance Safety and Security at LAX
In identifying and evaluating alternatives to the Yellow Light Projects, which are key elements of the LAX Master Plan, LAWA is seeking to maintain the ability of the LAX Master Plan, if and as modified by the outcome of the SPAS process, to enhance safety and security at LAX.

Question: There were dozens of recommendations in the 2004 RAND Study of LAX Security. Which of these have been introduced in the new alternatives? If not in the alternatives, how many have been addressed by separate projects?

Response:

The SPAS Draft EIR is a programmatic document, prepared pursuant to Section 15168 of the State CEQA Guidelines. A program EIR is prepared at a more general level of planning than a project level EIR, and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts." (State CEQA Guidelines Section 15168(b)(4).) At this level of planning, the SPAS alternatives do not include the final design of any of the individual project components, including the security measures to be incorporated into the proposed facilities. Security measures would be determined and addressed during project-level planning and design, at which time any impacts of these measures would be analyzed, and, if required, feasible mitigation measures imposed. Additionally, security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. Please also see Response to Comment SPAS-PC00130-424 regarding the implementation of security issues recommended by the RAND Corporation.

SPAS-PC00130-76

Comment:

Page 1-13 6. Minimize Environmental Impacts on Surrounding Communities
LAX is a major international airport located within a very urbanized area, with established communities situated directly to the north, east, and south. These communities are affected to varying degrees by existing operations at the airport. Recognizing that these existing effects to the surrounding communities may change based on the alternatives being considered in SPAS, LAWA seeks to identify and apply ways to avoid, reduce, or minimize environmental impacts on surrounding communities

Question: 1.2.2 Airfield Improvements
Where is taxiway placement to facilitate movement listed? How much improvement can be accomplished by moving and changing taxiways as opposed to runways? How do the analyses used in this study differ from those in the Northside Safety Analysis for which LAWA paid a couple million dollars?
Where are the assumptions listed used in the estimates? ie location of gates, taxiways, types of aircraft, frequency of aircraft, tower staffing, etc.

Response:

Taxiway construction and placement is discussed throughout Chapter 1, Introduction and Summary, and Chapter 2, Project Description, of the SPAS Draft EIR. The safety section, Section 4.7.2, also discusses the safety benefits of including a taxiway, such as movement of aircraft and minimizing aircraft incursions. As discussed and illustrated in Chapter 2 of the SPAS Draft EIR, the placement of each taxiway or taxilane is based on a separation standard per FAA guidelines. The facilities impacted by the placement of the taxiways/taxilanes are discussed in Sections 2.3.1 and 2.3.1.10 of the SPAS Draft EIR.

The EIR analyzed an alternative that did not propose runway relocation and did include taxiway modifications. Specifically, Alternative 2 does not include the relocation of Runway 6L/24R or Runway 6R/24L, but does include the modification and addition of high-speed runway exits (taxiways) to enhance safe and efficient movement of arriving aircraft. (See page 2-17 and Table 2-2 of the SPAS Draft EIR.)

The SPAS Draft EIR effort and the Los Angeles International Airport North Airfield Safety Study (NASS) are not easily comparable because they were conducted for different reasons and/or objectives. As stated in the Executive Summary of the NASS, the primary aim of the study was to "estimate as specifically as possible the level of future safety of several alternate configurations of the LAX North Airfield." An auxiliary goal was "to provide useful information about the capacity implications of the various configurations," in light of projections about LAX traffic levels in 2020.

The project objectives for the SPAS Report were more numerous, including (1) to improve the ground access system at LAX, (2) to maintain LAX's position as the premier international gateway in the Los Angeles region, and (3) to enhance safety at LAX, among others. The various project objectives for the SPAS effort are identified in Section 2.2 of the SPAS Draft EIR.

The NASS is referenced and summarized on page 4-505 in Section 4.7.2 of the SPAS Draft EIR and provided in its entirety as Appendix H-6 of the Preliminary LAX SPAS Report. Please refer to Response to Comment PC00130-168 regarding the NASS and the opinion of the academic panel involved in that study.

The elements and assumptions used in both studies are identified throughout the documents. The assumptions considered for the development of the SPAS alternatives can be found in the Preliminary LAX SPAS Report.

SPAS-PC00130-77

Comment:

Page 1-13 7. Produce an Improvement Program that is Efficient, Sustainable, Feasible, and Fiscally Responsible
The nature and scope of improvements associated with the Yellow Light Projects are substantial. Each of those projects represents a major undertaking, requiring substantial funding; considerable planning, engineering, and design; and major construction activities. The costs for each of these major improvement projects would be financed primarily by Airport Improvement Program grants, Passenger Facility Charges (PFCs), and bond sales, all of which are subject to federal requirements regarding expenditure of airport funds, and which will also be utilized to finance other airport improvements outside of the scope of SPAS. The ability to successfully fund such improvements is, to a large extent, dependent on whether certain airport activity levels are reached. Additionally, the types of improvements associated with the Yellow Light Projects and the alternatives thereto represent major long-term investments in the airport's infrastructure that must be efficient and sustainable for many years. The construction of these major improvements poses the potential for major disruptions to existing airport operations. In identifying and evaluating alternatives to those Yellow Light Projects, LAWA is seeking to produce an improvement program that is efficient, sustainable, feasible, and fiscally responsible. (underline is emphasis)

Question: Since LAWA is concerned about cost, what has LAWA identified as a prioritization for projects? Are any time phasing issues addressed? Has LAWA identified the potential disruptions? What are they? What assumptions have been made in the establishment of the costs? Who prepared the cost estimates and how reliable are they? ie Alt D was estimated at $6B prior to the approval cycle and increased to $12 at approval. Current estimates for Alt D we've heard exceed $100B. What is the actual current estimate? Cost estimates were done for LAWA in 2008 for SPAS. How have they changed in scope and confidence?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding phasing plans for SPAS. As discussed in that response, the SPAS Draft EIR is a programmatic document. Therefore, because there are no specific improvement or modification designs, potential disruptions associated with project implementation are unknown. A project-level environmental review will be conducted for individual projects prior to construction.

An EIR shall inform decision-makers and the public about the potential significant environmental effects of the proposed project and identify means to reduce, avoid, or mitigate environmental damage. (State CEQA Guidelines Section 15002(a).) The comment does not raise an significant environmental issue or address the adequacy of the environmental analysis included in the SPAS Draft EIR. It raises funding and economic questions, which need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Therefore, because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.) However, rough-order-of-magnitude cost estimates were prepared for all of the components of all of the SPAS alternatives evaluated in the SPAS Draft EIR (see Chapter 8 and Appendix G of the Preliminary LAX SPAS Report). These cost estimates did not rely on any previous cost estimates that may have been prepared. In addition to providing an equal basis of cost comparison between the SPAS alternatives, as presented in Chapter 8 of the Preliminary LAX SPAS Report, these cost estimates were used as the basis for the program-level air quality construction analysis. In order to complete the ROM cost estimates, assumptions were made as to the characteristics of the various improvements. The SPAS ROM cost estimates, prepared by professionals experienced in the development of construction cost estimates and familiar with the construction programs at LAX, were detailed and thorough estimates for this level of planning and, as the name states, provide a rough-order-of-magnitude of the costs associated with constructing the improvements associated with the various SPAS alternatives. The cost estimates consider a wide range of factors, and provide assumptions and allowances for those factors that are not known at this time. Assumptions used in the calculations are identified in Appendix G of the Preliminary LAX SPAS Report. The commentor provides no substantiation for the claim that costs associated with the approved LAX Master Plan have grown to over $100 billion. The estimated

costs to complete the remaining projects associated with the approved LAX Master Plan (i.e., Alternative 3) are presented in Chapter 8 of the Preliminary LAX SPAS Report, with details provided in Appendix G.

SPAS-PC00130-78

Comment:

Page 1-13 1.2.2 Overview of SPAS Alternatives
Nine alternatives offering various options to the Yellow Light Projects, including one alternative that provides for implementation of the Yellow Light Projects (i.e., implement the Yellow Light Projects as generally reflected in the LAX Master Plan instead of options to those improvements), are addressed within this Draft EIR for SPAS. Figure 1-4 identifies the location of the Yellow Light Project areas. The types of improvements used to define the key characteristics of each SPAS alternative can be grouped into the following three categories:
- Airfield improvements - Airfield improvements include changes to the runways, taxiways, navigational aids, and service and maintenance roads associated with the north airfield. The primary differences in airfield improvements associated with the various SPAS alternatives pertain to:
- Separation distances between runways and taxiways. Separation distances largely determine the maximum size aircraft that can freely operate on that system under various visibility conditions, and, in certain visibility conditions, would either require Federal Aviation Administration (FAA) approval of special operating procedures (i.e., Modifications of Standards or other forms of operational waivers) or would be prohibited;

Question: Where is taxiway placement to facilitate movement listed? How much improvement can be accomplished by moving and changing taxiways as opposed to runways? How do the analyses used in this study differ from those in the Northside Safety Analysis for which LAWA paid a couple million dollars?
Where are the assumptions listed used in the estimates? ie location of gates, taxiways, types of aircraft, frequency of aircraft, tower staffing, etc.

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-76; please refer to Response to Comment SPAS-PC00130-76.

SPAS-PC00130-79

Comment:

Page 1-14
- Whether an increase in the separation distance between Runway 6L/24R and Runway 6R/24L would allow for the construction of a centerfield parallel taxiway between the runways, to enable aircraft arriving on the outboard (6L/24R) runway to exit onto the center taxiway and hold while aircraft are departing on the inboard (6R/24L) runway, thereby allowing the departing aircraft to safely pass before the arriving aircraft proceeds to the terminal gates;
- The extent to which the Lincoln Boulevard and the Argo Drainage Channel would have to be modified in order to accommodate a northerly shift in the alignment of Runway 6L/24R;
- Whether Runway 6R/24L would be extended 1,250 feet eastward to provide greater departure length in west flow condition that would better accommodate departures of large aircraft on longhaul flights and improve the balance between the north airfield and the south airfield relative to such departures;
Whether Runway 6L/24R would be reconfigured or extended to relocate its associated RPZ with respect to residential uses, and/or to improve the north airfield and the south airfield relative to the operation of aircraft;
- How RSA requirements would be met, in terms of runway extensions, declared distances,11 displaced thresholds, 12 or a combination thereof; and
- Separation distances between Runway 6R/24L, Taxiway E, Taxilane D, the adjacent vehicle service road, and the aircraft gates/parking positions at the north end of the CTA, which largely determine the maximum size aircraft that can either freely operate on that system or would be subject to certain

limitations, particularly as related to the interface between aircraft going to or from the gates at Terminals 1 through 3 and aircraft taxiing to the east end of Runway 6R/24L for departure.

Question: Which flight mix was assumed as several were developed during the past four years? How was it determined? How does this flight mix assumption compare with the Part 161 study that LAWA is about to complete?

Response:

Please refer to Appendix F-1 of the Preliminary LAX SPAS Report. A future Design Day Flight Schedule (DDFS) was developed to represent forecasted activity levels for a Peak Month Average Day (PMAD) in 2025 (the forecast year). Specifically, aircraft fleet mix assumptions for the 2025 DDFS for scheduled passenger and cargo activity were based on the 2009 DDFS. Please see Appendix F-1, page 22 for a detailed discussion of the methodology for developing the 2025 DDFS. Information about the 2009 DDFS is also available in Appendix F-1.

In Appendix F-1, the LAX 2025 fleet mix is presented in Table 12 entitled "LAX 2025 DDFS Aircraft Fleet Mix by Airplane Design Group." Section 4.2 in Appendix F-1 of the Preliminary LAX SPAS Report presents the methodology used to develop the 2025 fleet.

The commentor is inquiring about how the 2025 DDFS compares to the LAX Part 161 Study currently under way. The LAX Part 161 Study and the SPAS Draft EIR analyzed two different forecast years, 2017 and 2025, respectively. Therefore, no valid comparison could be drawn because 8 years separate the two forecast years.

SPAS-PC00130-80

Comment:

- Terminal Improvements - Terminal improvements consist primarily of additions/demolitions to existing terminals/concourses, and, for most SPAS alternatives, the construction of a new terminal - Terminal 0 ("zero"). The primary differences in terminal improvements for the various SPAS alternatives are directly related to the movement of runways and taxiways under each alternative. Specifically, the alternatives differ in the location of their building limit lines (i.e., the "object free" safety area along runways and taxiways where no part of a structure can be present) and their aircraft parking limit lines (APLL) (i.e., the safety clearance setback area along runways and taxiways into which no part of an aircraft parked at a gate can extend). The northernmost limit of concourse building area and/or aircraft gate parking positions is defined by the southernmost safety clearance distance for the runways and taxiways in the north airfield. Depending on the location and design of the runways and taxiways associated with each alternative, the locations of the building limit line and APLL may differ between alternatives.

Question: How has LAWA reconciled and quantified Alt D improvements for comparison to current program proposed? ie More or less terminal area? curb space? seating area near gates? concessions? TSA and baggage handling areas?

What assumptions has LAWA made about the need and schedule for fixing current infrastructure? ie upper roadway, bridges, terminals, etc .

Response:

As described in Section 2.3.1.3 of the SPAS Draft EIR, the LAX Master Plan (Alternative D) is part of the SPAS alternatives as a fully integrated alternative which encompasses airfield, terminal and ground access components. Alternative 3 is the CEQA "No Project" Alternative and represents what would reasonably be expected to occur if the LAX Master Plan, and all associated improvements envisioned in the LAX Master Plan document, were to be implemented.

Throughout the SPAS Draft EIR, comparisons between Alternative 3 and the remaining SPAS alternatives can be drawn, in that all of the alternatives are addressed in each topical section and the tables within those sections provided side-by-side data for the alternatives. Specifically, Table 1-2 in Chapter 1 of the SPAS Draft EIR presents a preliminary evaluation of the relationship between SPAS

project objectives and alternatives. Table 1-3 of the SPAS Draft EIR also describes each of the SPAS alternatives' characteristics as related to the SPAS Draft EIR objectives. Please see Table 2-2 in Chapter 2 of the SPAS Draft EIR for a summary of elements studied in the SPAS Draft EIR analyses such as terminal and ground access key elements.

Regarding "seating area near gates, concessions, TSA and baggage handling areas," as a program-level document, the SPAS Draft EIR did not specify these elements. LAWA would analyze these project-specific elements as part of any subsequent project-level CEQA documentation.

Regarding "the need and schedule for fixing current infrastructure," ongoing maintenance and miscellaneous improvements were considered in the cumulative impacts analyses provided in Chapter 5 of the SPAS Draft EIR. Please see pages 5-17 through 5-22 for a description of the ongoing and planned airfield-, terminal-, and infrastructure/security-related improvements at LAX. Additionally, LAWA provides information on ongoing projects on their website under "Projects and Reports": http://www.lawa.org/welcomeLAX.aspx.

SPAS-PC00130-81

Comment:

Page 1-17 1.2.2 Terminals....
In general, the building lines and APLLs associated with most of the alternatives extend southward, overlapping, to varying degrees, portions of the concourse areas for Terminals 1 through 3, which would require removal (demolition) of those building areas that encroach past the building limit line and/or the elimination or reduction in aircraft size capability of gate parking positions that encroach past the parking limit line. Conversely, the building and parking limit lines associated with several alternatives do not extend as far south as the limit lines defined in the LAX Master Plan, which assumed the movement of Runway 6R/24L 340 feet south and defined the northerly building limits for the Tom Bradley International Terminal (TBIT) West Gates, currently under construction as part of the Bradley West Project, and the future Midfield Satellite Concourse (MSC). In those cases, establishing building and parking limit lines farther north than the current LAX Master Plan limit lines would allow the opportunity for a future northward extension (i.e., an addition to) the north concourses for Bradley West and the MSC.
While the amount of concourse area and the layout of aircraft gates vary between alternatives, none of the SPAS alternatives includes more than 153 passenger gates.

Question: The locations and purposes of the terminal 0 appear to have been located to create new gate types which are different than existing ones. Where is the chart which shows the number and types of gates that must be present? Include this information since although there is to be no more than 153 gates it appears that "remote gates" are not taken out of service.

Response:

Please see Figure B entitled "SPAS Alternatives 1 and 2 Gate Positions" in Attachment A to Appendix F-1 of the Preliminary LAX SPAS Report. Table 13 in Appendix F-1 illustrates the number of terminals and number of gates at each terminal under Alternatives 1 through 4. Alternatives 5 through 7 also include Terminal 0. However, as indicated in Section 2.3 of the SPAS Draft, the configuration of the terminal facilities in these alternatives are similar to Alternative 1. The minor differences are discussed in the section for each alternative in Section 2.3 of the SPAS Draft EIR.

As described in Sections 2.3.1.1.2, 2.3.1.2.2, 2.3.1.5.2, 2.3.1.6.2, and 2.3.1.7.2 of the SPAS Draft EIR, and as depicted in Figure B, Terminal 0 would include seven gates, under SPAS Alternatives 1, 2, 5, 6, and 7. Six out of seven gates would be Aircraft Design Group (ADG) III capable (depicted with representative Boeing 737-800s with winglets), with the seventh gate being ADG IV capable (depicted with a representative Boeing 757-200 with winglets).

The comment reads: "Include this information since although there is to be no more than 153 gates it appears that "remote gates" are not taken out of service." It is unclear which "remote gates" the commentor is referring to. As described in Section 2.3.1.1.2 of the SPAS Draft EIR, the west remote gates (currently located between Taxiways E17 and AA) would be eliminated upon completion of the

airfield and terminal improvements. That is reflected in Figure B, referenced above, whereby the west remote gates are no longer in service. Also, under Alternative 1, construction of Terminal 0 will replace gates lost or downsized at Terminals 1 through 3.

SPAS-PC00130-82

Comment:

Page 1-17 1.2.2 Terminals....
Certain alternatives propose a westerly realignment of the Terminal 3 concourse to provide a wider alleyway between the concourses at Terminals 2 and 3 for aircraft taxiing.
For those alternatives that include development of the new Terminal 0, the existing alignment of Sky Way (the primary access road connecting CTA to southbound Sepulveda and 96th Street Bridge) would be shifted east, into the area now occupied by the Park One parking lot, providing an improved entrance roadway into the CTA.

Question: 1.2.2 Terminals
The shift of the 96th street bridge appears to be the only major change to CTA traffic flow despite numerous suggestions during SPAS meetings. is there a listing of all of the traffic flow improvements in one location or table? Please list them as it appears that most have not been considered.

Response:

The SPAS Draft EIR considered numerous ground access improvements, including those related to the CTA. Please see Section 2.3.1 of the SPAS Draft EIR for a discussion of the types of ground access improvements proposed for each alternative. Additionally, as provided on page 1-17 of the SPAS Draft EIR, the proposed ground access improvements consist of changes to on-airport roads, the addition of specific transportation facilities, and development of dedicated access (i.e., busway or APM) into the CTA. The EIR also took into account non-Yellow Light ground access improvements, including an Intermodal Transportation Center (ITC) and an APM connecting the ITC and Consolidated Rental Car Facility (CONRAC) to the CTA.

All ground access suggestions during the SPAS meetings were considered. Please see Appendix D-1, Community Meetings, and Appendix D-2, Advisory Meetings, of the Preliminary LAX SPAS Report, for a list of advisory committee and community meeting dates, meeting materials, and public comments from community meetings. Section 5.1.2.1 provides a detailed discussion of the initial ground access concepts. Please see Chapter 5 and Appendix E2 of the Preliminary LAX SPAS Report which identifies the entire SPAS Concept Development Process and includes the ground access concepts that were provided at the SPAS meetings. The ground access concepts in SPAS Draft EIR are the final concepts that were included for the EIR analysis.

SPAS-PC00130-83

Comment:

Page 1-25 1.2.2 Alternatives interchangeability and functionally defined

Alternative 4 represents what would reasonably be expected to occur if all ongoing and reasonably foreseeable non-Yellow Light improvements identified in the LAX Master Plan (i.e., "Alternative D") were implemented, and none of the Yellow Light Projects or any of the identified alternatives to the LAX Master Plan Program were constructed or implemented. Analysis of Alternative 4 will allow decision-makers and the public to evaluate the impacts of simply eliminating the Yellow Light Projects from the LAX Master Plan Program. Alternative 4 is a fullyintegrated alternative, consisting of airfield, terminal, and ground access components. Ongoing and reasonably-foreseeable non-Yellow Light projects that would be developed include the Bradley West Project, an extension to Runway 6R/24L for RSA improvements, the MSC and related new passenger processor and connector within the CTA, and various terminal improvements. In addition, a CONRAC at Parking Lot C would be constructed and a new parking structure would be developed at the ITC site to accommodate the public parking displaced by the CONRAC. A portion of the Argo Drainage Channel would be covered to comply with existing RSA requirements by converting a portion of the existing open unlined channel to an enclosed concrete

box culvert. There would be no modifications to Lincoln Boulevard under this alternative. This alternative is illustrated in Figure 1-8.

Question:. How do Alternatives 3 and 4, the two LAWA identifies as unique and not "interchangeable" consider major capital improvements which will need to be made just to keep airport ground access functional? CTA upper roadway bridge repairs to take care of creeping rust issues. parking lots and passenger bridges to terminals etc.

Response:

Both Alternatives 3 and 4 include improvements designed to facilitate ground access. Alternative 4, for instance, includes the construction of a CONRAC at Parking Lot C, as well as a new parking structure to accommodate parking displaced by the CONRAC. (Section 1.2.2 of the SPAS Draft EIR.) Please see Section 1.2.2 of the SPAS Draft EIR for a discussion of the ground access improvements associated with Alternative 3.

Implementation of any of the SPAS alternatives, if approved, would be coordinated with other improvement projects, as well as with ongoing maintenance programs, at LAX as appropriate. The nature, characteristics, and timing of such coordination would be determined at the more detailed planning, design, and construction stages of each SPAS improvement project when implemented.

SPAS-PC00130-84

Comment:

Page 1-25 1.2.2 Alternatives interchangeability and functionally defined
Alternative 5 provides, as noted above, a focus on airfield improvements and associated terminal improvements, as may be compared to such improvements proposed under Alternatives 1 through 4. This alternative is compatible with the ground access improvements associated with Alternatives 1 and 2, as well as the ground access improvements associated with Alternatives 8 and 9, described below. The distinguishing feature of this alternative is the movement of Runway 6L/24R 350 feet north. Similar to Alternative 1, a new centerfield taxiway would be constructed, Runway 6R/24L would be extended, Taxilane D and Taxiway E would be modified/improved, and the service road would be relocated. Under this alternative, the taxilane/taxiway improvements would meet FAA design requirements to fully accommodate ADG VI aircraft. (Under Alternatives 1, 2, and 6, the taxiway configuration would either not meet or only partially meet ADG VI design standards, which would impose certain limitations and special requirements during the operation of those aircraft.) The increased runway-taxiway separation requirements under this alternative would cause the aircraft taxiway operations area to extend farther south than under Alternatives 1, 2, and 6, which, in turn, would result in comparatively less concourse and/or gate area for the potential TBIT extension and MSC extension. Under this alternative, a greater portion of Lincoln Boulevard would be below grade and/or tunneled than under Alternative 1. This alternative is illustrated in Figure 1-9.

Question: 1.2.2 Alternative 5 description notes that alts 1,2, and 6 taxiway/taxilanes would not fully accommodate ADG VI aircraft. What chart lists the taxiway/taxilane aircraft accommodations? Since the SPAS is supposed to address the same "problems" fixed by Alt D what specific changes in alt D changed taxiway/taxilane limits and how is this different from each of the alternatives?

Response:

A summary of north airfield runways and parallel taxiways compliance with FAA Airport Design Standards is provided in Table 4.7.2-8 of Section 4.7.2 of the SPAS Draft EIR. This table lists the differences between all of the alternatives in a tabular format. Additionally, Table 4.7.2-16 in Section 4.7.2 provides a summary of how each alternative relates to safety and efficiency enhancements to the north airfield, and Table 1-2 in Section 1 provides a preliminary evaluation of how each alternative responds to the objectives of the SPAS. In Section 2.3 of the SPAS Draft EIR provides a detailed discussion of each alternative, specifically the changes to north airfield runways and parallel taxilane/taxiway improvements. Chapter 6 of the Preliminary LAX SPAS Report describes how each of the SPAS alternatives addresses the criteria identified in Section V.D of the Stipulated Settlement, and Sections 6.3.1.5, 6.3.2.5, 6.3.4.5, 6.3.5.5, 6.3.6.5, 6.3.7.5, 6.3.8.5, and 6.3.9.5 specifically address how

and to what extent each of the SPAS alternatives provide solutions to the problems the Yellow Light Projects were designed to address.

SPAS-PC00130-85

Comment:

Page 1-25 1.2.2 Alternatives interchangeability and functionally defined
Alternative 6, similar to Alternative 5, also focuses on airfield improvements and associated terminal improvements, as may be compared to such improvements proposed under Alternatives 1 through 4. This alternative is compatible with the ground access improvements associated with Alternatives 1 and 2, as well as the improvements associated with Alternatives 8 and 9. The distinguishing feature of this alternative is the movement of Runway 6L/24R 100 feet north. Similar to Alternative 1, a new centerfield taxiway would be constructed. All other physical aspects of the airfield and terminal improvements associated with this alternative would be essentially the same as those of Alternative 1, described above, with a lesser portion of the Argo Drainage Channel requiring covering (i.e., conversion to a concrete box culvert) and a lesser portion of Lincoln Boulevard requiring tunneling. This alternative is illustrated in Figure 1-10.

Question: 1.2.2 Alternative 6 notes conversion of the argo ditch to a concrete box culvert. Since this is created to accommodate runoff and flow of water from an unknown water source what calculations has LAWA performed to ensure adequacy of flow capacity? Does it (or any other changes to the argo ditch) accommodate a 100 year storm (worst case flow condition)?

Response:

The Argo Drainage Channel does not convey runoff from an unknown water source; rather, the channel conveys stormwater from the Argo sub-basin, which is illustrated in Figure 4.8-1 of the SPAS Draft EIR. The modifications to the Argo Drainage Channel, proposed as a part of Alternatives 1, 5, and 6, have been developed at a program level of planning for SPAS. These alternatives do not define the final culvert design, including size of the culvert or the design storm that would be accommodated. These details will be determined and addressed at the project level, should one of those alternatives be approved. Please see Response to Comment SPAS-PC00130-169 for additional details regarding the design capacity of the Argo Drainage Channel improvements. As indicated in this response, and as stated in Mitigation Measure MM-HWQ (SPAS)-1, the design storm frequency used would be a minimum of a 10-year storm event in accordance with the City of Los Angeles Manual Part G, Storm Drain Design, Section G200 Hydrologic Design for areas without sumps (G 222, Design Frequencies),1 which is applicable to the airport. A depression or sump is an area from which there is no surface flow outlet and must meet one or more of the following conditions during a flood event: (1) Ponded depth of 3 feet or greater, and (2) Ponded water surface elevations within one foot below the base of adjacent dwellings resulting from construction of facilities with less than the design capacity. This condition does not apply if ponded water can escape as surface flow before reaching the base of adjacent dwellings during the design storm. There are no areas on the airport that meet these conditions. Therefore, LAX is subject to the criteria for areas without sumps (i.e., the 10-year storm event), noted above. This is considered an acceptable level of protection. Substantially larger storm events, such as the 100-year storm event, may result in short-term, localized flooding within portions of the airport. However, such a condition would occur so infrequently (i.e., there is a 1% probability that that such an event would occur in any given year) and would remain for a very limited period of time before flows would recess to the storm drain that investment in much larger infrastructure is not warranted unless there are special conditions such as sumps, for which a 50-year event is used as the design storm. Please also see Response to Comment SPAS-PC00130-273 for a discussion of the applicable flood standards.

1. City of Los Angeles, Department of Public Works, Bureau of Engineering, City of Los Angeles Manual Part G, Storm Drain Design, Hydrologic Design (G 200), June 1973.

SPAS-PC00130-86

Comment:

Page 1-26 1.2.3 Preliminary Evaluation of Relationship Between Project Objectives and SPAS Alternatives
Based on the project objectives presented above in Section 1.2.1 and the characteristics of the nine SPAS alternatives summarized in Section 1.2.2, Table 1-2 presents a preliminary evaluation of the relationship between each project objective and each SPAS alternative. A more detailed evaluation of that relationship will be completed in conjunction with further evaluation of the alternatives through preparation of the Final EIR and during the public hearings process. Table 1-3 provides additional information summarizing key characteristics associated with the SPAS alternatives that pertain to each objective. (underline for emphasis)

Question: The underlined sentence above states that further evaluations will be conducted. Is LAWA planning to recirculate their documents when this is done? How will LAWA ensure that each of the detailed assessments are changed to match the Alternative changes?

Response:

The subject statement was provided in anticipation of receiving comments during the public review period for the SPAS Draft EIR regarding the characteristics of each alternative and its environmental impacts. LAWA also received during the public review period comments and suggestions as to other potential alternatives that should be considered for SPAS. LAWA has carefully reviewed and considered all of those comments, prepared written responses to the comments, and, staff has recommended an alternative to the LAWA Board of Airport Commissioners (BOAC) for its consideration. As described in Chapter 2 of this SPAS Final EIR, the staff-recommended alternative is a combination of Alternative 1, for airfield and terminal improvements, and Alternative 9, for ground access improvements. The selection of Alternatives 1 and 9 combined as the staff-recommended alternative includes consideration of how these alternatives responded to the project objectives, in comparison to the other alternatives, based on existing information presented in Section 1.2.3 of the SPAS Draft EIR. Staff's evaluation of how the combination of Alternatives 1 and 9 respond to the project objectives is further described in detail in Chapter 2 of the Final EIR. Given that both Alternatives 1 and 9 were included in the SPAS Draft EIR analyses, and because no "significant new information" as defined in CEQA Guidelines Section 15088.5 has been added to the SPAS Draft EIR, there is no need to revise and/or recirculate the detailed assessment completed for the SPAS Draft EIR and circulated to agencies and the public.

SPAS-PC00130-87

Comment:

Page 1-45
Chapter1 -- Introduction and Executive Summary
This chapter introduces the project background and project description, an overview of the report organization, a discussion of areas of known controversy and issues to be resolved, and a delineation of documents that are incorporated by reference into this EIR. Also included is a summary of the environmental analysis and identification of the environmentally superior alternative. (underlined for emphasis)

Question: Since the analysis is summarized and environmentally superior alternative identified, why hasn't LAWA selected this as a preferred to go forward?

Response:

Please see Chapter 2 of this Final EIR regarding the rationale for the selection of the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, which includes an APM.

SPAS-PC00130-88

Comment:

Page 1-46 1.3 Organization of this EIR
Chapter 6 -- Evaluation of Amendments to the LAX Specific Plan
This chapter evaluates the environmental impacts associated with amendments to the LAX Specific Plan, including a revision to Section 7.H that would require completion of passenger and airline surveys and studies, the results of which would help inform LAWA as to potential actions that could be taken to encourage airlines to provide increased domestic passenger service at other airports in the region, particularly those owned or operated by LAWA, as well as administrative amendments to the LAX Specific Plan that might be needed depending on the SPAS alternative. (Underline for emphasis)

Question: If the underlined action to require passenger and airline surveys is performed, how will LAWA make these public and how will they correlate this information to result in actions?
What other Amendments to the LAX Specific Plan are contemplated? When will final versions of the changes become available and how will they be distributed?

Response:

It is anticipated that the summaries of the results of the surveys required by the potential amendment to Section 7.H of the LAX Specific Plan will be presented to the LAWA Board of Airport Commissioners (BOAC) and will also be accessible for public review. The specific details of this presentation are unknown at this time, but do not impact the analysis of environmental impacts that would result from this potential amendment. The manner in which the survey information would be correlated with actions for encouraging activity at other airports will depend on the content of, and responses to, the surveys, which are not known at this time.

Preliminary LAX Specific Plan amendments were described in Section 6.1 of the SPAS Draft EIR; an updated discussion of potential LAX Specific Plan amendments, as well as a discussion of potential amendments to the LAX Plan, is provided in Chapter 3 of this Final EIR. If the Board of Airport Commissioners chooses to adopt one of the SPAS alternatives, all amendments to the LAX Specific Plan necessary to effectuate this approval will receive consideration by other local agencies, including the Los Angeles City Planning Commission and the Los Angeles City Council. Notice of consideration of the amendments by these agencies will be provided pursuant to the Brown Act.

Comment:

Page 1-46 1.4 Executive Summary of Environmental Impacts Related to SPAS
Table 1-4 summarizes the environmental impacts after mitigation of the SPAS alternatives as identified in Chapter 4, Environmental Impacts Analysis, of this EIR. Impacts associated with implementation of the alternatives include those directly associated with proposed physical improvements (e.g., impacts to biological resources that would occur from grading activities, impacts to aesthetics, views, light, and glare that would occur from development of new structures or modification of existing structures). Impacts associated with implementation of the alternatives also include those associated with proposed or anticipated changes in airport operations (e.g., noise impacts, air pollutant emissions from aircraft operations, traffic impacts from vehicles traveling to and from the airport). The majority of the operations related impacts summarized in this section, and more fully addressed in Chapters 4 and 5, are primarily attributable to future growth in aircraft and passenger activity levels at LAX that are projected to occur independent of the SPAS alternatives. The Draft EIR analyzes and identifies mitigation for such impacts even though they are attributable to future growth not related to the proposed project.

Question: None of the past EIRs have mentioned sink holes, but we are aware that they are occurring all over the airport. What is the frequency and magnitude of the occurrences over the past 10 years? ie before and after the drought period? Since LAWA is now aware of the Manchester Tunnel and it had water before the drought, have they measured the water since the drought ended? Where are the results of the water tests from the Manchester Tunnel? What did they reveal?.

Response:

Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX and Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment.

SPAS-PC00130-90

Comment:

Page 1-47 1.4 Executive Summary of Environmental Impacts Related to SPAS
Specifically, the impacts analyses completed for the SPAS project include an evaluation of conditions projected to occur upon completion (buildout) of each alternative compared to conditions that existed at the time the Notice of Preparation (NOP) for the Draft EIR was published (i.e., existing baseline conditions). The analyses of operations-related impacts, such as those pertaining to air quality, noise, and traffic, account for the growth in activity projected to occur between 2009 (56.5 MAP and 1,493 average daily aircraft operations [landings and takeoffs combined]) and 2025 (78.9 MAP and 1,937 average daily aircraft operations). 13 This 30 to 40 percent increase in aircraft and passenger activity at LAX is projected to occur regardless of SPAS (i.e., would occur even if none of the SPAS alternatives were implemented). The SPAS Draft EIR analysis evaluates how the improvements specific to each alternative would interact with that projected growth and delineates the differences, or the similarities, in impacts between alternatives.

Question: How does the estimate of activity on page 1-46 2009 (56.5 MAP) to 2025 (78.9 MAP) correlate to what was used in the North Airfield Safety Study? Were the same flight mixes used? How do they differ?

Response:

The North Airfield Safety Study used a future Design Day Flight Schedule (DDFS) commensurate to 78.9 million annual passengers (MAP), the same MAP level as assumed under the SPAS Draft EIR analyses (as discussed on page 63 in Appendix A of Appendix E2-1 of the Preliminary LAX SPAS Report).

At the time the North Airfield Safety Study was initiated, the SPAS 2025 DDFS was not finalized and therefore not available to the North Airfield Safety Study team. However, a previous DDFS commensurate to 78.9 MAP had been developed for LAWA and was submitted to the North Airfield Safety Study team. This DDFS was previously developed by the LAWA technical consultant team using assumptions and methodology similar to those used in the SPAS Draft EIR analyses. Refer to Sections 4.1 and 4.2 of Appendix F-1 of the Preliminary LAX SPAS Report for details.

Regarding fleet mix differences, as shown in the table below, the fleet mixes assumed in the DDFS provided to the North Airfield Safety Study team and in the SPAS Draft EIR DDFS are similar in terms of percentages of total operations by Aircraft Design Group (ADG).

Percentages of Total Daily Operations

ADG	North Airfield Safety Study DDFS	SPAS Draft EIR 2025 DDFS
I	1.6%	0.6%
II	21.4%	21.0%
III	43.6%	46.5%
IV	20.4%	19.5%
V	11.2%	10.5%
V	1.8%	1.9%
Total	100.0%	100.0%

SPAS-PC00130-91

Comment:

Page 1-47 1.4 Executive Summary of Environmental Impacts Related to SPAS
As indicated in Table 1-4, impacts are anticipated to be less than significant after mitigation for all nine alternatives relative to most environmental topics. Unavoidable significant impacts are expected to occur for all alternatives relative to air quality, greenhouse gas emissions, human health risk, aircraft noise, construction equipment noise, on-airport surface transportation, and off-airport surface transportation.14 With the exception of construction equipment noise impacts, the vast majority of the unavoidable significant impacts that occur under all alternatives are primarily attributable to the projected growth in airport activity... (underlined for emphasis)

Question: Even though many impacts are significant and unavoidable, why hasn't LAWA presented the quantified each significant impacts in a way that each alternative performance can be compared and rank ordered? Will this be normalized to separate unavoidable impacts resulting from the assumed airport growth?

Response:

Table 1-5 of the SPAS Draft EIR provides a side-by-side summary comparison of the unavoidable significant impacts between alternatives which, in conjunction with summary of significant impacts and mitigation measures included in Chapter 1 of the SPAS Draft EIR, goes beyond the requirements of what must be included in the summary section of an EIR under State CEQA Guidelines Section 15123(b)(1). Depending on the relative value and importance that a reader may give to each type of environmental impact, the alternatives could be ranked based on those personal preferences. Table 1-5 includes a delineation of those unavoidable significant impacts that are caused primarily by the future growth in airport activity that would occur regardless of the SPAS alternatives.

SPAS-PC00130-92

Comment:

Pages 1-49 to 1-60 Table 1-5 Summary Comparison of Unavoidable Significant Impacts

Question: Table 1-5 What assumptions are made to show the differences in human health risk for each of the alternatives? Why is no runway separation best? and no airfield improvements worst by a significant amount. In Alt 4 are there no taxiway changes as well?

Response:

Please refer to the text in Section 4.7.1 and Appendix G1 of the SPAS Draft EIR for details regarding the human health risk analysis, which provides evaluation of possible impacts to human health for all alternatives. The calculations for the human health risk assessment were based on incremental TAC emissions associated with the SPAS alternatives activities relative to the 2009 environmental baseline. Please refer to Section 4.2.2 in the SPAS Draft EIR for detailed assumptions used in the modeling of the TAC emissions. In general, differences among alternatives are due to differences in aircraft operations associated with current conditions and various airside improvements.

The no runway separation scenario is represented by Alternative 2. As noted in the comparison of Alternative 2 to Alternative 4 in Section 4.2.6.3.2, Alternative 2 has fewer airside-related emissions than Alternative 4 due to reduced aircraft taxi/idle operations anticipated from proposed airfield improvements. In fact, Table 4.2-13 shows that incremental project operational emissions from aircraft are lowest for Alternative 2 when compared to all of the other alternatives. Since acrolein in aircraft emissions is the hazard risk driver for acute hazards, lower aircraft emissions for Alternative 2 translate into lower acute hazards than Alternatives 1, 3, 4, 5, 6, and 7.

The no airfield improvements scenario is represented by Alternative 4. As noted on page 4-120 in Section 4.2 of the SPAS Draft EIR, Alternative 4 is the future scenario that represents the least amount

of airfield improvements (the only airfield improvements would be the addition of pavement for safety purposes, which would not alter airfield operations), thereby resulting in longer taxiing time (i.e., longer periods of aircraft engine emissions). Greater aircraft emissions for Alternative 4 translate into greater acute hazards than those associated with Alternatives 1, 2, 5, 6, and 7. Alternative 3 has greater aircraft emissions and construction emissions than any of the other alternatives; however, improvements made in other areas result in Alternative 3 having lower acute risks than Alternative 4.

It should be noted that Alternative 4 does include taxiway changes, consisting of the easterly extension of Taxiway E; however, as with the extension of Runway 6R/24L, the taxiway improvement consists of additional pavement needed to meet Runway Safety Area requirements and would not alter existing airfield operations.

SPAS-PC00130-93

Comment:

Question: In table 1-5 what would the number of on-airport intersections w/o feasible fix be for the ARSAC suggested fix which we can't find in the DEIR where the 96th st bridge is moved east with a new drop off structure and moving sidewalk to support Terminal 1 allowing cars to enter the drop off and then exit directly to Sepulveda without having to clog up the CTA?

Response:

Development of a passenger drop-off center adjacent to Sepulveda Boulevard, allowing vehicles to enter from and exit onto Sepulveda Boulevard without entering the CTA, with passengers traveling between the drop-off center and Terminal 1, is not anticipated to substantially improve traffic conditions within the CTA and, if anything, would adversely affect traffic on Sepulveda Boulevard. The development of such a passenger drop-off center serving Terminal 1 is unlikely to attract a substantial amount of passengers, given that they would be dropped-off at the center, would need to board a moving sidewalk with all of their luggage and travel on a moving sidewalk approximately 1,000 feet to reach the Terminal 1 entrance. It is more likely that drivers dropping-off passengers at Terminal 1 would simply drive to the curbside directly in front of Terminal 1, where passengers could check their bags at the curb directly with the airlines and drivers would only need to continue west for approximately 250 feet, where they would turn south on East Way (see Figures 4.12.1-6 and 4.12.1-7 of the SPAS Draft EIR for the relationship of East Way to Terminal 1), which typically has little traffic (see Table 4.12.1-12 for traffic volumes, volume to capacity ratios, and level of service along East Way - specifically, Roadway Links UB, UC, UD, UP, CW, CX, CY, CZ, and CAA), and then turn east on World Way South where they can soon exit the CTA onto Sepulveda Boulevard or Century Boulevard. Even if some notable number of passengers were to utilize the remote drop-off center to access Terminal 1, that would do little to reduce total traffic volumes within the CTA associated with the other seven terminals plus Tom Bradley International Terminal and the future Midfield Satellite Concourse. SPAS Alternatives 1, 2, 8, and 9 include the Intermodal Transportation Facility and a dedicated access route (busway or APM) with a connection to transit as a means to reduce the overall traffic volumes within the CTA.

It should also be noted that while development of the remote passenger drop-off facility would not likely improve on-airport traffic conditions to any notable degree, operation of the subject facility would adversely affect traffic flows on Sepulveda Boulevard. Access to and from the facility for both northbound traffic and southbound traffic on Sepulveda Boulevard would occur through a new signalized intersection. Traffic flows on Sepulveda Boulevard would be interrupted by signal-operated access of facility traffic onto the roadway.

Based on the above, LAWA does not consider the Terminal 1 passenger drop-off facility suggested by ARSAC to be a feasible and effective means of improving traffic conditions within the CTA. Therefore, this suggestion was not evaluated in detail in the SPAS Draft EIR.

SPAS-PC00130-94

Comment:

Question: Page 1-54 to 1-56 Table 1-6 LAX Master Plan Commitments, LAX Master Plan Mitigation Measures, and SPAS-Specific Mitigation Measures as Related to the SPAS Alternatives

Question: Page 1-54 Table 1-6 What is the characteristic of the alt 1 (260' N), alt 5 (350' N), and Alt 6 (100' N) related to MM-SAF (SPAS)-1 Runway Protection Zone Reviews that impacts safety? What does note 4 to the table mean?

Response:

Mitigation Measure MM-SAF(SPAS)-1 cited in Table 1-6 is presented in its entirety in Section 5.5.7.2.10 of the SPAS Draft EIR (see pages 5-85 and 5-86). This measure is proposed as part of SPAS to mitigate aviation safety hazards that may result on a cumulative basis, as a combination of moving Runway 6L/24R northward under Alternatives 1, 5, and 6, and developing new uses within the LAX Northside area (i.e., FAR Part 77 imaginary surface impacts). Footnote 4 in Table 1-6 indicates that this mitigation measure pertains to cumulative impacts, as opposed to a project-specific mitigation measure.

SPAS-PC00130-95

Comment:

Question: Table 1-6 On-airport Shows no mitigations for Alts 5,6,7 in any intersection or on-airport condition. How is this possible when Alt 1 has mitigations?

Response:

As stated in Note 2 of Table 1-6 on page 1-60 of the SPAS Draft EIR, Alternatives 5, 6, and 7 focus on airfield improvements, and would not have any impacts related to ground transportation; however, assuming the airfield improvements under those alternatives would be paired with ground access improvements proposed under Alternative 1, 2, 8, or 9, there would be impacts to ground transportation that would subject to this mitigation measure.

SPAS-PC00130-96

Comment:

Question: Table 1-6 Wastewater Generation How is it possible that there are no wastewater generation mitigations for any SPAS or LAX Master Plan elements? If the runways are moved north and Lincoln/Sepulveda interface is necessarily below current levels it could impact the major sewer lines going to Hyperion. If the argo ditch is covered and/or enclosed and LAWA's capacity guess is too low can't there may be quite a wastewater issue causing spillage on to the runways and towards the terminals and or business district? What special precautions does LAWA plan to design?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-PC00130-730 through SPAS-PC00130-969, which address each separate comment provided in ARSAC's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR. The comments in both NOP comment letters were fully considered during preparation of the SPAS Draft EIR. Responses to all of the comments raised by ARSAC in its comment package on the SPAS Draft EIR are provided in Responses to Comments SPAS-PC00130-1 through SPAS-PC00130-1051.

SPAS-PC00130-97

Comment:

Page 1-61 Aesthetics
Alternative 3 would include the greatest extent of development throughout the airport environment, including improvements within the Los Angeles/Bl Segundo Dunes, north airfield, CTA, Lot C, Manchester Square, and Continental City. These improvements would affect aesthetics and views from sensitive receptors within the CTA, Century Corridor/eastern boundary, and southern, western, and northern boundary areas. Within the CTA, improvements related to the APM and terminal improvements under Alternative 3 would result in significant impacts to focal views of the Theme Building. Implementation of Mitigation Measure MM-HA (SPAS)-1, Preservation of Historic Resources: Theme Building and Setting (Alternative 3), described in Section 4.1, Aesthetics, would reduce impacts to views associated with Alternative 3 within the CIA to a level that is less than significant.
Compared to Alternative 3, improvements that would affect aesthetics and views under Alternatives 1 and 2 would not be as extensive, particularly within the CTA, Manchester Square, and Continental City. Impacts to views of the Theme Building under Alternatives 1 and 2 would be less than significant. Ground access facilities associated with Alternative 3, including the CONRAC, APM, and GTC, would not be developed under these alternatives. Alternative 4 has limited improvements with the potential to affect visual resources, including a CONRAC in the Lot C area and a parking structure in Continental City. (underline for emphasis)

Question: Aesthetics - what is the second paragraph of page 1-61 saying? Is there an explanation of the assumptions used to draw conclusions of this nature with more detail than section 4.1 of the document?

Response:

The text to which the commentor refers is a summary of comparative impacts between the SPAS alternatives that is provided in Section 1.4 of the SPAS Draft EIR. The second paragraph on page 1-61 notes that the aesthetic impacts of Alternatives 1 and 2 would not be as great as the aesthetic impacts of Alternative 3, particularly within the CTA, Manchester Square, and Continental City. In part, the reason that the aesthetic impacts would be less under Alternatives 1 and 2 than they would be under Alternative 3 is that Alternative 3 includes a CONRAC, APM, and GTC, all of which would result in aesthetic impacts. Alternatives 1 and 2 do not include these facilities.

The summary on page 1-61 is based on the full analysis of potential aesthetics impacts provided in Section 4.1 of the SPAS Draft EIR, which provides a detailed evaluation of aesthetics, including the assumptions used to draw conclusions of the type stated on page 1-61 of the SPAS Draft EIR. More specifically, regarding the assumptions used to support the analysis and related conclusions, please see the discussion in the Methodology section in Section 4.1 of the SPAS Draft EIR.

As discussed in Section 2.3.1 of the SPAS Draft EIR, the SPAS Draft EIR is a programmatic document; thus, no design or engineering plans are currently available. Project-level impacts related to aesthetics associated with implementation of individual SPAS components would be assessed in future CEQA documents. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-98

Comment:

Page 1-62 Air Quality
Table 1-7 and the text below summarize the conclusions regarding significant air quality impacts, all of which are based on the comparisons to baseline (2009) conditions or, in the case of construction impacts, the SCAQMD construction emission thresholds.

Question: Page 1-62 Air Quality references comparisons to a 2009 baseline condition. Why was this year chosen when the NOP was created in 2011 as a baseline and what year is assumed as the final year for comparisons?

Response:

Please see Response to Comment SPAS-PC00130-52 regarding the use of 2009 as the baseline year for aviation activity levels. As explained on page 4-91 of the SPAS Draft EIR, use of a full year's worth of aircraft activity data is required to ascertain the peak month average day activity characteristics, which are required for air quality modeling purposes. As further explained on page 4-91, baseline facilities in the air quality analysis are generally representative of 2010. In accordance with CEQA, air quality conditions with implementation of the project in 2025 were compared to 2009 baseline conditions to determine the significance of air quality impacts.

However, for many of the topics in the SPAS Draft EIR, including air quality, in addition to evaluating conditions at buildout of each SPAS alternative compared to existing baseline conditions, the analysis also provides, where possible, a comparison of conditions at buildout of each SPAS alternative in 2025 to conditions anticipated to occur in 2025 without the improvements proposed under the various SPAS alternatives. That latter form of comparison is intended to provide the public, agencies, and decision-makers with additional information regarding impacts attributable directly or indirectly to the improvements proposed under each SPAS alternative, which is not discernible through comparison against baseline conditions. For the air quality analysis, this was done by comparing the impacts of the SPAS alternatives to conditions under Alternative 4. Of the nine alternatives, Alternative 4 has the least amount of improvements and most closely represents a future (2025) "no Yellow Light Projects" scenario, from which to measure the differences in emissions that would occur with implementation of the improvements associated with each other alternative. It should be noted that Alternative 4 does not represent a future scenario with no airport improvements related to air quality impacts, as inclusion of a CONRAC (and associated consolidation/reduction of rental car company shuttle travel) in Alternative 4 provides some air quality benefits not achieved in the other alternatives. The modeling assumptions associated with Alternative 4 do, however, account for the continued implementation of more stringent motor vehicle emissions standards and cleaner vehicle fleets in the future that would also occur with all the other alternatives. In so doing, the differences between vehicular source emissions when compared to Alternative 4 are more illustrative of the differences in ground access improvements between the alternatives. Using Alternative 4 as a basis of comparison between alternatives also better represents the differences in aircraft emissions that are directly attributable to the different airfield configurations under the SPAS alternatives. Under Alternative 4, the only airfield improvement would be the eastward extension of Runway 6R/24L, which would be solely to provide for additional runway safety area in accordance with FAA requirements and would not alter existing airfield operations. When comparing impacts of the SPAS alternatives with 2009 baseline conditions, the incremental aircraft emissions associated with each alternative in 2025 (i.e., buildout year) are measured against the existing aircraft emissions in the baseline (2009) condition. As such, the incremental aircraft emissions of each alternative include both the growth in aircraft activity anticipated to occur between 2009 and 2025, which is common to all alternatives, and the changes in aircraft operations that are attributable to the proposed airfield configuration specific to each alternative. When comparing 2025 conditions to 2009 baseline conditions, the vast majority of the aircraft emissions increases are due to the anticipated growth in aircraft activity. When using Alternative 4 as a basis of comparison, the incremental aircraft emissions associated with each alternative in 2025 are measured against the 2025 emissions of Alternative 4. The same aircraft activity level and fleet mix are assumed for all alternatives in 2025. As such, the incremental aircraft emissions under this scenario are only influenced by the differences in the airfield configuration specific to each alternative. Although comparisons to 2009 baseline conditions and to 2025 Alternative 4 conditions are both disclosed in the SPAS Draft EIR, it should be noted that conclusions regarding whether the incremental emissions would result in a significant impact are based solely on the comparisons to 2009 baseline conditions. The comparisons to Alternative 4 conditions in 2025 are provided for informational purposes only.

SPAS-PC00130-99

Comment:

In order to assess intermediate air quality conditions there has to be some sort of construction order and schedule assumed. Where is this documented and the assumptions listed?

Response:

Please see Response to Comment SPAS-AR00002-43 regarding interim year air quality analysis and Response to Comment SPAS-PC00130-228 regarding the methodology used to evaluate construction-related air quality impacts.

SPAS-PC00130-100

Comment:

Why is the air quality apportionment study data which is currently 3 years beyond completion schedule not included in any of the discussion? As LAWA has not released any data from the first phase, second phase, or second (plus) phases which LAWA indicates are complete, how is this data reconciled with whatever IS used?

Response:

This content of this comment is similar to comment SPAS-PC00130-36; please refer to Response to Comment SPAS-PC00130-36.

SPAS-PC00130-101

Comment:

Question: Table 1-7 Air Quality impacts after Mitigation: Many of the elements and especially particulate matter of each size (ultra fines not addressed) show significant, unavoidable impact. Are some of the alternatives "better" than others? How are they ranked and what is the basis for the ranking? Is there a ranking that combines levels with concentrations?

Response:

Table 1-7 of the SPAS Draft EIR summarizes the comparison of the air quality impacts from each alternative to the significance threshold for that impact. Numerical results of air pollutant emissions are presented for each alternative in Table 4.2-13 (pages 4-122 through 4-125) and Table 4.2-14 (4-126 through 4-129) of the SPAS Draft EIR. Numerical results of air pollutant concentrations are presented in Table 4.2-15 (pages 4-139 through 4-141) and Table 4.2-16 (page 4-142) of the SPAS Draft EIR.

Table 4.2-13 provides the incremental emissions for each alternative relative to the 2009 baseline emissions, which allows one to see whether future (2025) emissions would go up or down, and by how much, when compared to existing emissions. Table 4.2-14 provides incremental emissions for each alternative in 2025 relative to Alternative 4 emissions in 2025, which allows one to compare the differences between alternatives for each pollutant.1 Table 4.2-15 provides pollutant concentrations for each alternative which can be compared between alternatives.

The South Coast Air Quality Management District has established separate significance thresholds for air pollutant emissions and air pollutant concentrations. Therefore, the comparisons of alternative impacts to emissions and concentrations are made separately. The lead agency can use the results to determine a ranking for each alternative, although such a ranking could potentially be different for emissions and concentrations. In addition, any ranking for air quality could be different than a ranking for traffic congestion, water quality, and noise, for example. It will be up to the lead agency to determine how to rank alternatives both environmentally and with regard to project objectives.

Please also see Responses to Comments SPAS-PC00130-225 and SPAS-PC00130-36 regarding ultrafine particulate matter (UFP) and the measurement of UFP as part of the LAX Air Quality and Source Apportionment Study, respectively.

1. Alternative 4 has the least amount of proposed physical changes to the airport; thus, is the most representative of a future no project alternative. A negative emission rate for a given alternative in Table 4.2-14 indicates that the proposed changes for that alternative would result in lower operational emissions than the proposed changes for Alternative 4.

SPAS-PC00130-102

Comment:

Page 1-70 Table 1-9
Summary of Impacts to Listed/Eligible Historical Resources After Mitigation
Question: Where is the Union Savings and other historic buildings located on a map in this document? Are these the only historical resources?

Response:

As described on pages 4-357 and 4-358 and shown in Figure 4.5-1 in Section 4.5 of the SPAS Draft EIR, the Union Savings building is located at 9800 S. Sepulveda Boulevard. The other historical resources identified within the SPAS cultural resources study area are also shown in Figure 4.5-1 of the SPAS Draft EIR. Section 4.5 of the SPAS Draft EIR is based in part on more comprehensive information contained in Appendix E of the SPAS Draft EIR.

The potential impacts of the SPAS alternatives were considered as they relate to known historical resources identified in previous surveys undertaken in association with the LAX Master Plan EIR, discussed on pages 4-350 through 4-354 and listed in Table 4.5-1 in Section 4.5 of the SPAS Draft EIR. The Section 106 Report and Supplemental Section 106 Report for the LAX Master Plan are provided in Appendix I and Appendix S-G of the LAX Master Plan Final EIR, respectively. In addition, previously unevaluated buildings/structures within the SPAS cultural resources study area, which were not old enough to be considered for evaluation as part of the previous LAX Master Plan EIR historical resources surveys but are now over 45 years in age, have been evaluated for purposes of the SPAS Draft EIR and are discussed in Section 4.5 of the SPAS Draft EIR on pages 4-354 to 4-358, and documented on DPR survey forms in Appendix E of the SPAS Draft EIR.

Of these properties, two eligible historical resources would potentially be affected by one or more of the SPAS alternatives: 1) the Theme Building and Setting, and 2) the Union Savings and Loan Building. The other historical resources would not be affected by the SPAS alternatives because of their distance from the proposed improvements. Mitigation measures to preserve and protect historical resources are identified on pages 4-380 through 4-383 of the SPAS Draft EIR and include Mitigation Measures MM-HA (SPAS)-1 Preservation of Historic Resources: Theme Building and Setting (Alternative 3); MM-HA (SPAS)-2 Preservation of Historic Resources: Theme Building and Setting (Alternative 9); and MM-HA (SPAS)-3 Preservation Of Historic Resources: Union Savings and Loan Building (Alternative 3).

SPAS-PC00130-103

Comment:

Page 1-70 Cultural Resources
No direct impacts to any historical resources would result from Alternatives 1, 2, 4, 5, 6, 7, or 8. Indirect impacts to historical resources associated with proposed concourse and terminal improvements under Alternatives 1, 2, 5, 6, and 7 would be less than significant due to their height limitations, design, and distance from the Theme Building and Setting and the intervening development. Similarly, indirect impacts to the Union Savings and Loan Building under Alternatives 1, 2, 8, and 9 would be less than significant due to the distance of the improvements to this resource. Impacts to historical resources under Alternatives 1, 2, and 5 through 9 would be further reduced with implementation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources.

Question: Page 1-70 discusses historical resource impacts. What potential impacts were considered if the hydrology efforts are found to be inadequate? Can't some of the movements of land and underground structures cause redirection of unknown water sources? What about leeching of airfield contaminants and those contaminants from the old Garret Research site (Park One) by new water flow patterns and deposit into new locations? Can't this also make some historic resources require significant clean up since they would no longer be buried under the Park One lot? What about "normally expected" fuel contaminants that occurred from pipeline leaks as well as normal aircraft operations?

Response:

The commentor provides no information or evidence explaining how stormwater flows or contaminated groundwater could adversely affect historic or cultural resources. Nor does the commentor provide any evidence in support of the notion that that the SPAS alternatives could alter groundwater flows or result in contamination of historic or cultural resources. No impacts to groundwater flows are anticipated as a result of implementing the SPAS alternatives. As discussed in Section 4.7.3 of the SPAS Draft EIR, sites with known groundwater contamination are undergoing remediation. These remediation efforts ensure that contamination does not migrate. Please see Response to Comment SPAS-PC00130-265 for a discussion of LAX Master Plan Commitment HM-2 which was designed to ensure that any potential effects from contaminated materials encountered during construction would be less than significant.

SPAS-PC00130-104

Comment:

Page 1-72 Table1-10 Summary of Impacts to Recorded Archaeological Resources
Note from table: Alternatives 1 through 4 consist of airfield, terminal, and ground access improvements. Alternatives 5 through 7 focus on airfield and terminal improvements only. Alternatives 8 and 9 focus on ground access improvements only. The airfield/terminal improvements associated with Alternatives 1, 2, 5, 6, and 7 could be paired with the ground access improvements associated with Alternatives 1, 2, 8, or 9. Similarly, the ground access improvements associated with Alternatives 1, 2, 8, and 9 could be paired with the airfield improvements associated with Alternatives 1, 2, 5, 6, or 7. The full impacts of any alternative must consider airfield, terminal, and ground access contributions. The airfield, terminal, and ground access improvements associated with Alternatives 3 and 4 are specific to each of those alternatives and cannot be paired with other alternatives.

Question: The note at the bottom of Table 1-10 (above) talks about the mix and match concept but doesn't properly spell out a concept for evaluation.

Response:

Please see Responses to Comments SPAS-AL00007-6, SPAS-AL00008-3, and SPAS-AL00008-26 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives.

SPAS-PC00130-105

Comment:

Has LAWA identified the native american indian sites which used to be located in the areas in and around LAX? How are they watching for artifacts and other indications of encampments and burial grounds?

Response:

As stated on pages 4-360 through 4-363 in Section 4.5.3.3 of the SPAS Draft EIR, a cultural resources records search through the South Central Coastal Information Center was completed that identified eight recorded archaeological resources, seven of which are Native American cultural resources, on LAX property and within the cultural resources study area for SPAS. These resources would not be impacted by any of the SPAS alternatives. In addition, a pedestrian survey of the undeveloped portions of the LAX property potentially affected by the SPAS alternatives was conducted to identify previously unknown archaeological or Native American resources. As stated on page 4-363 in Section 4.5.3.3 of the SPAS Draft EIR, no resources were identified during the pedestrian survey.

As stated on page 4-383 in Section 4.5.7.2 of the SPAS Draft EIR, Mitigation Measure MM-HA (SPAS)-4, Conformance with LAX Master Plan Archaeological Treatment Plan (ATP), is proposed to address significant impacts to previously unidentified archaeological resources by requiring construction activities to be undertaken in conformance with the ATP. Requirements outlined in the ATP include

specific procedures for archaeological monitoring, identifying and assessing the significance of resources, and the recovery and curation of resources when warranted. For example, an archaeological excavation program to remove the resources may be implemented, if deemed necessary. In such instances, the ATP provides for evaluation and treatment of archaeological resources consistent with the Secretary of the Interior's Standards and Guidelines for Archaeological Documentation and other applicable guidance. In addition, the ATP includes guidance on retaining a Native American monitor if Native American cultural resources are encountered. If human remains are found, LAWA will comply with the State Health and Safety Code regarding the appropriate treatment of those remains as outlined in the ATP. Finally, the ATP details the reporting requirements to document the archaeological monitoring effort and provides guidance as to the proper curation and archiving of artifacts in accordance with industry and federal standards.

SPAS-PC00130-106

Comment:

Page 1-74 Table 1-11 Summary of Human Health Risk Impacts After Mitigation

Question: What is the basis for these categorizations of significance of health risks?

Question: Table 1-11 Summary of Human Health Risk Impacts states that all alternatives have acute non-cancer health hazards as significant and unavoidable. Where have these been assessed in enough detail to rank order the impacts? What assumptions have been made to get to these conclusions?

Response:

Section 4.7.1 of the SPAS Draft EIR includes a detailed assessment of human health risks associated with the SPAS alternatives and provides the basis upon which determinations of significance for human health were made. In particular, Section 4.7.1.4 of the SPAS Draft EIR provides a discussion of the thresholds of significance that were used to reach the significance determinations that are summarized in Table 1-11 of the SPAS Draft EIR. The increased cancer risk of ≥ 10 in a million and the hazard index ≥ one thresholds are based on Southern California Air Quality Management District (SCAQMD) guidance.

The calculations in the HHRA were based on incremental toxic air contaminants (TAC) emissions associated with the SPAS alternatives relative to 2009 baseline conditions. Section 4.2.2 of the SPAS Draft EIR identifies the assumptions that were used in modeling the TAC emissions. Section 4.7.1 and Appendix G1 of the SPAS Draft EIR provide details regarding the analysis of acute non-cancer health hazards, including all assumptions and inputs to the calculations. Specifically, Section 4.7.1.6.3 provides a discussion of the results of the acute non-cancer health hazards analysis. Tables 4.7.1-7 and 4.7.1-8 present comparative results for each of the alternatives that could be used to rank the alternatives in order of impact for each receptor type.

SPAS-PC00130-107

Comment:

Again, as in several other commented areas, why has LAWA used a 2009 baseline?

Response:

As discussed in Section 4.7.1.3 of the SPAS Draft EIR, "Baseline conditions discussed herein refer to calendar year 2009, the last full calendar year for which air quality data were available from the SCAQMD prior to the release of the SPAS NOP. As operational activity in 2009 was lower than (2012) current conditions, use of this baseline year is considered to provide a conservative (i.e., protective) analysis." As explained in Section 4.7.1.2 of the SPAS Draft EIR, possible health impacts in the SPAS Draft EIR were assessed as an increment above baseline conditions. When baseline conditions reflect lower TAC releases than current conditions, as in 2009, the increment between baseline emissions and emissions for any given alternative is greater. Thus, protective in the text above means "likely to overestimate impacts to human health." Also note that the baseline year does not affect estimates of

health impact associated with construction emissions as baseline construction emissions are assumed to be zero.

As noted in Section 4.7.1.2.1 of the SPAS Draft EIR, the HHRA was conducted based on diesel particulate matter (DPM) emissions associated with SPAS construction and on total TAC emissions associated with operational activities. A detailed discussion regarding why 2009 emissions were selected to represent the baseline year is provided in Response to Comment SPAS-PC00130-52.

SPAS-PC00130-108

Comment:

Although this table on page 1-74 talks about "buildout in 2025" are there other impacts which are compared at other times?

LAWA has talked about time-phased and condition-phased implementation of various projects. What if significant elements have not been constructed by 2025?

Response:

As indicated on page 2-8 of the SPAS Draft EIR, the nine SPAS alternatives addressed within this Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. In general, however, it is anticipated that, if approved, all of the improvements proposed under each alternative would be completed by 2025, with construction beginning in 2015.

The SPAS Draft EIR identifies and compares between alternatives the impacts anticipated to occur at buildout in 2025 for all environmental topic areas. This provides a reasonable and appropriate basis for the decision-makers to compare the overall impacts of the all the alternatives in determining which, if any, of the alternatives to approve. Following selection and approval of a particular alternative, if any, the development of more detailed plans for the proposed improvements will provide the basis to formulate an implementation phasing program and schedule, which, in turn, will provide the basis for evaluating impacts at specific points in time within the implementation schedule.

As noted above, the SPAS planning and analysis framework is based on an anticipated buildout year of 2025. There is currently nothing at this conceptual level of planning to indicate that specific elements of the SPAS improvements would not be completed by 2025.

SPAS-PC00130-109

Comment:

Question: Table 1-11 health risks

Under what category are TAC (toxic air contaminants) which are generated during construction from toxic fugitive dust piles inadequately controlled during construction? One example are the piles in the staging area behind the Sepulveda Ralphs Market off Westchester Parkway which has been uncovered and unaddressed for in excess of 6 months despite several community requests.

Response:

Toxic air contaminants (TACs) that would be emitted during construction, in addition to those that would be emitted during operation of the alternatives, were calculated and analyzed for health risk impacts in Section 4.7.1 of the SPAS Draft EIR. In general, the construction dust-related TACs would be particulate phase metals and inorganic compounds, which are listed in Table 4.7.1-1 of the SPAS Draft EIR as PM-Metal or PM-Inorganics.

Section 4.2.5 of the SPAS Draft EIR identifies the LAX Master Plan commitments and mitigation measures relative to air quality, including measures pertaining to construction activities; these measures would extend to construction staging areas where appropriate. In addition, LAWA maintains a

construction hotline (310.649.5292) and an online construction inquiry and complaint form system (http://www.lawa.org/laxdev/CommunityInfo.aspx?id=3689). LAWA tracks its compliance with the requirements of the LAX Master Plan commitments and mitigation measures in annual progress reports.

Regarding the dirt mounds noted in the comment, this is not a comment on the SPAS Draft EIR and does not address potential impacts that would result from the SPAS project. The following response is provided for informational purposes only. Clean soils excavated from the CTA in conjunction with the installation of a segment of new underground pipelines and utility lines related to the Central Utility Plant Replacement Project were temporarily stored at the subject staging area site until that segment of pipeline/utility line installation could be completed. Although several more weeks of pipeline/utility line installation remained, LAWA removed the stockpiled soil based on concerns expressed by nearby residents and transferred the soils to Continental City, where they will remain until reused as backfill in the CTA. Please also see Response to Comment SPAS-PC00130-265 regarding the management of contaminated soils encountered during construction at LAX.

SPAS-PC00130-110

Comment:

Page 1-75 Health Risks section
...The increased acrolein emissions are attributable mostly to the increase in passenger activity levels and associated aircraft operations anticipated to occur between 2009 and 2025 for all alternatives....

Question: Page 1-75 highlight phrase notes that acrolein emissions are attributed to passenger activity levels. Is taxi time to gate a significant item in allowing for comparing the bad impacts from each alternative? What assumptions in flight mix, gate location, times of day (relative amounts of air traffic ie peak hours or not), and other factors were made? What were all of the factors?

Response:

The air quality impact analysis presented in Section 4.2 of the SPAS Draft EIR used the Federal Aviation Administration's Emissions and Dispersion Modeling System (EDMS), version 5.1.3, for developing emissions from aircraft. Aircraft taxi-in and taxi-out emissions are included in the emission estimates for aircraft.

The detailed aircraft fleet mixes used in the technical analyses are presented in Appendix J1-1 of the SPAS Draft EIR. Table 3 presents the fleet mix used for the baseline (2009) conditions, while Table 8 presents the fleet mix used for all alternatives in 2025. The relative number of operations, by aircraft type, for daytime, evening, and nighttime periods of the day are also included in Tables 3 and 8. The aircraft fleet mix is also summarized in Appendix F-1 of the Preliminary LAX SPAS Report: Table 8 for 2009 and Table 12 for 2025. Also, please refer to Response to Comment SPAS-PC00130-770 for a table of aircraft/engine fleet mix combinations used in the analysis.

In completing the analysis conducted with EDMS v.5.1.3, aircraft were assigned to specific terminals. For example, aircraft arriving at any gate associated with Terminal 3 under a given alternative are simply identified as arriving at Terminal 3.

Month-of-year, day-of-week, and hour-of-day activity levels for aircraft and vehicular traffic are also included in the analysis. Airport activity is generally highest in July and August, and on weekdays compared to weekends. The aircraft activity peaks during the hour between noon and 1:00 pm. Vehicular traffic follows a morning and afternoon peak overlaid on the airport peak.

Complete EDMS v.5.1.3 model input and output files were submitted to the South Coast Air Quality Management District on November 29, 2012. These file are available, upon request, in electronic format and are also available for public review in hard-copy form at LAWA's Capital Programming and Planning Division, Room 208, One World Way, Los Angeles, California. Please also see Response to Comment SPAS-AR00002-46 regarding these files.

Comment:

Page 1-75 Health Risks section
LAX Master Plan mitigation measures would reduce TAC emissions associated with all of the SPAS alternatives. However, even with implementation of these measures, acute non-cancer health hazards at some fence-line receptors would exceed the threshold of significance under all of the alternatives, compared to 2009 baseline conditions. As such, acute non-cancer health hazard impacts under all of the SPAS alternatives are considered to be significant and unavoidable.

Question: Why is 2009 used as the baseline condition when the NOP was released in 2010?

Response:

Please see Responses to Comments SPAS-PC00130-52 and SPAS-PC00130-107 regarding the use of 2009 as the baseline year for analyses that are based on aviation activity levels, such as human health risk.

SPAS-PC00130-112

Comment:

Page 1-76 Safety
Currently, no active solid waste landfills are located within a five-mile radius of LAX. Therefore, none of the alternatives would relocate a runway to within 10,000 feet of a solid waste landfill. Under all of the alternatives, no new facilities would be constructed or operational conditions implemented that would serve as attractants to birds. In accordance with FAA requirements, the airfield would continue to be maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. Therefore, impacts under all of the alternatives with respect to birdstrikes would be less than significant.

Question: Were is an analysis of the impacts of tunnels, utilities such as major sewer lines, hot oil lines and high voltage power on safety? Where is unknown water source causing sink holes evaluated in this document? What is the frequency and magnitude of sink holes? When a tunnel is removed, what controls for sink holes are in place if unknown water sources are in the area?

Response:

The commentor does not provide any factual basis or substantial evidence of a significant environmental issue not analyzed in the EIR. Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX. The SPAS Draft EIR is a programmatic document. Issues associated with implementation of individual components, such as specific impacts to utility pipelines and other infrastructure, will be assessed during project-level planning and engineering design. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-113

Comment:

Question: page 1-76 discusses safety and states that there are no impacts because there are no solid waste landfills within a five-mile radius. However there are known contaminants within the airport airside and landside plus areas in the Northside Development area that contain toxic items used or leaked into the ground as well as having had many oil wells and gas wells naturally occurring and operated in the past at these locations. When can disturbing the ground that may have covered contamination become a safety hazard? What about during construction and movement of the contaminated soil?

Response:

As indicated on page 1-76 in Section 1.4 of the SPAS Draft EIR, no active solid waste landfills are located within a five-mile radius of LAX. Therefore, none of the alternatives would relocate a runway to within 10,000 feet of a solid waste landfill. Under all of the alternatives, no new facilities would be constructed or operational conditions implemented that would serve as attractants to birds; therefore, impacts with respect to birdstrikes would be less than significant.

Please see Topical Response TR-SPAS-LR-1 regarding the identification of contaminated sites within the airport property and SPAS alternatives acquisition areas. As indicated on page 4-573 in Section 4.7.3 of the SPAS Draft EIR and in the topical response, the analysis of hazardous materials was based on a records search performed by Environmental Data Resources, Inc. (EDR) of all sites with known contamination (including both soil and groundwater contamination) within the airport property and SPAS alternatives acquisition areas. The EDR Report, which is provided in Appendix G3 of the SPAS Draft EIR, identifies the sites with known contamination throughout the airport property, as well as known contamination in some areas adjacent to the airport. The EDR records search found no known contamination sites in the LAX Northside area. The results of the EDR Report were supplemented by LAWA's existing records and knowledge of known contamination, which do not identify any known contamination within the LAX Northside area.

Although there is no known contamination within the LAX Northside area, Section 4.7.3 of the SPAS Draft EIR acknowledges that previously unknown contamination may be encountered during construction of any of the project components. With compliance with existing laws and regulations, including LAWA's Procedure for the Management of Contaminated Materials Encountered During Construction, which was prepared in accordance with LAX Master Plan Commitment HM-2 (Handling of Contaminated Materials Encountered During Construction), and adopted subsequent to approval of the LAX Master Plan, this impact was found to be less than significant.

There are no active oil wells at LAX although there are seven plugged or abandoned wells located within the airport property (see Figure F4.17.2-1 in Section 4.17.2 of the LAX Master Plan Final EIR). If any construction occurs in proximity to an abandoned well, it may be necessary to plug or re-plug the well to current specifications established by the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources. In addition, the State Oil and Gas Supervisor is authorized to order the reabandonment of previously plugged and abandoned wells when construction over or in the proximity of wells could result in a hazard (Section 3208.1 of the Public Resource Code). If construction over an abandoned well is unavoidable, an adequate gas venting system is required to be placed over the well. Compliance with these requirements would ensure that no impacts would occur with respect to plugged or abandoned oil wells.

SPAS-PC00130-114

Comment:

Page 1-76 and 1-77 Table 1-12 Summary of Safety and Efficiency Enhancements to the North Airfield Operations

Question: Table 1-12 summarizes safety and efficiency enhancements but there are some questionable items which give credit for improvements to certain alternatives over others. Where are the details and assumptions listed which justify classifications for each of the line items? Footnote 1 of this table indicates "greater amount of FAA Airport Design Standards for ADG V and VI are met as noted, but since there is a new version of AC150/5300-13A in draft review at this time is this still true? Under current design standards if a center line taxiway has an aircraft between two runways the actual separation distance from the taxiway to the adjacent runway is smaller than the current separation without the center line taxiway. How is this justified by LAWA and how is it considered in the current FAA design standard? The new draft mentions this condition and notes this issue on separation distances. Where did LAWA address this? Also, when a centerline taxiway exists how are the new failure modes such as landing or taking off from a taxiway addressed?

Question: Related to table item on "Realigns/straightens Taxilane D... Table 1-12 Safety and Efficiency Enhancements Why is the first item only referring to Taxilane D as full ADG VI when the version of Alt 6

given to Diego Alvarez twice and the one sent in a letter to GML in Jan 2011 each had full ADG VI? This again raises the question of what version of Alt 6 is used by LAWA in its evaluation, either of the two with poison pills in them drawn by LAWA or the corrected one provided by ARSAC?

Response:

Table 1-12 in the SPAS Draft EIR provides a summary of the safety and efficiency enhancements to the north airfield operations that would occur under each of the SPAS airfield improvement alternatives. The more detailed analysis supporting the conclusions in that summary table is contained in Section 4.7.2 of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-431 for a discussion of FAA Advisory Circular 150/5300-13A and the standards for runway-to-runway and runway-to-taxiway separation standards. Regarding the commenter's suggestion that the north airfield has to comply with new AC 150/5300-13A, as discussed in Response to Comment SPAS-PC00130-345, the separation standards did not change from the previous advisory circular. The SPAS Draft EIR uses the appropriate separation standards for analysis of the impacts to safety and operations, and the safety and efficiency enhancements associated with each alternative are accurately provided in Table 1-12 of the SPAS Draft EIR.

LAWA is in receipt of a letter from ARSAC dated January 3, 2011 regarding ARSAC's recommendations for Taxilane D improvements. That letter addresses Alternative 7 (i.e., Relocation of Runway 6R/24L 100 feet south) and suggests that Taxilane D be straightened and extended as an ADG V taxilane, which is exactly what SPAS Alternative 7 proposes. In ARSAC's current comment, inquiring why Alternative 6 does not propose Taxilane D as an ADG VI taxilane, there is no need to incorporate such a change into Alternative 6 given that the range of SPAS alternatives already includes two alternatives - Alternatives 3 and 5 - with such a taxilane configuration. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters. (State CEQA Guidelines Section 15204.) The SPAS alternatives represent a reasonable range of alternatives that would attain most of the basic objectives of the project, sufficient to allow informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).)

SPAS-PC00130-115

Comment:

Page 1-77 Safety enhancement evaluations...
Regarding cumulative impacts, none of the ongoing and reasonably foreseeable on-airport improvements identified in Chapter 5, Cumulative Impacts, would increase the potential for aviation incidents or accidents. Future development within LAX Northside would place new structures north of the north airfield complex. The relocation of Runway 6L/24R to the north under Alternatives 1, 5, and 6 and the westerly shift of the displaced landing threshold for Runway 24L would shift the associated FAR Part 77 Airspace Surfaces accordingly, drawing them closer to LAX Northside. Depending on the location, design, height, and timing of future development in LAX Northside, there would be a potential cumulative impact on aviation safety due to structures penetrating the Part 77 Airspace Surfaces (i.e., the potential for future development to penetrate existing Part 77 surfaces and, in combination with the shifting of the surfaces, increase the amount of penetration). FAR Part 77 imaginary surfaces are primarily intended to serve as a means of identifying objects that require more detailed analyses specific to the types of airspace operations and related safety requirements that occur within those surfaces. A determination of whether such penetrations of a Part 77 surface pose an aviation safety hazard, and the identification of the appropriate measure(s) to address any such hazard, occur through the more detailed analysis, which is completed by, or in coordination with, the FAA. Options to address potential aviation safety hazards can range from doing nothing (i.e., for low-risk objects), to placing high-visibility markings and lighting on structures to make them highly visible to pilots and indicating such objects on avigation maps, to...

Question: Re: Cumulative impact on safety of on-airport improvements; Didn't Congress mandate that all RPZ be resolved by 2015 and that new runways be constructed with full RPZ implemented?

Response:

In response to the commentor's question, Congress did not mandate that all Runway Protection Zones (RPZs) be resolved by 2015 and that new runways be constructed with full RPZ requirements being implemented. The comment does not include any evidence or facts to support its implication to the contrary. Congress did, however, set forth a mandate relative to meeting Runway Safety Area (RSA), which is different than an RPZ (see page 4-491 of the SPAS Draft EIR for additional explanation), by December 31, 2015. That Congressional mandate is discussed on page 4-492 of the Draft EIR. As part of the LAX Northside Update, which is a separate and independent project subject to its own environmental review process, building heights will be limited to 45 and 60 feet and will not penetrate the existing Part 77 surfaces and potential Part 77 surfaces related to any SPAS alternatives.

SPAS-PC00130-116

Comment:

Page 1-78 Hazardous Materials
Proposed improvements associated with all of the SPAS alternatives would require excavation in areas of known contamination. Alternative 3 would have the potential to affect ongoing remediation at the greatest number of sites, whereas Alternative 4 would affect the fewest. However, implementation of LAX Master Plan Commitment HM-1, Ensure Continued Implementation of Existing Remediation Efforts, impacts associated with interference with remediation efforts under all of the SPAS alternatives would be less than significant.

Question: LAWA has made low to no impact, but have they actually tested soil at each of the areas where digging is to be done? When was this testing done and were are the reports?

Response:

The SPAS Draft EIR is a program-level environmental document and therefore, the SPAS alternatives have been analyzed at a program level of planning and design. Analysis and testing of soil at areas to be excavated would occur as part of a project-level environmental review for each individual SPAS project. As discussed in Section 4.7.3 of the SPAS Draft EIR, to prevent SPAS-related construction, including excavation, from interfering with planned or ongoing remediation such that environmental contamination is exacerbated or permanent clean up of sites prevented, LAWA would implement LAX Master Plan Commitment HM-1, Ensure Continued Implementation of Existing Remediation Efforts. Implementation of this commitment would ensure that remediation projects would be completed to the extent possible and necessary before constructing SPAS improvements, or that alternate clean up methods would be implemented during construction to prevent contaminant migration, if necessary. As part of this commitment, remediation systems would be reinstated following the completion of construction, if required.

Exposure of construction workers would be minimized by implementing OSHA and CalOSHA standards, which establish exposure limits for workers; require protective equipment, and require employers to provide a written health and safety program, worker training, emergency response training, and medical surveillance. Furthermore, LAWA would comply with the Procedure for the Management of Contaminated Materials Encountered During Construction ("Procedure"), which identifies procedures associated with identification and handling of excavated contaminated materials. Please see Response to Comment SPAS-PC00130-265 for a more detailed discussion of the Procedure. Compliance with the Procedure would ensure that contaminated materials encountered during construction, including soil, are properly identified, stored, remediated, and disposed of in accordance with all applicable regulations. As a result, impacts associated with interference with remediation activities, as well as impacts to construction workers associated with the excavation of contaminated materials, would be less than significant.

SPAS-PC00130-117

Comment:

When the Manchester Tunnel was finally acknowledged and LAWA examined its contents were reports created? Where are those reports? When were those reports written? What levels of water and

contamination were found? Were samples taken one time or have they been taken since the drought ended two years ago?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.) The SPAS Draft EIR provides a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of the project's environmental consequences. (State CEQA Guidelines Section 15151.) Because the SPAS Draft EIR is a programmatic document, further project-level environmental review will be conducted if an alternative is selected. Therefore, if an alternative that moves the runway north is selected, any impacts associated with the north airfield abandoned tunnel segment will be evaluated at that time. Please see Section 4.7.3.5 of the SPAS Draft EIR for a discussion of applicable mitigation measures and LAX Master Plan commitments. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester Tunnel), including a discussion of the results of the tunnel inspection conducted in 2010.

SPAS-PC00130-118

Comment:

Page 1-78 Hazardous Materials
...A lack of adequate access could impair the effective implementation of emergency response activities by impeding the movement of emergency vehicles....

Question: Page 1-78 has a notation (above) noting potential for lack of adequate access...emergency response..." This was a defect noted by ARSAC and others when reviewing Alternative D and was one of many other safety and security issues noted in a RAND study provided to LAWA. Has LAWA reviewed the alternatives studied against the recommendations? If not, why not. If so, which of the recommendations were implemented in the alternatives?

Response:

Please see Response to Comment SPAS-PC00130-75 regarding the incorporation of security measures into the design of the SPAS alternatives.

SPAS-PC00130-119

Comment:

Question: p 1-78 Safety The statement says that Alternatives 5-7 do not propose ground access improvements, but if the tunnel under the north runways is opened and thereby destabilized, there may need for special access to the runway areas. Is this not considered? If it was, where will the access come from and what impact will it have on air operations? How long could this condition linger?

Response:

As described on page 2-52 of the SPAS Draft EIR, under Alternatives 1, 5, and 6, the north airfield abandoned tunnel segment would be filled and compacted to enable the relocation of Runway 6L/24R and/or taxiways. Certified clean fill would be used to fill the tunnel segment and stability would be ensured through engineering design. As a result, the relocated runway would not require special access following completion of construction.

SPAS-PC00130-120

Comment:

Page 1-79 Table 1-13 Summary of Hydrology and Water Quality Impacts After Mitigation

Question: What studies have been made on the north complex for sink holes? Does the CDM report contain this information to be included as part of the DEIR? Has the covering of the ergo ditch been assessed to ensure that mitigation is adequate under all conditions? What about movement of Lincoln Blvd to a new site and lowering it. Has all underground water flow been measured and monitored to ensure that it is not going to be driven onto the LAWA property and runways or terminal areas? Just because the baseline condition may or may not have been adequately determined doesn't relieve LAWA of responsibility to ensure that new construction doesn't cause more problems. This relates also to the Argo Flood Channel as well as underground utilities and tunnels.

Response:

CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended by commentors. (State CEQA Guidelines Section 15204.) Additionally, as discussed in Section 2.3.1 of the SPAS Draft EIR, the SPAS Draft EIR is a programmatic document, and no specific design or engineering plans exist for any of the alternatives. An EIR is not required to speculate about the environmental consequences of future development that is unspecified or uncertain. (See Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502.) Thus, if and when an alternative is selected and project details become more defined, project-level environmental review will be conducted.

Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX and Response to Comment SPAS-PC00130-169 regarding the covering of the Argo Drainage Channel. Please see Topical Response TR-SPAS-LR-1 regarding the Lincoln Boulevard realignment.

It is unclear what the commentor means by "just because the baseline condition may or may not have been adequately determined." As discussed in Section 4.8.3 of the SPAS Draft EIR, the analysis used existing conditions as a baseline for hydrology and water quality. The alternatives were then analyzed and compared to existing conditions. (See Section 4.8.6 of the SPAS Draft EIR.)

SPAS-PC00130-121

Comment:

Page 1-79 Hydrology
Since much of the area surrounding the airport in both the Santa Monica Bay and Dominguez Channel watersheds is developed (i.e., impervious) under baseline conditions, changes associated with the alternatives would represent a marginal increase in regional impervious area. However, the increases in impervious area and the associated increase in storm water peak flow rates could potentially exceed the capacity of the storm water facilities in area sub-basins, which would result in flooding in any location where capacity was exceeded...

Question: P 1-79 Hydrology
The storm water capacity and runoff is identified as an issue and the DEIR notes "under Alternatives 1,2,and 4 through 9, ...improvements may not fully mitigate flooding impacts..." Therefore what other measures have been evaluated to make sure that LAX operations are not impacted nor operations on lands outside of LAX?

Response:

Please see Response to Comment SPAS-PC00130-463 regarding the new mitigation measure, MM-HWQ (SPAS)-1 that is proposed to address hydrology and water quality impacts associated with Alternatives 1, 2, and 4 through 9. Under this mitigation measure, the existing LAX CDP would be tailored to the specific characteristics of the selected alternative and would provide the basis and

specifications by which detailed drainage improvement plans would be designed in conjunction with site engineering specific to each improvement associated with any selected SPAS alternative. With implementation of this measure, impacts associated with drainage and water quality would be less than significant, including impacts to LAX operations or operations on lands outside of LAX.

SPAS-PC00130-122

Comment:

Several paragraphs of this section are highlighted to identify questions of how a new mitigation was established to be adequate when construction and movement of Lincoln or other areas could drive more underground water into the area. If the argo ditch is enclosed what impacts could an earthquake have including loss of proper water flow? What quake level must occur to present unacceptable impacts? Please list all potential impacts.

Response:

The commentor does not specifically identify which paragraphs on page 1-79 of the SPAS Draft EIR he is referring to as highlighted text; the comment letter did not include highlighted text nor was an attachment provided with highlighted text. Mitigation Measure MM-HWQ (SPAS)-1, set forth in Section 4.8.7 of the SPAS Draft EIR, would mitigate hydrology and water quality impacts associated with the SPAS alternatives to a less than significant level. The commentor provides no evidence in support of the assertion that the realignment of Lincoln Boulevard or other activities could result in more underground water in the area. Please note, however, that the Caltrans Highway Design Manual Chapters 800-890, and in particular Chapter 840, address the design of roadways to safely collect and convey both surface and subsurface drainage from the completed road surface and not result in adverse impacts on the roadway or surrounding area. The City of Los Angeles Bureau of Engineering design of streets and roadways is covered in the Street Design Manual (Part E) and the Storm Drain Design Manual (Part G), which also address appropriate handling of surface and subsurface drainage. Improvements to Argo Drainage Channel would be designed in accordance with the BOE Storm Drain Design Manual (Part G) and all required standards, including seismic standards. Please see Response to Comment SPAS-PC00130-169 for additional detail regarding the design capacity of the Argo Drainage Channel with implementation of Alternatives 1, 5, and 6. It would be speculative to predict the impacts to the Argo Drainage Channel improvements in the event of an earthquake.

SPAS-PC00130-123

Comment:

Page 1-79 Hydrology
...flooding would be less than significant. However, under Alternatives 1, 2, and 4 through 9, the LAX Conceptual Drainage Plan improvements may not fully mitigate flooding impacts, as these improvements were not specifically designed for these alternatives. This would be a significant impact....

Question: If this is a significant impact what mitigations are necessary?

Response:

Please see Responses to Comments SPAS-PC00130-121 and SPAS-PC00130-463 regarding mitigation of hydrology impacts associated with Alternatives 1, 2, and 4 through 9.

SPAS-PC00130-124

Comment:

Page 1-80 Hydrology
Also, under Alternatives 1 and 5, the entire channel would be structurally covered to support aircraft and, therefore, not subject to erosion or siltation. Under Alternatives 2, 4, and 7, only the easterly end of the channel (750 linear feet) would be lined; however, there would be no increase in the peak flow rates

through the Argo Drainage Channel under these alternatives and, therefore, no increase in the potential for erosion or sedimentation. Under Alternatives 3 and 6 portions of the Argo Drainage Channel would remain unlined and there would be an increase in peak flows to the channel, resulting in the potential for erosion and sedimentation. As described in Section 4.8, Hydrology/Water Quality, a new mitigation measure, MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, is proposed to tailor the LAX Conceptual Drainage Plan recommendations to the specific characteristics of the selected SPAS alternative. This measure would reduce erosion and sedimentation impacts associated with Alternatives 3 and 6 to a level that is less than significant. Therefore, the impact of erosion or siltation due to runoff from the airport would be less than significant for all drainage facilities under all alternatives.

Question: If siltation and erosion are considered not to be a problem, why are sink holes occurring all over the airfield necessitating repairs? If silt clogs a flow what issues could occur to impact operations or even safety?

Response:

Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX. As noted in that comment, sink holes are not occurring all over the airfield, as stated by the commentor. Sink holes are not caused by siltation and erosion. Drainage channels and stormwater pipelines at LAX are maintained to prevent blockages that could lead to flooding. Please see Section 4.8 of the SPAS Draft EIR for a discussion of the impacts to hydrology and water quality from each alternative. As detailed in that section, specifically Section 4.8.7, impacts to hydrology and water quality would be less than significant with the implementation of Mitigation Measure HWQ (SPAS)-1, Conceptual Drainage Plan Revisions and Update. That mitigation measure provides the basis and specifications by which detailed drainage improvement plans shall be designed in conjunction with site engineering specific to each improvement associated with the alternatives to ensure that the effect of airport operations on hydrology would be less than significant.

SPAS-PC00130-125

Comment:

Page 1-82 Land Use Planning - Plan Consistency
No significant impacts due to a plan inconsistency or plan conflict with the applicable plans analyzed were identified for any of the SPAS alternatives. However, each of the alternatives would include plan amendments to either an off-airport or on-airport plan to ensure precise consistency with the applicable plan. Alternatives 1 and 4 would include amendments to the greatest number of plans, and Alternative 3 would include amendments to the fewest. All of the alternatives, with the exception of Alternative 3, would include amendments to the LAX Plan and LAX Specific Plan. All of the alternatives with ground access components (i.e., Alternatives 1 through 4, 8, and 9) would include amendments to the City of Los Angeles Transportation Element. Alternatives 1, 3, 4, 5, and 6 would also include amendments to the City of Los Angeles 2010 Bicycle Plan. Finally, all of the alternatives with airfield components, with the exception of Alternative 3, (i.e., Alternatives 1, 2, 4, 5, 6, and 7) would include amendments to the Los Angeles County Airport Land Use Plan (ALUP). With an amendment to the LAX Plan, LAX Specific Plan, City of Los Angeles Transportation Element, and City of Los Angeles 2010 Bicycle Plan to ensure precise consistency, impacts related to conflicts with plans and regulations would be less than significant.

Question: Page 1-82 talks about Chapter 5 Cumulative Impacts and Plan Consistency. Has any table been prepared to highlight these necessary changes? This section states that "Because acquisition and removal of businesses would not require changes..." however LAWA has told businesses in informal meetings that they would help relocate them into local areas which COULD require changes.

Response:

A description of changes required to the referenced plans to achieve precise consistency is provided in Section 4.9.6 of the SPAS Draft EIR. As stated on page 2-76 in Section 2.4.3 of the SPAS Draft EIR, implementation of the selected SPAS alternative would be subject to a series of actions by various City of Los Angeles departments as part of the review and approval process, including amendments and/or

updates to the LAX Plan and LAX Specific Plan, City of Los Angeles Transportation Element of the General Plan, City of Los Angeles Noise Element of the General Plan, City of Los Angeles Bicycle Plan, Los Angeles Coastal Transportation Corridor Specific Plan, and LAWA Aircraft Noise Mitigation Program. In addition, the County of Los Angeles Airport Land Use Commission will review the recommended SPAS alternative and make a determination as to whether the alternative is consistent with the County's Airport Land Use Plan. These subsequent actions, following the selection of a SPAS alternative, would include proposed changes to the applicable text and figures of these plans.

The referenced text on page 1-82 accurately states that "acquisition and removal of businesses would not require changes to existing General Plan or zoning designations" because these areas are already located within the boundaries of the LAX Plan and LAX Specific Plan (which provide the General Plan and zoning designations for LAX), as analyzed in Section 4.9.6 of the SPAS Draft EIR. The focus of the paragraph is on the potential for general plan and zoning inconsistencies within the boundaries of the LAX Plan and LAX Specific Plan.

The businesses proposed for acquisition under the various alternatives are identified in the LAX Master Plan Draft Relocation Plan. (See Section 4.9.6 of the SPAS Draft EIR.) The businesses identified are eligible for relocation assistance as described in LAX Master Plan Commitment RBR-1, Residential and Business Relocation Program. Acquired areas would be subject to LAX Master Plan Commitment LU-2, Establishment of a Landscape Maintenance Program for Parcels Acquired Due to Airport Expansion. Businesses that are located on LAWA property are not subject to the relocation provisions, and relocation of these uses would be a business decision.

It is acknowledged that relocated businesses could be faced with the need to request general plan and zoning changes, if they choose to relocate to areas that would require such changes. To the extent that new construction occurs in association with a displaced business as a result of acquisition and relocation, potential impacts, including changes to land use or zoning designations, would be addressed through applicable regulations and ordinances by jurisdiction, and through project-level environmental review for discretionary projects. Such potential effects were not evaluated in the SPAS Draft EIR as the circumstances surrounding environmental effects at relocation sites cannot be accurately predicted and such analysis would be highly speculative.

SPAS-PC00130-126

Comment:

Page 1-83 Aircraft Noise Exposure
...in Table 1-16, Alternative 4 would result in the greatest number of residential units, population, and non-residential noise-sensitive facilities that would be newly exposed to 65 CNEL or higher noise levels. This alternative would also result in the greatest number of residential units and acres that would be newly exposed to the 75 CNEL....

Question: Table 1-16 and the highlighted note on page 1-83 states that Alternative 4 (Alt D) would result in the greatest number of residential units....newly exposed..." This is counter intuitive as it leaves the outboard runways 24R in place and moves the inboard south 340'. Assuming that these newly impacted residences and other facilities are to the east, one would expect an equal number or greater number would be found moving north. What is the basis of these statements? What noise model and assumptions were used? What Integrated Noise Model was chosen and how was this validated? Was CNEL the only criteria used? Was any combination of factors such as single event also addressed? Which factors were they? If newer, more dense residential units were built in areas already impacted would they not be considered impacted because structures after a certain date require sound mitigation to preclude being included?

Response:

As shown in Table 1-16 and summarized on page 1-83 of the SPAS Draft EIR, Alternative 4 would result in the greatest number of residential units, population, and non-residential noise-sensitive facilities that would be newly exposed to 65 CNEL or higher noise levels. While it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there

would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. As summarized on the top of page 1-84 of the SPAS Draft EIR "[t]he density of the population is not constant across the area exposed to noise above 65 CNEL or higher; consequently, while the area of exposure may be similar among alternatives, the numbers of persons, dwellings or non-residential noise-sensitive facilities varies among the alternatives." Similar discussion was also provided in Section 4.10.1.6.8 of the SPAS Draft EIR.

As indicated in Sections 4.9 and 4.10.1, and summarized in Tables 1-16 and 1-17 of the SPAS Draft EIR, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward (Alternatives 1, 5, and 6) than would occur in moving 6R/24L southward (Alternatives 3 and 7) or not moving either runway (Alternatives 2 and 4), and the total residential population newly exposed to 65 CNEL would be lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to greater than 65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) or do not move the runways (Alternatives 2 and 4). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower with alternatives that move Runway 6L/24R northward--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas north of the airport. That is, although more homes to the north of the airport would be impacted by noise with a northward move of Runway 6L/24R, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in an overall decrease in the numbers of homes and people exposed to aircraft noise impacts.

Please see Response to Comment SPAS-PC00130-209 regarding the noise model and assumptions that were used and Response to Comment SPAS-AL00006-8 regarding the calculation of population and dwelling units. Regarding validation of the noise model, the model outputs were validated by comparing the 2009 baseline modeled contours with LAWA's RealContours, which is based on the information from the FAA's Automated Radar Terminal System data, FAA Tower Traffic Records, and Noise Monitoring Stations data.

Regarding other criteria used to determine noise impacts, as shown in Tables 1-19 and 1-20 and analyzed in Section 4.10.1.6 of the SPAS Draft EIR, other noise metrics were used to analyze single event aircraft noise exposure that result in nighttime awakening or classroom disruption including awakening probability contours, grid point analysis, interior noise levels of 55 dBA Lmax, 65 dBA Lmax, and 35 Leq(h).

The commentor also asks whether CNEL was the only criteria used and whether "single event" was addressed. Additional noise metrics and criteria were used in the aircraft noise analysis, including discussion of single event aircraft noise. See Section 4.10.1.2 of the SPAS Draft EIR for discussion of the methodology and noise metrics in the aircraft noise analysis and Section 4.10.1.4 of the SPAS Draft EIR for discussion of the thresholds of significance (i.e., the "criteria") applied in the aircraft noise analysis.

The commentor also asks questions about impacts to new unconstructed residential units. CEQA requires analysis of impacts to existing conditions, not future unconstructed facilities. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a).) Existing regulations require inclusion of noise insulation into new residential units which insure interior noise level are 45 dBA Ldn or less. (Title 24, California Code of Regulations (California Building Code or "CBC"), Part 2, Volume 1, Section 1207.11.2.)

SPAS-PC00130-127

Comment:

Page 1-86 Table 1-20 Awakening Probability Impacts of All Alternatives

Question: Table 1-20 indicates that all of the runway movement alternatives reduce the exposed population for likelihood of being awakened. This is far from intuitive since more people are impacted as shown by previous tables. How is this justified?

Response:

As summarized on the top of page 1-84 of the SPAS Draft EIR "[t]he density of the population is not constant across the area exposed to noise above 65 CNEL or higher; consequently, while the area of exposure may be similar among alternatives, the numbers of persons, dwellings or non-residential noise-sensitive facilities varies among the alternatives." Similar discussion was also provided in Section 4.10.1.6.8 of the SPAS Draft EIR.

As indicated in Table 1-20 on page 1-86 of the SPAS Draft EIR, there would be a decrease in the probability of nighttime awakening under Alternatives 1, 5, 6, and 7 compared to Alternative 4. As indicated in Table 1-17 and summarized on page 1-84 of the SPAS Draft EIR, there would be a decrease in the population and dwelling units exposed to 65 CNEL or higher noise levels under Alternatives 1, 2, 3, 5, 6, and 7 compared to Alternative 4. This decrease in population and dwelling units and corresponding decrease in nighttime awakening is due to the shift in the noise contours which would result in the removal of some densely populated areas to the east, southeast, and south from high noise levels as described in Response to Comment SPAS-PC00130-126.

SPAS-PC00130-128

Comment:

Under Mitigation Evaluation on same page, 1-86, numerous noise abatement program items are listed. One noise abatement used at LAX is take off on inboard and landing on outboard. This is not always followed, however, due to the fact that at certain times of the day more aircraft are landing than taking off and vice versa. This leads to both runways used for take offs at some periods which results in increased noise over the "modeled" amounts. What assumptions are identified which impact the conclusion as the one noted above, and where in the DEIR are they listed?

Response:

The comment (1) states that the Preferential Runway Use Policy (first bullet point on page 1-86 of the SPAS Draft EIR) is not always followed by aircraft pilots and (2) suggests this results in "increased noise over the 'modeled' amounts." As discussed in greater detail on page 4-930 in Section 4.10.1.7 of SPAS Draft EIR, LAWA currently implements the Preferential Runway Use Policy to reduce aircraft noise impacts to noise-sensitive uses by using inboard runways for departures and outboard runways for arrivals when possible. As acknowledged on page 4-930, '[t]he control of aircraft in flight is the responsibility of the FAA." Therefore, LAWA does not have the authority to make this a mandatory policy, and, in some instances, pilots deviate from this policy.

Contrary to the suggestion in the comment, the aircraft noise analysis did not assume the Preferential Runway Use Policy is always followed, therefore impacts would not be "increased over the 'modeled' amounts," as suggested in the comment. As described in Section 3.1.1.1 of Appendix J1-1 of the SPAS Draft EIR, the percentage use of the existing runways for the baseline (2009) conditions was based on information provided by LAWA's flight data through analysis of records of flight operations from the Federal Aviation Administration (FAA) Airport Traffic Control Tower (ATCT) radar data at LAX. Based on the data, the majority of the flights departed off the inboard runways and about 5 percent of the flights used the outboard runways for departures in 2009. Table 1 in Appendix J1-1 of the SPAS Draft EIR provides the 2009 conditions runway utilization percentages. Future runway assignments were developed based on the airfield and airspace simulations for the SPAS Draft EIR. The future runway use percentages for the SPAS alternative scenarios are presented under each of the alternative sections in Appendix J1-1 of the SPAS Draft EIR.

SPAS-PC00130-129

Comment:

Page 1-86 Mitigation Evaluation
The airport has a long history of addressing concerns related to aircraft noise. The operational elements of the current LAX noise abatement program are:

- Use preferred inboard runways for departures and arrivals and interior parallel Taxiways C and E during the hours between 10:00 p.m. and 7:00 a.m. This measure is intended to move nighttime noise to the interior of the airfield and away from noise-sensitive areas adjacent to the airport to the north and south.

Question: Even though this is an objective to keep takeoffs on the inboard runway, what percentage of aircraft take off from the outboard? Doesn't this occur especially when a majority of aircraft are waiting for takeoff rather than a mix of landings and takeoff?

Response:

Table 1 in Section 3.1.1.1 on page 8 of Appendix J1-1 of the SPAS Draft EIR provides the percentages of 2009 operations assumed in the aircraft noise analyses for the 2009 baseline conditions, by runway and landings and takeoffs. By adding the percentages presented in Table 1 for total takeoffs, the percentage of takeoffs recorded in 2009 from the outboard runways was 4.85 percent, i.e., Runways 7R (0.05 percent), 25L (3.31 percent), 6L (0.02 percent) and 24R (1.47 percent).

LAWA's Preferential Runway Use policy establishes a preference for arrivals on the outboard runways and departures on the inboard runways during the day and, at night (10:00 p.m. - 7:00 a.m.), the use of only inboard runways for arrivals and departures whether during Over Ocean or Westerly Operations. However, the FAA LAX Air Traffic Control Tower (ATCT) staff has the ability and authorization to utilize any runway when they deem necessary. The use of an outboard runway for a departure is not a violation of any kind.

Please refer to page 5 in Section 1.4.5 of Appendix F-2 of the Preliminary LAX SPAS Report regarding information on runway operating configurations. In addition, refer to Section 1.4.7 and Figure 4 regarding information on departure corridors.

The reasons for assigning takeoffs to the LAX outboard runways are numerous. It is the responsibility of the LAX ATCT staff to assign aircraft to runways. As suggested by the commentor, allowing takeoffs on the outboard runways can be a means to expedite takeoffs at peak departure times. In addition, and when considering a full year of data, reasons for assigning takeoffs to the outboard runways can vary widely and may include, but not be limited to, the following considerations: weather conditions (ceiling height, visibility, wind direction and speed); proximity of the departing aircraft to an outboard runway; departure length required by an aircraft; granted pilot-specific request by the ATCT to use a specific runway; and the need for a large aircraft to exit the local airspace by making an immediate left turn when departing from Runway 25L.

SPAS-PC00130-130

Comment:

Page 1-86 Mitigation Evaluation (third bullet)
- Conduct departures to the west along the runway heading until reaching the coastline. The measure has been the subject of continuing concern to assure better compliance to achieve the desired effect.

Question: Since a significant number of early turns have occurred and still occur how is this modeled into the sleep awakenings modeling? With a substantial number (even though reduced in recent times) of outboard over-ocean takeoffs on the south side how is this included in the model to establish sleep awakening impacts?

Response:

Please see Response to Comment SPAS-PC00112-1 regarding early turns. The INM modeling in Appendix J1-1 was also used as the basis for the sleep disturbance analysis. As discussed on page 4-811 of the SPAS Draft EIR "the INM and post-processor were utilized to calculate awakening probabilities at regularly-spaced intervals across a large grid area." Additional details regarding flight tracks (including early turns) is included in Appendix J1-1 as explained in Response to Comment SPAS-PC00130-354.

SPAS-PC00130-131

Comment:

Page 1-88 Airport Operating Regulations
Local regulations would be needed to implement mandatory reductions in airport operations, shifts in flight schedules, or changes in aircraft permitted to operate at the airport. With the adoption of the Airport Noise and Capacity Act of 1990, Congress required that airport operators could adopt such regulations only upon completion of a detailed study of the potential impacts of and alternatives to the proposed regulations. In most cases, the regulations can be adopted only after explicit FAA approval of the proposed restrictions.17 Before the FAA will consider a proposal to adopt a noise or access restriction, the airport sponsor must complete an analysis in compliance with 14 CFR Part 161. The analysis must demonstrate that the proposed restriction would meet the following six statutory conditions:

Question: What is the status of the Part 161 request LAWA has been preparing for the past four to five years? How is it accounted for in the conclusions made in this document? Is it assumed that it is granted? if not, what impacts are exacerbated and by how much?

Response:

As indicated on page 1-88 of the SPAS Draft EIR, LAWA is currently preparing the Part 161 Study.

As described in greater detail in Section 4.10.1.5 of the SPAS Draft EIR, these measures are directly related to aircraft noise abatement through operation or source noise control. One of the mitigation measures pertaining to aircraft noise adopted by LAWA as part of the LAX Master Plan and included in the Alternative D Mitigation Monitoring and Reporting Program (MMRP) is Mitigation Measure MM-N-5, Conduct Part 161 Study to Make Over-Ocean Procedures Mandatory. The Part 161 Study seeks federal approval of locally-imposed Noise and Access Restriction on departures to the east during Over-Ocean operations, or when the airfield is operating on the Westerly runway configuration during the Over-Ocean operations time period. Additional details regarding the Part 161 Study are provided on pages 4-929 and 4-930 in Section 4.10.1.7 of the SPAS Draft EIR. The Part 161 study was released in October 2012, with notice sent to the stakeholders and representatives of communities registered with the LAWA Noise Management Office including ARSAC. Additionally, information regarding the LAX Part 161 Study is available on LAWA's website for the subject study at http://www.laxpart161.com/en/index.cfm.

For the purposes of noise modeling for the SPAS Draft EIR, the future year noise exposure levels assumes the same percentage of flights complying with the existing Over-Ocean program that were identified for the baseline (2009), which provided a conservative approach related to noise modeling. It was speculative at the time of the release of the EIR to make assumptions regarding the outcome of the Part 161 process.

SPAS-PC00130-132

Comment:

Page 1-89 Airport Facilities
The construction and alteration of airport facilities can either directly or indirectly affect noise levels off the airport. Noise barriers, for example, can reduce the noise from aircraft ground operations that are heard off airport property. LAWA has already constructed noise barriers along the northern edge of the airport to reduce runway noise impacts to noise-sensitive uses to the north. Additionally, the LAX Master Plan and the LAX Noise Variance from the state include provisions for the future installation of two ground runup enclosures at LAX. Changes in runway length can alter noise patterns, as can the construction of new runways. The construction of taxiways can alter runway use by making the use of a given runway more convenient and safer for aircraft operators. Alternatives 1, 2, 3, 5, 6, and 7 include high-speed exists for arriving aircraft to exit from the runway and transition onto a taxiway that directs aircraft away from noisesensitive uses located to the north. Other airport facility improvements that serve to reduce aircraft noise impacts include the electrification of all passenger gates at LAX, along

with the installation of preconditioned (i.e., cooled) air systems, to reduce the need for parked aircraft to operate the on-board auxiliary power unit (i.e., turbine engine that provides power and cooling to the aircraft).

Question: page 1-89 Aircraft Noise abatement. There is a requirement for several hush hangers to be placed west of TBIT which is included in the CA DOT noise variance. Where are they to be located? If they are not present how has this been considered in the noise exposure predictions?

Response:

The comment is incorrect; there is no requirement for "several hush hangers to be placed west of TBIT." The LAX Master Plan indicates the future development of two ground run-up enclosures (i.e., "hush hangers"), one in the eastern portion of the airport and one in the western portion of the airport. The California DOT noise variance requires that design of the two ground run-up enclosures be done in the next several years, but does not specify any particular locations.

Section 5.3.1 of the SPAS Draft EIR describes development of the West Aircraft Maintenance Area, which includes development of a new maintenance hangar, along with aircraft Remain Overnight (RON) apron area, and a ground run-up enclosure (GRE), also known as "hush hanger" as referred to by the commentor. As stated in Section 5.3, the specific schedule of the development of the GRE is yet to be determined. The use of GRE was not modeled in the SPAS Draft EIR aircraft noise modeling analyses. Furthermore, noise associated with aircraft maintenance activities, such as engine ground run-ups, is relatively isolated and does not materially contribute to the airport's overall daily noise levels or the CNEL noise contours.

SPAS-PC00130-133

Comment:

Page 1-91 Table 1-22 Additional Schools Exposed to Significant Noise Impacts for Each Alternative 2025 Noise Exposure

Question: Table 1-22 Schools exposed to additional noise. The note indicates Alts 1,5,6,7 are comparable. Is the capacity of the runways assumed to be the same for each of these alternatives? If so, were the same aircraft mixes and numbers of aircraft creating the noise assumed to be the same? Since most of the schools are affected but not impacted per the legal definition, was there a predicted higher number of interruptions (single event) for one alternative over another?

Response:

As indicated in Appendix J1-1 of the SPAS Draft EIR, the fleet and aircraft operations assumptions remain constant for all of the alternatives. Aircraft noise impacts on schools, including number of disruptions, are presented in Section 4.10.1.6 of the SPAS Draft EIR for all of the alternatives. Aircraft noise impacts associated with classroom disruption are summarized in Table 4.10.1-60 of the SPAS Draft EIR.

SPAS-PC00130-134

Comment:

Page 1-92 Road Traffic Noise
The ground access improvements proposed under Alternatives 1, 2, 3, 4, 8, and 9 would result in changes in road traffic noise levels at off-site noise-sensitive receptors. The predicted changes in road traffic noise levels under each of these alternatives would be less than a 3 A-weighted decibel (dBA) increase in CNEL; therefore, the road traffic noise impacts associated with Alternatives 1, 2, 3, 4, 8, and 9 would be less than significant. Alternatives 5, 6, and 7 do not include ground access improvements and would therefore not affect road traffic noise levels at off-site noise-sensitive uses.

Question: Even though the underlined section above alternatives do not include ground access improvements will there be unacceptable levels of noise from construction equipment moving facilities north? How much impact?

Response:

Section 4.10.3 of the SPAS Draft EIR addresses construction noise impacts for each and every alternative, including as related to airfield improvements, terminal improvements, and ground access improvements. As summarized in Table 4.10.3-4, all of the SPAS alternatives are currently, at this program level of analysis, anticipated to result in significant unavoidable impacts related to construction noise. Please see Section 4.10.3.8 of the SPAS Draft EIR for a summary of these conclusions.

SPAS-PC00130-135

Comment:

Page 1-92 Road Traffic Noise
Regarding cumulative impacts, as discussed in Section 5.5.10.2 in Chapter 5, Cumulative Impacts, the increases in road traffic noise anticipated to occur between baseline (2010) conditions and future (2025) conditions, including the projected growth in regional traffic combined with the effects of each SPAS alternative, would not result in a 3+ dBA CNEL increase at any of the noise-sensitive receptor locations evaluated. As such, cumulative road traffic noise impacts would be less than significant.

Question: Is the rationale for no cumulative impact from noise along the northside due to an assumption that the previous 1982 Land Use Plan called for more traffic than that scaled back in Alternative D and neither has been enacted?

Response:

The traffic assumptions for future (2025) cumulative traffic include traffic from the buildout of LAX Northside as assumed in Alternative D of the LAX Master Plan. Although development within LAX Northside has not yet been commenced, it is assumed, for cumulative traffic modeling purposes, that the subject development would be completed by 2025, the planning horizon year for SPAS (i.e., development of LAX Northside is included in the Travel Demand Forecasting Model described in Section 4.12.2.2.1 of the SPAS Draft EIR).

SPAS-PC00130-136

Comment:

Page 1-96 Fire Protection
Airfield improvements under Alternatives 1, 2, 3, 4, 5, 6, and 7 would enhance the safety and efficiency of the airfield compared to baseline conditions, thereby decreasing the potential need for emergency fire response associated with airfield accidents.

Question: Where is the analysis that supports the above statement? What safety and efficiency factors are improved?

Response:

Section 4.11.1 of the SPAS Draft EIR provides a detailed analysis of impacts to fire protection services associated with the SPAS alternatives and identifies the factors that are evaluated in this analysis. As stated in Section 2.2 of the SPAS Draft EIR, one of the main objectives of the project is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. The existing outdated airfield design places aircraft at an increased risk of hazards. Those hazards include, but are not limited to, potential collisions with other aircraft and insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways and aircraft on nearby taxiways.

Enhancements in the safety and efficiency of the airfield under Alternatives 1 through 7 would have a beneficial effect on emergency fire response as the enhancements would address a current

circumstance where an outdated airfield design creates a situation where aircraft are at an increased risk of hazards, as described above. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on page 4-570 in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00130-137

Comment:

Page 1-97 Law Enforcement
It is anticipated that these facilities would be relocated to the future LAX Public Safety Building and Supporting Facilities that is being planned independent of SPAS.

Question: Page 1-97 A new public safety building is planned to be "independent of SPAS." Where is the list of all projects independent of SPAS listed and their contributions to traffic?

Response:

Section 5.3 of the SPAS Draft EIR includes a comprehensive list of past, present, and reasonably foreseeable cumulative development projects at LAX; related, non-LAWA projects on or adjacent to the airport; and regional projections and development projects. The locations of all of the cumulative projects that are currently known are identified in Figures 5-1 and 5-2 of the SPAS Draft EIR. As indicated on page 4-1023 of the SPAS Draft EIR, LAWA is currently in the design and site selection phase of a new public safety building. As noted on page 5-128 in Section 5.5.12.2 of the SPAS Draft EIR, cumulative impacts to off-airport transportation are incorporated into the analysis provided in Section 4.12.2. As stated on page 4-1208 of Section 4.12.2, "future (2025) scenarios were developed based on SCAG's land use projections for future interim year 2023 and future 2035 conditions plus planned development projects." Additional discussion of the planned development projects that were accounted for in the off-airport transportation analysis is provided on page 4-1208 and in Appendix K2-2 of the SPAS Draft EIR. (It should be noted that the table provided in Appendix K2-2 is the same as Table 5-2 provided in Chapter 5 of the SPAS Draft EIR. This table corresponds to the graphic depiction of project locations provided in Figure 5-1.)

SPAS-PC00130-138

Comment:

Page 1-98 On-Airport Transportation Curbside Operations
No significant impacts to curbside operations would occur under any of the alternatives addressed (Alternatives 1, 2, 4, 8, and 9) relative to Baseline (2009) versus Baseline (2009) With Alternative analyses. For Future (2025) versus Future (2025) With Alternative conditions, all of the alternatives would have a significant cumulative impact at the inner curbside at TBIT on the arrivals level.

Question: Does this mean that no matter what LAWA has in any of its alternatives traffic around TBIT will be terrible? Aren't there other improvements that could address this that should have been considered? Why not?

Response:

Section 4.12.1.11.2 on page 4-1178 of the SPAS Draft EIR addresses the mitigation measures to alleviate the curbside impacts. As Indicated in Table 4.12.1-44 on page 4-1179, implementation of Mitigation Measure MM-ST(OA) (SPAS)-1, Relocate Existing Taxi Loading Zone at TBIT, would reduce impacts associated with Alternatives 1, 2, 4, 8, and 9 to a level that is less than cumulatively considerable. The results of this analysis are presented in Appendix K1 of the SPAS Draft EIR.

SPAS-PC00130-139

Comment:

Page 1-98 On-Airport Transportation Roadway Links

No significant impacts to on-airport roadway links would occur under any of the alternatives addressed (Alternatives 1, 2, 4, 8, and 9) relative to the Baseline (2009) versus Baseline (2009) With Alternative analyses. For Future (2025) versus Future (2025) With Alternative conditions, Alternatives 1 and 2 would have significant cumulative impacts at three roadway links, all on the arrivals level; Alternative 4 would have significant cumulative impacts at five roadway links, all on the arrivals level; Alternative 8 would...

Question: 1-98 Roadway Links indicates No significant impacts, but LAWA has been pushing a BRT (articulated bus that shares CTA levels). How is it possible to add giant buses into a congested curbside area and not cause even more congestion?

Response:

The commentor inquired about the executive summary discussion on roadway links presented in Chapter 1 on page 1-98 of the SPAS Draft EIR.

The buses proposed by LAWA to operate on the evaluated busway are non-articulated buses similar to the existing LAX shuttles. While the total number of LAX shuttles accessing the CTA would increase under Alternatives 1, 2 and 8, the total number of commercial vehicles accessing the CTA would effectively decrease. This is because buses serving new off-airport facilities like the Intermodal Transpiration Facility (ITF) under Alternatives 1, 2, and 8 and the Consolidated Rental Car Facility (CONRAC) under Alternative 8, as well as some other commercial modes and about 5 percent of the private vehicles currently accessing the CTA would no longer access the CTA when the elevated busway is in place. Instead, passengers would be dropped off or picked up at the off-airport facilities, such as the ITF and the CONRAC, where passengers would be consolidated into groups and boarded onto high capacity LAWA-operated buses that would be used to transport passengers into the CTA. These buses would operate with higher average passenger loads than would the commercial vehicles that would otherwise access the CTA. LAWA buses taking access to and from the CTA via the elevated busway would be carrying a mix of riders including CONRAC customers, arriving passengers for the FlyAway buses, and charter long-distance transit buses, which, in turn, would result in a fewer number of bus operations within the CTA than would otherwise occur if the rental car companies, FlyAway program, and transit bus companies were operating their own individual buses within the CTA, each with comparatively fewer riders. Please see Table 4.12.1-15 of the SPAS Draft EIR for a discussion of the Future (2025) Passengers Mode Splits in the LAX CTA.

Notwithstanding the above, please see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, including the development of an APM system into the CTA instead of an elevated busway.

SPAS-PC00130-140

Comment:

Page 1-99 On-Airport Transportation Public Parking Impacts
The airport's public parking supply in each of the Future (2025) alternative scenarios is sufficient to accommodate the airport's estimated future (2025) public parking demand for all the alternatives; supplies which are assumed to be 15 percent greater than the space demand to account for fluctuations in vehicles arrivals in the facilities. Therefore, impacts associated with parking are considered less than significant....

Question: Page 1-99 Public Parking impacts. Has LAWA assumed that the parking structures will continue operation as is through 2025? Will there be major repairs or renovation to these facilities? What percentage of people are expected to park on-airport vs. off-airport? Was an assumption of off-site check in made? If not, why not?

Response:

Please see Table 2-2 on pages 2-47 and 2-48 in the SPAS Draft EIR for a summary of assumed parking structures under each SPAS alternative. All parking structures within the Central Terminal Area

(CTA) are assumed to remain in place throughout the SPAS development program, with the exception of parking structures P-2B and P-5 which would be demolished to allow for the construction of the Midfield Satellite Concourse (MSC) passenger processor, as noted in Footnote 2 of Table 2-2 on page 2-48. Additional details regarding parking assumptions for each alternative are provided in the On-Airport Transportation in Section 4.12.1.6.1 of the SPAS Draft EIR.

Any repairs or renovation of the CTA parking structures will be conducted on an as-needed basis as part of the normal LAX maintenance and operations.

Data from the 2006 LAX Air Passenger Survey shows that during the departures and arrivals level peak hours, 45.6 percent of parkers parked within the CTA, while 53.1 percent park outside of the CTA. Of those who chose to park outside of the CTA, 31.2 percent park in the remote airport lots, while 68.8 percent park in off-airport private parking lots not operated by LAWA. The 2006 LAX Passenger Survey is available to be downloaded at the following LAWA website address: http://www.lawa.org/uploaded files/lax/pdf/2006LAXPassengerSurveyFinal.pdf

The SPAS Draft EIR assumed that passenger and baggage check-in would not be provided at the off-site passenger processing facilities to provide a conservative basis for estimating traffic related impacts. The use of off-site check-in facilities would translate into a decrease in the number of vehicles entering the CTA as assumed for the SPAS Draft EIR and, therefore, further reduce the level of traffic activity and potential impacts as compared to that currently estimated. If off-site check-in facilities were incorporated, traffic operations within the CTA and local roadway system would likely be better than depicted in the SPAS Draft EIR. Additional details regarding parking assumptions are provided on pages 4-1054 and 4-1073 of the SPAS Draft EIR.

SPAS-PC00130-141

Comment:

Page 1-100 Note from Table 1-24 Summary of Off-Airport Transportation Impacts After Mitigation
The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. It would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods. As such, the total number of intersections that may be temporarily significantly impacted during construction cannot be determined at this time.

Question: The note in table 1-24 states that "no construction plans, programs, or schedules .... It would be speculative to estimate..." Was any consideration of construction traffic made? If not, why not?

Response:

Construction-related traffic impacts are addressed, at a program level of analysis, in Section 4.12.1.9.4 relative to on-airport transportation and in Section 4.12.2.6.3 relative to off-airport transportation. Please see Responses to Comments SPAS-PC00130-142 and SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-142

Comment:

Page 1-100
The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. As such, it would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods. Nevertheless, based on a qualitative evaluation,...

Question: Even at a program level some basic amounts of construction related traffic should be quantifiable if the general types of construction are identified. On the runway related movements it can be more difficult, but the amount of construction and a survey of potential complications should enable LAWA to make an estimate. Why hasn't these elements been properly considered. The cost estimates use boiler plate $xx/sq yard of runway, why can't construction related efforts be estimated at least as well as that?

Response:

As discussed on page 4-3 of the SPAS Draft EIR, the SPAS Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4)).

Section 15146(b) of the State CEQA Guidelines states that "An EIR on a project such as the… amendment of… a local general plan should focus on the secondary effects that can be expected to follow from the… amendment, but the EIR need not be as detailed as an EIR on the specific construction projects that might follow."

Program EIRs are commonly used in conjunction with the tiering process, which is "the coverage of general matters in broader EIRs (such as general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs…concentrating solely on the issues specific to the EIR subsequently prepare." (State CEQA Guidelines Section 15385.) Under CEQA's tiering principles, it is proper for a lead agency to focus a first-tier EIR on only the program's general impacts, "leaving project-level details to subsequent EIRs when specific projects are being considered." (State CEQA Guidelines Section 15152(c); In re Bay-Delta (2008) 43 Cal.4th 1143, 1174-1175.)

The State CEQA Guidelines establish several additional principles related to the level of detail appropriate for a first-tier program EIR. For example, an EIR project description should be "general" and "not supply extensive detail beyond that needed for an evaluation and review of the environmental impacts." (State CEQA Guidelines Section 15124.) Also, the degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated. (State CEQA Guidelines Section 15146(b)). An EIR's sufficiency is reviewed in the light of what is "reasonably feasible." (State CEQA Guidelines Section 15151.)

The requirements and principles for first-tier program EIRs reviewed above apply directly to the SPAS Draft EIR. As stated on page 1-10 in Section 1.2.1 of the SPAS Draft EIR, "The project is to complete a Specific Plan Amendment Study (SPAS) that fulfills Section 7.H of the LAX Specific Plan consistent with the definition of the SPAS set forth in the LAX Master Plan Stipulated Settlement." The outcome of SPAS is the possible amendment of the LAX Specific Plan, which is an element of the City's General Plan. Therefore, the SPAS Draft EIR is appropriately a program EIR that focuses on program-wide impacts, and is not a project-level EIR. Because it is a program EIR, the SPAS Draft EIR is not required to analyze the impacts of specific construction projects included in the program at a project-specific level of detail. An EIR is not required to speculate about the environmental consequences of future development that is unspecified or uncertain. (Environmental Protection Info. Ctr. v. Department of Forestry & Fire Protection (2008) 44 Cal.4th 459, 502.)

As indicated on page 2-74 in Section 2.4 of the SPAS Draft EIR, "Certification of the SPAS EIR would complete the program-level CEQA compliance review for the SPAS process. Depending on the outcome of the SPAS process, additional project-level CEQA review may be required for implementation of the improvements associated with the selected SPAS alternative." LAWA's approach to preparing second-tier project-level CEQA documents is exemplified by project-specific EIRs prepared for major elements of the LAX Master Plan implemented to date, such as the South Airfield Improvement Project EIR, the Bradley West Project EIR, and the LAX Crossfield Taxiway Project EIR.

Comment:

Page 1-101 Transportation-Related Fuel

... As discussed above, the SPAS alternatives with ground access components (i.e., Alternatives 1, 2, 3, 4, 8, and 9) include a variety of design features to shift individuals away from personal vehicle use to other more efficient modes of transportation, which would reduce transportation related fuel consumption. With these design features, Alternatives 1, 2, 3, 4, 8, and 9 would not result in a wasteful, inefficient, or unnecessary consumption of Jet A fuel, gasoline, or diesel....

Question: p 1-101 Transportation-Related Fuel
This section states that there will be no "wasteful, inefficient, or unnecessary consumption..." Since we would continue to expect the CTA to be gridlocked during peak hours, what does that statement mean? How many cars are assumed to be able to use the CTA during peak hours? What number of people changing access modes is necessary to reduce vehicle access enough to remove this limiting constraint on passenger growth?

Response:

Please note that the comment presents a personal opinion about expecting the "CTA to be gridlocked during peak hours" that is unsupported by facts or evidence. Based on the on-airport transportation analysis presented in Section 4.12.1 of the SPAS Draft EIR, future traffic conditions within the CTA are anticipated to be generally good during peak hours and would not be "gridlocked" as suggested in the comment. As indicated in Tables 4.12.1-17, 4.12.1-19, and 4.12.1-21 on pages 4-1108 through 4-1117 of the SPAS Draft EIR, future (2025) traffic conditions during peak hours within the CTA would operate at Level of Service A ("Excellent") or B ("Very Good") for the vast majority of curbsides, roadway links, and intersections within the CTA.

Please refer to Response to Comment SPAS- PC00130-140 regarding the number of vehicles that would be removed from the CTA roadways under the various SPAS alternatives.

It is not necessary to induce additional mode changes beyond those assumed in SPAS to accommodate the vehicle activity generated by the anticipated passenger growth. In addition, mitigation measures discussed in Section 4.12.1.10.2 of the SPAS Draft EIR have been identified to mitigate potential on-airport traffic impacts associated with the SPAS alternatives.

SPAS-PC00130-144

Comment:

Page 1-101 Solid Waste
Improvements associated with the proposed alternatives would not, in themselves, alter passengerrelated municipal solid waste generation. Passenger activity at LAX would increase by 2025 due to projected growth with or without implementation of the SPAS alternatives, and those future passenger activity levels would be the same under each of the alternatives. As a result of increased passenger activity levels, passenger-related solid waste generation at LAX would increase by 22 percent compared to baseline (2010) conditions. The increase in solid waste generation would be the same under all alternatives. The Sunshine Canyon Landfill has sufficient physical and permitted capacity to accommodate this increase in solid waste generation. LAWA would continue to implement and enhance existing programs aimed at reducing waste generation, which are designed to fulfill LAX Master Plan Commitment SW-1, Implement an Enhanced Recycling Program, and increase the diversion rate to meet the state's 70 percent requirement by 2020. Therefore, under all alternatives, impacts to solid waste disposal capacity and to diversion-related policies and objectives associated with the solid waste generated from the increased number of passengers would be less than significant. With respect to cumulative impacts, passenger activity levels at LAX are forecasted to be 78.9 MAP by 2025 as a result of natural growth. The increase in passenger activity is expected to occur with or

without implementation of any of the SPAS alternatives. Projected increased passenger demand at LAX, in...

Question: Since solid waste is expected to be significant regardless of alternative can LAWA utilize conversion techniques for its waste similar to that identified in RENEW LA which could reduce waste by 90% and thereby reduce the need for Sunshine Canyon or any other dump?

Response:

Contrary to the statement in this comment, as indicated in Section 4.13.2 of the SPAS Draft EIR, under all of the SPAS alternatives, impacts to solid waste disposal capacity and to diversion-related policies and objectives associated with the solid waste generated from the increased number of passengers would be less than significant. As stated on page 4-1362 of the SPAS Draft EIR, Sunshine Canyon Landfill has sufficient physical and permitted capacity to accommodate this increase in solid waste generation. However, as indicated in Section 5.5.13.2 of the SPAS Draft EIR, as future regional solid waste disposal capacity to meet projected demand in Los Angeles County is not assured, impacts associated with projected increased passenger demand at LAX, in conjunction with other regional projects and population growth, would be significant, and LAX's contribution to these impacts would be cumulatively considerable. Cumulative impacts could be mitigated through implementation of LAX Master Plan Mitigation Measure MM-SW-1 (Provide Landfill Capacity) Implementation of this mitigation measure is the responsibility of another agency (or agencies). If this mitigation measure is not fully, implemented, cumulative impacts would remain significant, and LAX's contribution would remain cumulatively considerable.

The City's RENEW LA Plan, is a 20-year blueprint that will guide the City in reducing the use of landfills by maximizing recycling and reuse, and converting solid waste that currently goes to landfills into clean energy and/or raw materials. As part of this plan, the City continues to evaluate conversion technologies and has initiated efforts to identify material recovery facility and transfer stations in Southern California that could potentially host a conversion technology facility. LAWA will continue to enhance its recycling programs at LAX, which may include conversion technologies in the future.

As indicated in Section 4.13.2 of the SPAS Draft EIR, LAWA would continue to implement and enhance existing programs aimed at reducing waste generation, which are designed to fulfill LAX Master Plan Commitment SW-1 (Implement an Enhanced Recycling Program) and increase the diversion rate to meet the state's 70 percent requirement by 2020 or sooner.

SPAS-PC00130-145

Comment:

Page 1-103 1.5 Environmentally Superior Alternative
Section 15126.6(e)(2) of the State CEQA Guidelines requires an EIR to identify an environmentally superior alternative. If the environmentally superior alternative is the "no project" alternative, the EIR must identify an environmentally superior alternative among the other alternatives. Based on the analyses in Chapter 4, Environmental Impact Analysis, and Chapter 5, Cumulative Impacts, of this EIR, Alternative 2 is considered to be the Environmentally Superior Alternative of the nine alternatives evaluated in detail throughout this document.21

Question: Section 1.5 Environmentally Superior Alternative. Since Alternative 2 is the environmentally superior noted alternative and the Settlement Agreement calls for the least impact, how are any of the other alternatives justified?

Response:

The Stipulated Settlement does not "call for the least impact" as indicated in the comment. Instead, Section V of the Stipulated Settlement, which identifies the SPAS process, calls for study of a range of alternatives. For example, Section V(D) of the Stipulated Settlement calls for the study of potential alternatives that would provide solutions to the problems the Yellow Light projects were designed to address.

The SPAS Draft EIR provides a broad range of alternatives that each respond to the project objectives differently (refer to Tables 1-2 and 1-3) and each have different environmental effects (refer to Tables 1-4 and 1-5); however, each and every alternative are subject to an extensive set of LAX Master Plan commitments and feasible mitigation measures to minimize environmental impacts (refer to Table 1-6).

Comment:

Page 1-105 Incorporation by Reference
Question: Was the 2004 LAX Master Plan Final EIR and addendums recently delivered and available at the libraries? Which ones?

Response:

The LAX Master Plan Final EIR, including addenda, was not distributed to local libraries in conjunction with the distribution of the SPAS Draft EIR, nor were these documents required to be distributed to local libraries under CEQA. However, as noted on page 1-105 of the SPAS Draft EIR, it was available for public review at Los Angeles World Airports, Capital Programming and Planning Division (formerly Facilities Planning Division), One World Way, Los Angeles, CA 90045, and also accessible via the internet at www.ourlax.org.

SPAS-PC00130-147

Comment:

Page 2-2 Project Objectives (third bullet)
- The primary north airfield departure runway (6R/24L) is too short for certain larger aircraft (e.g., fullyloaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield, resulting in less efficient operations and disproportionate environmental impacts.

Question: p 2-2 Project objectives states that runway 24L length can't handle "fully loaded 747-400" but isn't it true that many of these aircraft do take off from the north complex? What number and percent of the 747-400 must taxi to from the north to the south? What percentage is this number of the total aircraft operations? If the runway is "too short" what should it be and how did Alternative D account for this problem?

Response:

As discussed on page 5-80 in Chapter 5 of the Preliminary LAX SPAS Report, some long-haul departures occurring at the maximum certificated takeoff weight (MTOW) cannot use the north airfield and must use the longer runway available on the south airfield. A Takeoff Length Analysis for heavy aircraft, those with an MTOW of 255,000 pounds or more, was prepared for Runway 6R/24L at LAX. This analysis can be found in Appendix E1-5 of the Preliminary LAX SPAS Report. The analysis states that B747-400 and B747-400F aircraft require 10,500 ft. and 10,700 ft. of runway, respectively, for takeoff at MTOW and a temperature of 59°F. B747-400 and B747-400F aircraft require 11,300 ft. and 11,500 ft. of runway, respectively, at MTOW and with temperatures in excess of 90°F. B747-400 and B747-400F aircraft departing at weights less than MTOW may be able to use north airfield runways for departure.

The Takeoff Length Analysis also states that by using the 2020 No Yellow Light Project flight schedule, there are approximately 49 B747-400 and B747-400F daily departures, making up 12.99 percent of heavy aircraft departure operations. Combined, B747-400 and B747-400F aircraft make up approximately 4.12 percent of total airport operations.

Please see Response to Comment SPAS-PC00130-62 for a more detailed discussion of the findings of the Takeoff Length Analysis, including the percentage of heavy aircraft departures that cannot be accommodated at the existing north airfield. Alternative D extends Runway 6R 135 ft. to the west and Runway 24L 1,280 ft. to the east for a total runway length of 11,700 ft. According to the Takeoff Length Analysis, this runway length is sufficient to accommodate 100 percent of heavy aircraft departures at

MTOW and a temperature of 59°F, while accommodating approximately 90 percent of heavy aircraft departures at MTOW and a temperature of 86°F. (See Tables 1A and 1B of Appendix E1-5 of the Preliminary LAX SPAS Report.)

SPAS-PC00130-148

Comment:

Page 2-2 Project objectives (eighth bullet)
- The existing Runway Protection Zone (RPZ) associated with Runway 6L/24R includes residential uses.

Question: p2-2 Project objectives states "The existing Runway Protection Zone...includes residential uses." The Alt D yellow light project moved the inboard runway south with no change in the location of 24R therefore the RPZ remained the same. Since the key component of the Stipulated Settlement objective is to address the issues resolved by the yellow light project how is this an issue that is appropriate for consideration? If anything, since the RPZ was fixed by Alt D then no action which changes that for the worse should be unacceptable.

Response:

Under Section V.D of the Stipulated Settlement, LAWA is to focus the SPAS on, among other things, potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address. Section 2.2 of the Preliminary LAX SPAS Report and Section 2.2 of the SPAS Draft EIR set forth the SPAS project objectives and the problems that the Yellow Light Projects were designed to address. As stated therein, one of the SPAS objectives is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. One of the problems associated with the outdated airfield design is that the existing Runway Protection Zone (RPZ) associated with Runway 6L/24R includes residential uses.

One of the objectives of the SPAS, as presented later in the last bullet on page 2-2, is for LAWA to seek airfield improvements that minimize or eliminate the extent to which RPZs overlay residential areas. The commentor is correct that LAX Master Plan Alternative D does not propose to relocate Runway 6L/24R; hence, the homes that are currently within the existing RPZ for that runway would continue to remain in the RPZ under the approved LAX Master Plan. It is LAWA's objective to identify and evaluate airfield improvement options that would remove the RPZ boundary from encompassing these homes, and the SPAS alternatives includes three options that do so - Alternatives 1, 5, and 6 (see Table 4.7.2-16 on page 4-569 of the SPAS Draft EIR).

SPAS-PC00130-149

Comment:

Page 2-2 2. Improve the Ground Access System at LAX to Better Accommodate Airport -
Related Traffic, Especially as Related to the Central Terminal Area
Travelers, visitors, employees, vendors, and others utilizing the commercial passenger terminal at LAX, defined by the Central Terminal Area (CTA), have various ground access options including private vehicles, transportation service providers (i.e., taxis, shuttles, limousines, etc.), and public transit. Ground...

Question: P2-2 Improve Ground Access System...Especially.. Central Terminal Area" What quantifiable values are need to conveniently access the CTA curbside at each terminal? What specific queing, weaving, and conflict points are being addressed to reduce the impedance of traffic? What causes each of these limits? Since no quantifiable numbers are provided it's hard to judge actual effectiveness.

Response:

The quantifiable values assumed to access the Central Terminal Area (CTA) curbsides are included in numerous sections of the SPAS Draft EIR. Refer to Section 4.12.1.3.13 on pages 4-1074 through 4-

1087 which discusses the procedures used to analyze the CTA curbsides. In addition, Tables 4.12.1-6 and 4.12.1-7 on page 4-1075 of the SPAS Draft EIR define the level of service thresholds using volume/capacity ratios within specified ranges, providing a way to quantify curbside operations analysis. The results of this analysis for the Baseline with Alternatives traffic conditions are provided in Table 4.12.1-16 on pages 4-1107 and 4-1108 of the SPAS Draft EIR. The results of future (2025) with Alternatives are provided in Table 4.12.1-17 on page 4-1108 through 4-1110 of the SPAS Draft EIR. Additional analysis is presented in Appendix K1 of the SPAS Draft EIR.

The effects of queuing, weaving and conflict points are addressed within the calculation of CTA roadway capacity. The curbside utilization is a measure of queuing on the curbsides. For example, on single loading curbsides, utilization of more than 100 percent would mean that the vehicles are queuing or actively loading/unloading on the second lane of the curbside roadway. The impedance of this condition on the overall flow of traffic within the CTA is considered in the roadway link analysis. Figure 4.12.1-8 on page 4-1081 of the SPAS Draft EIR shows the relationship between the curbside utilization and the reduction on throughput capacity of the adjacent roadway. The results of the CTA roadway link analysis under Baseline conditions are presented in Table 4.12.1-18 on pages 4-1110 through 4-1112 and the results of the CTA roadway link analysis under future (2025) conditions are presented in Table 4.12.1-19 on pages 4-1113 through 4-1115 of the SPAS Draft EIR. Additional analysis is presented in Appendix K1 of the SPAS Draft EIR.

SPAS-PC00130-150

Comment:

Page 2-3 Improve Ground Access
- Curbside demand is unevenly distributed, especially during peak periods, creating concentrations of passengers that are not accommodated by the existing curbside system;

Question: Page 2-3 Project objectives states that ground access is critical. I agree, but what is LAWA doing to reduce peak time access? Since it is stated that curbside demand is unevenly distributed what amounts of changes (quantitative measure) is needed? Would a third level for buses and emergency vehicles help the situation as has been suggested at SPAS meetings but has never made it into any LAWA plan?

Response:

As discussed on pages 1-11 and 1-12 in Section 1.2.1 of the SPAS Draft EIR, all alternatives considered and evaluated under the SPAS Draft EIR analyses are intended to reduce traffic accessing the Central Terminal Area (CTA) in both peak and non-peak hours.

For example, facilities such as the Intermodal Transportation Facility (ITF) under Alternatives 1, 2, and 8 and Consolidated Rental Car Facility (CONRAC) under Alternative 8 are anticipated to reduce the number of vehicles accessing the CTA by diverting trips to these off-site locations where passengers would be consolidated into groups and transported to the CTA using efficient high-occupancy shuttle buses on an elevated busway connecting airport facilities at Manchester Square, the new Green Line Aviation/LAX light rail station, the ITF and the CTA. CTA operational improvements such as the elimination of "double-looping" of certain shuttle bus operations for a more efficient single-level busing operation would further reduce traffic activity and related congestion in the CTA. Mitigation Measures MM-ST(OA) (SPAS)-2 on page 4-1178 of the SPAS Draft EIR describes the measures that address CTA curbside operations. Other alternatives, namely Alternative 3, eliminate private vehicle access to the CTA thereby reducing curbside traffic congestion.

Regarding the potential addition of a third level for buses and emergency vehicles discussed in the comment, construction of a third-level curbside would require significant reconfiguration of the terminals and CTA roadway system. Construction of a third level roadway and new pedestrian connections to the terminal buildings within the CTA would be infeasible. Accommodating these new facilities would require significant reconfiguration of the CTA's access and egress roadways, along with the simultaneous closures and reconstruction of portions of both the existing arrivals and departures level roadways to facilitate construction of the third level roadway support structure and deck. Additionally, development of a third level roadway and new pedestrian connections would substantially constrain

potential alignment and design options for a future Automated People Mover (APM) within the CTA, which is proposed under Alternative 9 (Note: Although Alternative 3 also proposes an APM system within the CTA, the CTA roadway system under that alternative would be closed to private vehicles, therefore there would be no need/purpose for a third level roadway). LAWA's priority for landside development is to implement improvements which encourages passengers to access the CTA using high-occupancy modes via an elevated busway (SPAS Alternatives 1, 2, and 8) or an APM system (SPAS Alternatives 3 and 9) in favor of constructing additional roadway capacity for private vehicles within the CTA. Furthermore, existing physical constraints, the expectation of limited availability of capital funding, and disruptions to CTA operations are additional factors for why construction of a third-level roadway was not considered as part of the SPAS Draft EIR.

Further, a third level would be just an alternative to one project component. Under CEQA, for multi-component projects like the SPAS alternatives, an EIR need not evaluate alternatives for each project component. (California Oak Foundation v. Regents of University of California (2010) 190 Cal.App.4th 227, 276-277; Big Rock Mesas Prop. Owners Ass'n v. Board of Supervisors (1977) 73 Cal.App.3d 218, 277; see also No Oil, Inc. v. City of Los Angeles (1987) 196 Cal.App.3d 223, 235.)

SPAS-PC00130-151

Comment:

Page 2-3 Improve Ground Access
- The roadway system is not designed to efficiently accommodate security screening of vehicles entering the CTA.

Question: P2-3 Project objectives states that LAX must remain the premier point for all activity to keep the vitality of the region. The SetOntarioFree.com has a study that shows an extra 1.6 million cars are being directed to the LAX area that could be handled in Ontario. Since the area is already gridlocked how much business expenses are wasted by employees and transportation of goods in an unnecessarily gridlocked area where regionalization has not been fostered?

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization. The subject Topical Response also discusses LA/Ontario International Airport, which is assumed within the regionalism of air travel demand.

LAWA could find no reference on the "SetOntarioFree.com" website to "a study that shows an extra 1.6 million cars are being directed to the LAX area that could be handled in Ontario" (website accessed on December 15, 2012). Although the subject website includes claims to the effect that 1.3 million cars annually are traveling to LAX for flights that should be offered at Ontario International Airport, no study or other evidence supporting such claims could be found on or through the subject website.

SPAS-PC00130-152

Comment:

Page 2-3 3. Maintain LAX's Position as the Premier International Gateway in Supporting and Advancing the Economic Growth and Vitality of the Los Angeles Region
LAX serves a key role in the region's economy. This is particularly true relative to LAX's position as the international gateway for the western United States. According to a study completed in 2007 by the Los Angeles Economic Development Corporation (LAEDC), over the course of 2006 an average transoceanic flight traveling round-trip from LAX everyday added $623 million in economic output and sustained 3,120 direct and indirect jobs in Southern California with $156 million in wages.25 Given the continued growth in, and reliance on new large aircraft such as the Airbus A380 by major airlines operating on those long distance international routes, it is important that LAX be able to effectively accommodate those aircraft.

LAX is a major employer on both a local level and a regional level. According to the LAX Master Plan Final EIS/EIR, on-airport employment at LAX provided almost 59,000 jobs and, on a larger-scale, LAX related regional employment provided over 400,000 jobs and $60 billion in economic output.26 (underlined for emphasis)

Question: Page 2-3 Project objectives states that the roadway system is not designed to efficiently accommodate security screening, but again LAWA 's plans have failed to address a recommended, effective fix of putting weight scales and cameras into the roadway at critical points. These could be monitored automatically at all times. How many check points does LAWA need to avoid creating a security bottleneck? How many cars per hour can be accommodated in any one location? Has LAWA considered a special access for buses and commercial vehicles?

Response:

Security is not an environmental impact and, therefore, is not required to be discussed in the SPAS Draft EIR under CEQA. However, a Security Assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report pursuant to the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. As indicated in Section 5 of the SPAS Security Assessment, while the redesigned entry roadway by itself would not increase airport security, the roadway would provide the opportunity for in-road traffic calming measures to control traffic entering the CTA, which would improve security. As discussed in Section 4.11.2.6.10 of the SPAS Draft EIR, as ground access improvements under each alternative would reduce traffic congestion and curb-front demands, overall security would be enhanced throughout the CTA.

As a program-level document, the SPAS Draft EIR did not include specific improvement projects such as the installation of "weight scales and cameras into the roadway at critical points." Similarly, a study of the number of required checkpoints, the car throughput of each checkpoint, or special access for buses and commercial vehicles was not evaluated as part of SPAS. The dedicated busway associated with Alternatives 1, 2, 8, and 9, and the APM systems associated with Alternatives 3 and 9, would bypass the entry roadways for direct access to the CTA.

Please see Responses to Comments SPAS-PC00130-424 and SPAS-PC00130-495 regarding implementation of security measures at LAX. LAWA has implemented numerous recommendations provided by security experts and agencies including the Transportation Security Administration, Federal Bureau of Investigation, Department of Homeland Security Office of Critical Infrastructure Protection, international experts, and others. The details regarding the security measures considered and implemented is considered Sensitive Security Information under federal law and is therefore not subject to disclosure.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Comment:

Page 2-4 6. Minimize Environmental Impacts on Surrounding Communities
LAX is a major international airport located within a very urbanized area, with established communities situated directly to the north, east, and south. These communities are affected to varying degrees by existing operations at the airport. Recognizing that these existing effects to the surrounding communities may change based on the alternatives being considered in SPAS, LAWA seeks to identify and apply ways to avoid, reduce, or minimize environmental impacts on surrounding communities. (underlined for emphasis)

Question: page 2-4 Program Objectives item 6 highlighted section states that LAWA is concerned about environmental impacts on surrounding communities. What area do they consider "surrounding" since areas both north including Santa Monica and Culver City, LA County areas, and the entire South Bay is affected (not necessarily impacted by the legal definition). Also all those communities on the arrival flight paths as far away as Palm Springs, but also midway like Lahabra Heights and Monterey Park are also very affected by even slight changes in flight paths or absolute numbers of aircraft operations.

Response:

As described on page 4-641 and shown in Figure 4.9-1 in Section 4.9 of the SPAS Draft EIR, the term "surrounding communities" is used in reference to portions of unincorporated Los Angeles County and the cities of Los Angeles, El Segundo, Inglewood, and Hawthorne that are shown within the SPAS land use study area. An EIR is required to discuss significant impacts that the proposed project will cause in the area that is affected by the project. (Muzzy Ranch Co. v. Solano County Airport Land Use Com'n (2007) 41 Cal.4th 372, 387.) The SPAS Draft EIR analyzes a geographic area that is affected by the project and includes the surrounding communities. The geographic area studied in the SPAS Draft EIR generally coincides with the geographic area of LAWA's Aircraft Noise Mitigation Program (ANMP), since the potential for incompatible land use is primarily related to aircraft noise. Aircraft noise impacts under the Alternatives 1 through 7 that would occur due to changes in the flight path are analyzed in Section 4.9.6 of the SPAS Draft EIR. In addition, Section 4.10.1 of the SPAS Draft EIR analyzes a larger area east of the I-110 (primarily in the city of Los Angeles) where the increased probability of nighttime awakening could occur under SPAS Alternatives 1 through 7. Based on these analyses, changes in the flight path would not affect more remote communities outside of the SPAS land use study area, associated with high noise levels or nighttime awakening. Other jurisdictions and communities outside the SPAS land use study area that have concerns regarding LAX operations can

and do participate in the LAX Community Noise Roundtable (which is comprised of elected officials, community representatives, and LAWA and FAA staff among others). The purpose of the LAX Community Noise Roundtable is to reduce and mitigate the adverse noise impacts that the users of LAX create on the surrounding communities (including those outside the SPAS land use study area) and their environs. In addition, noise complaints may be filed by calling the LAX Noise Complaint Line (424) 64-Noise or completing a form online at http://www331.webtrak-lochard.com/webtrak/lax4.

Regarding changes in the number of aircraft operations, the project would not change the potential for growth at LAX; rather, future passenger activity is forecast to reach 78.9 MAP at LAX by the planning horizon year of 2025 with or without the SPAS alternatives.

SPAS-PC00130-156

Comment:

Page 2-5 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR
Problems the North Airfield Reconfiguration was Designed to Address: Under existing conditions, the north airfield does not meet FAA standards for ADG V and VI aircraft under any weather conditions. Failure to meet these standards results in restricted operations when ADG V or VI aircraft utilize the north airfield, impacting operations of all aircraft on the north airfield. Restricted operating procedures increase operational delays and aircraft-related emissions and adversely affect passenger convenience. Additionally, without a centerline taxiway and other airfield improvements, there is an increased risk of incursions and collisions. Further, Runway 24L is not long enough to accommodate some fully-loaded departing aircraft, resulting in higher utilization of the south airfield by these aircraft.

Question: Section 2.3 Project Characteristics
Defining problems; Agreed that neither Alt D nor existing conditions meet full ADG V or VI design standards. Nor would any of the alternatives. The excuse for these is that there is some accommodation necessary for the larger aircraft. What is the quantified impact in seconds and number of these aircraft that impact. As the percentage of these NLA is small and most A380s will not arrive during peak hours how much practical impact is there?

Response:

SPAS Alternatives 1 through 7 provide a broad range of improvement options for the north airfield, each of which responds differently to meeting FAA runway and taxiway separation design standards for Aircraft Design Group (ADG) V and VI aircraft. Table 4.7.2-8 in the SPAS Draft EIR summarizes the extent to which each alternative responds to such standards relative to runways and taxiways in the north airfield. As indicated in the table, Alternative 5 is the alternative most responsive to those standards in meeting ADG V and VI design standards on all runways and taxiways, with the exception of Taxilane D which would only meet ADG V standards.

An airspace simulation analysis (SIMMOD) was conducted for the purposes of the SPAS Draft EIR for Alternatives 1 through 4 to identify operational delays (in minutes and fractions of a minute [seconds]). SIMMOD addresses the design and procedural aspects of air traffic operations and produces measures of runway throughput, aircraft travel time, and aircraft delay. (See Section 1.4.1 of Appendix F-2 of the Preliminary LAX SPAS Report.) The results of these simulation analyses are included in Appendix F-2 of the Preliminary LAX SPAS Report. The simulation analysis determined that, as a result of an increase in the number of operations per day, all the alternatives would result in longer delays. (See pages 107 and 108 in Section 4 of Appendix F-2 of the Preliminary LAX SPAS Report.) As discussed below, the number of ADG V and VI operations will increase markedly from 2009 to 2025.

As provided in Table 8 on page 18 of Appendix F-1 of the Preliminary LAX SPAS Report, ADG V and VI aircraft accounted for 149 operations in the 2009 baseline design day flight schedule. That number is expected to increase to 254 on a peak month average day at LAX in 2025. (See Table 12 on page 26 of Appendix F-1 of the Preliminary LAX SPAS Report.) For additional information regarding the 2009 and 2025 fleet mixes, please refer to Response to Comment SPAS-PC00130-770.

SPAS-PC00130-157

Comment:

Similarly, since an A380 is designed for take off and landings in shorter distances than a 747 then only the very heavily loaded with full fuel are even at issue. How many of these are anticipated by 2025? What is the percentage of total aircraft operations?

Response:

Please see Table 12 in Appendix F-1 of the Preliminary LAX SPAS Report. The 2025 Design Day Flight Schedule (DDFS) assumed 27 Airbus 380-800 daily operations on the Peak Month Average Day (PMAD). This represents 14 Airbus 380-800 aircraft operating on the PMAD, with 13 daily arrivals and 14 daily departures. The Airbus 380-800 operations were assumed to represent 1.9 percent of all operations (2,053 daily operations) on the PMAD in 2025.

Page 2-6 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR
Problem the Demolition of Terminals 1, 2, and 3 was Designed to Address: Under the LAX Master Plan, substantial portions of Terminals 1, 2, and 3, notably the piers/concourses, would be demolished in order to provide room for the relocation of Runway 6R/24L 340 feet to the south of the existing runway centerline. The existing terminals would be replaced by a linear concourse that would provide aircraft gates and passenger hold rooms but no passenger processing capacity. Under the LAX Master Plan, the passenger processing capacity provided by existing Terminals 1, 2, and 3 would be replaced by new passenger processing facilities in the interior of the CTA (where the existing parking garages are currently located). Only the demolition of Terminals 1, 2, and 3 is a Yellow Light Project.

Question: section 2.1 Problems addressed...
Quantify how much terminal space is needed to handle the 78.9 MAP. Also curb space requirement specifics?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, the response below is provided for informational purposes.

In the context of Section 2.3.1 on page 2-6 of the SPAS Draft EIR and the discussion of Master Plan concept for a linear concourse to replace Terminals 1, 2 and 3, the commentor is inquiring about "how much terminal space is needed to handle the 78.9 MAP" and "curb space requirement specifics." Please refer to Response to Comment SPAS-AL00008-29 regarding the capacity of the Alternative 3 linear concourse. Although not mentioned in Response to Comment SPAS-AL00008-29, the same reasoning would apply to the associated linear concourse curb space requirements.

Comment:

Page 2-6 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR
...Problem the Ground Transportation Center was Designed to Address: Under the LAX Master Plan, the function of the GTC is to replace CTA curb front for drop off and pick up of passengers and to replace a portion of the private vehicle parking area and all of the commercial vehicle (e.g., taxis, shuttle vans, and limousines) staging area. The GTC was designed to allow closure of the CTA to private

vehicle access and provide the curb front function at a location well removed from the main terminal area to enhance security within the CTA. The GTC, in conjunction with the Intermodal Transportation Center (ITC) and other parking facilities proposed as part of the LAX Master Plan, also provided replacement parking for the existing parking that would be eliminated under the LAX Master Plan, such as in the CTA and Parking Lots C and D. Problem APM 2 was Designed to Address: Under the LAX Master Plan, the function of APM 2 is to provide connection between the planned GTC and the CTA.

Question: section 2.1 Problems addressed...
How many parking spaces are required? How many are lost given that LAWA has called for the ConRAC in Manchester Square? Why isn't Belford Square area used or contemplated for any airport use since it was vacated at the same time as Manchester Square? What is the anticipated number of cars given that LAWA has plans for a people mover (or direct train connection or bus connection)? How many cars does LAWA anticipate will be removed from consideration by the 8 flyaway routes to be developed?

Response:

Table 4.12.1-40 on page 4-1167 in the SPAS Draft EIR provides the Baseline (2009) and Future (2025) public parking supply, demand, and requirements for Alternatives 1, 2, 4, 8, and 9. A more detailed breakdown of the parking proposed under each of these alternatives, and also for Alternative 3, is provided in Table 2-2 in Chapter 2 of the SPAS Draft EIR. Relative to Manchester Square, there is currently no public airport parking within that area; however, the Ground Transportation Center (GTC) proposed for Manchester Square under Alternative 3 would include 7,515 public parking spaces. SPAS Alternatives 8 and 9 (which include a Consolidated Rental Car Facility (CONRAC) at Manchester Square) are proposed to include 4,200 public parking spaces, which would amount to 3,315 fewer public parking spaces at Manchester Square than under Alternative 3. Relative to total public and employee parking proposed under each alternative, Alternatives 1 and 2 would each have 32,905 spaces, Alternative 3 would have 35,712 spaces, Alternative 4 would have 22,986 spaces, and Alternatives 8 and 9 would each have 32,155 spaces - see Table 2-2.

Please see Response to Comment SPAS-PC00130-175 regarding land uses in the Belford area.

Regarding the number of cars that LAWA anticipates under each alternative, including Alternatives 3 and 9 that include APM systems, Table 4.12.2-10 on page 4-1212 of the SPAS Draft EIR provides a detailed breakdown of the vehicle trip generation associated with each alternative during the morning, mid-day, and afternoon peak hours.

Please see Response to Comment SPAS-PC00130-399 for a discussion of the LAWA FlyAway Service. Regarding how many cars LAWA anticipates will be removed from consideration by the establishment of future additional FlyAway stations and routes, LAWA does not have a specific estimate, given that the performance of each new FlyAway will largely depend on the local setting and the particular characteristics of each facility (i.e., is the new FlyAway facility co-located with a major transportation center in a high-density area with high activity levels and different transit modes or is it single facility located in a lower density area, but near a major freeway; does the travel route between the new facility and LAX connect with a freeway network with high-occupancy vehicle (HOV) lanes and do those lanes go directly freeway to freeway, etc.) While LAWA does not have an estimate of cars removed by future FlyAways, LAWA records for the FlyAways that were in operation in 2011, as presented in LAWA's LAX FlyAway Network Emissions Reduction Report Summary, indicate that the four FlyAway bus operations in operation at the time (Van Nuys, Union Station, Westwood and Irvine) saved approximately 1,175,700 annual trips to the Airport.

SPAS-PC00130-160

Comment:

Page 2-6 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR Airfield Improvements - Airfield improvements include changes to the runways, taxiways, navigational aids, and service and maintenance roads associated with the north airfield. The primary differences in airfield improvements associated with the various SPAS alternatives pertain to:

- Separation distances between runways and taxiways. Separation distances largely determine the maximum size aircraft that can freely operate on that system under various visibility conditions, and, in certain visibility conditions, would either require FAA approval of special operating procedures (i.e., Modifications of Standards or other forms of operational waivers) or would be prohibited...

Question: P 2.6 Airfield improvements states an obvious that" separation distances determine the maximum size aircraft that can freely operate on that system..." but fails to provide any quantitative information. This section also talks about a centerfield parallel taxiway between runways without referencing any specific slats. In other airports when a CLT was built, how many new incursion opportunities occurred due to an aircraft on the CLT or mistakenly landed on it?

Response:

For more information on runway-taxiway separation distances, please see Tables 3-6 and 3-7 of FAA Advisory Circular (AC) 150/5300-13A Airport Design available at http://www.faa.gov/airports/engineering/airport_design/.

LAWA is not aware of statistics of, or specifics on, other airports with new incursion opportunities presented by a parallel taxiway located between runways. However, as of February 2010, LAWA had approximately 18 months of data that suggested that the south airfield changes have reduced incursion risk on the south airfield at LAX by about 40 percent. The apparent reason for the reduction of incursions was the new centerfield taxiway. The new centerfield taxiway forces aircraft to slow down before crossing Runway 25R and also gives air traffic controllers more flexibility to cross the departure runway.

SPAS-PC00130-161

Comment:

Page 2-6 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR

- Whether Runway 6R/24L would be extended 1,250 feet eastward to provide greater departure length in west flow condition that would better accommodate departures of large aircraft on long haul flights and improve the balance between the north airfield and the south airfield relative to such departures;

Question: 2.3 Problems addressed... talks about the need for balance between the two runways and implies that there must be a balance of each type of aircraft. What number of ADG V and ADGV1 aircraft originate from gates on the south and how many originate from gates on the north? If the number is not exactly 50% on each, doesn't this add to the taxiway traffic unnecessarily?

Response:

The content of this comment is similar to comments SPAS-PC00130-511 and SPAS-AL00007-57; please refer to Response to Comment SPAS-PC00130-511 and Response to Comment SPAS-AL00007-57.

The commentor is incorrect in assuming that taxiway traffic will increase if the number of large aircraft originating from gates on the north and south is not 50 percent. Currently, there is an imbalance because large aircraft that cannot depart from the north complex must be taxied to the south complex. (See page 5-80 of the Preliminary LAX SPAS Report.) If those large aircraft were able to take-off from the north airfield, it would improve taxiway traffic, thereby increasing safety and efficiency.

Please see Appendix F-2 of the Preliminary LAX SPAS Report for a discussion of the average delay and taxi time of the individual SPAS alternatives.

SPAS-PC00130-162

Comment:

Page 2-6 Project Characteristics 2.3.1 Alternatives Addressed in this Draft EIR

Separation distances between Runway 6R/24L, Taxiway E, Taxilane D, the adjacent vehicle service road, and the aircraft gates/parking positions at the north end of the CTA, which largely determine the maximum size aircraft that can either freely operate on that system or would be subject to certain limitations, particularly as related to the interface between aircraft going to or from the gates at Terminals 1 through 3 and aircraft taxiing to the east end of Runway 6R/24L for departure.

Question: Page 2-7 highlighted note states that concourse areas and layout of aircraft gates vary between alternatives. When the assessment of efficiencies (travel distance times to get off a runway and get to their gate) were these variances in gate locations used in the calculations? What amount of sensitivity to change in gate locations exists in the efficiency times? What variances impact is there for taxiway availability versus runway separation?

Response:

As described in Appendix F-2 of the Preliminary LAX SPAS Report, the network of ground links representing the LAX airfield (i.e., runways, taxiways, taxilanes, and gates) were updated in the SIMMOD model for each alternative. As such, the model captures any difference in travel time and distance to taxi between two points on the airfield. Similarly, because the gate positions were updated to reflect the alternative specific plans presented in Figures 12, 14, 23, and 29 in Appendix F-2 of the Preliminary LAX SPAS Report, changes in taxi times to the terminals, as well as gate availability were also captured by the model. Statistics detailing the taxi time for arrivals and departures can be found in Tables 6, 9, 11, 13, and 15 in Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-163

Comment:

Page 2-7 Project Characteristics Terminal Improvements
In general, the building lines and APLLs associated with most of the alternatives extend southward, overlapping, to varying degrees, portions of the concourse areas for Terminals 1 through 3, which would require removal (demolition) of those building areas that encroach past the building limit line and/or the elimination or reduction in aircraft size capability of gate parking positions that encroach past the parking limit line. Conversely, the building and parking limit lines associated with several alternatives do not extend as far south as the limit lines defined in the LAX Master Plan, which assumed the movement of Runway 6R/24L 340 feet south and defined the northerly building limits for the Tom Bradley International Terminal (TBIT) West Gates, currently under construction as part of the Bradley West Project, and the future Midfield Satellite Concourse (MSC). In those cases, establishing building and parking limit lines farther north than the current LAX Master Plan limit lines would allow the opportunity for a future northward extension (i.e., an addition to) the north concourses for Bradley West and the MSC.
<u>While the amount of concourse area and the layout of aircraft gates vary between alternatives, all of the SPAS alternatives include no more than 153 passenger gates</u>.
Certain alternatives propose a westerly realignment of the Terminal 3 concourse to provide a wider alleyway between the concourses at Terminals 2 and 3 for aircraft taxiing.
For those alternatives that include development of the new Terminal 0, the existing alignment of Sky Way (the primary access road connecting CTA to southbound Sepulveda and 96th Street Bridge) would be shifted east, into the area now occupied by the Park One parking lot, providing an improved entrance roadway into the CTA. (underline for emphasis)

Question: Page 2-7 highlighted note states that concourse areas and layout of aircraft gates vary between alternatives. When the assessment of efficiencies (travel distance times to get off a runway and get to their gate) were these variances in gate locations used in the calculations? What amount of sensitivity to change in gate locations exists in the efficiency times? What variances impact is there for taxiway availability versus runway separation?

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-162; please refer to Response to Comment SPAS-PC00130-162.

SPAS-PC00130-164

Comment:

Page 2-8 Project Characteristics Ground Access Improvements
Yellow Light projects that are integral parts of the overall ground access system. Such projects include the Consolidated Rental Car Facility (CONRAC), the ITC, the APM connecting the ITC and CONRAC to the CTA, and the West Employee Parking facility. The ground access improvements proposed under the various SPAS alternatives represent different combinations of options to the Yellow Light Projects. Due to integral nature of these key non-Yellow Light projects with the overall ground access system, the SPAS alternatives include proposed modifications to, or proposed deletion of, these non-Yellow Light projects.

Question: P2-8 Ground access improvements. The ITC in Alternative D is in Continental City near the Green Line. Since LAWA has not included it in any of their plans what numerical changes in traffic flow have occurred? How does this impact traffic flows and the assessment of intersections? Although LAWA has done their traffic assessments based on one design day we also know that the access to LAX CTA varies substantially by time of day. The assessments don't appear to assess this type of impact inside or outside of the CTA. What impacts will the time of day have on intersection service level grade?

Response:

The comment is incorrect. The Intermodal Transportation Center (ITC), as envisioned under Alternative D of the LAX Master Plan, is included in SPAS Alternative 3 and has been accounted for accordingly in the SPAS traffic analysis of the alternatives.

As described in Chapter 2 of the SPAS Draft EIR, Alternatives 1, 2, 3, 8, and 9 each include one or more new off-airport facilities such as an Intermodal Transportation Facility (ITF), a Ground Transportation Center (GTC), or an ITC intended to offer passengers alternative locations outside of the CTA to park or be dropped off, and allow them convenient access to the CTA via an Automated People Mover (APM) or consolidated busing operation. Such ground access improvements were included in traffic modeling for the transportation impacts analyses included in Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR.

Section 4.12.1.9, beginning on page 4-1127, of the SPAS Draft EIR presents results for the on-airport transportation analysis which considered impacts at different times of day based on the departures and arrivals level peak hours provided in Table 4.12.1-14 on page 4-1100 to assess the impacts during the each level's peak activity periods. Please also see Section 4.12.1.2 of the SPAS Draft EIR for a discussion of the methodology used to measure project-related on-airport traffic impacts. These peaks periods for on-airport are used in assessing on-airport traffic conditions as they typically represented the peak traffic and congestion on each level of the CTAs roadway networks. For the off-airport transportation analysis, the assumptions used in the reallocation of airport-generated traffic are provided in Section 4.12.2.2.5 of the SPAS Draft EIR. The traffic impact analysis conducted at 200 study intersections during three peak hours under each SPAS alternative is presented in Section 4.12.2.6, and the impacts are summarized in Tables 4.12.2-13 and 4.12.2-19 (prior to mitigation) and in Tables 4.12.2-27 and 4.12.2-33 (with mitigation). If and when a SPAS alternative is approved and individual projects are proposed more detailed project level traffic impact analysis would be conducted to determine in greater detail the on-airport traffic conditions at different times of day. Also, more detailed project-level traffic impact analyses would be conducted for off-airport intersections.

SPAS-PC00130-165

Comment:

Page 2-8 2.3.1.1 Alternative 1
Overview
Alternative 1 is a fully-integrated alternative, consisting of airfield, terminal, and ground access components. The distinguishing airfield improvement feature of this alternative is the movement of

Runway 6L/24R 260 feet north, along with the addition of a centerfield taxiway, the extension of Runway 6R/24L, improvements to Taxilane D and Taxiway E, and relocation of the service road. Terminal Improvements include addition of new Terminal 0, loss or modifications to concourse areas and/or gates

Question: 2.3.1.1. Alternative 1 description. Where are the detail drawings that identifies the number of gates in terminal 0 and their location to be used in the efficiency calculations?

Response:

Appendices F-1, LAX 2009-2025 Passenger Forecast and Design Day Flight Schedule Development, and F-2, North Runway Alternatives Simulation Analysis, of the Preliminary LAX SPAS Report contain detailed drawings showing the number and location of gates for Alternative 1. Please see Figure B to Appendix F-1 and Figure 14 in Appendix F-2.

SPAS-PC00130-166

Comment:

Page 2-9 2.3.1.1.1 Airfield Facilities
Alternative 1 meets FAA airport (runway) design standards for ADG V with a Category II/III outboard runway (Runway 6L/24R) and Category I inboard runway (Runway 6R/24L), and provides sufficient space between Runway 6R/24L and the centerfield taxiway for ADG V aircraft to hold prior to crossing the runway with a pilot line-of-sight of the end of Runway 24L. This alternative provides the FAA standard ADG VI runway-to-taxiway separation between Runway 6L/24R and the centerfield taxiway for approach visibility at or above one-half mile (Category I approaches). Taxiway E and Taxilane D dimensions would meet ADG V standards.

Question: 2.3.1.1.1 Airfield Facilities... States that it meets FAA requirements for ADG V and ADG VI runway to taxiway. Is this statement based on AC150 5300-13 or -13A which goes into effect next month? If the FAA changes requirements (which it is doing) how has LAWA planned to accommodate these changes?

Response:

During development of the SPAS alternatives and preparation of the SPAS Draft EIR, Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13 was the applicable, governing AC. Since that time, the FAA has released AC 150/1300-13A. However, the runway to taxiway separation standards for Aircraft Design Group (ADG) V and VI did not change between AC 150/5300-13 and AC 150/1300-13A. It is speculative to predict what changes may be included in future ACs; it was appropriate for LAWA to develop the SPAS alternatives based on the AC in effect at the time development occurred.

SPAS-PC00130-167

Comment:

Page 2-9 Runway Modifications Runway 6L/24R
- Relocate 260 feet north of current location to accommodate a new centerfield parallel taxiway (see below) and to provide for ADG V separation distances
- Extend 604 feet west so that the RPZ no longer extends over residential areas
- Establish dual displaced thresholds to remove existing residences from the RPZ (east end displaced threshold) and maintain existing westerly aircraft landing heights (west end displaced threshold)
- Widen to 200 feet to meet FAA standards

Question: 2.3.1.1.1 Modification of Runway 24R 604' west... If the runway is extended west, what additional noise will occur on the PDR areas in terms of single event noise? How will this impact the possibility of extra go-arounds over the PDR community? It might be an appropriate time if the runway is fully rebuilt, but is it necessary to expand to 200' wide runway since even the A380 is approved for a 150' wide runway with hardened shoulders?

Response:

As indicated on page 2-9 of the SPAS Draft EIR, Alternative 1, which relocates Runway 6L/24R 260 feet north and extends it 604 feet west, establishes displaced thresholds on both ends of the runway. As such, the westward extension is offset for westerly aircraft landings so that the existing approach profile height is maintained. Departures from Runway 6L/24R to the west are rare, however, and in cases when this operation does occur, LAWA would continue to have in place a noise abatement procedure to continue along the runway heading until reaching the coastline.

In regards to widening the runway to 200 feet, LAX currently has a waiver granted by the Federal Aviation Administration (FAA) to operate the A380 on Runway 6L/24R, which is 150 feet wide. However, as a specific condition of approval, the FAA has stated that "construction of new runway/parallel taxiways for Aircraft Design Group (ADG) VI airplane operations must be in accordance with AC 150/5300-13A, Airport Design." Because LAWA would use the relocated runway for ADG VI operations, the new runway would be required to comply with the FAA's ADG VI standard of 200 feet.

SPAS-PC00130-168

Comment:

Page 2-9 Taxiway Modifications
Centerfield Taxiway
- Construct an 82-foot-wide centerfield taxiway between Runways 6L/24R and 6R/24L, with a centerline separation distance of 500 feet to Runway 6L/24R and 460 feet to Runway 6R/24L, to enhance safety and reduce incursions and other airfield hazards, while providing for ADG V separation distances; also provide exit taxiways from Runway 6L/24R to the centerfield taxiway, taxiways from the centerfield taxiway to and across Runway 6R/24L, and other related airfield taxiway improvements...

Question: If the centerfield taxiway is installed LAWA states that it enhances safety and reduces incursions. The $2M Northside Safety Study paid for by LAWA using the top academic experts chosen by LAWA stated a % improvement but of an extremely small base number resulting in no appreciable improvement. What number of incursions and incidents has LAWA calculated will be alleviated? Does that change if the flight mix changes? What about impacts of control tower movement or staffing? What about new construction which causes increased non-visibility areas?

Response:

As indicated in Section 4.7.2 of the SPAS Draft EIR, the LAX North Airfield Safety Study (NASS) was initiated at the request of City of Los Angeles elected officials. The North Runway Safety Advisory Committee composed of LAX stakeholders was formed to oversee the study, including selection of academic panel members to be involved in the study. The panel consisted of six professors from various universities and various disciplines in Science and Engineering, but who had in common a longstanding interest in issues about aviation safety and efficiency. As indicated on page 4-505 of the SPAS Draft EIR, the academic panel's review of the technical work completed for the NASS had several main conclusions including, but not limited to: the LAX north airfield is extremely safe under the current configuration for the projected 2020 activity forecast; and, certain improvements to, and reconfiguration of, the north airfield would substantially increase airfield safety (i.e., reduce the risk of a fatal runway collision). The academic panel also concluded that, based on safety grounds alone, it would be hard to argue for reconfiguring the north airfield (i.e., given that the baseline level of risk is so low, reducing the risk of a fatal runway collision by a substantial level is of "limited practical importance"). The academic panel's opinion, which represents a subjective value judgment on the importance of reducing the risk of a fatal runway collision, is not shared by the Federal Aviation Administration, the federal agency responsible for the safety of civil aviation.

LAWA is not required to calculate, and has not calculated, the number of incursions and incidents that would be alleviated by improvements to the north airfield, although the NASS indicates that new configurations of the north airfield that include increased runway separation and the addition of a centerfield taxiway would reduce by a substantial percentage (40-55 percent) the risk of a fatal runway collision. The aircraft fleet mix assumed for the SPAS Draft EIR is described in Appendix F-1 of the Preliminary LAX SPAS Report; none of the SPAS alternatives would result in a change to that projected fleet mix. None of the SPAS alternatives propose movement of the air traffic control tower, and staffing

within the tower is the responsibility of the FAA. LAWA maintains ongoing coordination and communication with the FAA regarding airfield visibility from the control tower, and should any proposed construction have the potential to adversely affect the tower's view of the airfield operations area (AOA), as evaluated during preliminary design planning, the necessary and appropriate measures are incorporated into the more detailed planning to address such potential concerns, if any.

Comment:

Page 2-10 Other Airfield-Related Features
- Cover the entire length of the Argo Drainage Channel (9,857 linear feet) such that the weight of an aircraft could be supported within the RSA by converting the existing open unlined channel to a concrete box culvert.

Question: 2.3.1.1.1 Alt 1 features. How much capacity will the Argo Flood Channel have after being converted to a concrete box culvert? Will it be the same or less than current? Will it require the bottom to be moved or lowered resulting in disturbance of the substructure where there is an unknown water source? How has the total volume capacity been calculated for the channel? Does it consider 100 year storms? Fifty year storms? Where will the extra water go and what will it's impact be?

Response:

The SPAS Draft EIR is a programmatic document. Details regarding the Argo Drainage Channel would be considered during project-level planning and design, if Alternatives 1, 5, or 6 are selected for implementation. The design of the subsurface box culvert would provide sufficient capacity to meet the design storm flow for the tributary area based on the proposed improvements recommended in the updated Conceptual Drainage Plan as described in Mitigation Measure MM-HWQ (SPAS)-1 set forth in Section 4.8.7 of the SPAS Draft EIR. As stated in this mitigation measure, the design storm frequency used would be a minimum of a 10-year storm event, which is the minimum design frequency storm for areas without sumps per the City of Los Angeles Bureau of Engineering (BOE) Storm Drain Design Manual, Part G 200 Hydrologic Design Section G21. As required by BOE, the design would ensure that flows from a 50-year storm event would not do any damage to private property. The actual design storm frequency to be used in the design would be determined by LAWA during the project-level engineering design phase, in conjunction with BOE. Following completion, it is expected that the invert elevation would generally be similar to that of the existing channel and would not be substantially deeper than the current open channel. The commentor provides no evidence to support the claim that there is an unknown water source beneath the channel. As noted on page A-8 of the 2008 SPAS NOP, the depth to groundwater at LAX is generally greater than 90 feet and perched groundwater conditions have been noted in the upper 20 to 60 feet at some locations at the airport. As noted in Table 4.8-5 of the SPAS Draft EIR, the change in impervious surface and, therefore, drainage flows, within the Santa Monica Bay watershed, within which the Argo Drainage Channel is located, would range from 0 to 2.1 percent, meaning that there would be no increase or minimal increase in flow as a result of the improvements. After construction of the box culvert, Argo Drainage Channel would continue to function as it does currently, and as outlined in Section 4.1.1.2 of Technical Report 6 of the LAX Master Plan Final EIR. Flows would enter the culvert at the eastern end of the airport, and would be conveyed through the culvert to an existing concrete box drain and ultimately through the Argo outfall to the Santa Monica Bay.

Comment:

Page 2-10 Terminal Facilities
- Construct a new Terminal 0 with seven gates in the western portion of the area now occupied by Park One to replace gates lost or downsized at Terminals 1 through 3

Question: 2.3.1.1.2 Terminal Facilities. States that Terminal 0 will replace lost or downsized gates. What has LAWA done with the existing remote gates? Will they continue to be available? If they are to be removed, how will this be accomplished?

Response:

As indicated under the heading of "Terminal Facilities" on pages 2-10, 2-17, 2-21, 2-30, 2-33, and 2-37 in Chapter 2 of the SPAS Draft EIR, under Alternatives 1, 2, 3, 5, 6, and 7 the west remote gates would be eliminated upon completion of the airfield and terminal improvements. As described on page 1-17 in Chapter 1 of the SPAS Draft EIR, none of the SPAS alternatives include more than 153 passenger gates, which did not include any of the west remote gates. Note that the LAX Master Plan also assumed that the west remote gates would no longer be available for passenger activity.

Currently, the west remote gates accommodate not only passenger operations (deplaning, boarding, and busing of passengers to terminals) but also remain all day and remain overnight operations for aircraft that cannot be accommodated for long periods of time at terminal gates.

Specific plans to render the west remote gates unavailable to passenger activity have not yet been developed. Although passenger activity would no longer be accommodated at the west remote gates, LAWA might reserve the west remote gates areas for remain all day or remain overnight operations.

SPAS-PC00130-171

Comment:

Page 2-10 Terminal Facilities
- Demolish and reconstruct the Terminal 3 concourse and associated gates, with the building centerline shifted 40 feet to the west to increase the width of the alleyway between Terminals 2 and 3 to allow for dual-directional aircraft movement and comply with FAA standards

Question: 2.3.1.1.2 Demo and reconstruction of Terminal 3 40' west to provide better spacing from Terminal 2. This happens to be a good idea that should have been included in all of the alternatives where terminals could be moved. Why wasn't it?

Response:

A reconfigured Terminal 3 was assumed under Alternatives 1, 2, 5, 6 and 7. Please see Section 2.3.1 of the SPAS Draft EIR for the assumed terminal facilities under each of these alternatives.

The remaining alternatives assumed the following Terminal 3 conditions. Alternative 3, as described in Section 2.3.1.3.2 of the SPAS Draft EIR, includes the demolition of Terminal 3, along with Terminals 1 and 2, to be replaced with a linear concourse. Alternative 4, as described in 2.3.1.4.2 of the SPAS Draft EIR, does not assume any changes to any of the LAX terminals. As discussed in Sections 2.3.1.8 and 2.3.1.9, respectively, Alternatives 8 and 9 focus on ground access improvements, as may be paired with the airfield and terminal improvements associated with Alternatives 1, 2, 5, 6, and 7 described above. For these reasons, there was no opportunity to consider including a reconfigured Terminal 3 in Alternatives 3, 4, 8, and 9.

SPAS-PC00130-172

Comment:

Page 2-10 Terminal Facilities
- Demolish and replace the northerly end of the TBIT concourse and associated gates (with new concourse and gates in line with the new Bradley West concourse) to the Alternative 1 APLL Provide the opportunity to extend the northerly end of the future MSC to the Alternative 1 APLL...

Question: 2.3.1.1.2 Demo and replace northerly end of TBIT. Is this demo of the TBIT currently being built? What is assumed in all of the evaluations for aircraft movement efficiency? Will more gates be added? Where? How many?

Response:

As described in Section 2.3.1.1 of the SPAS Draft EIR, Alternative 1 includes the relocation of the Aircraft Parking Limit Line (APLL) associated with the realigned Taxilane D. Alternative 1 APLL would therefore crop the northerly end of the Tom Bradley International Terminal (TBIT), based on its ultimate terminal footprint, should Alternative 1 be implemented. Demolition of the northerly end of the TBIT concourses and associated gates refers to existing TBIT facilities; there would be no demolition of the new concourse area or associated gates currently under construction as part of the Bradley West Project. As depicted in Figure B in Appendix F-1 of the Preliminary LAX SPAS Report, Alternative 1 assumes that TBIT would still have 19 gates, counting towards the 153 passenger gate count. No additional gate beyond the 153 passenger gate count would be required.

The commentor inquired about "what is assumed in all of the evaluations for aircraft movement efficiency?" It is unclear how "aircraft movement efficiency" relates to TBIT terminal facility improvements discussed in the comment. If the commentor meant to inquire about taxiing operations on runway, taxiway/taxilane and apron systems, please refer to Appendix F-2 of the Preliminary LAX SPAS Report regarding airspace simulation, which includes taxiing operations from the runways to the terminal areas.

SPAS-PC00130-173

Comment:

Page 2-10 Terminal Facilities
- The commuter facility currently in use east of Sepulveda Boulevard would be maintained
- West remote gates would be eliminated upon completion of the airfield and terminals improvements

Question: 2.3.1.1.2 Continue use of commuter facility. Is this the AA terminal? What aircraft mix is assumed in the evaluations? How is this considered in the equivalent gate count? Is this done for every one of the options? Why not?

Response:

Section 2.3.1.1.2 of the SPAS Draft EIR refers to the commuter facilities (both terminal and apron facilities) located east of Sepulveda Boulevard that are currently operated by American Eagle (as of November 2012). The SPAS Draft EIR assumes these would continue to be operated by commuter carriers in 2025.

The aircraft fleet mix assumed to operate at these commuter facilities in 2025 includes Embraer 120 Brasilia, Embraer Regional Jet 135/140/145, and Canadair Regional Jet 700.

Each alternative analyzed in the SPAS Draft EIR includes commuter gates at these facilities. As depicted in Appendix F-1 of the Preliminary LAX SPAS Report (Figures B, C, and D), the assumed number of commuter gates at these facilities varies with each alternative.

SPAS-PC00130-174

Comment:

Page 2-10 Terminal Facilities
- The total number of gates used at LAX for scheduled passenger service would be 153

Question: 2.3.1.1.2 West remote gates will be removed. How will they be removed? Will the concrete be changed or will the gates just stop being used so that they become available after 2020? What was assumed for the efficiency calculations? With remotes or without? If used, how does this impact conclusions? Is open space with a roll up stairs and articulated bus still be available for use?

Response:

The content of this comment is similar to comment SPAS-PC00130-170; please see Response to Comment SPAS-PC00130-170 regarding the existence and use of the west remote gates in 2025.

When referring to "efficiency calculations," it is assumed that the commentor is referring to the analysis of aircraft efficiency on the north airfield analyzed in the airspace SIMMOD simulation efforts. As discussed and illustrated in Section 3 and Figures 14, 23 and 29 of Appendix F-2 of the Preliminary LAX SPAS Report, the SPAS Draft EIR SIMMOD modeling analyses assumed the use of 153 passenger gates, which did not include any west remote gates in 2025.

Regarding the future use of "roll up stairs and articulated bus," as discussed in Response to Comment SPAS-PC00130-170, the use of the west remote gates for passenger operations would be eliminated upon completion of the airfield and terminal improvements. In conjunction with elimination of passenger operations at the west remote gates, LAWA might reserve the subject area for "remain all day" or "remain overnight" (RAD/RON) operations, which is the parking of aircraft between flights. With the elimination of passenger operations, as described above, the use of "roll up stairs and articulated bus" at the west remote gates in 2025 would therefore become unnecessary.

SPAS-PC00130-175

Comment:

Page 2-13 2.3.1.1.3 Ground Access Facilities
- Relocate Lincoln Boulevard to the north, outside of the Runway 6L/24R RSA, with a portion below grade and/or tunneled.

Question: Page 2-13 and nowhere in the document is Belford Square area plans mentioned. How can the impacts of LAX be assessed without some assumption of its use?

Response:

The comment refers to the relocation of Lincoln Boulevard, listed as one of the characteristics of the ground access system under Alternative 1. This part of the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required to this part of the comment because it does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

The question raised in this comment asks how future plans for the Belford area are addressed in the impact analysis for the SPAS Draft EIR. No future land uses are assumed for the Belford area in the SPAS Draft EIR as LAWA has no development plans at this time for this property; any assumptions regarding future land uses would be purely speculative. The impacts of the SPAS alternatives are, and can be evaluated without considering future uses for the Belford area. Impacts associated with any future development of the Belford area would be addressed in environmental documentation prepared at such time as development is proposed.

SPAS-PC00130-176

Comment:

Page 2-13 2.3.1.1.3 Parking
- Generally, no changes to existing CTA parking conditions would occur as a result of SPAS, although future pricing structures may change long-term/short-term composition
- Parking Lot E, would no longer be used for employee parking, although this property could be used for other airport purposes in the future. Changes to the use of this parking area would occur independently from SPAS.

No changes are proposed to Public Parking Lot C
- Parking Lot D would provide approximately 1,944 employee parking spaces. The Jenny Lot east of Parking Lot D would provide approximately 2,000 employee parking spaces. These parking areas were not in use in the 2010 baseline year; however, their use for parking is occurring independently from SPAS.

- Development of the ITF would include approximately 4,900 short-term public parking spaces to facilitate passenger drop off and pick up outside of CTA
- Construct parking within Manchester Square, including 4,200 long-term spaces and 3,500 employee parking spaces
- No public or employee parking is proposed for the area referred to as Continental City

Question: We know that CTA parking will be changing even if LAWA doesn't define the cause as SPAS changes. How are the cumulative impacts established?

Response:

The traffic and transportation-related cumulative impacts associated with the SPAS alternatives were analyzed and documented in Sections 4.12.1, 4.12.1.2. and 4.12.2 of the SPAS Draft EIR. As explained in Section 5.5.12 of the SPAS Draft EIR, cumulative impacts to on-airport and off-airport transportation are incorporated into the analysis provided in Sections 4.12.1 and 4.12.2, respectively. The analyses included any potential effects that future parking capacity for the various alternatives would have on mode choice, trip generation, and trip distribution within the Central Terminal Area (CTA) and surrounding study area.

Table 2-2 in Chapter 2 and Section 4.12.1.6.1 starting on page 4-1090 of the SPAS Draft EIR documents the total parking capacity to be provided under the various SPAS alternatives. As indicated in Section 4.12.1.9.3 and Table 4.12.1 40 of the SPAS Draft EIR, the airport's public parking supply in each of the Future (2025) alternative scenarios is sufficient to accommodate the airport's estimated future (2025) public parking demand for all the alternatives, which are assumed to be 15 percent greater than the space demand to account for fluctuations in vehicle arrivals in the facilities. Therefore, the SPAS Draft EIR concluded that impacts associated with parking would be less than significant.

SPAS-PC00130-177

Comment:

Question: Page 2-13 ground access states that no parking would be placed in Continental City. What is intended to be placed there? Why is it not identified as part of the Master Plan or used to determine the comprehensive impacts?

Response:

Page 2-13 in Section 2.3.1.1.3 of the SPAS Draft EIR pertains to Alternative 1. As indicated therein, under Alternative 1, no public or employee parking is proposed for the area referred to as Continental City. In addition, as discussed and depicted in Section 2.3.1 of the SPAS Draft EIR, no development is proposed at Continental City for any of the other SPAS alternatives, with the exception of an Intermodal Transportation Center proposed at the site under Alternative 3, and parking proposed at the site under Alternative 4. Such uses at the Continental City site under Alternatives 3 and 4 were included in the modeling to determine the traffic impacts associated with Alternatives 3 and 4 discussed in Section 4.12 of the SPAS Draft EIR. At this time, LAWA has made no decision on the long-term use of the Continental City property, should an alternative other than Alternative 3 or 4 be selected. As such, the potential traffic demand for a future development under Alternatives 1, 2, 8, and 9 cannot be determined at this time. If and when a project is proposed that contemplates use of the Continental City property, a traffic impact analysis would be conducted to assess any traffic impacts and potential mitigations as required by CEQA.

SPAS-PC00130-178

Comment:

Question: Page 2-13 and nowhere in the document is Belford Square area plans mentioned. How can the cumulative impacts of LAX be assessed without some assumption of its use?

Response:

The content of this comment regarding future plans for the Belford area is essentially the same as in comment SPAS-PC00130-175; please refer to Response to Comment SPAS-PC00130-175.

SPAS-PC00130-179

Comment:

Page 2-15 Figure 2-2 LAX Specific Plan Amendment Study Draft EIR Alternative 2

Question: Figure 2-2 Why are the relocated taxiways in Alternatives 2 vs. 4 different? There were both supposed to be based on the safely study which LAWA prepared three years ago to do some quick fixes of taxiways for safety improvement.

Response:

Alternative 4 was not based on the referenced safety study. The study to which the comment refers, the Comparative Safety Risk Assessment: Interim Taxiways Safety Improvement Project, was used as the basis for Alternative 2. (Preliminary LAX SPAS Report, pages 5-107, 5-77.) Alternative 4 includes minor airfield improvements, such as increased displacement thresholds, among other things, to incorporate the changes presented in the Runway 6L/24R and 6R/24L Safety Area Practicability Study. (Preliminary LAX SPAS Report, page 5-108.)

The difference in taxiway layouts between Alternative 2 and Alternative 4 is explained in Section 2.3.1.2 and Section 2.3.1.4 of the SPAS Draft EIR. Section 2.3.1.4 states "Alternative 4 represents what would reasonably be expected to occur if all ongoing and reasonably foreseeable non-Yellow Light improvements identified in the LAX Master Plan (i.e., "Alternative D") were implemented, and none of the Yellow Light Projects or any of the identified alternatives to the LAX Master Plan Program were constructed or implemented. Analysis of Alternative 4 will allow decision-makers and the public to evaluate the impacts of simply eliminating the Yellow Light Projects from the LAX Master Plan Program."

SPAS-PC00130-180

Comment:

Page 2-26 2.3.1.5 Alternative 5 Overview
As noted above in Section 2.3.1, the focus of this alternative is on airfield improvements and associated terminal improvements, as may be compared to such improvements proposed under Alternatives 1 through 4. This alternative is compatible with the ground access improvements associated with Alternatives 1 and 2, as well as the ground access improvements associated with Alternatives 8 and 9, described below. The distinguishing feature of this alternative is the movement of Runway 6L/24R 350 feet north. Similar to Alternative 1, a new centerfield taxiway would be constructed, Runway 6R/24L would be extended, Taxilane D and Taxiway E would be modified/improved, and the service road would be relocated. Under this alternative, the taxilane/taxiway improvements would meet FAA design requirements to fully accommodate ADG VI aircraft. (Under Alternatives 1, 2, and 6, the taxiway configuration would either not meet or only partially meet ADG VI design standards, which would impose certain limitations and special requirements during the operation of those aircraft.) The increased runway-taxiway separation requirements under this alternative would cause the aircraft taxiway operations area to extend farther south than under Alternatives 1, 2, and 6, which, in turn, would result in comparatively less concourse and/or gate area for the potential TBIT extension and MSC extension. Under this alternative, a greater portion of Lincoln Boulevard would be below grade and/or tunneled than under Alternative 1. This alternative is illustrated in Figure 2-5. (underline for emphasis)

Question: 2.3.1.5 Alternative 5 States that for "Alternatives 1,2, and 6. the taxiway configuration would either not meet or only partially meet ADG VI design standards... The ARSAC submitted Alternative 7 contained a taxiway that meets ADG VI. How was this considered in the evaluations? Why does the underline statement say that the taxiway doesn't meet the ADG VI standards?

Response:

An EIR need not consider every conceivable alternative to the project. (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1163.) Rather, an EIR must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).) It must include information sufficient to permit a reasonable choice of alternatives so far as environmental consequences are concerned. (Village Laguna of Laguna Beach, Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022, 1029.) Here, the SPAS alternatives constitute a reasonable range, sufficient to allow informed decision-making. (See City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.)

Alternatives 1, 2, 6, and 7 do not meet full ADG VI requirements for taxiways. A summary of north airfield runways and parallel taxiways compliance with FAA Airport Design Standards is provided in Table 4.7.2-8 in Section 4.7.2 of the SPAS Draft EIR. This table lists the differences between all of the alternatives in a tabular format. Please see Chapter 5 of the Preliminary LAX Specific Plan Amendment Study Report which discusses the steps used in the development of the alternative projects ultimately addressed in the SPAS Draft EIR, including the role of the community and SPAS Advisory Committee, in the formulation of "Yellow Light Project" replacement concepts, which ultimately led to the identification of the SPAS alternatives. Please also see Chapter 6 of the Preliminary LAX SPAS Report, which identifies how and to what extent each of the SPAS alternatives provides solutions to the problems the Yellow Light Projects were designed to achieve.

SPAS-PC00130-181

Comment:

Page 2-33 2.3.1.6.3 Ground Access Facilities

Alternative 6 includes airfield and terminal components only. This alternative is compatible with the ground access improvements associated with Alternatives 1, 2, 8, and 9.

Question: 2.3.1.6.2 Alt 6 terminal facilities section states "same as Alternative 1" for facilities and gate configuration. Does this mean that LAWA is including the same Terminal 0 with the same intent of eliminating the remote gates?

Response:

As depicted in Figure 2-6 of the SPAS Draft EIR, Alternative 6 assumes the construction of a new Terminal 0. Section 2.3.1.6.2 of the SPAS Draft EIR also describes that the terminal facilities and gate configuration assumed under Alternative 6 are identical to those assumed under Alternative 1. As stated in Section 2.3.1.1.2 of the SPAS Draft EIR, which describes the terminal facilities under Alternative 1, the west remote gates would be eliminated upon completion of the airfield and terminal improvements.

SPAS-PC00130-182

Comment:

Page 2-33 2.3.1.7 Alternative 7

Question: 2.3.1.6.2 Alt 7 terminal facilities section states "similar to Alternatives 5 and 6" .... Terminal improvements... Does this mean that LAWA is including the same Terminal 0 with the same intent of eliminating the remote gates?

Response:

The commentor refers to Section 2.3.1.6.2 of the Draft EIR, which describes the terminal facilities under Alternative 6. However, the comment is related to Alternative 7. Since the comment is similar to comment SPAS-PC-00130-181, it was assumed that a typographic error was made and that the commentor meant to reference Section 2.3.1.7.2, discussing Alternative 7 terminal facilities.

As depicted in Figure 2-7 of the Draft EIR, Alternative 7 assumes the construction of a new Terminal 0. As stated in Section 2.3.1.7.2, which describes the terminal facilities under Alternative 7, the west remote gates would be eliminated upon completion of the airfield and terminal improvements.

Further, as indicated in Table 2-2, Summary of SPAS Alternatives, and depicted in Figures 2-1, 2-2, 2-5, 2-6, and 2-7, Alternatives 1, 2, 5, 6, and 7 all include construction of a new Terminal 0. As indicated in Table 2-2, the new Terminal 0 would be at the same location and in the same configuration under Alternatives 1, 2, 5, and 6, but would contain slightly less overall square footage under Alternative 7 (325,000 under Alternative 7 compared to 330,000 under Alternatives 1, 2, 5, and 6) due to a more southerly Aircraft Parking Limit Line under Alternative 7. Please see Section 2.3.1.7.2 for further discussion of terminal facilities proposed under Alternative 7.

SPAS-PC00130-183

Comment:

Page 2-34 2.3.1.7.1 Airfield Facilities, Taxiway Modifications, Centerfield Taxiway
- Construct an 82-foot-wide centerfield taxiway between Runways centerline separation distance of 400 feet to each runway, to enhance and other airfield hazards, while providing for ADG V separation distances; from Runway 6L/24R to the centerfield taxiway, taxiways from the Runway 6R/24L, and other related airfield taxiway improvements. (underlined for emphasis)

Question: 2.3.1.7 Alt 7 centerfield taxiway is listed as 82-foot-wide. Is this the same for all centerfield taxiways? Highlighted item on centerfield taxiway indicates 400' separation from each runway. Has LAWA or FAA done any evaluations of safety impact of a distance less than the initial distance between runways when a centerfield taxiway is made? What were the results and where can they be found? Does LAWA and FAA consider the safety the same if an aircraft is on the taxiway or not? Why?

Response:

The north airfield alternative taxiways are being designed to Aircraft Design Group (ADG) VI standards for aircraft with tail heights greater than 66 ft. and wingspans greater than 214 ft. This includes the A380 family of aircraft. Except for SPAS Alternative 3, the north airfield alternatives' centerfield taxiways are being designed based upon standards for Taxiway Design Group (TDG) 7. The TDG 7 standards are further discussed below. The centerfield taxiway assumed under Alternative 3 (i.e., LAX Master Plan Alternative D), was planned based upon former Taxiway Dimensional Standards included in the FAA Advisory Circular (AC) 150/5300-13, Airport Design, in effect at the time the LAX Master Plan was developed. Based on AC 150/5300-13 Change 4, Table 4-1 on page 36, dated November 10, 1994, the minimum taxiway width to accommodate ADG VI aircraft operations was 100 feet.

The updated AC 150/5300-13A, Airport Design, dated September 28, 2012, includes taxiway width standards, runway-taxiway separation standards for ADG VI and Taxiway Design Group (TDG) 7 aircraft. Taxiway design standards are detailed in Table 4-1 and Table 4-2. Table 4-2 provides taxiway width standards for all TDGs. Taxiway width standards are based on the dimensions of the airplane's undercarriage and remain the same for all taxiways at LAX being designed to TDG 7 standards. The minimum taxiway width for aircraft in the TDG 7 is 82 feet. Taxiways designed for other TDG aircraft may have different dimensions.

Runway-taxiway separation standards for ADG-V aircraft are provided by the FAA in Tables 3-6 and 3-7 of AC 150/5300-13A. According to the AC in Section 321(a)(2), these standards are determined by landing and takeoff flight path profiles and physical characteristics of aircraft.

For more information on safety impacts of the north airfield alternatives, please see Section 4.7.2 of the SPAS Draft EIR, as well as Appendix E1-4 and Appendix H-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-184

Comment:

Question: Is the Terminal 0 the same in these alternatives? What are the differences? Why?

Response:

Please see Response to Comment SPAS-PC00130-182 regarding Terminal 0 proposed under Alternatives 1, 2, 5, 6, and 7.

SPAS-PC00130-185

Comment:

Page 2-37 2.3.1.8 Alternative 8

Question: Several presentations made by LAWA prior to the release of the draft EIR used Alternative 8 to represent no ConRAC and LAWA stated an unofficial desire to delay or eliminate the ConRAC. Do any options show the elimination of the ConRAC?

Response:

As discussed in Chapter 2 of the SPAS Draft EIR, under SPAS, no CONRAC would be developed under Alternatives 1 and 2, nor would one be built under Alternatives 5, 6, and 7 should the airfield and terminal improvements proposed under those alternatives be paired with the ground access system proposed under Alternatives 1 and 2. Only under Alternatives 3, 4, 8, and 9 is a CONRAC proposed to be constructed as part of SPAS. Under Alternatives 3 and 4, the CONRAC would be developed at Lot C and under Alternatives 8 and 9, the CONRAC would be developed in the southern portion of Manchester Square.

SPAS-PC00130-186

Comment:

Page 2-45 Summary of SPAS Alternatives

Question: Table 2-2 shows most alternatives extend runway 24L east 1250' but Alt D is 1280'--why? What causes the 30' difference?

Response:

The 1,250-foot eastward extension of Runway 6R/24L in Alternatives 1, 2, 5, 6, and 7 differs from the 1,280-foot proposed in Alternative 3 because of the relationship between the north-south location of the runway and the alignments of Pershing Drive (to the west) and Sepulveda Boulevard (to the east). Those two streets limit the lengths of Runway 6R/24L.

SPAS-PC00130-187

Comment:

Question: Table 2-2 shows Terminal 0 as 330,000 sq ft in all but Alt 7 when it is built. Why? Are the number of gates the same in each Terminal zero? If not, why not?

Response:

As depicted in Figure 2-7 and described in Section 2.3.1.7.2 of the SPAS Draft EIR, Alternative 7 includes the relocation of the Aircraft Parking Limit Line (APLL) associated with the southerly realignment of Taxilane D. As a result, the northern end of Terminal 0 Concourse would be cropped and its footprint reduced, as detailed in Table 2-2.

As presented in detail in Section 2.3 of the SPAS Draft EIR, a Terminal 0 Concourse was assumed under Alternatives 1, 2, 5, 6, and 7. Based upon the assumed configuration and location of Taxilane D and Taxiway E just north of the northern Central Terminal Area (CTA) terminals, the available footprint of each terminal may vary depending on the resulting location of the APLL for each alternative. Therefore, the numbers of gates at Terminal Concourse 0 may slightly vary.

SPAS-PC00130-188

Comment:

Question: Table 2-2 shows many changes in the terminals with demolitions and reconfigured square feet. How many gates does this represent in each change? What kind of gates? (ie ADG VI dual, single? etc.) Please provide information in terms of gate types AND single gate equivalents so that it can be compared to the Stipulated Settlement number requirement.

Response:

Please see Appendix F-1 of the Preliminary LAX SPAS Report for illustrations of the passenger gate position layouts assumed under Alternatives 1 through 4 (Figures B through D). As discussed in Section 4.3.1 on page 28 of Appendix F-1, Alternatives 5, 6, and 7 were not gated but the results of Alternative 1 gating exercise were assumed to apply to Alternatives 5, 6, and 7. Therefore the information presented below for Alternative 1 can be assumed for Alternatives 5, 6, and 7. Alternatives 8 and 9 were not gated as they do not include terminal or airfield improvements.

On each figure, a summary table is provided which lists the number of assumed gates at each terminal. A nominal gate is indicated by a gate number in a circle. As depicted in Figures B through D and as discussed in Section 2.3.1 on page 2-7 of the SPAS Draft EIR under the heading of "Terminal Improvements," all SPAS alternatives assumed no more than 153 passenger gates. Depending on each alternative, as Aircraft Parking Limit Lines (APLL) movements warranted the closure of one or more passenger gates at terminal concourses, opportunities for the creation of additional passenger gates were assessed with priority given to adjacent terminals.

The table below presents the assumed numbers of gates under SPAS Alternatives 1 through 4 by terminal and Aircraft Design Group (ADG). As used in the LAX Master Plan studies, the ADG IIIa is comprised of Boeing 757 series. As discussed in Section 3.3.3 in Appendix F-1 of the Preliminary LAX SPAS Report, gate dependencies were assumed at locations throughout the terminals. Gate dependency refers to the situation when parking a large aircraft at a particular gate requires that the adjacent gate(s) either be closed or accommodate a smaller aircraft than the nominal gate size would allow (a situation referred to as downsizing).

Note that the table below reflects the ADGs of the largest aircraft that could be accommodated at the gates at any time, regardless on potential downsizing of gates due to gate dependencies. For example, as depicted in Figure B in Appendix F-1 of the Preliminary LAX SPAS Report, Gates 72A and 72B at Terminal 7 are dependent gates. A Boeing 777-200 parked at Gate 72A would require Gate 72B to be closed. However, two Airbus 320-200s could be parked at the same time at Gates 72A and 72B. The ADG count for this pair of gates was therefore counted as one ADG V gate (Gate 72A with a Boeing 777-200) and one ADG III gate (Gate 72B with an Airbus 320-200).

Page 2-53 Figure 2-10 Existing Facilities Affected by SPAS Improvements

Question: Item notation 9, Urgent Care Facility is shown to be relocated subject to tenant decision. What alternatives force this move?

Response:

As discussed on page 2-55 in Chapter 2 of the SPAS Draft EIR, under all alternatives except Alternative 4, the urgent care medical facility would be removed due to the realignment, or the removal under Alternative 3, of the 96th Street Bridge/Sky Way. The urgent care medical facility could potentially be

relocated elsewhere in the airport area. This facility is privately operated; any decision to relocate would be at the discretion of the facility owners.

SPAS-PC00130-190

Comment:

Page 2-69 Potential Construction Staging Areas

Question: Areas C and D are north of Westchester Parkway adjacent to residences. What usage limitations are specified? There are already uncovered dirt mounds in area D which have been inadequately addressed for at least five months, what actions are planned and what provisions are to be put in place to preclude repetition in future uses?

Response:

Section 4.2.5 of the SPAS Draft EIR identifies the LAX Master Plan commitments and mitigation measures relative to air quality, including for construction activities which would extend to construction staging areas where appropriate, and Section 4.10.3.5 identifies such commitments and mitigation measures related to construction noise impacts. In addition, LAWA maintains a construction hotline (310.649.5292) and an online construction inquiry and complaint form system (http://www.lawa.org/laxdev/CommunityInfo.aspx?id=3689). Regarding the dirt mounds in Area D noted in the comment, clean soils excavated from within the CTA, in conjunction with the installation of a segment of new underground pipelines and utility lines related to the Central Utility Plant Replacement Project, were temporarily stored at the subject staging area site until that segment of pipeline/utility line installation could be completed. Although several more weeks of pipeline/utility line installation remained, LAWA removed the stockpiled soil based on concerns expressed by nearby residents and transferred the soils to Continental City, where they will remain until reused as backfill in the CTA.

SPAS-PC00130-191

Comment:

Question: Area E appears to be Belford Square set aside for potential staging. Is this assumed to be near permanent (or at least beyond the Master Plan? If not, what uses are planned? What kinds of staging are planned? Similarly, what is planned for Manchester Square (F) and Continental City (G)?

Response:

As described on page 2-57 of the SPAS Draft EIR, the vast majority of the Belford area is largely vacant at this time. While it is anticipated that the subject area will be redeveloped in the future with airport-compatible uses, there are currently no specific development plans or schedule. As such, all or portions of the subject site could be available for construction staging in the development of SPAS-related improvements, depending on the location and timing of any future redevelopment of the area.

Similarly, Manchester Square is largely vacant and could be available for construction staging until developed with another use. (See page 2-57 of the SPAS Draft EIR.) As described in Section 2.3 of the SPAS Draft EIR, Manchester Square would be developed for surface parking under Alternatives 1 and 2, a Ground Transportation Center (GTC) under Alternative 3, and a combination of a CONRAC and parking under Alternatives 8 and 9. Under Alternative 4, Manchester Square is assumed to remain vacant unless/until another permanent airport-related land use is designated for the area separate from SPAS.

Relative to Continental City, the property is currently vacant and is proposed for an Intermodal Transportation Center (ITC) under Alternative 3 and a parking structure under Alternative 4. Under the other SPAS alternatives, Continental City is assumed to remain vacant unless/until another permanent land use is designated for the area separate from SPAS.

As also indicated on that page, the potential construction staging areas identified in Section 2.3.1.12, including Areas E, F, and G, are considered generally suitable for the placement of construction trailers/offices, storage of construction materials, and staging of construction activities.

SPAS-PC00130-192

Comment:

Page 2-71 2.3.2.1 Alternative Location

Implementation of any of the SPAS alternatives would not be feasible at any location other than LAX. Pursuant to the Stipulated Settlement, the SPAS will plan for the modernization and improvement of LAX. Implementing the SPAS alternatives at any other location would not accomplish this fundamental goal. The existing facilities at LAX cannot accommodate the existing demand and forecasted increase in the numbers of aircraft, cargo, and passengers without significant delays and a very poor level of service. As the existing facilities are used beyond their design capacity, the level of service provided to the user degrades. This lowering of the level of service may be demonstrated by increased congestion within the passenger terminals, the various surface roads on and around the airport, and on the airfield itself. The consequences of taking no action to solve this problem will result in a loss of air service and declining economic benefits (jobs) for the Los Angeles region. Air service and economic benefits would likely relocate to other regions both within the state of California and to other states. Therefore, any comprehensive solution to meeting the regional demand for transportation must include improvements at LAX. (underline for emphasis)

Question: The sentence in the paragraph makes a strong statement of LAX facility limitations. What is the limiting factor that creates the concern? What is the current capacity of aircraft on the existing runways? What is the current capacity of the existing taxiways? What is the current capacity of the existing gates? What is the current capacity of the current roadways in the CTA and also in the streets surrounding LAX?

Response:

Section 2.2 of the SPAS Draft EIR, when describing project objectives 1 and 2, also describes capacity and other constraints of the existing LAX north airfield and the existing LAX transportation systems, respectively.

The operational efficiency of the LAX airfield was examined as a complete system, not as individual components. Please refer to Sections 2 and 3 in Appendix F-2 of the Preliminary LAX SPAS Report for a description of the terminal, airfield, airspace, cargo, and general aviation areas, as well as metrics detailing aircraft delay and taxi times.

In regards to the capacity of Central Terminal Area (CTA) roadways and roadways in the immediate vicinity of LAX, please refer to Section 4.12 of the SPAS Draft EIR, which addresses the on-airport and off-airport transportation system. This section includes discussion on the CTA curbsides, CTA intersections, arterial roads, highway segments, and ramps that serve traffic approaching and departing the airport environs.

SPAS-PC00130-193

Comment:

Question: While there is already CTA curbside traffic over-congestion, what reconfiguration is needed to handle the 78.9 MAP? How much can be accomplished by the re-routing of traffic as opposed to expanding the amount of curbside space?

Response:

The SPAS Draft EIR defines a series of alternatives that have been analyzed to assess anticipated operations at the 78.9 million annual passenger (MAP) traffic activity levels, identify potential impacts, and define appropriate mitigation measures to address impacts within the Central Terminal Area (CTA).

As described in Section 4.12.1.9.5 of the SPAS Draft EIR, the SPAS alternatives would not have significant impacts on curbside operations compared to baseline (2009) conditions. As described in Section 4.12.1.10.2 of the SPAS Draft EIR, the SPAS alternatives would have cumulatively considerable impacts on curbside operations compared to 2025 future conditions, but these impacts can be mitigated to less than cumulatively considerable levels by Mitigation Measures MM-ST(OA) (SPAS)-1 and MM-ST(OA) (SPAS)-2, neither of which would require expanding the amount of curbside space.

Furthermore, as described in Section 4.12.1.6 of the SPAS Draft EIR, all of the SPAS alternatives seek to reduce the CTA traffic by redistributing traffic to various off-site facilities such as the Intermodal Transit Facility and the Consolidated Rental Car Facility (CONRAC). Please also see Response to Comment SPAS-PC00130-150.

SPAS-PC00130-194

Comment:

Question: The subject paragraph states that everything must be done at LAX to alleviate congestion. If other regional airports increase in capacity doesn't this reduce peak hour needs? What if alternative transportation were available, such as HSR to reduce demand? What was actually considered? The statement that economic benefits would be lost to CA if not at LAX, but what evidence is there that this is true? Isn't the entire regional impacts tied together and that if congestion around LAX were reduced the costs of doing business on the coastal area would reduce thereby INCREASING overall economic benefits? LAWA provided a 2012 LAEDC study that LAX was responsible for about $40 billion in economic impacts as evidence that LAX needs to be expanded whereas a 10-24-2005 LAWA presentation stated, "Contributes $60 billion annually to the regional economy." Since LAWA, as operator, is responsible for the reduction in service at Ontario (or in the case of Palmdale no service), why isn't improvements at those facilities a larger driver for economic benefits?

Response:

The paragraph in Section 2.3.2.1 of the SPAS Draft EIR does not state "that everything must be done at LAX to alleviate congestion." The subject paragraph describes how and why a scenario whereby the proposed SPAS improvements are made at an alternative location (i.e., at a site/facility other than LAX) does not make sense and would not accomplish the fundamental goal of SPAS. While the discussion acknowledges that a likely outcome of not making improvements at LAX would be increased congestion in the future and degraded levels of service, the alleviation of congestion at LAX is not the focus of SPAS. There are several other issues encompassed in the project objectives, such as the need for improvements to the north airfield that support the safe and efficient movement of aircraft at LAX and maintaining LAX's position as the premier international gateway for the region, that are separate from congestion and are specific to LAX that cannot be addressed by making SPAS improvements at an alternative location.

Both LAWA and the LAX Master Plan, of which SPAS is a part, support the regionalization of air travel demand in Southern California, as further discussed in Topical Response TR-SPAS-REG-1. As described therein, the planning of improvements at LAX based on a future passenger activity level of 78.9 MAP is consistent with the previously adopted SCAG 2008 Regional Transportation Plan (RTP) and the currently adopted 2012 RTP/Sustainable Communities Strategy (SCS). The 2012 RTP/SCS takes into consideration the potential implications of the current planning for the California High Speed Rail (HSR) system, as may be integrated with airports in Southern California including the possibility of a station in the vicinity of Bob Hope Airport and a station in the vicinity of LA/Ontario International Airport. The RTP/SCS notes that none of the alternative routes being considered for the California HSR system go anywhere near LAX (see Section 2.3.2 in the Aviation and Airport Ground Access Appendix of the 2012 RTP/SCS). It is beyond the scope of the SPAS project and Draft EIR to address the potential implications of HSR on aviation demand at LAX.

The statement in Section 2.3.2.1 regarding the potential that making no improvements to LAX would lead to degraded level of service and congestion within passenger terminals, on various surface streets around the airfield, and on the airfield which, in turn, would likely result in air service and economic benefits relocating to other regions both within the state of California and to other states pertains

primarily to international travel. The international travel market is highly desired by, and highly competitive between, major airports. The west coast international travel market has long been highly competitive between LAX, San Francisco International Airport, Seattle-Tacoma International Airport, McCarran International Airport in Las Vegas, Nevada, Sky Harbor International Airport in Phoenix, Arizona, and Denver International Airport in Denver, Colorado. Should LAX remain unimproved and passengers and airlines experience increasingly poor levels of service, more delays, and congestion, it is reasonable to anticipate that international air carriers will likely consider and ultimately choose other options.

As noted above, and further discussed in Topical Response TR-SPAS-REG-1, LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. LAWA disagrees that LAWA is responsible for reductions in service at ONT and PMD. Efforts to bring air service to PMD and increase service to ONT are discussed in TR-SPAS-REG-1. As discussed therein, LAWA continues to identify, evaluate, and implement measures to enhance the stability and growth of LA/Ontario International Airport. As indicated in the 2012 RTP/SCS, LA/Ontario International Airport will serve a key role in the regionalization of air travel demand in Southern California, in conjunction with, not in lieu of, the planned future activity level of 78.9 MAP at LAX.

The commentor also raises economic impact issues. However, these are purely economic issues, and thus are not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e)).

SPAS-PC00130-195

Comment:

Page 2-71 2.3.2.2 Alternative Designs
Several alternative concepts were formulated and considered during development of the nine SPAS alternatives addressed in this EIR. Chapter 5 of the SPAS Report describes the basis, nature, and characteristics of those early concepts. The SPAS Report is available for review at LAWA's Facilities Planning Division, One World Way (LAX), Los Angeles or online at www.laxspas.org. Three of the airfield improvement concepts initially considered for inclusion in this Draft EIR were subsequently refined or consolidated. Specifically, an airfield improvement concept proposing to relocate Runway 6L/24R 400 feet north, which would meet all FAA standards for ADG VI aircraft, was subsequently refined to meet the basic requirements with only a 350-foot northward move. That refined alternative is Alternative 5 in this Draft EIR. Two other airfield improvement concepts, one proposing to move Runway 6L/24R 200 feet north and the other to move the subject runway 300 feet to the north were consolidated into the 260-foot north move, which is Alternative 1 in this Draft EIR. (underline for emphasis)

Question: The alternatives were stated to have been melded to meet full ADG VI aircraft standards. However, the same argument was used prior to "fixing" the south runway complex. As the "fix" was being instituted the standards were changed and made those runways undesirable for use with NLA. What has been studied to meet the newer, greater separation standards of AC150 5300-13A? If the separation standard is currently resolved by not using the adjacent runway for a short period, what frequency of NLA causes excessive delay? It certainly isn't current conditions or the runways would be closed to NLA traffic.

Response:

The runway-taxiway separation standards in FAA Advisory Circular (AC) 150/5300-13 Airport Design used by LAWA for the preparation of the SPAS Draft EIR do not differ from the runway-taxiway separation standards provided in FAA AC 150/5300-13A Airport Design; therefore, no additional study was performed/required.

Airfield operations were analyzed using the SIMMOD simulation model. Excessive delay due to NLA operations was not observed during the planning horizon (i.e., operations associated with 78.9 MAP in 2025). For more information on the results of the simulation process, please see Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-196

Comment:

Page 2-72 2.3.2.4 Next Generation Technology
The application of NextGen to the SPAS effort was considered by LAWA to determine if any component of NextGen could provide for a viable concept. Although NextGen systems could provide for better ground situational awareness for air traffic controllers and pilots, and it could make airfield operations more efficient, it would not increase safety-related hysical separation distances on the ground to meet ADG V and VI runway and/or taxiway/taxilane separation standards and obstacle free zone requirements. Based on this evaluation, LAWA determined that no component of NextGen technology can provide a viable concept (i.e., a SPAS alternative) and, therefore, NextGen was eliminated from further consideration.

Question: NextGen is a broad category of technology. The FAA has been evaluating and developing numerous elements for safety such as runway status lights, but also other ground and air technological improvements. Where in the EIR are these enumerated and why haven't they been included in the consideration as parts of the solution?

Response:

The contents of this comment are similar to the concerns expressed in comment SPAS-PC00096-5; please refer to Response to Comment SPAS-PC00096-5.

SPAS-PC00130-197

Comment:

Question: The existing airfield has several "non-visibility" areas created by recent projects. How is the design of this SPAS program addressing them?

Response:

Please see Responses to Comments SPAS-PC00130-362 and SPAS-PC00130-577 regarding ATCT line-of-sight.

SPAS-PC00130-198

Comment:

Page 2-74 2.4 Intended Use of this EIR
This EIR will be used by LAWA, the Board of Airport Commissioners, and the Los Angeles City Council to evaluate and consider the potential environmental impacts of each of the SPAS alternatives and to take action relative to amendments to the LAX Specific Plan. Certification of the SPAS EIR would complete the program-level CEQA compliance review for the SPAS process. Depending on the outcome of the SPAS process, additional project-level CEQA review may be required for implementation of the improvements associated with the selected SPAS alternative.
In addition to use of this EIR by the City of Los Angeles, implementation of the selected SPAS alternative may require various federal, state, and local approvals, for which the approving agencies may use this EIR in their respective environmental reviews and decision-making and approval processes. Provided below is an overview of the actions and permits anticipated to be required for the project.

Question: The above paragraph says that project level EIRs "may" be required. Why not "must" be required since there are so many impacting construction details that are not addressed.

Response:

As indicated in the excerpt from page 2-74 of the SPAS Draft EIR, additional project-level CEQA review may be required for implementation of components of the SPAS alternatives, depending on the

outcome of the SPAS process. While the SPAS Draft EIR identifies and evaluates nine alternatives, which the LAWA Board of Airport Commissioners (BOAC) will review and consider, it is premature to say whether any of the alternatives will be approved. Also, second-tier project-level CEQA reviews, if undertaken, could result in another type of CEQA document other than an EIR.

SPAS-PC00130-199

Comment:

In a previous paragraph LAWA dismissed dual runway moves as impractical due to logistics. Several factors on runway movement could be even more confounding that that issue (such as the Manchester tunnel which would need to be removed due to its destabilizing effects when a runway is moved along with the unknown water source impacts)? What other factors does LAWA consider to be cause for impractical phasing decisions?

Response:

Regarding dual runway moves, Section 2.3.2.6, Dual Runway Relocations, of the SPAS Draft EIR presents reasons why such an approach to reconfiguring the north airfield is considered infeasible, impractical, and likely to result in environmental impacts comparable or greater to the alternatives evaluated in detail in the SPAS Draft EIR. Further, Section 2.3.2.6 describes why this alternative is within the range of the alternatives that the SPAS Draft EIR evaluates in detail. An EIR need not consider multiple variations on the range of alternatives evaluated in detail. (Village Laguna of Laguna Beach Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022, 1028.) Nor must an EIR consider every conceivable alternative to the project. (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1163.) Moreover, an EIR need not analyze alternatives that do not offer significant advantages over the alternatives presented in the EIR, or that constitute a different version of an alternative presented in the EIR. (Sequoia Hills Homeowners Ass'n v. City of Oakland (1993) 23 Cal.App.4th 7045.)

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as the Manchester Tunnel). Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements and see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX. The commentor provides no evidence to substantiate the claim that that the area has unknown water sources that would affect runways.

SPAS-PC00130-200

Comment:

Page 2-74 and -75 Federal Actions
- Decisions regarding project eligibility for federal grant-in aid funds or PFC funds for land acquisition, site preparation, runway and taxiway construction, environmental activities, and mitigation;....

U.S. Army Corps of Engineers (USACOE). Key action by the USACOE may include:
- Issuance of a Clean Water Act Section 404 permit if/as needed for impacts to jurisdictional wetlands (i.e., should jurisdictional wetlands be determined to exist within the Argo Drainage Channel).

Question: What commitments or comments have been provided to LAWA regarding project funding during this EIR preparation? What assurances have they received which grants waivers in advance?

Response:

Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

No commitments, assurances, or grant waivers have been provided to LAWA regarding project funding for SPAS improvements. As provided in Section 8.6 of the Preliminary LAX SPAS Report, the principal sources of funding for alternative improvements are expected to include, among other things, LAX tenant funds and grants from the Federal Aviation Administration and the Transportation Security

Administration. If assumed funding sources are not available in the future, certain projects would be deferred until funds become available. A more detailed discussion of the funding assumptions for the project is provided in Chapter 8 of the Preliminary LAX SPAS Report.

SPAS-PC00130-201

Comment:

Question: Since earlier sections acknowledge that the USACOE have not been consulted on items such as jurisdictional wetlands and the Argo Drainage Channel when will this be addressed to determine the adequacy of LAWA assumptions?

Response:

As discussed in Section 4.3 of the SPAS Draft EIR, Alternatives 1, 5, and 6 would result in significant impacts to U.S. Army Corps of Engineers (USACOE) jurisdiction associated with the Argo Drainage Channel, which would be reduced to a less than significant level with implementation of mitigation measure MM-BIO (SPAS)-13. As discussed in Section 4.3 of the SPAS Draft EIR, although the USACOE previously determined that upon completion of emergency operations and maintenance activities, the Argo Drainage Channel would no longer be subject to its Clean Water Act jurisdiction, analysis in the SPAS Draft EIR assumes that the Argo Drainage Channel has the potential to continue to be subject to USACOE Clean Water Act jurisdiction. Mitigation Measure MM-BIO (SPAS)-13 requires consultation with USACOE to obtain a final determination of jurisdictional area associated with the Argo Drainage Channel and mitigation for impacts. However, as MM-BIO (SPAS)-13 applies only to Alternatives 1, 5, and 6, it is anticipated that consultation with USACOE would be initiated following the selection of a preferred alternative, if Alternative 1, 5, or 6 were selected, and during the planning stages of the improvements that would result in the impact. If any of the other alternatives are selected, no such consultation would be necessary.

It should be further noted that, if Alternative 1, 5, or 6 were to be selected, USACOE would not be able to issue a Section 404 permit until a Section 401 Water Quality Certification is obtained from the Los Angeles Regional Water Quality Control Board, which in turn would not be able to issue the Water Quality Certification until the EIR has been certified.

SPAS-PC00130-202

Comment:

Page 2-77 2.4.4 Other Actions
Other permits and approvals of specified types, but as yet unknown, may be issued to implement various aspects of the selected SPAS alternative.

Question: Please describe what additional permits and types of approvals LAWA is referring to and the conditions under which they would expect this to occur?

Response:

Section 2.4 of the SPAS Draft EIR lists and describes numerous federal, state, and local permits and approvals that are anticipated to be required in the course of implementing the proposed SPAS improvements, and also acknowledges the possibility that other permits of specified types, but as yet unknown, may also be necessary. This reflects the fact that the current planning and consideration of the SPAS alternatives is only at the conceptual program level and that as additional details and specifications are developed in the future for the approved alternative, it may be determined that certain other permits and approvals are needed. Additionally, development of the SPAS improvements is anticipated to occur over many years, with buildout project to occur in 2025. It is possible, if not likely, that compliance laws and regulations will change over that time, requiring new or different permits and approvals than exist today.

SPAS-PC00130-203

Comment:

Page 3-1 3.1 Land Use Setting
As indicated in Chapter 1, Introduction and Executive Summary, and Chapter 2, Project Description, depicted in Figures 1-1 and 1-2, the SPAS improvement areas are located at LAX, within highlydeveloped, urbanized area consisting of airport, commercial, transportation (i.e., interstate highways), residential uses. West of the project site are the Los Angeles/El Segundo Dunes (Dunes), Environmentally Sensitive Habitat Area (ESHA), and beyond the Dunes is the Pacific Ocean.
Surrounding land uses include the following:
- Open space, recreation, and residential to the north;
- Commercial, industrial, and residential to the east and south; and
- Dockweiler State Beach and Pacific Ocean to the west.
The land use setting for each of the SPAS improvement areas is provided below.

Question: 3.1 Land Use Setting - Surrounding land uses: There are commercial uses to the north as well. What does LAWA consider the use of the Westchester Business District?

Response:

The overview of the land use setting and description of surrounding land uses presented in the text cited by the commentor, which appears on page 3-1 of the SPAS Draft EIR, is intended to provide a general overview of land uses surrounding the airport. More detailed descriptions of surrounding land uses follow this introductory text. While the Westchester Business District and other commercial uses are located north of the airport, the predominant land uses north of the airport are open space, recreation, and residential. The more detailed descriptions which follow the introductory text, specifically the text provided in the discussion of the "North Airfield," identify existing commercial uses, including the Westchester Business District. These uses are also described on page 4-680 and designated in Figure 4.9-6 in Section 4.9 of the SPAS Draft EIR.

SPAS-PC00130-204

Comment:

Question: 3.1 Land Use Setting. Surrounding land uses: in addtion to Docweiler State Beach there are also protected dunes with protect species and other adjacent habitat lands. Why is this not identified when the paragraph above it lists this land use?

Response:

The land use setting description of the Los Angeles/El Segundo Dunes (Dunes) is presented on page 3-1 of the SPAS Draft EIR. The Los Angeles/El Segundo Dunes (Dunes) is not considered a surrounding land use to the west because it is located on LAX property. As described on page 3-1, Dockweiler State Beach and the Pacific Ocean are adjacent to and west of the Dunes.

SPAS-PC00130-205

Comment:

Question: 3.1 Land Use Setting - North Airfield: left out the construction staging and construction support which is home to many dunes of potentially contaminated dirt deposited from other areas of the airfield. How/when will this be reconciled?

Response:

The land use setting description under the heading "North Airfield" presented on page 3-1 of the SPAS Draft EIR, provides an overview of the notable uses related to the SPAS improvement areas. As indicated therein, "Surrounding land uses [i.e., uses around the SPAS improvement areas within the north airfield] include vacant land and the Westchester Golf Course (both on LAX property), and

residential and recreation uses within the community of Westchester to the north" The "vacant land" includes undeveloped parcels within LAX Northside, portions of which are used for construction staging on LAX improvement projects. While those temporary activities in the LAX Northside area may include the stockpiling of excavated soils, such stockpiling does not include contaminated soils. Please see Response to Comment SPAS-PC00130-265 regarding the management and removal of contaminated soils encountered during construction at LAX.

SPAS-PC00130-206

Comment:

Page 3-3 Land Use...
Cultural Resources - The findings of the historical resources surveys of LAWA-owned property and adjacent areas conducted as part of the LAX Master Plan EIR indicated that four buildings within the overall boundary of LAX are considered potentially significant historical/architectural resources: (1) Hangar One (listed on the National Register of Historic Places [National Register]) on the southeastern portion of LAX near the northwest corner of Aviation Boulevard and Imperial Highway; (2) the Theme Building and Setting (eligible for listing on the National Register) in the center of the LAX terminals; (3) the WWII Munitions Storage Bunker (eligible for listing on the National Register) near the western boundary of LAX; and (4) the Intermediate Terminal Complex (eligible for listing on the California Register of Historical Resources [California Register]) on the south side of Century Boulevard between Sepulveda Boulevard and Airport Boulevard. Immediately adjacent to the airport, the Union Savings and Loan Building at 9800 S. Sepulveda Boulevard is eligible for listing on the California Register and for local designation. Eight archaeological resources have been recorded within the SPAS cultural resources study area. Due to the lack of important prehistoric or historic association and/or insufficient integrity, all but one of these sites were determined by the Federal Aviation Administration (FAA) to be ineligible for federal, state, and/or local designation as part of the Section 106 process undertaken for the LAX Master Plan EIS.30
Similarly, with the exception of one site, these sites are not considered to be historical or unique archaeological resources pursuant to CEQA or the Public Resources Code.

Question: 3.1 Environmental Setting - Cultural Resources: Just because the Alt D EIR did not identify the former uses by Native Americans doesn't mean their historic use was not there. What studies has LAWA conducted to identify burial grounds and other significant uses?

Response:

Please see Response to Comment SPAS-PC00130-105 concerning the cultural resources records search and pedestrian surveys conducted during preparation of the SPAS Draft EIR to identify cultural resources within the SPAS study area, including sites formerly used by Native Americans. Please see Response to Comment SPAS-AS00002-1 concerning consultation with the California Native American Heritage Commission and local Native American groups and individuals requesting their assistance in the identification of traditional tribal "cultural places."

Comment:

Page 3-3 Hazards/Hazardous Materials
...With respect to aviation safety, the runways and taxiways within the north airfield at LAX were designed and constructed in the late 1960s. Issues associated with the outdated airfield design include, but are not limited to, the following:
- The north airfield is not fully designed for the largest aircraft types currently in service (i.e., Aircraft Design Group [ADG] V aircraft, such as the Boeing 747-400, and ADG VI aircraft, such as the Airbus A380).

Question: 3.1 Environmental Setting - Hazards/Hazardous Materials talks extensively about waivered conditions for aircraft operation, but fails to discuss the multiple sources of toxic contamination from the former oil field, airport activities and fuel, rocket testing, and chemical contamination related to manufacturing. Why doesn't this section mention the unknown water source and water flow

characteristics which could spread contamination within the airport lands and also to adjacent habituated lands?

Response:

Known contamination within the study area is identified in Section 4.7.3.3 of the SPAS Draft EIR. The commentor provides no substantiation of or evidence to support the claim that there is an unknown water source at the airport that could spread contamination. Moreover, please see Section 4.7.3.5 of the SPAS Draft EIR for a discussion of applicable LAX Master Plan commitments and mitigation measures. As provided in that section, LAWA has adopted a "Procedure for the Management of Contaminated Materials Encountered During Construction." (Page 4-582 of the SPAS Draft EIR.) The Procedure, along with LAX Master Plan Commitment HM-2, will ensure that all contaminated soils and/or groundwater encountered during construction are handled in accordance with all applicable regulations. (Section 4.7.3.5 of the SPAS Draft EIR.)

SPAS-PC00130-208

Comment:

Page 3-4 Hydrology/Water Quality - Much of the SPAS improvement areas are developed and paved, although there are areas of disturbed, undeveloped pervious areas adjacent to the runways in the north airfield and within Manchester Square and Continental City. Surface water from LAX drains into storm drain facilities within the jurisdiction of the County of Los Angeles and the City of Los Angeles, which discharge to either San Pedro Bay, via the Dominguez Channel, or to Santa Monica Bay. The Argo Drainage Channel, a 9,857-foot-long drainage channel, lies to the north of, and approximately parallel to, Runway 6L/24R. This channel is unlined and uncovered across most of the north airfield, becoming a subsurface box culvert at the west end of the airfield before emptying into Santa Monica Bay. The project site is located within the West Coast Groundwater Basin. Groundwater beneath LAX is not used for municipal or agricultural purposes. Due to its largely impervious nature, the project site provides a negligible amount of recharge to the regional groundwater basin. Existing surface water pollutants typically include total suspended solids, oil and grease, metals, and fuel hydrocarbons, as associated with airfield activities and aircraft maintenance. No 100-year floodplain areas are located within the airport boundaries. (underlined for emphasis)

Question: Since LAX is within the Dominguez flood plain why is the 100 year storm not applicable?

Response:

As identified in Section 4.8.3 of the SPAS Draft EIR, a portion of LAX is located within the Dominguez Channel sub-basin. However, none of the project components associated with any of the SPAS alternatives are located within a floodplain, including the 100-year floodplain, as mapped and identified under the National Flood Insurance Program of the Federal Emergency Management Agency.1 Please see Response to Comment SPAS-PC00160-18 regarding use of the 50-year storm event to design major drainage facilities in the City of Los Angeles and Response to Comment SPAS-PC00130-169 regarding the design capacity of the Argo Drainage Channel with implementation of Alternatives 1, 5, and 6.

SPAS-PC00130-209

Comment:

Page 3-4 Noise - The existing noise setting at the project site, a very active international commercial airport, is dominated by aircraft activities that occur throughout the day and evening, primarily involving commercial jets. These activities generate noise from aircraft arriving and departing on the north and south runway complexes, aircraft movements on taxiways, and aircraft undergoing maintenance

activities that require engine testing (i.e., engine "run-ups"). Traffic noise from vehicles on-airport and on off-site area roadways and highways, as well as ongoing construction activities at LAX, also contribute to the existing noise setting at and near the SPAS improvement areas.

Question: 3.1 Environmental Setting - Noise. When CNEL is calculated how is the ground air traffic and any maintenance included in the calculations? How is topography included in the application of the INM model? Which version was used? What flight mix was assumed and is it the same one used in determining ground efficiency times from runway to gate?

Response:

The commentor inquires about the various input assumptions used for noise modeling including aircraft ground movement, maintenance activities, and topography for calculating CNEL. The commentor also inquires whether the same aircraft fleet mix was used for the noise analyses from the simulations that were conducted for the SPAS Draft EIR.

The Federal Aviation Administration's Integrated Noise model (INM), Version 7b was used to generate the aircraft CNEL contours, as was explained on page 4-797 in the SPAS Draft EIR. The U.S. Geological Survey (USGS) terrain data for LAX and the surrounding communities were used as one of the input variables in the noise modeling. As described in Section 3.1.1.4 in Appendix J1-1 of the SPAS Draft EIR, the existing Baseline (2009) aircraft fleet mix and operations were derived from the FAA Airport Traffic Control Tower counts and LAWA's noise and operations monitoring system data. Table 3 in Appendix J1-1 of the SPAS Draft EIR provides the average annual day operations and fleet mix for the baseline (2009) conditions. The average annual day operations used for aircraft noise modeling in the future alternative scenarios were developed from the 2025 Design Day Flight Schedule (DDFS) developed for SPAS Draft EIR gating, SIMMOD simulation, and aircraft noise analyses. Table 8 in Appendix J1-1 of the SPAS Draft EIR provides the average annual day operations and fleet mix for the future (2025) conditions. Noise associated with aircraft maintenance activities, such as engine ground run-ups, are not included in the airport CNEL contour calculations, as such activities are very limited, relatively isolated, and do not materially contribute to the airport's overall daily noise levels. Moreover, relative to the SPAS project, the improvements proposed under the various alternatives would not affect future aircraft maintenance and ground-run up activities.

SPAS-PC00130-210

Comment:

Page 3-5 Utilities - The City of Los Angeles Department of Water and Power (LADWP) is the water purveyor for most areas in the City of Los Angeles, including LAX. LAX is served by a trunk line in Sepulveda Boulevard that distributes water to transmission lines running along the airport perimeter. LAX also uses reclaimed water from the West Basin Municipal Water District's (WBMWD) Edward C. Little Water Recycling Facility and has implemented other measures to decrease potable water use at the airport. Sanitary wastewater generated by activities at LAX is treated at the Hyperion Treatment Plant (HTP), a City-owned treatment plant located adjacent to the southwest boundary of LAX, approximately two miles southwest of the CTA. Electric power at LAX is supplied by LADWP. LAWA participates in LADWP's "Green Power for LA" program to purchase electricity from renewable resources and incorporates energy efficiency and conservation into existing buildings and new construction. In addition to obtaining electricity from LADWP, LAWA operates the CUP, which provides heating and air conditioning to the CTA. The CUP also houses a co-generation system that generates electrical power, which is sold to LADWP. The CUP is currently being replaced with a more modern facility with higher capacity and greater efficiency. LAWA has had a comprehensive, facility-wide recycling program at LAX to reduce solid waste generation and disposal since 1992. This program includes collection of recyclable materials generated by LAWA and within airport terminals and airfield areas; collection of materials from airlines and tenants at no cost to participants; independent airline and tenant recycling programs; and source reduction through purchase of recycled products and reuse of materials. Solid waste that cannot be recycled is transferred to the Sunshine Canyon Landfill in Sylmar for disposal.

Question: In other sections of this EIR LAWA acknowledges that the amount of waste will be increasing just because more passengers will be accommodated at LAX. Where are the innovative ways to improve recycle and reuse studied by LAWA?

Response:

LAWA developed a comprehensive, facility-wide solid waste recycling program at LAX in 1992. A number of initiatives have been successfully implemented by LAWA since that time, as discussed on page 4-1360 in Section 4.13.2 of the SPAS Draft EIR, including the collection of recyclable materials generated by LAWA and within airport terminals and airfield areas; collection of materials from airlines and tenants at no cost to participants; independent airline and tenant recycling programs; and source reduction through purchase of recycled products and reuse of materials. LAWA also recycles construction and demolition materials, green waste, batteries, and electronic waste. Donations of packaged food from airline caterers are sent to local food banks. Additional programs are under development, including recycling of coffee grounds and filters into compost, and an airport-wide collection program for cooking oil and grease.

In addition to these efforts, subsequent to the approval of the LAX Master Plan, LAWA adopted the LAWA Sustainable Airport Planning, Design and Construction Guidelines for implementation on all airport projects. These Guidelines provide goals and performance standards for recycling of materials during both construction and operation of airport facilities in accordance with the provisions of LAX Master Plan Commitment SW-1, Implement an Enhanced Recycling Program (see Section 4.13.2.5).

As indicated on page 4-1361 of the SPAS Draft EIR, as a result of the efforts undertaken to date, in 2009, LAWA reached a diversion rate of 66.4 percent. LAWA's goal for LAX is to meet the City's objective of 70 percent diversion by 2015, which is five years ahead of the state goal. LAWA will continue to improve its recycling programs as requirements change.

Comment:

Question: 3.1 Environmental Setting - Utilities
At one time there were some fuel cell experiments done at LAX to provide power. What were the results and where was any potential contamination from them deposited?

Response:

LAWA has never conducted experiments of the ability of fuel cells to provide power. At one time, American Airlines planned to conduct a fuel cell pilot study for their maintenance facility; however, this project was never implemented. LAWA did undertake a hydrogen fueling facility demonstration project to refuel light duty vehicles. The proposed facility consisted of equipment to generate hydrogen gas using electrolysis technology to separate water into hydrogen and oxygen. The facility did not use hazardous materials that could result in contamination.

As stated in response to comments received from the commentor on the Central Utility Plant Replacement Project (CUP-RP) Final EIR (Comment CUP-PC00001-14), "[t]he use of fuel cells would not be feasible as part of the CUP-RP, due to the size constraints and energy inefficiency. The space required to generate 9 megawatts (MW) of power using fuel cell power generation units would exceed the space available for the new CUP-RP. In addition, the fuel cell technology would fail to capture the energy efficiency of co-generation, which allows for combining steam and power production."1 Another factor contributing to the limited market penetration of fuel cell technology for both stationary power and automobile power is the high capital cost.2

LAWA has not identified an application of fuel cell technology that can be accommodated in the constrained space available at LAX and that could function as a meaningful emergency back-up power alternative to diesel generators.

Page 3-5 3.3.1 LAX Development Projects Not Related to the SPAS Elements
LAX development projects that are not related to the SPAS elements include the following: Airfield-Related Improvements

Question: 3.3.1 LAX non-SPAS projects

Where are the hush hangers shown in Alt D and agreed to install by 2015 as a condition of the CA Noise Variance?

Response:

Please see Response to Comment SPAS-PC00130-132 regarding the aircraft ground run-up enclosures (GRE), also known as "hush hangers," as referred to by the commentor.

SPAS-PC00130-213

Comment:

Where is the Continental City activity which appears to be starting?

Response:

The area generally referred to as "Continental City" is located at the northeast corner of Aviation Boulevard and Imperial Highway, and is bounded by Imperial Highway on the south, Aviation Boulevard on the west, W. 111th Street on the north, and the LAX property line on the east. The entire area within Continental City is identified as Construction Staging Area "G" in the SPAS Draft EIR (see Figure 2-15). SPAS Construction Area "G" is also identified as a construction staging and parking area for the Bradley West Project in the LAX Bradley West Project EIR (see LAX Bradley West Project Draft EIR, Figure 2-8, page 2-41) and is identified as a construction staging area for the Runway 7L/25R RSA Project (see Proposed Runway 7L/25R Runway Safety Area (RSA) Project and Associated Improvements Draft Environmental Assessment, Figure 2-8, page 1-43). The site was vacant during the SPAS baseline year (2010); however, the site is used periodically by LAWA Construction and Maintenance and is currently being used as a temporary receiving and storage area for materials and equipment associated with ongoing construction at LAX.

Comment:

Page 3-6 3.3.1 LAX Development Projects Not Related to the SPAS Elements

LAX development projects that are not related to the SPAS elements include the following: Terminal-Related Improvements

Question: 3.3.1 LAX non-SPAS projects
What cargo related projects are planned? What about relocations of LAWA staff or LAWA PD?

Response:

Section 3.1.1 of the SPAS Draft EIR lists airfield-related improvements on pages 3-5 and 3-6. As indicated on page 5-21 of the SPAS Draft EIR, cumulative cargo-related projects include electrification of cargo areas and cargo hangar interior renovations (these are listed under Miscellaneous Projects). Page 5-21 also identifies the development of a new consolidated facility that would centralize police, fire, and other public safety administrative operations and functions. No projects that would relocate other LAWA staff are currently planned. Please also see Response to Comment SPAS PC00130-137 regarding future location of a public safety building.

SPAS-PC00130-216

Comment:

Page 3-7 3.3.2 Non-LAX Planned Development
A list of other development projects in the City of Los Angeles and neighboring communities within the vicinity of the project area is provided in Chapter 5, Cumulative Impacts. A total of 140 projects in the LAX area (illustrated in Figure 5-1 and briefly described in Table 5-2) have been identified whose development could occur within the same time frame as SPAS. Information regarding the background development projects is based on site visits and/or consultation with staff from and/or websites of the County of Los Angeles and the cities of Culver City, El Segundo, Hawthorne, Inglewood, and Los Angeles.

Question: 3.3.2 LAX non-SPAS projects
There are numerous residential and commercial projects throughout the areas that are contained within the intersections identified for the traffic study not in Table 5-2. A sanity check item missing is Howard Hughes Center covering multiple large towers (over 1M sq ft). Playa Vista phases are not show either. There is a 140 unit appt bldg on LaTijera/74th just west of the 405 exit being planned as well of several others off Airport blvd also not listed. Which other ones has LAWA not included? What date is the list "as of"? Does LAWA believe that nothing will be built in this area after that time?

Response:

The comment states "there are numerous residential and commercial projects throughout the areas that are contained within the intersections identified for the traffic study not in Table 5-2." The comment also suggests that there are several missing projects from Table 5-2.

As discussed on page 4-1208 of the SPAS Draft EIR, LAWA used a hybrid approach to its cumulative traffic analysis, which used both growth projections from SCAG and a list of projects, which is considered conservative:

"Traffic volume forecasts for future (2025) scenarios were developed based on SCAG's land use projections…This forecasting method accounts for growth in the study area as well as growth outside the study area…Planned development projects in the City of Los Angeles and neighboring communities within the vicinity of the study area are shown in Appendix K2-2…[r]elated project information and the land use growth in the corresponding TAZs were checked against future year model SED and vehicle trip growth and increased as necessary to ensure the model accounted for the likely increase in traffic from the projects."

The list provided in Appendix K2-2 (the same as SPAS Draft EIR Table 5-2) was based upon information collected in 2010 and 2011 (as noted in the Appendix footnotes). Among the projects listed in these tables, referred to in the comment, is a new office building in the Howard Hughes Center (related project #121) and the later phase of Playa Vista (related project #128). These related projects were mapped and checked against the socio-economic data from SCAG which is one of the elements in

the travel demand forecasting model used in the traffic analysis. Wherever necessary to forecast growth within each model zone, socio-economic inputs were increased to account for all known pending development projects.

While LAWA could have elected to rely exclusively upon the projections approach, LAWA used a hybrid approach which is considered conservative. In Neighbors for Smart Rail v. Exposition Metro Line Construction Authority (2012) previously published at 205 Cal.App.4th 552, 141 Cal.Rptr.3d 1, 21-22 (Pending Review by the California Supreme Court on issues unrelated to the ones discussed here), petitioners alleged "that the EIR 'made no attempt to actually quantify the traffic generated by [a specific cumulative project] or even discuss the potential cumulative traffic impacts'…and instead 'merely relied on regional traffic volumes…'" The Court noted that "[t]he lead agency 'had the discretion to set the date of the application for the current Project as the cutoff date to determine which projects should be included in the cumulative impact analysis'." (Id., citing Gray v. County of Madera (2008) 167 Cal.App.4th 1099, 1127-1128.) "Here, the Expo Authority employed the 'summary of projections' approach. The EIR's traffic analysis, based as it is on projected traffic conditions in 2030, discloses 'the severity and significance of the cumulative impacts'…What it does not include is a microanalysis of those impacts as they may be affected at a particular intersections by a particular project that was not under environmental review when the draft EIR was circulated. But there is no requirement for such an analysis where the lead agency has used the 'summary of projections' approach." (Id.)

The 140-unit apartment building that the comment states is "being planned" was not known at the time that the traffic impact analysis was begun and is in the early planning stages.1 In response to this comment, a query was made to the Los Angeles City Planning Department on December 4, 2012 and information on the City's NavigateLA website (http://navigatela.lacity.org/index.cfm) was reviewed. It was found that there is no application currently on file for this project. Such a project would generate only a modest amount of traffic during the analyzed peak hours (fewer than 90 trips in either the AM or PM peak hours); if it were to replace the existing liquor store on the corner of La Tijera Boulevard and 74th Street. The SCAG-forecast growth projections used in the SPAS Draft EIR are considered to account for future development projects that were unknown, such as the 140-unit apartment building mentioned in the comment. In addition, as discussed on page 4-1208 of the SPAS Draft EIR, the fact that the 2025 Future Without Alternatives scenario does not include the natural growth forecast to occur at LAX, but rather attributes it to each of the alternatives, the SPAS Draft EIR analysis provides a very conservative analysis of future traffic impacts.

The commentor raised similar issues several years ago on both the Crossfield Taxiway Project EIR in 2008 (Comment CFTP-PC00002-99) and the Bradley West Project EIR in 2009 (Comment BWP-PC00011-48). As similarly explained in the Bradley West Project Final EIR Response BWP-PC00011-48:

"The proposed office development (i.e., the Entrada Office Tower Project, on the Radisson Hotel site in Culver City was included in the off-airport surface transportation cumulative analysis for the Bradley West Project…Table 4.2-5 in the Draft EIR is considered to contain the most current information provided at the time the document was prepared; however, given the fluid nature of the planning and development process within the local area, the list of projects will continue to fluctuate over time…Any fluctuations not reflected in Table 4.2-5 of the Bradley West Project Draft EIR would be accounted for in the assumed 2 percent growth factor for background traffic used in the off-airport surface transportation analysis for the Bradley West Project."2 (A response substantively similar was also provided for the Crossfield Taxiway Project Final EIR.)

Comment:

Page 4-1 Environmental Impact Analysis - Public Services

Question: Page 4-1 Environmental Intro. Shouldn't public services include health care/ trauma care? What about related EMT and the ability to handle disasters?

Response:

Consistent with Appendix G of the State CEQA Guidelines, and with LAFC (LAMC, Section 57.09.01-11), Section 4.11.1 of the SPAS Draft EIR evaluated whether any of the SPAS alternatives would result in restricted emergency access, increased response times, or extended station response distances beyond the standards maintained by the agencies serving LAX and the surrounding communities, or whether they would result in the need for a new fire station or the expansion, consolidation, or relocation of an existing facility to maintain adequate service levels. This analysis complies with CEQA's requirements for analysis of public services, which focuses on the project's potential physical effects on the environment. (See State CEQA Guidelines Section 15358(b) ("Effects analyzed under CEQA must be related to a physical change")).

As discussed in Section 4.11.1 of the SPAS Draft EIR, LAX Master Plan Commitments FP-1, LAFD Design Recommendations, and PS-2, Fire and Police Facility Space and Siting Requirements, as well as enforcement of Federal Aviation Regulations and state and local fire code requirements, would ensure maintenance of adequate fire and emergency response times; LAFD staffing, including EMT and paramedic personnel; equipment; facilities; and emergency access.

Additionally, as described on pages 4-994 through 4-997 in Section 4.11.1 of the SPAS Draft EIR, LAX and surrounding communities are subject to various emergency response and disaster response plans and regulations including the County of Los Angeles Mutual Aid Operations Plan, LAX Airport Emergency Plan, and LAX/Sea Disaster Preparedness Plan.

SPAS-PC00130-218

Comment:

Page 4-2 and -3 Commitments
- The Applicable LAX Master Plan Commitments and Mitigation Measures section lists the LAX Master Plan commitments and mitigation measures applicable to the SPAS alternatives. As background, in conjunction with approval of the LAX Master Plan and certification of the Final EIR in December 2004, the Los Angeles City Council adopted a Mitigation Monitoring and Reporting Program (MMRP)34 to ensure that mitigation measures and LAX Master Plan commitments identified in the Final EIR are implemented. Mitigation measures are activities, policies, or practices designed to avoid or minimize significant environmental impacts. Besides mitigation measures, the MMRP for the LAX Master Plan includes Master Plan commitments. LAX Master Plan commitments were determined to be more appropriate than mitigation measures where: (1) standards and regulations exist with which compliance is already required by the applicable regulatory agency; (2) impacts would be adverse but not significant; and (3) design refinements could be incorporated into the project to reduce or avoid potential impacts. The timing of implementation of LAX Master Plan commitments and mitigation measures is set forth in the LAX Master Plan MMRP. Unless otherwise noted, the impacts analysis for the SPAS alternatives assumes that the applicable LAX Master Plan commitments and mitigation measures would be implemented concurrently with and as part of each alternative. To the extent that the LAX Master Plan commitments and mitigation measures would not reduce significant environmental impacts to a level that is less than significant, SPAS-specific...
- The Impacts Analysis section presents the analysis of impacts for the nine SPAS alternatives for the buildout horizon year 2025. Impacts were compared to the thresholds of significance to determine whether they would be, under CEQA, significant or less than significant. For purposes of determining significance, potential impacts were compared to the environmental baseline conditions, as further described in the Analytical Framework below.

- Level of Significance After Mitigation is a CEQA determination of the significance of a particular impact after implementation of the proposed mitigation measures. This section identifies any significant impacts that cannot be mitigated to a level that is less than significant. These "significant unavoidable impacts" are also listed in Section 7.1, Significant Environmental Effects, of this EIR. The level of significance after mitigation is not included for those environmental topics where no significant impacts would occur and, as a result, where no mitigation measures specific to SPAS are required. (underlines for emphasis)

Question: Since many projects identified in this EIR are were not in the LAX Master Plan and several projects referenced as not being part of the EIR are also not in the Master Plan (such as terminals 1.5 or 2.5 or the midfield check in inside the CTA) how has LAWA identified and included mitigations in the MMRP let alone provide implementation schedules? How are the construction impacts of these projects included?

Response:

As noted by the commentor, many of the projects associated with the SPAS alternatives, such as the ITF and the dedicated busway, were not components of the LAX Master Plan. Rather, consistent with Section V.D.1 of the Stipulated Settlement, these potential projects represent "alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers."

As explained in the text cited by the commentor, LAX Master Plan commitments and mitigation measures that apply to the alternative projects are identified throughout the SPAS Draft EIR. In addition, new mitigation measures are identified, where required, to address significant impacts associated with the SPAS alternatives. A list of all applicable LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS-specific mitigation measures, is provided in Table 1-6 of the SPAS Draft EIR. All of the measures applicable to the selected SPAS alternative, if any, would be included in a SPAS Mitigation Monitoring and Reporting Program (MMRP), which would include the timing of implementation for each measure.

The non-SPAS projects identified by the commentor (i.e., the North Terminals Improvements Project (also referred to as Terminals 1.5 and 2.5) and the "midfield check in inside the CTA", are LAX Master Plan projects. The North Terminals Improvements Project is consistent with the new north linear concourse under Alternative D (i.e., the approved LAX Master Plan). The commentor's reference to a "midfield check in inside the CTA" appears to be a reference to the MSC Passenger Processor, which is consistent with the new passenger terminals that would be constructed in place of the existing CTA parking facilities under Alternative D. Both of these projects would be subject to the mitigation measures in the LAX Master Plan MMRP. Both of these projects are identified as cumulative terminal-related projects on page 5-18 in Section 5.3.2 of the SPAS Draft EIR, and the cumulative impacts of these projects, in conjunction with SPAS and other cumulative projects, are analyzed in Chapter 5, including cumulative construction impacts.

SPAS-PC00130-219

Comment:

Question: Many of the "significant unavoidable impacts" are acknowledged by LAWA as resultant from the growth of flights, passengers, etc. for all alternatives. How has LAWA provided an assessment of these which allows for comparison of the alternatives so that the least of the unavoidable impacts can be chosen and why hasn't LAWA presented possible partial mitigations for these impacts?

Response:

Table 1-5 of the SPAS Draft EIR delineates the unavoidable significant impacts associated with each alternative and indicates, through the use of bold type face, those impacts that are primarily attributable to future growth in airport activity that will occur regardless of the SPAS alternatives. Reduction of unavoidable significant impacts was taken into account in the selection of the environmentally superior alternative in Section 1.5 of the SPAS Draft EIR.

Decision-makers for the SPAS project will take into consideration the environmental impacts associated with each alternative, including unavoidable significant impacts, before taking action on the project. In accordance with CEQA, the SPAS Draft EIR includes feasible mitigation measures to reduce or avoid significant impacts, including impacts attributable to future growth in airport activity (refer to Table 1-6), despite the fact that the increase in passenger activity over time would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR.

SPAS-PC00130-220

Comment:

Question: Although detail phasing is generally in a project EIR and since the EIR is willing to consider general phasing of mitigations, why doesn't it address phasing of the key project improvements?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements.

Comment:

Page 4-4 Environmental Baseline
The Notice of Preparation (NOP) for the SPAS EIR was first published in March 2008; however, the EIR work effort was temporarily suspended while the North Airfield Safety Study (NASS) was being completed, based on the possibility that the study results would yield new information relative to the range of airfield alternatives being considered for the SPAS Draft EIR (see Section 4.7.2, Safety, for a description of that study). Upon completion of the NASS, work on the SPAS Draft EIR resumed and a revised NOP was published in October 2010.
In accordance with the provisions of CEQA, October 2010 is the baseline date for characterizing existing conditions in the environmental analysis. Where existing conditions data specific to October 2010 were not available or where October 2010, by itself, was not an appropriate representation of baseline conditions, this Draft EIR identifies this fact, explains what data was used to determine existing conditions, and provides evidence of why this information is representative of baseline conditions. For example, in some cases, available reports and other documentation were only available for timeframes preceding 2010. For those topics which relied upon site surveys, such information was collected during preparation of the Draft EIR, typically in 2011. Due to the highly developed nature of LAX and the surrounding communities, and the lack of economic growth in recent years, site conditions at and around LAX have not materially changed. Therefore, the available information in 2009 or 2011 that was used to characterize baseline conditions is considered to be generally representative of 2010 conditions. The methodology discussion for each environmental topic addressed in this section describes the nature, timeframe, and basis of the data used to characterize existing baseline conditions. (underline for emphasis)

Question: Even though a full year was desired, why was it necessary to go back to 2009 when most of the elements of studied have data collected and reported monthly?

Response:

Please see Response to Comment SPAS-PC00130-52 regarding the use of calendar year 2009 as the baseline year for aviation activity levels. As explained in that response, use of a full year's worth of aircraft activity data (for a calendar year) allows for the development of the peak month average day activity, which is required for modeling purposes.

4-10 Aesthetics
- Policy P7: Provide and maintain landscaped buffer areas along the southern boundary of Airport Airside and northern boundary of LAX Northside that include setbacks, landscaping, screening, other appropriate mechanisms with the goal of avoiding land use conflicts, shielding lighting, enhancing privacy, and better screening views of airport facilities from adjacent residential areas.

Question: Why is there no complimentary landscape policy for the east and west ends of LAX where there is substantial traffic passing along the north-south routes daily?

Response:

LAX Plan Policy P7 is part of the LAX Plan and is one of the policies governing "Airport Landside" areas which include the Central Terminal Area, and other designated areas included as components of the proposed SPAS alternatives (e.g., GTC and APM). The LAX Street Frontage and Landscape Development Plan Update provides integrated and coordinated landscape design guidelines for new development along the perimeter areas and key entry areas of LAX. As the commentor notes, one of the goals of the LAX Street Frontage and Landscape Development Plan Update is for LAWA to provide and maintain setbacks, landscaping, screening, or other appropriate improvements along those portions of the northerly and southerly airport property boundaries which abut visually-sensitive residential uses to the north and south.

However, as discussed on pages 4-11 through 4-13 in Section 4.1 of the SPAS Draft EIR, in addition to guiding the development of buffers and visual treatments to the north and south, the LAX Street Frontage and Landscape Development Plan Update requires visual treatments and landscaping for other areas along the perimeter and key entryways of LAX. For example, the LAX Street Frontage and Landscape Development Plan Update requires key entry corridors and entryways, such as major boulevards, perimeter roadways, and gateway intersections, to present a strong identity for LAX. As such, these corridors and roadways merit a high level of landscaping and visual treatments that include the creation of interchange gardens, shade trees, planted central medians, public art, and attractive fencing. Key gateway and entry corridors include north-south corridors such as Pershing Drive at the west end of LAX and Aviation Boulevard at the east end. It is important to note that Pershing Drive is bordered on the west by the Los Angeles/El Segundo Dunes (Dunes), which provide views of open space for motorists traveling along Pershing Drive, and along Vista del Mar at the western boundary of the airport property. The LAX Street Frontage and Landscape Development Plan Update calls for the continued maintenance of habitat preserves and undeveloped areas such as the Dunes and associated Habitat Restoration Area. Other key corridors identified in the LAX Street Frontage and Landscape Development Plan Update include Sepulveda Boulevard, and east-west corridors such as Imperial Highway, Century Boulevard, and Lincoln Boulevard, which traverses the northern boundary of the airport northwest from Westchester Parkway.

Furthermore, the LAX Street Frontage and Landscape Development Plan Update requires key facilities, such as the ITF, APM, CTA terminals, CONRAC, and parking garages, that may be visible from various vantage points from the east and west to include landscaping amenities and visual treatments. Such visual treatments would include edge treatments, pedestrian amenities, and other decorative elements. In addition, the LAX Specific Plan requires the development of conceptual design guidelines for new projects, including new central terminals and passenger facilities.

SPAS-PC00130-223

Comment:

Page 4-12 Aesthetics
LAWA committed to updating design-related guidelines and plans, including the LAX Street Frontage and Landscape Development Plan, in order to avoid view degradation and incompatibility between on-site and off-site land uses. The LAX Street Frontage and Landscape Development Plan Update,40 adopted in 2005, fulfills this component of LAX Master Plan Commitment DA-2, and now serves as a basis for reviewing future public and private development projects at LAX....

The objectives set forth in the LAX Street Frontage and Landscape Development Plan Update are identified below:
- Coordinate and enhance the visual and aesthetic appeal of streets, buffer areas, and open space surrounding LAX.
- Maintain and improve safety and security at and surrounding LAX through coordination of street frontage and landscape design with airport security and in compliance with the LAX Wildlife Hazards Management Plan.
- Enhance pedestrian, bicycle, and vehicular circulation on streets internal to and surrounding LAX, and comply with airport security requirements, as feasible and practical.
- Enhance LAX's compatibility with adjacent land uses, neighborhoods, and communities.
- Ensure that street frontage and landscape design is cost-effective, efficient, environmentally sensitive, and sustainable.
- Provide the basis for the design and review of public and private development projects at LAX by establishing a hierarchy of landscape treatments based on airport gateways and public facilities. The LAX Street Frontage and Landscape Development Plan Update also calls for the preparation of a Neighborhood Compatibility Program (NCP), based on commitments made in the LAX Master Plan, which outlines interface treatments along the airport perimeter for the purpose of "ensuring that the airport complements surrounding properties and neighborhoods." The NCP, which is to address all issues relating to compatibility, including landscape buffers, noise, light spillover, odor, and vibration, is to include the following measures to ensure that this policy is achieved

Question: If this plan has been in place since 2005 why haven't improvements been made to the perimeters? is there a schedule to get started?

Response:

The LAX Street Frontage and Landscape Development Plan Update is a set of integrated and coordinated landscape design guidelines for the perimeter areas of LAX that apply to new development at the airport. The Plan is not intended as a commitment by LAWA to affect and/or change existing conditions, nor is it a set of improvements that will be implemented by LAWA. However, as discussed on pages 4-14 and 4-15 in Section 4.1 of the SPAS Draft EIR, LAWA is currently implementing a LAX Beautification Enhancements Program for the purpose of improving the image, function, circulation, and wayfinding of the airport, through the use of architecture, graphics, landscaping, lighting, and art. Several projects that have been completed under the LAX Beautification Enhancements Program include the Imperial/Sepulveda Landscape Improvement Project and the Gateway LAX Enhancement Project. The latest project is the New Face of the CTA Improvements/Enhancements, which will enhance and unify the aesthetic appearance of the CTA. As described on page 5-21 in Chapter 5 of the SPAS Draft EIR, Phase I of the New Face of the CTA Improvements/Enhancements project includes a new canopy and replacement of the roadway light poles at TBIT and other miscellaneous improvements/enhancements. Phase I will be completed by 2013, with the remainder of the project to occur on an ongoing basis.

In addition, LAWA has recently initiated the LAX Northside Plan Update as an independent planning process that will consider and complement other plans and projects underway at LAX. Development of buffer areas and setbacks within the LAX Northside areas would occur with development of the LAX Northside Plan.

Page 4-83 Impacts Summary 4.2.1. Introduction

Question: LAWA started an air quality apportionment study in 2006 but has failed to provide any data or information to the public other than a verbal statement that it has finished two and a half phases. What data from this study has been used to evaluate impacts for this EIR. If none, why not? How does the data from this study compare with the assumptions made to result in air quality evaluations. What concentration assumptions were made based on LAWA property boundaries? Did it assume ownership of Manchester Square and Belford Square? What uses were assumed for these properties?

Response:

SPAS-PC00130-225

Comment:

Question: There are many particulate studies of PM 0.1 including one on the LAX properties by Froines (UCLA) which concluded that these smaller, more dangerous particles are evident in plumes correlating to takeoffs and landings. The study also showed that the measurement of larger particles were NOT a predictor for the ultra-fine particles.

Response:

As noted in the comment, a number of studies which measured ultrafine particulate matter (UFP, sometimes referred to as PM0.1) have been conducted around airports, as well as around marine ports and along freeways. The study mentioned was conducted by researchers from UCLA led by Dr. John Froines.1 That study focused on measuring UFP, black carbon, and PM2.5. As noted in the comment, UFP and PM2.5 did not correlate well, indicating that PM2.5 is not a good predictor of UFP variation with distance or time.

At this time, UFP and black carbon are not directly regulated by the U.S. Environmental Protection Agency or California Air Resources Board, the agencies with authority to set ambient air quality standards for air pollutants. Since there are no current standards, the South Coast Air Quality Management District has not set CEQA significance thresholds for UFP or black carbon. It is not even known at this time what form a standard or threshold would take. For example, the PM2.5 standard is a mass-based standard with units of micrograms (the mass) per cubic meter of air. The health impact from UFP may not be easily correlated with mass because of the small amount of mass associated with UFP. Examples of possible forms the standard or threshold may take, if established, include the number concentration (number of particles per volume of air), the surface area concentration (total surface area of particles per volume of air), the volume concentration (volume of particles in the air to the volume of air), or some measure of specific compounds or chemicals on the UFP. The form of any such standard is not limited to these examples.

Black carbon and UFP are components of PM2.5 for which ambient air quality standards have been established by both agencies, and the air quality impact analysis in Section 4.2 of the SPAS Draft EIR includes impacts associated with PM2.5. In addition, diesel particulate matter also includes UFP and black carbon fractions. California has established a cancer potency slope factor and a chronic hazard index for diesel particulate matter. Human health risks associated with exposure to project-related diesel particulate matter emissions were evaluated in Section 4.7.1 of the SPAS Draft EIR.

UFP is ubiquitous in the urban environment. It is typically generated from combustion in various types of sources, or by atmospheric photochemical activity that leads to homogenous nucleation (the formation of particles from gas phase molecules).2 High levels of UFP number concentrations, similar to the values in the Froines study for aircraft, have been reported from measurements along freeways in southern California.3

Finally, UFP, black carbon, and other pollutants are being measured as part of the LAX Air Quality and Source Apportionment Study (AQSAS). The third and final phase of this study is currently being conducted, and the final study report is due out in spring 2013. Please refer to Response to Comment SPAS-PC00130-36 for a discussion of the LAX AQSAS.

SPAS-PC00130-227

Comment:

Page 4-88 Meteorology
Airport-specific meteorological data were used to analyze air quality impacts. The data set used consisted of twelve continuous months of hourly surface data collected at LAX for calendar year 2007, the most recent data year available from the SCAQMD's on-airport meteorological station. This data set, provided by the SCAQMD, included ambient temperature, wind speed, wind direction, and atmospheric stability parameters, as well as mixing height parameters from the appropriate upper air station, and was provided "AERMOD-ready," including hourly O3 concentrations from the LAX Hastings monitoring station collected in 2007. The location of the on-airport SCAQMD meteorological and air quality monitoring station is identified in Figure 4.2-1.

Question: Why is CY 2007 considered representative since the number of aircraft (a major contributor) and port activities (another major contributor) were artificially low due to the recession? Also wasn't 2007 abnormal drought conditions that impacts assumptions of wind and atmospheric conditions?

Response:

Meteorological parameters, such as wind speed, wind direction, temperature, rainfall, and relative humidity are not materially affected by airport or marine port operations. These parameters are governed by global movements of mass and energy. For example, the air temperature and relative humidity are really gauges of the thermal energy and water status of the atmosphere, and these are tied to the fundamental energy and water cycles of the earth-atmosphere system 1. Wind is the movement of air mass, driven by regional and global pressure gradients affected by the earth's rotation. Therefore, the selection of meteorological data for modeling is not influenced by economic-related activities.

The selection of the 2007 meteorological data was informed by a screening analysis using the 2009 baseline emissions. Oxides of nitrogen (NOx) are precursors to ozone, NO2, and PM2.5 formation. Therefore, NOx emissions were modeled since it is a critical pollutant to air quality in the region. A comparison of the modeled results of NOx using AERMOD ready meteorological data from LAX for 2005, 2006, and 2007 (provided by the South Coast Air Quality Management District) indicated that 2007 would produce the highest peak 1-hour NO2 concentration. Therefore, the 2007 meteorological data set was used in all air quality impacts analyses.

Finally, a comparison of the wind roses for 2005, 2006, and 2007, did not reveal any substantial differences in wind direction or wind speed. These are the parameters that determine where the emissions travel after leaving the airport. Differences in precipitation do not have an impact on modeled ambient concentrations using AERMOD. Practically speaking, the years with lower precipitation, such

as 2007, would have potentially higher ambient concentrations since less rainout/washout of pollutants would occur.

Comment:

Page 4-91 Emission Source Types: Aircraft
Information on the number and types of aircraft operations considered at LAX for 2009 and 2025 was developed as part of the LAX SPAS forecasts. The aircraft activity levels for baseline conditions are from calendar year 2009 (i.e., full years' worth of aircraft activity data in order to develop peak month average day activity characteristics to be used in modeling). The aircraft activity levels for future conditions were based on aircraft activity growth forecasts for LAX in the year 2025. These data were used to develop airport simulation models (SIMMOD) of aircraft operations for baseline (2009) conditions and future (2025) conditions. The simulation models used information about facilities and operations to predict specific timing, volume, and location (e.g., runway used) for future aircraft operations. This modeling provides specific information regarding aircraft engine operations, such as time-in-mode (i.e., the amount of time aircraft engines are idling, or being used for taxiing, or are in take-off or landing modes), that is used to estimate aircraft emissions. Detailed SIMMOD runs were completed for Alternatives 1 through 4. For Alternatives 5 through 7, the existing SIMMOD data were reviewed to assess the operational characteristics applicable to those alternatives and adjusted where necessary to reflect the airfield design configuration specific to each alternative. Such adjustments took into account the runway improvements associated with each alternative, particularly whether a runway would be relocated closer to or farther from the CTA, as this would affect aircraft taxiing distance/time, and the extent a runway relocation would result in a loss of aircraft gates on the north side of the CTA, potentially causing aircraft to use more gates on the south side of the CTA.

Question: What does the above paragraph mean? Was actual flight data used from 2009 or was it "approximated and summarized?" Similarly, which aircraft growth forecasts were used and the assumptions made? Several were generated during the past several years ie one in 2006, one for the Part 161 Study, one in 2008, one for the Northside Safety Study. What assumptions were made for the 2009 airport layout and availability of runways and taxiways? What about location and number of gates in use? Was APU use assumed to be 100%, 90% or what? Since LAWA had conducted dispersal and particulate studies on the actual flight field why did it revert to FAA EDMS models instead of actual information?

Question: For an estimation of construction equipment emissions did LAWA use a formula to approximate the number and types of equipment? If LAWA hasn't decided what construction (or when) is to occur and its phasing, how did LAWA estimate maximum amounts for a worst case condition?

Response:

The 2009 aircraft activity and fleet mix are based on actual operations at LAX in 2009. However, typical airport planning is based on a design day flight schedule. To determine the change in airport activity between the existing conditions and the future alternatives, a design day flight schedule is developed for the existing conditions as well as the future conditions under each alternative. This approach allows the same, consistent method to be used on all alternatives and the existing baseline for comparison purposes. For example, to estimate time in mode for taxi and delay it is common practice to model aircraft activity in the airport simulation model (SIMMOD) for the baseline period as well as the future year(s) analyzed in a project's planning reports. As noted above, the actual airport activity from 2009 was used to develop the design day flight schedule for the baseline. The details of the development of the design day flight schedule for 2009, including fleet mix, are presented in Chapter 3 of Appendix F-1 of the Preliminary LAX SPAS Report.

For the SPAS Draft EIR, the future airport activity in 2025 was assumed to be 78.9 million annual passengers for all alternatives, consistent with the 2012 Regional Transportation Plan adopted by the Southern California Association of Governments. The details of the development of the design day

flight schedule for the 2025 alternatives, including fleet mix, are presented in Chapter 4 of Appendix F-1 of the Preliminary LAX SPAS Report. Discussions of various airport activity growth forecasts are presented in Chapter 1 of Appendix F-1 of the Preliminary LAX SPAS Report.

Gate numbers and layouts are presented in Attachment A of Appendix F-1 of the Preliminary LAX SPAS Report, and detailed discussion of gating is included in Appendix F-2 of the Preliminary LAX SPAS Report. Runway use, taxiway use, and general airport operating assumptions are also presented in Appendix F-2 of the Preliminary LAX SPAS Report.

Airport air pollutant concentrations, including PM10 concentrations, monitored at the South Coast Air Quality Management District Southwest Coastal Monitoring Station (also known as the LAX Hastings site) are presented in Table 4.2-3 in Section 4.2.3.3 of the SPAS Draft EIR. This station did not monitor PM2.5 during the baseline time period; therefore, PM2.5 measurements were obtained from the South Coastal Monitoring Station, as noted in Section 4.2.3.3. Because the existing monitoring was conducted at only one location on the airport, air dispersion modeling was conducted for the baseline and future alternatives. The modeling analysis, presented in Section 4.2.6 of the SPAS Draft EIR, was used to predict existing and future pollutant concentrations, including particulate matter concentrations, around the airport property line and in the Central Terminal Area. Modeling must also be done to analyze future impacts, since it is impossible to monitor future conditions. Modeling was conducted using FAA's EDMS model because the FAA requires its use to evaluate air quality impacts of proposed projects for regulatory purposes.

The auxiliary power unit (APU) usage for both the baseline and 2025 conditions was based on the EDMS default assumption that APUs would operate 13 minutes for each arrival and 13 minutes for each departure, or a total of 26 minutes for a landing and takeoff operation (LTO) cycle. This assumption is conservative since most of the existing passenger gates at LAX have preconditioned air and 400 hertz (Hz) power hookups that would allow the aircraft to plug in and shut off the APU. The APU emissions for each alternative under two operating flight rules (visual flight rules and instrument flight rules) are presented in Attachment 2 of Appendix C of the SPAS Draft EIR. These emissions are summarized in Section 4.2 of the SPAS Draft EIR, Table 4.2-4 (baseline) and 4.2-13 (future alternatives).

The method used to estimate construction emissions is described in Section 4.2.2.1 of the SPAS Draft EIR. The construction emission estimation methodology is summarized below:

- The analysis started with the detailed construction analysis that was performed for the LAX Master Plan, Alternative D. That analysis, contained in the LAX Master Plan EIR, included construction related emissions for various projects (runway movements, taxiway movements, terminal building demolition and construction, roadway improvements, etc.).
- Next, the construction emission estimates for the LAX Master Plan Alternative D were updated to account for current emission factors developed by the California Air Resources Board and included in its OFFROAD and EMFAC models. The total construction emissions associated with Alternative D, if it had been started today, are summarized in Appendix C of the SPAS Draft EIR, Attachment 1, Page 2 (Table 1, page 4 of 342) under the line item titled "Program Total (tons)" 1.
- Construction emissions of the SPAS alternatives start with the updated Alternative D emissions, then remove the major projects included in Alternative D that have already been completed (e.g., South Airfield Improvement Project and Crossfield Taxiway Project).
- Alternative 3 is essentially the completion of the LAX Master Plan Alternative D, thus once the completed projects were removed, the remaining updated Alternative D construction emissions represent the Alternative 3 construction emissions, shown in Appendix C of the SPAS Draft EIR, Attachment 1, Page 1 (Table 1, page 1 of 342).
- Total program emissions for all other alternatives were estimated using the ratio of construction costs for specific projects/activities within the given alternative to the construction cost for that project/activity under LAX Master Plan Alternative D. The construction costs for each SPAS alternative are shown in Appendix G of the Preliminary LAX SPAS Report, and the resulting ratios for each project/activity are shown in Appendix C of the SPAS Draft EIR, Attachment 1, page 2 (Table 1, page 4 of 342, far right columns).
- The program total construction emissions in tons for each alternative (Appendix C of the SPAS Draft EIR, Attachment 1, pages 1 and 2 (Table 1, pages 1 through 4 of 342) are multiplied by 2000 (converting tons to pounds), divided by 11 years (construction duration), and divided by 300 days per

year (working days per year) to obtain annual average daily emissions. This estimate would assume that every project or activity would be construction simultaneously for the 11 year duration. This average daily emission is multiplied by a factor of 2 to estimate the peak daily construction emissions.
- The peak daily construction emissions are summarized in Table 4.2-10 in Section 4.2.6.1 of the SPAS Draft EIR.

1. The printed version of Table 1 in Attachment 1 of Appendix C does not show the rows associated with major projects of the LAX Master Plan that have already been completed (e.g., South Airfield Improvement Project and Crossfield Taxiway Project). However, the emissions from these completed projects are included in the totals shown in the Program Total (tons) line for Alternative D.

Comment:

Page 4-100 4.2.3.4 Existing Airport Emissions
The baseline (2009) airport-related emissions, including those from aircraft, GSE, and APU operations, on-airport and off-airport roadways, parking lots and structures, and the CUP are shown in Table 4.2-4.

Question: Were the baseline values shown in Table 4.2-4 measured or estimated by modeling? Subsequent sections state that the main drivers of these values is increased ground traffic and air traffic. Since most of the alternatives assume the same numbers of vehicles and aircraft, how are the smaller differences among alternatives displayed to give decision makers a frame of reference as to the significance of the differences (even if all are designated as significant, not mitigatable)?

Response:

Mobile source (such as aircraft, trucks, cars, ground support equipment, and construction equipment) emissions are not routinely measured, except by regulatory agencies to develop emission factors. Therefore, the existing (baseline) emission inventories presented in Table 4.2-4 in Section 4.2.3.4 of the SPAS Draft EIR are modeled using the same emission factors that the South Coast Air Quality Management District uses to estimate emissions in the South Coast Air Basin.

As discussed in Section 4.2.6 of the SPAS Draft EIR, increases in air traffic and ground traffic relative to the existing conditions drive the increases in SO2, PM10, and PM2.5. Specifically, SO2 emissions are from aircraft and APUs while fugitive road dust (PM10 and PM2.5 fractions), which is the major source of increased particulate matter emissions, are from vehicular ground traffic. Although the number of flights is the same for all of the 2025 alternatives, the taxi and delay times are different. In addition, vehicle miles traveled by ground traffic also varies between alternatives due to different parking locations under the different alternatives. The affect that the differences in aircraft taxi and delay, and vehicle miles traveled have on emissions can be seen in Attachment 2 of Appendix C of the SPAS Draft EIR. These results are summarized for each alternative in Tables 4.2-13 and 4.2-14 in Section 4.2.6.3 of the SPAS Draft EIR. Detailed evaluations for aircraft taxi and delay times are included in Section 2 (for baseline) and Section 3 (for 2025 alternatives) in Appendix F-2 of the Preliminary LAX SPAS Report. Ground traffic volumes are included in Appendix K1 (on-airport transportation) and Appendix K2-8 (off-airport transportation) of the SPAS Draft EIR.

Page 4-105 -106 LAX Master Plan - Mitigation Plan for Air Quality; MM-AQ-3, Transportation-Related Mitigation Measures.
This measure applies to mass transit, surface traffic, and on-site parking facilities. The principal feature of MM-AQ-3 is to replicate and expand the current LAX FlyAway service to other communities within regions of Los Angeles County. This initiative also includes a public outreach program to encourage the use of both the existing and new facilities. For the mitigated emissions inventory presented in Section 4.6.8.5 of the LAX Master Plan Final EIR, only emissions reductions associated with the new FlyAway capacity were quantified to account for the ensuing decrease in VMT regionwide combined with less traffic congestion in the vicinity of the airport and the use of clean-fueled buses used in FlyAway service. The remaining, secondary, transportation-related air quality mitigation measures contained in MM-AQ-3 may also be implemented to help ensure the emission reduction goals of the LAX Master Plan Final EIR and MMRP are achieved.

Question: Little of the FlyAway outreach has been accomplished that is required in the Settlement Agreement. What assumptions are made by LAWA about what is to be accomplished since this section talks about "equally feasible and practical, but that are not specifically identified in the MMRP, may also be considered." What was assumed complete in the assessments?

Response:

LAWA provides detailed information on the LAWA website about the FlyAway program and other alternative modes of transportation to and from LAX (lawa.org/welcome_LAX.aspx?id=132), and also provides FlyAway information brochures at transit centers, such as Union Station, and to major employers upon request as part of their transportation demand management/trip reduction programs.

The LAX FlyAway program was expanded since development of the LAX Master Plan to include FlyAway connections at Union Station in downtown Los Angeles, in Westwood/UCLA, as well as continued use of the original FlyAway station in Van Nuys. Although LAWA also initiated FlyAway service to and from the Irvine Transit Center in Orange County, that service was terminated on August 31, 2012 due to low ridership. LAWA staff continues to work on establishing additional FlyAway sites. The next FlyAway service, connecting LAX with the Metro Exposition light rail line at its Expo/LaBrea station, was approved by the LAWA Board of Airport Commissioners in October 2012 and is expected to begin service in spring 2013. Other potential LAX FlyAway locations which LAWA staff is currently evaluating for service include Santa Monica, Long Beach, Torrance, Hollywood, and Glendale.

The percentage of passengers using the FlyAway service during the peak arrival and peak departure periods in the 2009 baseline is included in Table 4.12.1-5 (page 4-1073) in Section 4.12.1.3.11 of the SPAS Draft EIR. The percentage of passengers assumed to use FlyAway service during the peak arrival and peak departure periods in the 2025 alternatives are included in Table 4.12.1-15 (page 4-1103) in Section 4.12.1.7.2 of the SPAS Draft EIR. FlyAway use by passengers was between 1.49 and 1.90 percent for the 2009 baseline during peak arrival and departure periods, and is estimated to be up to 3.1 percent in 2025. While the existing FlyAway routes demonstrate a consistent and mature level of passenger demand, this change does not substantially alter the number of private vehicles driving to or from LAX; thus, the FlyAway impact on the emissions for each alternative were not specifically quantified, and the analysis did not assume any reduction in emissions as a result of the FlyAway service. However, LAWA remains committed to developing and providing FlyAway service.

- Provide free parking and preferential parking locations for ultra low emission vehicles/super low emission vehicles/zero emission vehicles (ULEV/SULEV/ZEV) in all (including employee) LAX lots; provide free charging stations for ZEV; include public outreach to reduce air emissions from automobiles accessing airport parking...
- Expand LAWA's rideshare program to include all airport tenants Additional Ridership

Question: How much of the above parking has been assigned and how much will be assigned in the future? What is the schedule for doing so? How much and what percentage of rideshare is currently occurring now, what is the target?

Response:

Applicable LAX Master Plan Mitigation Measure MM-AQ-3, Transportation-Related Mitigation Measures, provides for free parking and preferential parking locations for ultra-low emission vehicles/super low emission vehicles/zero emission vehicles (ULEV/SULEV/ZEV). In addition, LAWA has partnered with the Department of Water and Power to install 32 public access electric vehicle charging stations at LAX. A number of electric charging stations are currently available in Parking Structure P1 in the Central Terminal Area, next to Terminal 1. LAWA's Rideshare Program includes 66 vanpools, 88 carpool program participants, 320 free monthly transit passes, and numerous marketing and advocacy activities to recruit and retain program participants. Currently, about 26 percent of LAWA's employees are participating in the Rideshare Program, saving over 1,000 vehicle trips to LAWA facilities every day. In 2011, LAWA met the required Average Vehicle Ridership (AVR) Target under South Coast Air Quality Management District Rule 2202 for the 7th consecutive year.

SPAS-PC00130-233

Comment:

Page 4-107 Air Quality LAX Master Plan Community Benefits Agreement; X.A., Electrification of Passenger Gates. This provision requires that all passenger gates newly constructed by LAWA shall be equipped with and able to provide grid electricity to parked aircraft (for lighting and ventilation) from and after the date of initial operation and that LAWA will ensure that all aircraft (unless exempt) use the gate provided grid electricity in lieu of electricity provided by operation of an auxiliary or ground power unit.

This provision would apply in conjunction with construction or modification of passenger gates that occurs as a result of implementing any of the SPAS alternatives, specifically Alternatives 1, 2, 3, 5, 6, and 7.

Question: There is also a requirement to address existing gates as well as new ones. What percentage and how many do not provide grid electricity availability? What is the completion schedule? How many new gates are planned to replace old ones? Will those gates be kept closed until electricity is available? If a unit fails, what is the target to get it back on line?

Response:

LAWA has installed preconditioned air and gate power from the grid at all of its passenger gates in the Central Terminal Area. LAWA plans to include preconditioned air and gate power at all future gates under the SPAS alternatives.

SPAS-PC00130-234

Comment:

Question: General air quality. When taxiways are closed for extended periods causing longer than programmed routes to gates is there a way this is included in the air quality modeling?

Response:

Taxiway closures are not considered part of the normal airport operation. The intent of the CEQA air quality impact analysis in Section 4.2 of the SPAS Draft EIR is to compare the future impacts of various potentially viable alternatives to the existing (baseline) conditions. This comparison is best made when comparing normal existing baseline operations with normal future operations and is appropriately done at a programmatic level, in light of the fact that the SPAS Draft EIR is a programmatic EIR. Given the range of taxi and delay times considered in the air quality impact analysis for visual flight rule and instrument flight rule conditions, it is likely that emissions associated with a short-term taxiway shutdown would fall within the range of emissions provided in Tables 4.2-13 and 4.2-14 in Section 4.2.6.3 of the SPAS Draft EIR. Emissions for each flight rule condition are presented in Attachment 2 of Appendix C of the SPAS Draft EIR.

SPAS-PC00130-235

Comment:

Page 4-108 to -111 4.2.6.1 Construction Emissions Impacts Analysis
Peak daily construction emissions for Alternatives 1 through 9 are presented in Table 4.2-10. To provide a more representative basis of comparison between all nine alternatives, the emissions of those alternatives that focus solely on airfield and related terminal improvements (Alternatives 5, 6, and 7) were combined with the range of emissions that could occur under various ground access improvements scenarios. Similarly, the emissions of those alternatives that focus solely on ground access improvements (i.e., Alternatives 8 and 9) were combined with the range of emissions that could occur under various airfield/terminal improvements scenarios -- see Notes 2 and 3 in Table 4.2-10. In so doing, the total potential emissions associated with these focused alternatives can be better compared to the emissions associated with the "fully integrated" alternatives (i.e., Alternatives 1 through 4, which consider...

Question: Since LAWA has failed to do more than a program level review, how is it determining the amount of construction required? What did it assume was necessary for the tunnels, utilities, and water flow mitigation work? Did LAWA include the amounts of construction work necessary to move and change Lincoln Blvd and Sepulveda? How was the amount of work determined? The SPAS report cost section lists some numbers, but does not provide assumptions made. Almost all emissions in Table 4.2.10 show "threshold significant." Has LAWA made recommendations on how to reduce these numbers? Where?

Response:

The SPAS Draft EIR analyzes the nine SPAS alternative at a programmatic level of conceptual planning. As discussed in Section 4.0 of the SPAS Draft EIR, CEQA authorizes the preparation of a "program EIR" when the project at hand consists of a program, regulation, or series of related actions that can be characterized as one large project. Typically, such a project involves actions that are closely related either geographically or temporally. Program EIRs are typically prepared for general plans, specific plans, and regulatory programs. Generally speaking, program EIRs analyze broad environmental effects of the program with the acknowledgment that site-specific environmental review will be required when future development projects are proposed under the approved program. (State CEQA Guidelines Section 15168.) An EIR prepared for "program level" entitlements "need not be as detailed as an EIR on the specific construction projects that might follow." (State CEQA Guidelines Section 15146(b).) As discussed by the California Supreme Court "it is proper for a lead agency to use its discretion to focus a first-tier EIR on only the general plan or program, leaving project-level details to subsequent EIR's when specific projects are being considered." (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143.) LAWA's preparation of a programmatic analysis of the SPAS project was appropriate and consistent with the level of detail currently known about the various SPAS alternatives as no design or engineering plans, or construction phasing plans or schedules are currently available for any of the alternatives. Please also see Response to Comment SPAS-PC00130-142 for further discussion of the appropriateness of the programmatic review conducted for the SPAS project.

Please refer to Response to Comment SPAS-PC00130-228 for a discussion of the methodology used to estimate construction emissions. Table 4.2-7 and Table 4.2-8 in Section 4.2.5 of the SPAS Draft EIR

summarizes the approximately 17 mitigation actions identified to address construction-related emissions.

SPAS-PC00130-236

Comment:

Pages 4-120 to Table 4.2-13 and 4.2-14 Incremental Project Operational Emissions Compared to Baseline (2009) Conditions and Future (2015)
...The vast majority of the aircraft emissions increases shown in Table 4.2-13 are due to the anticipated growth in aircraft activity. Within Table 4.2-14, the incremental aircraft emissions associated with each alternative in 2025 are measured against the 2025 emissions of Alternative 4. The same aircraft activity level and fleet mix are assumed for all alternatives in 2025. As such, the incremental aircraft emissions shown in Table 4.2-14 are only influenced by the differences in the airfield configuration specific to each alternative.

Question: Since detailed gate layouts are not assumed in the "Program level" of this document, how were the gate assignments (and therefore types of aircraft for emission calculation) determined? Related, how did LAWA estimate the time to gate for each class of aircraft since the locations of airlines (and their particular types used) could change substantially between now and 2025?

Response:

The development of gate layouts for the SPAS alternatives is included Chapter 2 (2009 baseline) and Chapter 3 (2025 alternatives) in Appendix F-2 of the Preliminary LAX SPAS Report. The aircraft taxi and delay times for each alternative are also included in each of these chapters. See Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-237

Comment:

Pages around 4-147 There are Peak Operational Concentration Figures for each Alternative presented.

Question: What is the color coding of the areas on the figures represent? The highest concentration items for the varied parameters are shown on each figure and are different for each alternative. Is there a summary overview chart that explains why each alternate is different? What can be done to mitigate?

Response:

The colored items in Figures 4.2-2 through 4.2-8 of the SPAS Draft EIR simply show the areas and facilities that would be constructed under the given alternative. The peak concentrations for each alternative are summarized in Table 4.2-15 and Table 4.2-16, and Section 4.2.6.4 of the SPAS Draft EIR includes discussions of the pollutant concentration impacts for each alternative including a summary of the major contributors to the significant impacts. LAX Master Plan Mitigation Measures MM-AQ-3 (expansion of the FlyAway service and measures identified in Table 4.2-9) and MM-AQ-4 in Section 4.2.5 of the SPAS Draft EIR summarize approximately 17 mitigation actions that will be applied to operational sources under each SPAS alternative.

Page 4-218 Figure 4.3-7 Vegetation/Land Uses and Sensitive Species: Navigational Aids - Alternative 1
Page 4-227 Figure 4.3-8 Vegetation/Land Uses - Alternative 2
Page 4-229 Figure 4.3-9 Vegetation/Land Uses and Sensitive Species: Navigational Aids - Alternative 2

Question: There are black rectangles shown near the end of runway 6L (just north) and in the dunes which are not identified by coded legend colors. Similarly there is a black bar in Figure 4.3-8 just north of 6L but 1/3 from the west end. The black bars in Figure 4.3-9 are similar to the Alt 1 version. These bars are in each alternative figure. What do they represent? What is their function or impacts?

Response:

It is unclear which black bars the commentor is referring to in Figures 4.3-7, 4.3-8, and 4.3-9, as well as the other figures in Section 4.3 of the SPAS Draft EIR. The commentor may be referring to the blue rectangles that depict existing navigational aids that would be removed with implementation of the SPAS alternatives, and the red rectangles that depict proposed navigational aids for each of the SPAS alternatives. If the figures were reproduced in black and white, the existing and proposed navigational aids would appear as black rectangles. Color copies of the SPAS Draft EIR were made available for public review at Los Angeles World Airports, Capital Programming and Planning Division (formerly Facilities Planning Division), One World Way, Los Angeles, CA 90045 and via the internet at www.laxspas.org. Color copies were also made available at six area libraries. The SPAS Draft EIR is available at http://www.lawa.org/laxspas/Draft_EIR.aspx (accessed October 24, 2012).

Comment:

Page 4-339 Figure 4.5-1 Surveyed Historical resources

Question: Several underground, lead lined air raid/bomb shelters were constructed at LAX. These are not shown in the diagram. Where are they located?

Response:

Underground bunkers were constructed as part of a Nike missile surface-to-air defense battery that was established by the Army in the mid-1950s in the northwest corner of the airport (current location of Jet Pets). The launch facilities were destroyed in the early 1990s with the construction of Westchester Parkway. The Nike site itself is not considered to be a historical resource because the Nike launch facilities were destroyed and are no longer extant. Even if there are unknown remnants of the missile testing site, the site is not a historical resource as defined under State CEQA Guidelines Section 15064.5. As noted on page 4-362 of the SPAS Draft EIR, CA-LAN-2385H is a recorded site of historic debris at the same location as the missile site, and may be associated with the Nike facility. CA-LAN-2385H is not a historical resource or a unique archaeological resource under State CEQA Guidelines Section 15064.5 and Section 21083.2 of the Public Resources Code, respectively. As noted on page 4-360 of the SPAS Draft EIR, CEQA prohibits the disclosure of information about the specific location of archaeological sites (State CEQA Guidelines Section 15120(d)). Therefore, none of the archaeological sites are shown in Figure 4.5-1 of the SPAS Draft EIR, which only depicts locations of historical resources.

Comment:

4.7.2 Safety information is in Appendix G2

Page 4-485 Table 4.7.2-1 Birdstrikes at LAX by Year

Question: How many bird strikes occurred on the north complex versus the south runway complex? The number of events does not appear to be a function of number of aircraft operations since 2001 was the highest and the variance of strike numbers is quite high. What explanation is given for the variability?

Response:

According to the FAA Wildlife Strike Database, between January 1, 2001 and December 31, 2011, there were a total of 753 birdstrikes reported at LAX.1 Of those, 334 birdstrikes occurred in the north airfield and 294 occurred in the south airfield; no location for the remaining 125 birdstrikes was provided in the FAA Wildlife Strike Database.

Reporting of wildlife strikes with civil aircraft in the United States is voluntary but strongly encouraged by the FAA. Thus, increases or decreases in the number of birdstrikes reported at LAX are not necessarily associated with the number of aircraft operations, but rather also take into account the reporting of birdstrikes by aircraft operators to the FAA. A 2009 FAA report on the trends in wildlife strike reporting under this voluntary system indicated that the overall reporting rate was 39 percent; that "there is a significant positive trend [increase] observed in overall strike reporting from 1990 to 2008"; and that "there has been a decline or stabilization in the reporting of damaging strikes since 2000." 2

The potential for birdstrikes associated with the SPAS alternatives is addressed in Section 4.7.2 of the SPAS Draft EIR. The most important factor in the occurrence of birdstrikes is the presence or absence of bird attractants on or very near the airfield. As indicated on page 4-484 of the SPAS Draft EIR, LAX uses anti-perching devices on structures such as signs, lights, fences, and building edges. In accordance with FAA Advisory Circular 150/5200-33B, Hazardous Wildlife Attractants on or Near Airports, the airfield is maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. As indicated on page 4-569 of the SPAS Draft EIR, under all of the alternatives, no new facilities would be constructed or operational conditions implemented that would serve as attractants to birds. In accordance with FAA requirements, the airfield would continue to be maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. Therefore, impacts under all of the alternatives with respect to birdstrikes would be less than significant.

1. The number of birdstrikes for the year 2011 in Table 4.7.2-1 of the SPAS Draft EIR reflect reported birdstrikes on the FAA's Wildlife Strike Database listed as of December 20, 2011; thus, the number of overall reported birdstrikes in Table 4.7.2-1 (723) is lower than the total reported birdstrikes (753) listed for the period January 1, 2001 through December 31, 2011 on the FAA's Database as accessed on November 30, 2012.
2. U.S. Department of transportation, Federal Aviation Administration, DOT/FAA/AR-09/65, Trends in Wildlife Strike Report, Part 1-Voluntary System 1990-2008; Available http://www.airporttech.tc.faa.gov/safety/downloads/09-65.pdf.

SPAS-PC00130-242

Comment:

Page 4-486 Safety
The ALP for LAX was updated in conjunction with the FAA's issuance of the Record of Decision in 2005 for the LAX Master Plan Improvements. That ALP update includes a plan sheet for future conditions (i.e.,buildout of the LAX Master Plan improvements) and a plan sheet for current airport conditions. The ALP plan sheet for current airport conditions is in the process of being updated by LAWA, in coordination with the FAA, to incorporate improvements completed since 2005, such as the South

Airfield Improvement Project (SAIP), the Crossfield Taxiway Project (i.e., Taxilane R), and the new Airport Rescue and Fire Fighting (ARFF) station, as well as other recent and pending near-term improvements at LAX. Depending on the outcome of the SPAS process, the LAX ALP may need to be amended to reflect the airport modifications identified by LAWA. Such amendment of the LAX ALP would first require completion of the NEPA review process by the FAA and issuance of a Record of Decision specific to the proposed ALP modifications. It is common at airports throughout the country to have facilities depicted on ALPs that depart from FAA Airport Design Standards in order to meet local site conditions and constraints. Such differences do not compromise safety. Operational changes and restrictions are made to preserve an acceptable level of safety.... (underline for emphasis)

Question: When updating to 'current" will LAWA/FAA include both Crossfield Taxiways planned (ie S and T) or just S as built?

Response:

The latest update of the LAX Airport Layout Plan (ALP), signed by the Federal Aviation Administration (FAA) on September 24, 2012, reflects the construction of Taxilane S, and the future construction of Taxilane T. The completion of construction specifications and bid documents for Taxilane T is currently underway. The ALP is available for review upon request to LAWA (SPAS Contact Person: Diego Alvarez as indicated on SPAS public notices and SPAS website).

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-243

Comment:

Question: Since the ROD has approved the mod of standards for handling ADG V and ADG VI and the FAA uses these operational changes then these operations are "safe." Does LAWA or the FAA predict when the frequency and number of operations would make changes or restrictions not practical?

Response:

The FAA and LAWA work together to implement the Modification of Standards (MOS) for handling Aircraft Design Group (ADG) V and VI aircraft. These MOS applications are done on a case-by-case basis and the conditions the FAA and LAWA agree to for approval are tailored to preserve an acceptable level of safety. Currently, no MOS which has been approved for LAX details a frequency or number of operations which would make the MOS impractical. However, providing for airfield improvements that meet FAA design standards reduces the need for, and number of, MOS applications or waivers for north airfield alternatives, which, in turn, allows for more efficient movement of ADG V and ADG VI aircraft. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-244

Comment:

Page 4-488 Safety
Of particular relevance to the SPAS alternatives are the runway to taxiway separation requirements related to large aircraft, as follows:
Aircraft Design Group (ADG) V Aircraft (e.g., B747)
- 400 feet - Good visibility (approach visibility >1/2 mile)
- 500 feet - Low visibility (approach visibility <1/2 mile)
- ADG VI Aircraft (e.g., A380)
- 500 feet - Good visibility (approach visibility >1/2 mile)
- 550 feet - Low visibility (approach visibility <1/2 mile)

Relative to the existing (baseline) configuration of the north airfield at LAX, the two existing runways (Runways 6L/24R and 6R/24L) are separated by 700 feet, which allows simultaneous arrivals and departures during good visibility conditions. In low visibility conditions, Air Traffic Control (ATC) will not land or depart aircraft simultaneously on Runways 6R/24L and 6L/24R; however, ATC can clear two aircraft for landing on adjacent runways if the trailing aircraft has a visual sighting of the aircraft ahead. In addition, ATC has a procedure called "2 increasing to 3" where they can clear an aircraft to land in low visibility conditions after an aircraft on the adjacent runway has begun its takeoff roll, as long as the arriving aircraft is at least two miles out.
To the south of Runway 6R/24L is Taxiway E, which meets FAA Airport Design Standards for ADG V aircraft during periods of good visibility. The movement of the A380, an ADG VI aircraft, on Taxiway E during poor visibility conditions is only allowed with the observance of several restrictions and special conditions set forth by FAA, specific to that taxiway. During good visibility conditions, the A380 can operate on the full length of Taxiway E with no restrictions on 6R/24L due to an approved MOS from FAA. Vehicular traffic on the adjacent service road is restricted anytime an A380 is on Taxiway E. During CAT I conditions, not more than one ADG VI aircraft can be on the first 3,000 feet of the taxiway from the runway threshold.
South of Taxiway E is Taxilane D, which is separated by 300 feet, with a service road between them for most of its length. Based on FAA design standards, the maximum size aircraft that can operate on this existing taxilane ranges from ADG III in the eastern portion to ADG VI between Taxiway R and Taxiway S in the western portion, with the difference being defined by variations in its and the service road's alignment and nearby obstructions (i.e., parked aircraft, etc.). (underline for emphasis)

Question: Since there is an approved MOS for moving ADG VI along taxiway E during good visibility, how often is IFR required at LAX? How many aircraft ops can be accommodated in IFR before movement along taxiway E is impacted? If taxiway E is made to accommodate Grp VI is this a mute question?

Response:

As noted in Figure 1 in Appendix F-2 of the Preliminary LAX SPAS Report, Instrument Flight Rule (IFR) conditions exist for approximately 4.1 percent of operations.

Section 3.4 in Appendix F-2 of the Preliminary LAX SPAS Report describes the modeling assumptions and delay metrics for Alternative 4, which represents what would reasonably be expected to occur if all ongoing and reasonably foreseeable non-Yellow Light improvements identified in the LAX Master Plan were implemented, and none of the Yellow Light Projects or any of the identified alternatives to the LAX Master Plan Program were constructed or implemented. IFR conditions were modeled in this analysis and the results can be found in Table 15.

If Taxiway E is made to be a full Group VI taxiway, all restrictions or the MOS associated with the current Taxiway E and ADG VI operations would be eliminated, as they would no longer be necessary.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-245

Comment:

Page 4-492 Runway Safety
The FAA completed an RSA evaluation and analysis for LAX in 2006, in accordance with FAA Order 5200.8, Runway Safety Area Program, to reconsider the adequacy of existing RSAs at LAX.389 The FAA determined that none of the RSAs at LAX met current standards but all are practicable to improve. U.S. Congressional House Rule 3058 provides the statutory requirements that airports must comply with current RSA requirements by December 31, 2015. In light of the above, a Runway Safety Area Practicability Study was conducted by LAWA identifying, evaluating, and recommending preferred RSA improvement solutions for LAX runways within operational, environmental, and financial constraints. 390 The Runway 7L/25R Study was finalized and submitted to the FAA for their review and determination in December 2009. These improvements are currently scheduled to take place in 2013.

Identification of potential solutions for noncompliant RSAs in the north airfield was included in an evaluation completed in April 2010.391 The analysis noted that permanent RSA compliance solutions for these runways can be integrated into all the SPAS build alternatives, such as by extending the eastern end of Runway 6R/24L and by covering the eastern portion of the Argo Drainage Channel for Runway 6L/24R. The FAA has acknowledged that implementation of solutions to RSA compliance issues in the north airfield may not be practicable by December 31, 2015, particularly given overall runway improvements associated with the SPAS alternatives, including RSA improvements, are not proposed to be completed by 2015. The FAA and LAWA are coordinating on the identification and evaluation of potential interim solutions.

390 Although the 2006 RSA evaluation by FAA found none of the RSAs at LAX to comply with current requirements, the FAA acknowledged that RSA improvements for Runway 7R/25L would be made with the LAX Runway 25L Relocation and Outer Taxiway Project (South Airfield Improvement Project), which has since been completed. As such, it was not necessary to identify solutions for Runway 7R/25L in the Runway Safety Area Practicability Study; however, RSA improvements to the other runway within the south airfield complex - Runway 7L/25R - would still be needed and were, therefore, addressed in the Practicability Study.
391 Ricondo & Associates, Inc., Runway 6L-24R & 6R-24L Safety Area (RSA) Practicability Study, April 2010.

Question: What accommodation has been agreed to by the FAA? With the impending release of AC150/5300-13A are there any changes that will affect these agreements? Where are the documents in footnotes 390 and 391 available?

Response:

LAWA is currently working with the FAA to identify permanent or interim solutions for improving the north Runway Safety Areas (RSA). This may include implementing the recommended solutions in the RSA Practicability Study or through improvements resulting from the SPAS effort. Because all RSA improvements will meet FAA standards, there are no changes in the release of Advisory Circular 150/5300-13A that would impact the RSA improvements. Footnote 390 is located in Section 4.7.2 of the SPAS Draft EIR. Footnote 390 is a text note, quoted by the commentor, and does not contain a direct reference to any specific document. Footnote 391 references the RSA Practicability Study. LAWA compiled copies of the references used in the preparation of the SPAS Draft EIR pursuant to Public Resources Code Section 21092(b)(1) and Section 15087(c)(5) of the State CEQA Guidelines, including references that were cited in footnotes to the SPAS Draft EIR. These documents were available for review at LAWA's Administrative offices during the public comment period and continue to be available for review upon request to LAWA (SPAS Contact Person: Diego Alvarez as indicated on SPAS public notices and SPAS website).

SPAS-PC00130-246

Comment:

Question: Has any runway approach changes been made or are any contemplated to respond to the RPZ not being fully clear?

Response:

Yes. Alternatives 1, 5, and 6 include a western extension of Runway 6L/24R and a westerly shift in the displaced (landing) threshold for Runway 24R, which, in turn, shifts the existing RPZ for Runway 6L/24R westward such that existing homes are no longer located within the RPZ (see Table 4.7.2-16 on page 4-569 of the SPAS Draft EIR).

SPAS-PC00130-247

Comment:

Page 4-498 Runway Safety Based on FAA guidelines, Table 4.7.2-4 delineates the calculated declared distances for runways in the north airfield. To date, declared distances for LAX have not been added to the ALP.

Question: Since offsets have been in place at LAX for some time, why have the declared distances not been added to the ALP since release in 2005? Does this impact safety or is this just an administrate exercise?

Response:

Page 4-498 of the SPAS Draft EIR describes that declared distances is the independent treatment of each of the four runway performance characteristics: take-off run, take-off distance, accelerate stop distance and landing distance. To date, only displaced thresholds for Runways 6R and 25R have been implemented. As defined in Footnote 12 on page 1-14 in Section 1.2.2 of the SPAS Draft EIR, a displaced threshold is a runway threshold located at a point other than the physical beginning or end of the runway. The portion of the runway so displaced may be used for takeoff but not for landing. Landing aircraft may use the displaced area on the opposite end for roll out.

The implementation of only a displaced threshold does not require the publication of declared distances in the Airport Layout Plan (ALP). If at any time declared distances in addition to displaced thresholds are implemented at LAX, they will be added to the ALP. As indicated in Footnote 11 on page 1-14 in Section 1.2.2 of the SPAS Draft EIR, declared distances are used by pilots to calculate available take-off and landing distances for a particular runway. This ensures that pilots can safely use a runway based on their aircraft types and loads. The fact that LAWA has not implemented declared distances at LAX, has no bearing on safety.

SPAS-PC00130-248

Comment:

Page 4-499 Figure 4.7.2-4 Parcels Within RPZ Baseline Conditions (2010)
Notes: 3/ For planning purposes, all runways are assumed to have approaches with minimums less than 3/4 mile.

Question: What does note three mean? If the approach is > 3/4 mile how does this impact RPZ and safety?

Response:

As shown in Table 3-8 of Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, the dimensional standards for the Runway Protection Zone (RPZ) are dependent upon the wake turbulence category and aircraft approach category of the most demanding aircraft using the runway, as well as the most restrictive approach visibility minimums. As each of these criteria grow, the dimensional standards of the RPZ increase. As such, in order to provide a conservative analysis of future land uses within the RPZ, all runways were assumed to have approach visibility minimums less than 3/4-mile as this produces the dimensionally largest RPZ. The land uses and object clearing criteria remain the same regardless of wake turbulence category, aircraft approach category, or approach visibility minimums.

SPAS-PC00130-249

Comment:

Page 4-501 Other FAA/LAWA Safety Measures

The FAA and LAWA have worked together in recent years to deploy new technologies and enhanced training to improve airfield safety at LAX. The following provides a summary of these recent and ongoing improvements:
- Airport Movement Area Safety System (AMASS) was installed and fully operational at LAX in 2003. AMASS is a radar-based system that tracks ground movements and provides an automatic visual and audio alert to tower controllers when it detects potential incursions or collisions on runways and taxiways.
- Enhanced airfield signs, lighting, and pavement markings to FAA updated standards have been installed.
- In 2009, Airport Surface Detection Equipment, Model X (ASDE-X) was installed at LAX. ASDE-X provides a more precise surface detection technology than AMASS by providing accurate target position and identification information and thus gives controllers a more reliable view of airport operations. A Phase 1 upgrade to the multi lateration receiver units was completed in 2011 and a Phase 2 enhancement and upgrade to the ASDE-X equipment is scheduled for installation at LAX in 2013.
- Recurrent training takes place with all airport, airline, and FAA personnel with access to or control of the LAX airfield movement areas (runways, taxiways, and service roads).
- The FAA and LAWA are deploying Runway Status Lights (RWSL) technology at LAX. This tool increases situational awareness for aircrews and airport vehicles and thus serves as an additional layer of runway safety against incursions. A Prototype Program (Phase 1) has been installed and operating since June 2009. LAX was the first airport to have RWSLs installed on multiple runways.
- In February 2010, LAWA and the FAA entered into a Memorandum of Agreement for a full implementation (Phase 2) of RWSL technology. This is to include upgrading existing prototype equipment and new installations on both north and south runway complexes. The design was completed in May 2011; however, the FAA informed LAWA that same month that the implementation schedule was on hold due to budgetary constraints. Based on discussions between LAWA and the FAA in December 2011, the FAA is re-evaluating the scope and budget with the goal of initiating the implementation in 2012. In order for the safety benefit of this technology to be fully realized, an airfield geometry designed to accommodate modern aircraft is needed.
- As part of the overall goal of improving operational safety at LAX, the FAA has made procedural changes since 2007 that are related to airspace operations.

Question: What other improvements, such as more extensive ground movement tracking system which includes all vehicles, are available to improve flight field safety? When can they be implemented? How would improving tower staffing help? Runway status lights were only partially installed three years ago. Why is it taking so long to complete installation of the rest of the airfield coverage? What other situational awareness systems should be installed at LAX for safety?

Response:

While the FAA and LAWA continue to work together in evaluating the characteristics and feasibility of other improvements, the list provided on pages 4-501 and 4-502 of the SPAS Draft EIR delineates the current nature and status of recent and ongoing improvements at LAX. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

SPAS-PC00130-250

Comment:

Page 4-502 to 4-504 North Airfield Safety Studies
Seven independent assessments of north airfield safety were completed. The following is a summary of each of these studies.
- LAX North Airfield Special Peer Review, March 2007 - A special peer review process involving airport industry experts was formed to objectively review the facts concerning the north airfield improvements (i.e., various options for increasing the separation distance between Runways 6L/24R and 6R/24L,

adding a centerfield parallel taxiway, and modifying the locations designs of taxiway/runway intersections) and to provide the group's insight and advice on the best solution and way to move forward. The Peer Review Group consisted of 13 aviation experts from the private, airport, and public sector with experience in planning, engineering and operations of major U.S. airports. The Peer Review Group393 evaluated the north airfield from the perspectives of operational safety, airfield balance, and efficiencies. They found that there is a definite need for improvements to the north airfield, that doing nothing is not an option, and massive terminal demolition is not feasible. The Group concluded that shifting the northerly runway 340 feet northward offers maximum safety, balance, and efficiency advantages. This option provides for new large aircraft operations, does not impact the apron/gate terminal infrastructure, presents fewer construction phasing impacts, and provides for a full-length center taxiway to promote safe and efficient aircraft landing and takeoff operations.

- Analysis of LAX North Airfield Alternatives, May 2007 - An analysis of LAX north airfield alternatives was prepared by the International Aviation Management Group, Inc.,394 an aviation planning firm headed by a professor of Airport Operations and Management from Embry Riddle Aeronautical University. The purpose of this study was to provide expert and objective guidance as to which alternatives being considered for the SPAS at the time (i.e., provide more separation between runways by moving Runway 6L/24R north by either 100 feet or 340 feet, or moving Runway 6R/24Lsouth by either 100 feet or 340 feet, or keeping runways in current locations) were most appropriate for further study as they relate to operational safety, aircraft compatibility, capacity, and environmental considerations. The study determined that the alternatives that provided an additional runway separation of 340 feet (LAX Master Plan Alternative D [340 feet south] and 340-foot north alternative) were the most appropriate for further study, while the least appropriate alternatives were the no additional separation and the 100-foot south concepts.
- Los Angeles International Airport North Airfield Assessment, May 2007 - A north airfield assessment was prepared by URS Corporation,395 a large multi-disciplinary worldwide aviation-consulting and engineering firm. The study examined options for reconfiguring the north airfield to address airfield safety related to runway incursions, the need to accommodate ADG VI aircraft, operational efficiencies, and cost factors. The study concluded that several aircraft types create operational challenges to the existing airfield and that addition of a center taxiway, which could occur if there was more separation between the existing runways, would eliminate several risks and problems. The study recommended, based upon FAA standards, pursuing relocating Runway 6L/24R 350 feet northerly and increasing its runway takeoff length. Current FAA design standards require greater separation between parallel runways and between runways and taxiways than what exists in the north airfield today, to safely and efficiently accommodate larger aircraft.
- Los Angeles International Airport Modernization - Tomorrow is Now, May 2007 - Twenty-two members of the Airline Pilots Association (ALPA) 396 formed a committee to present their findings and recommendations in a presentation entitled "Los Angeles International Airport Modernization - Tomorrow is Now." ALPA is an international organization of over 60,000 pilots representing over 40 airlines that is heavily engaged in safety issues and improvements for the airline industry. The ALPA Committee recommended that Runway 6L/24R be relocated northward to provide 623 feet, but not less than 550 feet, of runway to taxiway separation and that mirroring the separation on the south airfield is not an option.
- LAX North Airfield Proposed Runway Configuration - Safety Risk Assessment, May 2007 - The Washington Consulting Group, Inc. (WCG)397 led a panel of subject matter experts through a safety risk assessment on the north airfield proposed runway configurations. WCG is an Air Traffic Management Systems and Air Traffic Controller Training firm that is expert in conducting an FAA defined Safety Risk Management (SRM) Study. The SRM panel was to identify operational hazards, analyze associated risks, and establish mitigating strategies to ensure the safe and expeditious management of air traffic and then specifically develop and prioritize improvements that will increase the level of airfield safety. The analysis by panel produced a list of ten preliminary hazards associated with aircraft operating on the existing north airfield. Table 4.7.2-5 describes the ten hazards.
- LAX North Airfield Safety Study (NASS) - Following the completion of the five studies described above, City of Los Angeles elected officials requested preparation of an additional independent safety study, referred to as the LAX NASS, and formed the North Runway Safety Advisory Committee (NRSAC) composed of LAX stakeholders to oversee the study. The study's objective was to "inform decision makers on the scope and severity of operational safety problems of the north airfield and a range of potential solutions." The primary aim of the study was to estimate as specifically as possible the level of future safety associated with each of the alternate configurations of the north airfield, and, secondarily, look at capacity implications of each. In support of the safety study, LAWA contracted with

NASA Ames in May 2008, to perform detailed airfield simulation modeling, and with a six member Academic Panel in July 2008, made up of distinguished professors and aviation safety efficiency experts from the Massachusetts Institute of Technology; Virginia Polytechnic Institute and State University (Virginia Tech); University of California, Berkeley; George Mason University; and University of Maryland.
The Preliminary NASS Report was released in February 2010, and the Final Report with all supportive documentation was submitted in May 2010.398 The following were the Academic Panel's main conclusions:
- The LAX north airfield is extremely safe under the current configuration for the projected 2020 forecast.
- New configurations of the north airfield that include increased runway separation and the addition of a centerfield taxiway would reduce by a substantial percentage (40-55 percent) the risk of a fatal runway collision.
- Since the baseline level of risk is so low, reducing that risk by a substantial level is of "limited practical importance."
- The 340-foot north alternative significantly improves the operational efficiency of LAX and it would improve safety.
- Based on safety grounds alone, the Panel found it hard to argue for reconfiguring the north airfield.
- FAA's Response to the NASS Report - In response to the NASS Report, the FAA's Office of Airports, Office of Accident Investigation and Prevention, Runway Safety Office, Western Pacific Regional Flight Standards Division, and the Air Traffic Organization conducted a detailed review of the study and identified several critical flaws in the assumptions, methodology, and conclusions. In April 2010, the FAA Administrator provided FAA's comments and position on the NASS and the north airfield in a letter to the Mayor of Los Angeles and to Los Angeles World Airports. 399 The FAA stated that they strongly disagree with the study's main conclusion that reducing the risk of a fatal runway collision is of limited practical importance and the study's conclusion that reconfiguring the north airfield on the grounds of safety alone is not a compelling argument. Besides taking issue with several of the assumptions, methodologies, and uses of data in the report, the FAA made the following statements:
- The only complete and single-most significant solution for LAX's safety and efficiency needs must include airfield geometry designed to accommodate modern aircraft. Everything possible must be done to make the north airfield as safe as it can be.
- North airfield safety and efficiency would be greatly improved by further separating the two runways and constructing a center taxiway between them. This would address equally important issues of standards, safety, and efficiency.
- FAA firmly believes the 40-55 percent reduction in risk would be more than sufficient justification for the reconfiguration of the north airfield on safety grounds alone.

Question: What information was provided to the review panels to support their conclusions? What number of aircraft operations and flight mix was assumed? What budget were they given to conclude that "massive terminal demolition is not feasible."? What efficiency advantages did they find since the comprehensive NASA study and this DEIR results disagree with that conclusion? Did the Peer Review Group identify the new safely failure modes of erroneous landings on the taxiways experienced at other airports? Are these center taxiways more effective at airports with much larger land areas?

Response:

Copies of the seven independent assessments of north airfield safety summarized on Section 4.7.2 of the SPAS Draft EIR are contained in Appendices H-1 through H-7 of the Preliminary LAX SPAS Report. The information provided therein, including any descriptions of analysis methodology and assumptions, is what is currently available. The comment does not raise any environmental issue or address the adequacy of the environmental analysis included in the SPAS Draft EIR. Rather, it raises funding and economic questions, which need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-251

Comment:

Question: There was only one comprehensive study, the NASS to which the FAA was a significant participant. The DEIR lists seven studies, but in the context of the statements there were eight. The Academic Panel responded to the FAA conclusions and found fault with their methodology. Why are the AP responses to the FAA assertions not included in this DEIR?

Response:

The question raised in this comment deals with the same issue discussed in comment SPAS-PC00130-728; please refer to Response to Comment SPAS-PC00130-728.

SPAS-PC00130-252

Comment:

Page 4-510 Table 4.7.2-7 Runway Incursions/Incidents at LAX (2001-2011)
... For the FAA, an incident without an aircraft in potential conflict -- such as an unauthorized aircraft crossing an empty runway -- was previously defined as a "surface incident" and not a runway incursion. The new definition means that some incidents formerly classified as surface incidents are instead classified as C or D category runway incursions, which are low-risk incidents with ample time and/or distance to avoid a collision. The classification of the most serious kinds of runway incursions, Categories A and B, remains unchanged.

Question: There are no category A or B shown for either complex in the table. There was an event in 2011 where a landing aircraft missed an aircraft waiting to take off on 25R by less than 75 feet. Is it true that the FAA fails to post events until the full evaluation is complete? What else is not included in the totals presented? Seven 2011 category C are shown for the north airfield. Please identify their causes and correlate to the design changes in the alternatives. Under the new definitions when two aircraft back into each other is this counted as two?

Response:

Regarding the 2011 runway incursion event suggested by the commentor, LAWA airfield operations staff has reviewed the reports for all runway incursions in 2011 and has no record of the event described by the commentor.

Regarding the question of whether the FAA fails to post events until the full evaluation is complete, the FAA reviews "possible runway incursions" on a monthly basis. According to FAA Air Traffic Control (ATC), the runway incursion determination will typically take one to two months.

Regarding the question of "what else is not included in the totals presented [in Table 4.7.2-7 of the SPAS Draft EIR]", the Draft EIR includes all information necessary to analyze the safety of the SPAS alternatives. However, there was an incident on January 21, 2011 where four baggage carts being towed broke away and ended up in the Runway Safety Area of Runway 25R. The incident was reported to airfield operations, the errant carts were retrieved by airfield operations and the responsible carrier, and a runway inspection was conducted to confirm that no additional carts were near the runway. The incident does not meet the definition of an operator error, a pilot deviation, or a vehicle pedestrian deviation, as set forth in FAA Order 7050.1A Runway Safety Program Order, which states "surface events which cannot clearly be attributed to a mistake or incorrect action by an air traffic controller, pilot or pedestrian will be classified as 'other'."

Regarding a description of seven 2011 Category C incursions shown in Table 4.7.2-7 for the north airfield, the following describes each event.

February 24, 2011(1414 hrs.): A white van with a trailer entered Runway 24L northbound at Taxiway E16 delayed for approximately 15 seconds and exited Runway 24L at Taxiway E17 southbound without approval. A departing aircraft was on departure roll on Runway 24L approaching Taxiway E10 when the ASDE-X runway safety warning system indicated, "warning runway 24 left occupied." Air Traffic

Control Local 2 was alerted of the deviation by the ASDE-X safety logic alert and did not amend departing aircraft's takeoff clearance due to the position, speed, and configuration of the aircraft. Subject aircraft departed without incident. LAWA Operations at LAX was notified of the incident and escorted the van away from the runway environment and provided the vehicle operator's information. At the time of the incident, Runway 24R was closed for monthly inspections. The vehicle operator advised he thought he was entering a closed runway. This incident was classified as a Vehicle Deviation.

March 5, 2011 (2211 hrs): An aircraft was instructed to line up and wait on Runway 24L at Taxiway V. The subject aircraft entered Runway 24L at intersection E8. A second aircraft was cleared for takeoff at the full length of Runway 24L (Taxiway Victor), and was instructed, "at taxiway victor, runway two four left line up and wait, caution wake turbulence." The first aircraft entered Runway 24L at Taxiway E8, and the second aircraft's takeoff clearance was cancelled prior to beginning its takeoff roll and was taxied off the runway. This incident was classified as a Pilot Deviation.

May 14, 2011 (1310 hrs.): An arriving aircraft landed on Runway 24R, exited at Taxiway AA, and was given instructions to hold short of Runway 24L. The pilot of the arriving aircraft read back the hold short instruction. A departing aircraft was issued takeoff clearance on Runway 24L. As the departing aircraft passed Taxiway Y on departure roll, the pilot of the arriving aircraft advised they had passed the Runway 24L hold bars. The departing aircraft became airborne prior to Taxiway Z. Safety Logic did not alert. This incident was classified as a Pilot Deviation and Runway Safety.

June 10, 2011 (2210 hrs): An arriving aircraft landed on Runway 24R, was instructed to hold short of Runway 24L at Taxiway AA, and the pilot read back the hold short instructions correctly. A departing aircraft was cleared for takeoff on Runway 24L. The pilot of the departing aircraft stated they were rolling with the red lights (referring to the runway status lights). The pilot of the arriving aircraft stated they had passed the hold short bars for Runway 24L. The ASDE-X was out of service and safety logic did not alert. On departure roll the pilot of the departing aircraft was informed that the arriving aircraft was past the hold bars at Taxiway AA. The departing aircraft became airborne without further incident. This incident was classified as a Pilot Deviation.

June 29, 2011 (2202 hrs): An arriving aircraft landed on Runway 24R and exited at Taxiway Z, and the pilot was instructed to hold short of Runway 24L. The pilot read back the hold short instruction. A departing aircraft was cleared for takeoff on Runway 24L. The arriving aircraft was observed to be past the hold bar and traffic control was notified. The departing aircraft was departure roll approaching Taxiway W when traffic control reissued the hold short instruction to the arriving aircraft, which was acknowledged. The ASDE-X Safety Logic issued a Runway 24L "occupied" warning. The departing aircraft rotated at Taxiway Y approximately 1,337 feet prior to Taxiway Z. This incident was classified as a Pilot Deviation.

June 30, 2011 (2153 hrs): An arriving aircraft landed on Runway 24R and exited on Taxiway AA. The pilot was instructed to hold short of Runway 24L and the pilot read back the instructions. A departing aircraft was in position for departure on Runway 24L. Controller cleared the departing aircraft for takeoff and pilot advised he had red lights. The arriving aircraft had crossed the hold bars at Taxiway AA. Controller immediately cancelled takeoff clearance, and then crossed the arriving aircraft across Runway 24L. This incident was classified as a Pilot Deviation.

November 19, 2011 (1110 hrs): An arriving aircraft crossed the Runway 24L hold short line on Taxiway AA when a departing aircraft was on departure roll. The pilot of the arriving aircraft read back the Runway 24L hold short instructions correctly. The pilot of the departing aircraft advised he observed red Takeoff Hold Lights (THLs) on departure roll and aborted takeoff. Controller canceled the departing aircraft's takeoff clearance and the subject aircraft stopped after rolling approximately 300 feet. The Controller team became aware of the runway incursion when the pilot of the departing aircraft reported the red THLs and aborted takeoff. Controller asked if arriving aircraft had crossed the Runway 24L hold bar; the reply was affirmative. Safety Logic did not alert. Pilot of the arriving aircraft stated during the investigation they were attempting to brake smoothly, were anticipating approval to cross Runway 24L, and passed the Runway 24L hold bars. This incident was classified as a Pilot Deviation.

The causes of the aforementioned Category C runway incursions do not pertain to the airfield design changes associated with the proposed alternatives.

Regarding the question of whether "Under the new definitions when two aircraft back into each other is this counted as two?" the event described by the commentor would likely be considered a "surface incident" and according to ATC, this type of event would be counted as one incident.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a).)

SPAS-PC00130-253

Comment:

Page 4-512 Runway Safety
Part 77 imaginary surfaces provide a means of identifying objects that require a more detailed safety analysis. This analysis, performed by the FAA, considers the airspace operations and safety requirements applicable to the Part 77 surface, as well as the nature, location, and extent of the object's penetration into the Part 77 surface. The analysis requires detailed runway design and engineering data not available at this conceptual level of planning, and would occur during the normal course of FAA review and approval of proposed airfield improvements. The analysis would set forth and define the appropriate means and measures to address potential safety concerns related to objects located within the Part 77 surface. As described above in Section 4.7.2.3, options for addressing potential safety hazards associated with objects located within controlled airspace areas can range widely and can include (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. . . . (underline added for emphasis)

Question: This section acknowledges that the Westchester Business District is within the RPZ. The underlined section above states that a Part 77 surface analysis requires more depth than currently available. How, then, can LAWA promise anyone that they will not have to remove our businesses without a commitment from the FAA? What is to stop the FAA from changing their mind after making a verbal or even written commitment to LAWA? If the approach is changed to be closer to homes and businesses doesn't this transfer some risk to those on the ground?

Response:

As indicated in the SPAS Draft EIR text presented in the comment, there are several options that may be considered relative to addressing potential safety hazards associated with incompatible structures and uses located within an RPZ. However, a determination as to the appropriate option cannot be made until a complete evaluation of potential safety hazards can be conducted in consultation with the FAA, after which more detailed levels of planning and engineering on the selected option will be completed. It would be premature and speculative to say at this time, prior to FAA consultation, whether incompatible structures or land uses within the RPZs would stay, be modified, or be removed. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144-15145.) Note that Section 4.7.2 of the SPAS Draft EIR includes an analysis of potential indirect or secondary impacts associated with modification or removal of structures and uses within the RPZ, should that occur in the future.

SPAS-PC00130-254

Comment:

Page 4-514 and 515 Table 4.7.2-8
Summary of North Airfield Runways and Parallel Taxiways Compliance with FAA Airport Design Standards

Question: The subject table shows runway separations from between 700' to 1050' but separations less than current spacing between the proposed center taxiway to a runway by as much as 300'. How is this presented as safer? All Taxiway E ADG sizes allowed are shown to be the largest, ADG VI except Alt D with Taxilane D being a mixture of ratings with less than ADG V for parts currently, but all reasonable changes including no additional separation being ADG V. It also shows runway to taxiway separation is BETTER if the runway is not moved! Based on this safety design standards Alternative 2 is superior. How is this reconciled with the desire to expand north?

Response:

Please see Responses to Comments SPAS-PC00130-63, SPAS-PC00130-260, and SPAS-PC00135-2 regarding the safety and operational benefits of a centerfield taxiway.

SPAS-PC00130-255

Comment:

Page 4-524 Hydrology/Water Quality
Potentially affected areas are mostly developed/urbanized; hence, surface hydrology is characterized primarily by runoff flowing across impervious surfaces into the existing storm drain system, and water quality is characterized by typical urban storm water pollutants (i.e., oil and grease, metals, nitrogen, fecal coliform, trash, etc.). Implementation of the above measures could result in reduced surface runoff to the extent that existing structures and impervious surfaces are removed, and also reduce or change urban stormwater pollutants to the extent existing urban uses are taken out of service or replaced with lower intensity uses. Construction activities associated with the removal or modification of existing structures could result in short-term erosion and sedimentation and other construction-related water quality pollutants (i.e., from fueling/servicing of construction equipment, storage of materials including temporary stockpiles of demolition debris, etc.). Mitigation of such construction-related pollutants would be accomplished through adherence with the requirement of the State Water Resources Control Board General (Construction) Permit (2009-0009-DWQ). Hydrology and water quality impacts are anticipated to...

Question: This section states that the major issue is surface runoff, but if this area has unknown sources from Centinela Creek and feeds the Dominguez flood plain, can the underground water create more problems and potential flooding than the surface water when there are major utilities needing to be moved and a six lane tunnel being removed along with the modification of the Argo Drainage Channel?

Response:

The analysis referenced in this comment does not pertain to the direct impacts of the SPAS alternatives. Rather, pages 4-522 through 4-526 provide an analysis of secondary or indirect environmental impacts that may occur if measures to address potential airspace obstructions or incompatible structures/uses within RPZ areas require the removal or modification of existing structures and/or uses. The subject analysis includes discussion of potential measures to reduce impacts. Given that neither the need for, nor the nature of, actions to modify or remove existing structures or uses have been determined and will not be known until sometime in the future, it would be premature and speculative to reach a final significance conclusion at this time, or to delineate specific mitigation measures for impacts that are unknown at this time. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144 and 15145.) If and when removal, modification or acquisition actions were required, the discretionary approvals associated with such

actions would be subject to environmental review under CEQA, at which time feasible mitigation measures to reduce potential impacts to a less than significant level would be required.

In any event, if such removals or modifications were to occur, they would not require relocation of major utilities because removal or modification of existing structures would all occur above ground, whereas major utilities are located beneath the ground surface. Moreover, such removals or modifications of existing land uses would not require alterations to the Argo Drainage Channel as the uses within the RPZ are located to the northeast of the airport, whereas the Argo Drainage Channel is located on airport property, over 1,000 feet from the nearest use within the RPZ. It is unclear what the commentor is referring to in the reference to removal of a six lane tunnel. If this is a reference to the north airfield abandoned tunnel segment, removal of this tunnel segment would similarly not be associated with the removal or modification of existing structures and/or uses within the RPZ. The commentor provides no evidence in support of the statement that the area has unknown sources from Centinela Creek. As indicated on pages 4-524 and 4-525 of the SPAS Draft EIR, indirect effects, if any, are expected to be associated with surface water. Adverse indirect impacts from groundwater are not anticipated.

SPAS-PC00130-256

Comment:

Page 4-525 Land Use and Planning
The potentially affected areas are designated in the City's General Plan for Commercial (Community) land use. Similarly, the subject areas are zoned for commercial uses, primarily C1-Light Commercial and C2-General Commercial. The removal of existing uses would not require a General Plan amendment or a change in zoning. The potential replacement of existing uses with other uses compatible with an RPZ would need to be reviewed in light of the provisions of the existing zoning relative to permitted and conditional uses. In general, however, the removal of existing uses and replacement with lower intensity uses is not expected to conflict with the existing land use plans for the area. Similarly, it not expected to create physical or functional incompatibility with existing land uses nearby. To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal of existing uses, implementation of LAX Master Plan Commitment RBR-1, Residential and Business Relocation Program, and LAX Master Plan Mitigation Measure MM-RBR-1, Phasing for Business Relocations, would reduce impacts associated with business relocation. With implementation of the commitment and mitigation measure, impacts related to business relocation would likely be reduced to a level that is less than significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Question: If the construction destroys the Lincoln Blvd and Sepulveda Blvd intersection then traffic on Sepulveda, which Westchester Business District relies, will cause major losses if/when construction takes an extended period. Coupled with many closures and forced move of hundreds of businesses there can be a significant impact. When will this be evaluated? It should be done as part of the SPAS process, not wait until a project level EIR is prepared because the consequence is too great.

Response:

Based on the current concepts for the proposed realignment of Lincoln Boulevard under SPAS Alternatives 1, 5, and 6 shown in Figures 2-1, 2-5, and 2-6 of the SPAS Draft EIR, which indicates that the proposed realignment would begin about 500 feet west of Sepulveda Boulevard, it is speculative to suggest at this point that construction would "destroy" the Lincoln Boulevard/Sepulveda Boulevard intersection. It is also speculative to suggest that construction would cause "major losses" and there would be "many closures" and "hundreds of businesses" would be forced to move. The commentor provides no substantial evidence or any other information in support of those claims.

The likelihood, nature, location, and timing/duration of construction-related impacts associated with the realignment of Lincoln Boulevard, should one of the aforementioned alternatives be approved, are would be addressed in conjunction with the development of more detailed design and construction plans. Based on such information, a second-tier project-specific CEQA document would be prepared that discloses detailed project-specific impacts and mitigation measures.

The commentor's recommendation that such analysis should be completed now and "not wait until a project level EIR is prepared" is inconsistent with CEQA tiering principles. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v, County of San Joaquin (1996) 47 Cal.App.4th 29,37.)

Please also see Topical Response TR-SPAS-LR-1 for additional discussion pertaining to construction impacts associated with the realignment of Lincoln Boulevard.

SPAS-PC00130-257

Comment:

Page 4-525 Transportation
...Construction activities associated with the removal or modification of existing structures would result in temporary construction-related traffic and possible lane closures and detours...

Question: The DEIR indicates that Terminal 3 will be rebuilt in a different location. How will only a lane detour occur in the CTA when the upper roadway is attached to Terminal 3 at its present location? When LAWA (or CalTrans) starts moving Lincoln Blvd to a totally new location below grade, how can this be achieved with a possible lane closure?

Response:

Section 4.12.1.9.4 of the SPAS Draft EIR discloses the impacts of construction on traffic within the airport at a program level of detail. As indicated in that section, "In the current absence of specific construction plans, schedules, and approaches for the SPAS alternatives, which would be determined during more detailed planning and design stages in the future, it is not possible to conclude whether the on-airport transportation system construction impacts would be fully mitigated by the aforementioned [LAX Master Plan commitments and mitigation] measures. As such, construction impacts to the on-airport transportation system are considered at this time to be significant." Detailed information on the impacts of construction on traffic within the airport would be developed during project-specific design and CEQA reviews, should a SPAS alternative be selected for implementation. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29,37.)

Relative to off-airport construction-related traffic impacts that may occur in conjunction with implemental of the SPAS alternatives, including those involving the relocation of Lincoln Boulevard, Section 4.12.2.6.3 of the SPAS Draft EIR addresses such impacts. Similar to on-airport traffic impacts, the analysis notes that specific off-airport traffic impacts associated with construction activities depend on the specifics of the construction program for each improvement, as would be determined during project-level planning and CEQA review. The analysis concludes with an acknowledgement that construction-related traffic impacts could, at times, be significant and unavoidable on streets surrounding LAX. Regarding Lincoln Boulevard realignment, please also refer to Topical Response TR-SPAS-LR-1.

Comment:

Page 4-527 Air surfaces
. . . The improvements proposed at the east end of Runway 6R/24L and the covering of the eastern end of the Argo Drainage Channel would bring the RSAs for the north airfield into compliance with FAA standards....

Question: This DEIR indicates that LAWA has not consulted USCOE on modifications to the Argo Channel. If this causes flooding to occur onto the runways how long will the north airfield be closed? How long can operations on one half of the airport support the full complement of arrivals?

Response:

The Argo Drainage Channel is not under control of the U.S. Army Corps of Engineers (USACOE), although USACOE has regulatory authority over jurisdictional areas associated with the Argo Drainage Channel and mitigation for impacts. A jurisdictional delineation was conducted by Glenn Lukos Associates for the SPAS alternatives. The results of the report are provided in Appendix D-2 of the SPAS Draft EIR. The report summarizes the preliminary findings of Glenn Lukos Associates pertaining to the jurisdiction of the USACOE and the California Department of Fish and Game (CDFG) regarding USACOE and CDFG jurisdictional areas. Consultation with these agencies would occur prior to implementation of an alternative that would have the potential to affect the Argo Drainage Channel (i.e., Alternatives 1, 5, and 6), as outlined in Mitigation Measure MM-BIO (SPAS)-13. Please also see Response to Comment SPAS-PC00130-201 regarding USACOE jurisdiction and Response to Comment SPAS-PC00130-433 regarding flooding associated with conversion of the Argo Drainage Channel to a concrete box culvert.

SPAS-PC00130-259

Comment:

Page 4-547

"As indicated in Table 4.7.2-8, implementation of Alternative 5 would increase the separation distance between Runways 6L/24R and 6R/24L from 700 feet to 1,050 feet, but would not change the existing capabilities relative to allowing simultaneous arrivals and departures."

Question: This (or similar statement) is made for each of the alternatives which increases runway separation. How much improvement is due to the runway separation versus how much is due to the taxiway separation improvement?

Response:

Runway-runway and runway-taxiway separation standards can be found in Chapter 3 of FAA Advisory Circular (AC) 150/5300-13A Airport Design.1 Increasing runway-runway separation may, depending on the separation, allow arrival and departure operations from both runways simultaneously. An increase in runway-taxiway separation may allow larger aircraft to use the runway or taxiway. Additionally, an increase in runway-taxiway separation also allows greater flexibility in their use during low visibility weather conditions.

The purpose of the proposed increase in runway-runway separation at LAX is to add a parallel taxiway between the two runways to become compliant with the runway incursion mitigation requirements outlined by FAA AC 150/5300-13A Airport Design.

1. Available: http://www.faa.gov/airports/resources/advisory_circulars/index.cfm/go/document.information/documentID/1019951).

SPAS-PC00130-260

Comment:

Page 4-548 Other Safety Considerations
As described above in Section 4.7.2.3, numerous safety studies have been prepared relative to aircraft operations on the north airfield. While the nature, approach, and scope of analysis may differ between the studies, there is general consensus between the studies that increased separation between runways and the addition of a centerfield parallel taxiway can reduce the potential for a runway collision or incursion and enhance safety, <u>particularly as related to future operations involving a greater number of large aircraft</u>. Additionally, the safety benefits of relocated and redesigned runway crossing points along the last-third of Runway 6R/24L, including the advantage of pilot visibility to the end of the runway, were noted in some of the studies. The airfield improvements proposed under Alternative 5 provide for these desired safety improvements. (underline for emphasis)

Question: Although the above statement states "general consensus...addition of a centerfield parallel taxiway (CFT) can reduce potential for a runway collision or incursion..." a blanket statement of this type needs proof. Again, what if any is added by the CFT as opposed to fixing the other taxiways and/or changing the location of exit ramps from the runway? How much safety is lost by having the taxiway closer to an adjacent runway as opposed to the larger separation between the two runways? How much does positioning of the gates relative to the landing area impact safety if moved to locations where the landing site is beyond the gate and must taxi back on a fully separated taxiway?

Response:

The statement to which commentor refers is supported by the conclusions of the safety studies referenced in Section 4.7.2 of the SPAS Draft EIR. The LAX North Airfield Safety Study (NASS), for example, concluded that new configurations of the north airfield that included increased runway separation and the construction of a centerfield taxiway would reduce the risk of a fatal runway collision by a substantial percentage. (See Section 4.7.2 of the SPAS Draft EIR.) The current airfield design is outdated, and has insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways and aircraft on nearby taxiways.

The addition of a midfield parallel taxiway between the two runways is also being proposed, in part, to be compliant with the current version of FAA Advisory Circular (AC) 150/5300-13A Airport Design. The AC includes the runway incursion mitigation design strategies which were recommended in FAA Engineering Brief #75. In particular, Section 411(b) of FAA AC 150/5300-13A states "Do not provide direct access from a high speed exit to another runway."

LAWA is not aware of statistics of, or specifics on, other airports with new incursion opportunities presented by a parallel taxiway located between runways. However, as of February 2010, LAWA had approximately 18 months of data that suggested that the south airfield changes have reduced incursion risk on the south airfield at LAX by about 40 percent. The reduction of incursions can be attributed, at least in part, to the addition of the centerfield taxiway. The new centerfield taxiway forces aircraft to slow down before crossing Runway 25R and also gives air traffic controllers more flexibility to cross the departure runway.

Due to the acceptance of Airport Improvement Program (AIP) funding and Passenger Facility Charge (PFC) funds, LAWA is required to adhere to current FAA guidance for airport design standards incorporated in the FAA Advisory Circulars. The north airfield does not meet current AC 150/5300-13A standards for high-speed exit taxiways.

Additionally, all runway-taxiway separations were proposed in accordance with FAA AC 150/5300-13A Airport Design.

The following statement made by the commentor is unclear: "How much does positioning of the gates relative to the landing area impact safety if moved to locations where the landing site is beyond the gate and must taxi back on a fully separated taxiway?" The commentor discusses three different concepts: positioning of landing area or site; relative positioning of gates; and safety.

It is unclear what the commentor considers as the "landing area" or "landing site." Landings occur starting at the threshold (or displaced thresholds on Runways 6R and 25R) of each of the four runways. In general, an aircraft has the ability to use the entire runway length beyond the threshold to complete its landing operation. Therefore, a landing area or site could be any point along the entirety of the runway after the threshold.

Regarding the "positioning of the gates relative to the landing area," except for the proposed addition of Terminal 0 and the Midfield Satellite Concourse (MSC), the SPAS Draft EIR did not analyze the relocation of any existing terminal gates beyond the current general area of the CTA. Opportunities for "positioning of the gates relative to the landing area" are very limited within the central core area in between Runways 6R/24L and 7L/25R, or outside the CTA.

As it relates to the SPAS Draft EIR analyses, the relocation of the "landing site" or runway to a location father from the existing terminal gates, and any associated safety impacts, has been analyzed under Alternatives 1, 5, and 6 (northerly relocation of Runway 6L/24R).

SPAS-PC00130-261

Comment:

Page 4-553 Implementation of Alternative 5 would not involve construction of a runway within 10,000 feet of a solid waste landfill or create an attractant to birds. In general, implementation of this alternative would enhance aircraft safety and efficiency, as summarized above, particularly with respect to better achieving compliance with FAA Airport Design Standards for operation of large aircraft. The 350-foot northward shift of Runway 6L/24R would, however, result in a northward shift of the Part 77 imaginary surfaces placing portions of two multi-story structures within Part 77 Surfaces. As described above, there are several options available to address potential safety hazards associated with objects being located within controlled airspace areas, ranging from doing nothing (i.e., for low-risk objects), to placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps, to lowering, reducing, or removing the object, and, in some cases, an approach or departure procedure will be modified to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. Such measures would reduce this safety impact to a level that is less than significant. Secondary or indirect impacts associated with implementation of such options could range from no impact, such as in the case of low-risk objects that do not require any safety measures, to impacts typically associated with removal of an object/structure, such as temporary construction-related air quality, noise, and traffic impacts, visual impacts (i.e., changes in existing appearance), and land use impacts. Such secondary or indirect impacts would be similar to those described at the end of the impacts analysis for Alternative 1 above.

Question: Based on the above statement and this applies to all alternatives: although incursions are important from a safety point, a larger panel of experts and the FAA have stated that excursions are, in general, more serious. This doesn't seem to be addressed in most of these discussions. As you move runways closer to residences and commercial properties doesn't the potential impact of an excursion increase? Where is this addressed? How much less safe is the movement of operations closer to homes and commercial property? If the plan by LAWA is to mitigate impacts on the Westchester Business district by relocating into the Northside Development area what risks are increased and by how much?

Response:

Runway excursions are events in which planes deviate suddenly and sharply from their intended paths. The comment provides no evidentiary support, nor specific reference or citation in support of the claim that excursions are, in general, more serious than incursions. The FAA sets various airport design standards, including but not limited to those related to runway safety areas (RSAs) and runway protection zones (RPZs), that provide a safe environment for aircraft operations. Section 4.7.2 of the SPAS Draft EIR addresses RSA and RPZ considerations applicable to each SPAS alternative, including a delineation of the relationship between these safety zones and existing uses nearby. As described therein, any relocation of a runway would be accompanied by relocation of the RSA and RPZ (i.e., if a runway is moved, the applicable safety buffer zones and other associated safety requirements go with it). Compliance with these safety requirements is intended to reduce risks to any facilities (both on and off an airport) to the feasible. Section 4.7.2 addresses the potential for modification or removal of incompatible structures or uses being required within Part 77 imaginary surfaces or RPZ areas for certain alternatives; however, the need for, and nature of, such actions will not be determined until more detailed levels of planning for the selected alternative, if any. Such a determination would be made in consultation with the FAA. Please see Response to Comment SPAS-AL00007-26 regarding incompatible structures in RPZs. In the event that acquisition and relocation of uses within the Westchester business district is required, implementation of LAX Master Plan Commitment RBR-1, Residential and Business Relocation Program, would address acquisition and relocation impacts. The future development of LAX Northside may offer the opportunity for local business to relocate to that

area, should they so choose. Any future development within LAX Northside would be subject to FAA safety standards, including those related to Part 77 imaginary surfaces and RPZs, relative to operations in the north airfield under any alternative.

SPAS-PC00130-262

Comment:

Pages 4-569 and 570 Table 4.7.2-16 Summary of Safety and Efficiency Enhancements to the North Airfield Operations

Question: Why was the airside redesigned in the alternatives such that Taxilane D was enhanced to ADG VI for Alternatives 3,5 but only ADG V for Alternatives 1,2,6,7 ? The main difference appears that Alt 5 moves/rebuilds terminal 3, why weren't the others?

Response:

The Preliminary LAX SPAS Report and SPAS Draft EIR focused on potential alternative designs, technologies, and configurations that would provide solutions to the problems that the Yellow Light Projects were designed to address. Nine alternatives offering various options to the Yellow Light Projects are addressed within the SPAS Draft EIR. A range of options were put forth in an effort to balance various benefits and drawbacks of each.

In Alternatives 3 and 5, for example, Taxilane D would be relocated to comply with ADG VI standards. However, as explained in Section 2.3.1.3 and 2.3.1.4 of the SPAS Draft EIR, respectively, in both Alternative 3 and 5, the Aircraft Parking Limit Line would be moved south and the terminal facilities would be modified, resulting in the elimination of gates. For more information on the effect of each alternative on LAX airside and landside operations, please see Section 6.3 of the Preliminary LAX SPAS Report.

An EIR need not consider every conceivable alternative to the project. (In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1163.) Rather, an EIR must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. (State CEQA Guidelines Section 15126.6(a).) It must include information sufficient to permit a reasonable choice of alternatives so far as environmental consequences are concerned. (Village Laguna of Laguna Beach, Inc. v. Board of Supervisors (1982) 134 Cal.App.3d 1022, 1029.) Here, the SPAS alternatives constitute a reasonable range, sufficient to allow informed decision-making. (See City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.)

SPAS-PC00130-263

Comment:

Page 4-571 4.7.2.7 Mitigation Measures

Alternatives 1 through 9 would not have a significant impact with respect to safety; therefore, no mitigation is required.

Question: If the primary reason for runway and taxiway movement is for "safety" why is there "no significant impact?"

Response:

Under CEQA, the purpose of an EIR is to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided. (Public Resources Code Section 21002.1(a).) The fact that LAWA is proposing improvements to the north airfield to support the safe and efficient movement of aircraft at LAX has no bearing on whether the airfield improvements themselves would result in significant environmental effects.

That said, the determination of significant impacts related to safety is based on the thresholds of significance presented in Section 4.7.2.4 of the SPAS Draft EIR. As indicated therein, a significant safety impact would occur if the direct and indirect changes in the environment that may be caused by the particular SPAS alternative would result in one or more of the following future conditions:

- Construction of runways within 10,000 feet of a solid waste landfill.
- Construction of facilities or implementation of operational conditions that would serve as attractants to birds.
- A compromise in aviation safety or an aviation safety hazard for people in the project area.

Based on the analysis, and supporting substantial evidence, for each of the alternatives addressed in Section 4.7.2, it was determined that none of the alternatives would have a significant impact with respect to safety.

Safety is one of several reasons why LAWA is proposing improvements to the north airfield. As described in Section 2.2 of the SPAS Draft EIR, LAWA is seeking to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX; specifically, such improvements:

- Are consistent with FAA design standards for the largest aircraft types currently in service and anticipated for the future (ADG V and VI aircraft) for all weather conditions;
- Minimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service;
- Reduce the potential for airfield hazards, including incursions, and enhance the overall safety of airfield operations through runway and taxiway design;
- Accommodate a greater percentage of departing aircraft, thereby increasing airfield efficiency;
- Provide sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft; and
- Minimize or eliminate the extent to which Runway Protection Zones overlay residential areas.

SPAS-PC00130-264

Comment:

Page 4-577 4.7.3 Hazardous Materials Table 4.7.3-1 Existing Soil and Groundwater Contamination and Remediation Status Note 1This list includes only those sites with known contamination, as determined through database and information from LAWA personnel.

Question: Where was past rocket fuel testing done on the northside? Which areas on the south and west have fuel dispensed that pose a significant possibility of leakage? What other potential contamination sites exist based on type of land use airport operation? Where are the lead lined fallout shelters? Why were only those identified by LAWA in a database listed in this table?

Response:

Underground bunkers were constructed as part of a Nike missile surface-to-air defense battery that was established by the Army in the mid-1950s in the northwest corner of the airport (current location of Jet Pets). The launch facilities were destroyed in the early 1990s with the construction of Westchester Parkway. It is not known if rocket fuel testing was conducted at the site or if these were lead-lined fallout shelters at the site, and the commentor provides no evidentiary support that such testing was conducted on the LAX Northside or that lead-lined shelters exist. Please see Response to Comment SPAS-PC00130-113 regarding the identification of contaminated sites in the study area. As indicated in that response, the sites identified in the SPAS Draft EIR were based on a records search performed by EDR, which includes local, state, and federal databases of properties with known or potential contamination, as supplemented by LAWA's knowledge of contaminated properties. The fuel farm is located on the west side of the airport, north of World Way West. Fuel is also stored in other locations throughout the airport. Storage of fuel in above ground and underground tanks must adhere to stringent regulations. Underground storage tanks must meet requirements for construction standards, leak detection, and spill and overfill protection. Above ground storage tanks of a certain size require secondary containment. These regulations serve to reduce occurrences of releases. In addition,

tenants who store greater than a threshold quantity of petroleum products, which vary depending on vessel type and size, are required to maintain Spill Prevention Control and Countermeasure (SPCC) plans in accordance with federal and state requirements. With inclusion of these regulations, as well as required spill maintenance plans, none of these storage locations have a significant potential for leakage.

The commentor's reference to lead-lined fallout shelters does not raise any significant environmental issues or question the adequacy of the SPAS Draft EIR. An EIR's project description should not provide extensive detail beyond that needed for evaluation and review of the project's environmental impacts. (State CEQA Guidelines Section 15124.) Here, the SPAS Draft EIR analyzes the project at a programmatic level. It is appropriate for a program-level document to defer detailed descriptions and impact analysis of individual project in the program to future project-level review. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.) If any project-level review reveals additional structures that could contribute to hazardous materials, including lead-lined fallout shelters, the environmental impacts of those structures would be analyzed in detail and mitigation measures would be identified at that time.

SPAS-PC00130-265

Comment:

Question: Must these sites be cleaned up before or during project construction? Are the costs for this clean up included in the cost estimates? Since there are underground springs and water flow under LAX has the distribution of contaminants been evaluated? When this contaminated dirt has been moved to staging areas are these cleaned up? Is there testing data to confirm? Where is this data and how is it presented and available to the public?

Response:

The questions in this comment pertain to page 4-577 of the SPAS Draft EIR, which contains a table that identifies existing soil and groundwater contamination at LAX or within the acquisition areas. The commentor provides no substantial evidence to support the claim that there are underground springs under LAX or that the SPAS alternatives would result in the distribution of contaminants from the sites identified in Table 4.7.3-1. There are no known underground springs at LAX. Groundwater aquifers exist at depth below the surface at LAX, which are comprised of various mixtures of sand, gravel, silt, and clay. Groundwater is present in pore spaces between these materials, and typically flows from higher to lower groundwater elevations. Groundwater typically flows at significantly lower rates than surface water. Section 4.7.3.3 of the SPAS Draft EIR discusses the existing conditions at the project site, including known soil and groundwater contamination within the hazardous materials study area. The approximate locations of identified soil and groundwater contamination on the existing LAX property and within the acquisition area for the SPAS alternatives are shown in Figure 4.7.3-1. Sites with significant soil and/or groundwater contamination and that are undergoing remediation activities are discussed on pages 4-576 and 4-581 of the SPAS Draft EIR. As indicated in the SPAS Draft EIR, the distribution of contaminants in groundwater from these sites has been evaluated or evaluation is planned or underway. The most widespread groundwater contamination at LAX is associated with the Continental Airlines Aircraft Maintenance Facility on the west side of the airport. Groundwater contamination at this site has not migrated west of Pershing Drive. An extensive groundwater remediation effort is underway at this site.

Impacts associated with contaminated soils and groundwater are addressed in Section 4.7.3 of the SPAS Draft EIR. As indicated in that section, during construction activities, previously unidentified soil and/or perched groundwater contamination could be encountered. Contaminated soils that would be excavated during construction of SPAS improvements, or contaminated groundwater encountered during construction, would be cleaned up prior to or during construction. LAX Master Plan Commitment HM-1 addresses clean up of sites with known contamination prior to construction and LAX Master Plan Commitment HM-2 addresses the handling of contaminated materials encountered during construction. With implementation of these commitments, impacts associated with contaminated soil or groundwater would be less than significant.

In particular, LAX Master Plan Commitment HM-2 was designed to ensure that any potential effects from contaminated materials encountered during construction would be less than significant. In order to facilitate the implementation of this LAX Master Plan commitment, in 2005 LAWA adopted the "Procedure for the Management of Contaminated Materials Encountered During Construction" ("Procedure") for application to all LAX Master Plan projects. This Procedure provides detailed guidance for implementing HM-2, especially for projects involving excavation and grading of soils. The Procedure has provisions for, among other matters, preparing detailed plans for handling previously unknown areas of contaminated soil encountered and spills of hazardous materials that occur during construction, including provisions for preparing detailed health and safety and soils management plans, and for testing and segregating contaminated soils for proper disposal outside landfills. While the Procedure focuses on previously unknown contaminated materials, its provisions for handling, storing, and disposing of contaminated materials also apply to contaminated materials that LAWA already has identified, or will identify before the start of construction in the area of contamination. By following HM-2 and the Procedure that implements it, the environmental effects of grading, excavating and other construction activities associated with SPAS that involve handling of contaminated materials would be less than significant. As a result, potential impacts associated with contamination of soil or groundwater and exposure of workers to hazardous materials in areas that may be contaminated would be less than significant.

Section 4.7.3 of the SPAS Draft EIR also addresses the potential for contamination from SPAS improvements. As indicated in that section, activities associated with the operation of all the SPAS alternatives would increase the chances of a spill or release of substances that could result in contamination of soil or groundwater. However, the handling and storage of hazardous substances are stringently regulated, as are releases of hazardous materials, including emergency response and clean up requirements. In addition, compliance with the Procedure would ensure that spills and releases associated with the SPAS alternatives would not create a hazard to the public or the environment, and would not result in contamination of soil or groundwater. Therefore, impacts would be less than significant.

Soils that have been stockpiled at construction staging areas as part of past or ongoing construction activities at LAX were sampled prior to transport in accordance with LAWA's Procedure for the Management of Contaminated Materials Encountered During Construction, and with federal, state, and local laws. Contaminated soils are not stockpiled on the airport but, rather, are handled in accordance with federal, state, and local laws and regulations and LAWA's procedures.

SPAS-PC00130-266

Comment:

Page 4-582 HM-2. Handling of Contaminated Materials Encountered During Construction.
Prior to the initiation of construction, LAWA will develop a program to coordinate all efforts associated with the handling of contaminated materials encountered during construction.411 The intent of this program will be to ensure that all contaminated soils and/or groundwater encountered during construction are handled in accordance with all applicable regulations. As part of this program, LAWA will identify the nature and extent of contamination in all areas where excavation, grading, and pile-driving activities are to be performed. LAWA will notify the appropriate regulatory agency when contamination has been identified. If warranted by the extent of the contamination, as determined by the regulatory agency with jurisdiction, LAWA will conduct remediation prior to initiation of...

Question: Taxiway S, for instance, was recently constructed and dirt excavated. This soil was near the fuel farm and subsequently moved to staging areas. Where is the documentation that this soil was tested? Was the staging area tested for contamination? If this soil was moved from one staging area to another how was it tracked and documented?

Response:

Please see Response to Comment SPAS-PC00130-265 regarding testing of soil associated with past construction activities at LAX.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-267

Comment:

Page 4-586 Hazardous Materials
Due to the extent of the VOC contamination associated with the Park One (Former Honeywell/Allied Signal Aerospace) site, it is possible that remediation will still be underway when construction of Terminal 0 and the redesigned entry roadways is initiated. Remediation for this site consists of an SVE system that includes small aboveground vessels for treating the soil vapor, pipes connecting the dry wells to the vessels, and groundwater monitoring wells. Due to the extent of excavation needed for the Alternative 1 improvements, it is likely that part, or all, of the remediation system would have to be removed during construction, if it is still in operation at the time the SPAS improvements are constructed. This would entail destruction of the extraction wells and removal of underground piping and aboveground vessels. Removing the active remediation system at Park One for an extended period would interfere with existing clean up efforts. However, temporary cessation of remediation would not have any impacts on human health as groundwater beneath the site is not used for municipal purposes and contaminated soils lie beneath asphalt and would not be exposed.

Question: Since the groundwater will be contaminated from this site and the water is then allowed to flow into the ocean what regular testing is done to ensure safety?

Response:

Contamination at the Park One site (former Honeywell/Allied Signal Aerospace facility) is addressed in Section 4.7.3 of the SPAS Draft EIR. As indicated in Table 4.7.3-1 of the SPAS Draft EIR, soil and groundwater contamination have both been identified at the site. However, as noted on page 4-576, current remediation at the Park One site (former Honeywell/Allied Signal Aerospace facility) is focused on soil contamination. Further investigation of groundwater contamination is anticipated to occur in order to determine if remediation is required and, if it is so determined, to identify the nature of the remediation. Groundwater contamination from this site is primarily migrating to the east of the site. Westerly flow of contaminated groundwater has been limited to just west of Sky Way.1 Contrary to the statement in this comment, contaminated groundwater from the site has not migrated to the Pacific Ocean.

As provided in Section 4.7.3 of the SPAS Draft EIR, none of the SPAS alternatives would either cause or contribute to groundwater contamination at the Park One site. However, all of the alternatives except Alternative 4 would involve some degree of excavation at the Park One site that may conflict with the subsurface remediation system, if it is still in operation at the time the SPAS improvements associated with these alternatives are constructed. With implementation of LAX Master Plan Commitment HM-2, Procedure for the Management of Contaminated Materials Encountered During Construction ("Procedure") this impact would be less than significant. Please see Response to Comment SPAS-PC00130-265 for further discussion of the Procedure.

Comment:

Page 4-599 Hydrology 4.8.2 Methodology
The various sources and methodologies used for the hydrology and water quality analyses are consistent with the methodologies as applied in Technical Report 6, Hydrology and Water Quality

Technical Report, and Technical Report S-5, Supplemental Hydrology and Water Quality Technical Report, of the LAX Master Plan Final EIR. Relevant portions of those documents are incorporated by reference and summarized in this section (see Section 1.6 in Chapter 1, Introduction and Executive Summary, regarding where these documents are available for public review)....
413 Similar to Manchester Square, the Belford residential area is also being acquired under the Aircraft Noise Mitigation Program; however, the Belford Area is not included in the hydrology and water quality analysis because none of the SPAS alternatives propose a future reuse of that area.

Question: 4-599 LAWA acknowledges this is tiered and relies on old Alt D reports. One has to question their accuracy. The Manchester Tunnel which extends Lincoln Blvd under the north runway could not have been considered at that time because the key LAWA managers were denying its existence until about two years ago!

Response:

The SPAS Draft EIR is not tiered off of the LAX Master Plan Final EIR, although, as stated in Section 1.7 of the SPAS Draft EIR, portions of the LAX Master Plan Final EIR are incorporated by reference. The commentor provides no substantiation for the claim that the analysis of hydrology and water quality conducted for the LAX Master Plan Final EIR is inaccurate. The north airfield abandoned tunnel segment has no effect on, and is not affected by, hydrology or water quality at LAX. The tunnel segment is a below ground structure that runs beneath Runway 6L/24R. The structure has no entrance or exit but, rather, can only be accessed via manholes. LAWA has not denied the existence of the tunnel segment. Please see Response to Comment SPAS-PC00130-1012 for more details regarding the north airfield abandoned tunnel segment.

SPAS-PC00130-269

Comment:

Question: 4-599 Note 413 states that the hydrology report excludes Belford Square because none of the alternatives propose a future reuse of the area. How does a Master Plan not cover a significant piece of LAWA property? What is planned for this area?

Response:

Please see Response to Comment SPAS-PC00130-175 regarding land uses in the Belford area.

SPAS-PC00130-270

Comment:

Page 4-601 Operational Impacts Wet Weather Flows
Estimating the mass of pollutant load discharged to a water body requires knowledge of surface water runoff volume, discharge location, and pollutant load sources for a given area. Pollutants transferred out of the HWQSA by wet weather flows are the result of non-point pollution sources. A commonly accepted method is to estimate pollutant loads on an average annual basis using average pollutant concentration data from relevant published storm water investigations and monitoring, combined with estimates of annual average runoff from the project area. The U.S. Environmental Protection Agency's (USEPA) National Urban Runoff Program's (NURP) Final Report presents the results of an extensive runoff sampling and analysis program that consisted of collecting samples from more than 2,300 separate storm

Question: This analysis appears to assume that the wet weather runoff is "normal" as if it were from a residential or commercial street setting. Since it's known that many of the areas within airside are particularly contaminated it would be reasonable to assume more contaminants in the runoff. Where is this documented and how is it controlled?

Response:

The commentor is incorrect in its assertion that "it's known that many of the areas within airside are particularly contaminated" and provides no citations, information, or evidence in support of that claim. Section 4.7.3 of the SPAS Draft EIR addresses all known contamination at LAX. As described therein, and summarized in Table 4.7.3-1 and accompanying Figure 4.7.3-1, several specific sites at or near LAX have been evaluated relative to known or suspected soil or groundwater contamination, and the vast majority of those sites are now characterized as "case closed," indicating that contamination, if any, has been addressed to the satisfaction of regulatory agencies. Additionally, the majority of contamination issues at LAX have been associated with leaking subsurface fuel tanks and underground fuel lines, many of which are beneath paved surfaces. Notwithstanding that the comment mischaracterizes the airport relative to known contamination, the limited contamination that does exist primarily occurs below the surface and would have no contact with surface water runoff. Please refer to Response to Comment SPAS-PC00130-265 for a discussion of LAX Master Plan Commitments HM-1 and HM-2 which address clean up of sites with known contamination prior to construction and the handling of contaminated material encountered during construction. With implementation of these commitments, impacts association with contaminated soil or groundwater would be less than significant.

As discussed on pages 4-601 through 4-603 in Section 4.8 of the SPAS Draft EIR, the pollutant load calculations used Event Mean Concentration (EMC) taken from several sources for different types of land use in the various alternatives. For airport operations and airport open space land uses, EMC data were taken from a combination of monitoring data from runoff monitoring at airports compiled by the American Association of Airport Executives (AAAE), and data from transportation land uses compiled by the Los Angeles County Department of Public Works (LACDPW), which represents higher traffic volume streets. Therefore, these EMCs assume runoff quality that is typical from airports and roadways and are considered a reasonable basis for estimating loads from SPAS-related activities, as supported by substantial evidence in the SPAS Draft EIR.

SPAS-PC00130-271

Comment:

Page 4-604 Hydrology/Water Quality 4.8.3 Existing Conditions
The affected environment for this evaluation includes the HWQSA. The baseline conditions for drainage and water quality are described separately below.
As previously noted, the only hydrology issue considered for this analysis is drainage. Drainage is discussed as it relates specifically to the management of the systems designed to convey storm water runoff to prevent flooding as well as to the potential to cause or increase the potential for erosion or siltation. The environmental setting with respect to drainage and the potential for flooding focuses on the existing drainage system at LAX, as well as the off-site drainage facilities to which the drainage system at LAX discharges and regulatory issues that apply in designing drainage and flood control structures....
Note 429 The Conceptual Drainage Plan provides the basis by which detailed drainage improvement plans associated with LAX Master Plan projects are to be designed in conjunction with site engineering specific to each LAX Master Plan improvement project.

Question: 4.8.3 Only hydrology issue consider is drainage. Why were other issues ignored? Why are the LA City and County reports not referenced as noted in the body of the document except for a 2005 City plan? Note 429 simply states that there is a Conceptual Drainage Plan.

Response:

As explained on page 4-599 in Section 4.8 of the SPAS Draft EIR, impacts related to groundwater supply and recharge, and inundation by seiche, tsunami, and mudflow, were addressed in the 2010 SPAS NOP and do not require further analysis in the SPAS Draft EIR. Under CEQA, EIRs should focus their discussion on potentially significant impacts, and may limit discussion of other impacts to a brief explanation of why the impacts are not potentially significant. (Public Resources Code Section 21002.1(e).)

It is unclear to which Los Angeles City and County reports the commentor is referring. Federal, state, and local requirements pertaining to hydrology and water quality are discussed on pages 4-608 through

4-611 of the SPAS Draft EIR. In addition, as discussed in the Section 4.8 of the SPAS Draft EIR, and noted in this comment, the Conceptual Drainage Plan provides the basis by which detailed drainage improvement plans associated with LAX Master Plan projects are to be designed in conjunction with site engineering specific to each LAX Master Plan improvement project.1

1. City of Los Angeles, Los Angeles World Airports, Los Angeles International Airport Conceptual Drainage Plan, June 2005.

SPAS-PC00130-272

Comment:

Page 4-630 4.8.6.6 Alternative 6
Alternative 6 focuses on airfield and terminal improvements only. However, as noted in Section 4.8.2, for purposes of this analysis, impacts associated with ground access improvements are also considered. The distinguishing changes considered in this analysis relative to hydrology and water quality are the northerly movement and westerly extension of Runway 6L/24R, conversion of a portion of the unlined Argo Drainage Channel into a concrete box culvert (1,400 linear feet), conversion of open space to accommodate the realignment of Lincoln Boulevard, conversion of industrial area for the ITF, and conversion of the Manchester Square area to parking use. (underline for emphasis)

Question: 4.8.6.6 Alternative 6 analysis of Hydrology/Water Quality talks about extension of Runway 24R west but this was (and is) not part of the submitted plan by petitioners. What was the reason for ignoring the petitioner input?

Response:

LAWA staff considered all input received during the formulation of the SPAS alternative. Chapter 5 of the Preliminary LAX SPAS Report discusses the concept development process, including the steps used in the creation of the alternatives projects and the community involvement. (See also Chapter 4 of the Preliminary LAX SPAS Report.) Appendices D-1, D-2, and E1-01 of the Preliminary LAX SPAS Report provide further detail as to the community involvement process and concept development. As provided in those appendices and in Chapter 4 and Chapter 5, LAWA engaged the public throughout the alternatives formulation process, and incorporated many of the public's suggestions into the final SPAS alternatives.

As indicated on page 2-30 of the SPAS Draft EIR, Alternative 6 is proposed to extend Runway 6L/24R 604 feet west so that the existing RPZ at the east end of the runway no longer extends over residential areas, which responds to one of the SPAS project objectives, as presented on page 2-2 of the SPAS Draft EIR.

SPAS-PC00130-273

Comment:

Page 4-632 4.8.6.7 Alternative 7 Hydrology
Under Alternative 7, the total impervious area within the HWQSA would increase by 61 acres as compared to baseline conditions of 3,082 acres. Since much of the area surrounding the airport in both the Santa Monica Bay and Dominguez Channel watersheds is developed (i.e., impervious) under baseline conditions, this change would represent a marginal increase (2.0 percent) in regional impervious area.
The changes in impervious area would only occur within the Dominguez Channel Watershed, and would represent an increase of 5.5 percent (see Table 22 in Appendix H, Hydrology and Water Quality). As noted above, previous studies indicate that, under baseline conditions, the conveyance capacity of drainage infrastructure within the Argo sub-basin and Imperial sub-basin (including both the Pershing and Imperial components of the sub-basin) is adequate for the LADPW 50-year storm, while the Dominguez Channel sub-basin infrastructure would flood under these same conditions. Detailed analysis of the Dominguez Channel sub-basin capacity under this design storm for Alternative 7 was not conducted given the conceptual level of planning associated with all SPAS alternatives at this time as

discussed in Section 4.8.2. As shown in Table 4.8-5, the increase in impervious surface in the portion of the HWQSA tributary to Dominguez Channel is 5.5 percent, which would result in a net increase in peak flow rates to be conveyed by the drainage systems serving these areas. As previously noted, the Dominguez Channel is currently over capacity off-site and downstream from LAX; therefore, a 5.5 percent increase in peak

Question: Why was 50 year storm condition chosen instead of the 100 year storm condition given the criticality of LAX air operations?

Response:

The hydrology analysis for the SPAS Draft EIR did not calculate design flows associated with the various SPAS alternatives. Rather, as explained on pages 4-600 and 4-601 of the SPAS Draft EIR, the analysis of drainage impacts was conducted by evaluating changes in impervious surface area with implementation of the alternatives compared to baseline conditions. The text quoted by the commentor pertains to a prior study of drainage at LAX (referenced in Footnote 430 on page 4-607 of the SPAS Draft EIR), which was based on a 50-year storm event. The 50-year storm event is the maximum design storm event used by LADPW and LACDPW to design large capital drainage facilities. Storm events greater than this are extremely rare and facilities are not typically designed for these larger events. Large storm events, such as the 100-year storm event, may result in short-term, localized flooding but occur so infrequently (i.e., there is a 1% probability that that such an event would occur in any given year) and would remain for a very limited period of time before flows would recess to the storm drain that investment in much larger infrastructure is not warranted unless there are special conditions such as sumps, for which a 50-year event is used as the design storm.1 Similar hydrologic design standards are typical for most local public agencies with drainage responsibilities in California and other states, including the City of Los Angeles and the Los Angeles County Department of Public Works.2 Larger storm events with return frequencies such as 100-year or greater are generally only used when designing flood control dams and reservoirs by agencies such as the U.S. Army Corps of Engineers.3

Comment:

Page 4-638 4.8.7 Mitigation Measures Hydrology and Water Quality
Compliance with the Conceptual Drainage Plan, developed in accordance with LAX Master Plan Commitment HWQ-1, would ensure that impacts to hydrology and water quality associated with Alternative 3 would be less than significant. Therefore, no mitigation specific to SPAS is required for this alternative.

Question: 4.8.7 Mitigation Measures for Hydrology and Water Quality states that since Alt D was less than significant then so is any SPAS alternative based on Alt D. At the time of Alt D the Manchester Tunnel was unknown to LAWA and therefore the impact of underground, unknown sourced water was not considered. Now that this is known LAWA should have done more analysis. What are the results and impacts or mitigations now necessary?

Response:

The commenter misstates the conclusions reached in Section 4.8 of the SPAS Draft EIR. As evidenced by Section 4.8.6 of the SPAS Draft EIR, each proposed alternative was evaluated separately for impacts to hydrology and water quality. Because Alternative 3 must comply with the Conceptual Drainage Plan, developed in accordance with the LAX Master Plan, the impacts to hydrology and water quality were found to be less than significant. Similarly, to address impacts to hydrology and water

quality for other alternatives, Mitigation Measure MM-HWQ (SPAS)-1 was identified. The mitigation measure would revise and update the Conceptual Drainage Plan, to account for changes in the nature, location, design, and timing, if known, of the improvements under a specific alternative. With the implementation of MM-HWQ (SPAS)-1, as indicated in Section 4.8.7 of the SPAS Draft EIR, the hydrological and water quality impacts of Alternatives 1, 2, and 4 through 9 would be reduced to a less than significant level. The SPAS Draft EIR was prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of the environmental consequences of the project. (State CEQA Guidelines Section 15151.)

The commentor does not provide any factual basis or substantive evidence for the proposition that unknown source water exists at or near the Manchester Tunnel. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester Tunnel).

SPAS-PC00130-275

Comment:

Page 4-638 4.8.7 Mitigation Measures Hydrology and Water Quality
The CDP revision and update will provide the basis and specifications by which detailed drainage improvement plans shall be designed in conjunction with site engineering specific to each improvement associated with any selected SPAS alternative, as well as the remaining LAX Master Plan improvements that would not change due to the SPAS alternative, including, if necessary, improvements to address increased erosion and sedimentation. Consistent with the requirements for the 2005 CDP, the drainage system design and identification of needed improvements shall be based upon providing flood protection for a minimum 10-year storm event. As also required in the 2005 CDP, water quality treatment BMPs, which may include infiltration basins/systems, bioretention, vegetated swales, detention/retention basins/systems, media filtration, water quality inlets, catch... (underline for emphasis)

Question: 4.8.7 Mitigation measures. LAWA again states that it bases its Conceptual Drainage Plan (CDP) on the old LAX Plan. However new factors have been raised such as the need to run artesian wells for several years in order to build the Manchester tunnel. These have apparently not been taken into consideration and should be updated. Further, since the potential issue of sandy soil combined with an unknown water source creates more serious consequences from not providing adequate flood protection. This means that LAWA should have provided more adequate mitigation in its plan for beyond a min 10-year storm event. Rather it should have addressed the 50 year or 100 year event to reduce potential consequences. Please provide this information and updated impacts.

Response:

As noted in footnote 429 on page 4-604 of the SPAS Draft EIR, the CDP prepared for the LAX Master Plan provides the basis by which detailed drainage improvement plans associated with LAX Master Plan projects are to be designed in conjunction with site engineering specific to each individual improvement project. The CDP is a valid document and would serve as the foundation for any revisions necessary to address the SPAS alternatives. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester tunnel) and a discussion of artesian wells as related to construction activities. The commentor provides no evidence to substantiate the claim that unknown water sources or sandy soils would adversely affect flood protection. Please see Response to Comment SPAS-PC00130-169 regarding the design criteria for drainage facilities at LAX and the appropriateness of using a 10-year storm event as the minimum standard for CDP revisions.

SPAS-PC00130-276

Comment:

Page 4-649 Figure 4.9-2 Los Angeles County Airport Land Use Plan Land Use Compatibility Table

Question: The Los Angeles County Airport Land Use Plan, 1991 quoted in the subject table shows "Caution. Review Noise Insulation Needs" for residential land use category from 60 CNEL. Where are the reports in the DEIR showing this review? Contours shown are for 65 CNEL.

Response:

While the Land Use Compatibility Table shown in Figure 4.9-2 of the SPAS Draft EIR provides a general indication of the compatibility relationship between certain types of land uses and various levels of community noise exposure, its primary application in the ALUP pertains to the siting of new uses and the recycling of incompatible land uses, as evidenced in General Policies G-1 and G-2 on page 12 of the County ALUP. Those two policies state, respectively: "Require new uses to adhere to the Land Use Compatibility Chart" and "Encourage the recycling of incompatible land uses to uses which are compatible with the airport, pursuant to the Land Use Compatibility Table." (The "chart" and "table" referenced in these two policies both refer to the same Land Use Compatibility Table in the ALUP.) In addition, ALUP Policy N-3 provides that agencies should utilize the table listing land use compatibility for airport noise environments in evaluating projects within the planning boundaries.

The Land Use Compatibility Table is advisory, and the note "Review Noise Insulation Needs" for uses that are categorized as "Caution" in the subject table is advisory to the land use jurisdictions considering the approval of new uses that fall into that category. Relative to the potential need to add sound insulation to homes that may be newly exposed to aircraft noise levels in excess of 65 CNEL, the application of such noise insulation is administered in accordance with the LAX Aircraft Noise Mitigation Program described in Section 4.9.5 of the Draft EIR. Regarding the use of 65 CNEL for identification of significant impacts, as defined on page 4-684 of the SPAS Draft EIR, the 65 CNEL noise contour is the appropriate threshold used to determine aircraft noise impacts based on criteria presented in 14 CFR Part 150; FAA Order 5050.4B; FAA Order 1050.1E; Title 21 California Code of Regulations; and the Caltrans California Airport Land Use Planning Handbook. The ALUP further clarifies on page 10 that the 60-65 CNEL noise contour more accurately represents the annoyance factor associated with smaller but lower flying aircraft for general aviation airports (e.g., Hawthorne, Santa Monica, Torrance). The ALUP also states that for commercial airports, such as LAX, the 65-70 CNEL contour boundaries will be used.

Nevertheless, for informational purposes Section 4.10.1 of the SPAS Draft EIR depicts the 60 CNEL noise contour for Alternatives 1, 2, 3, 4, 5, 6, and 7 and Section 4.9.6 identifies those non-residential noise-sensitive facilities that would be exposed to increases of 3 CNEL between the 60 and 65 CNEL noise contours compared to 2009 baseline conditions.

SPAS-PC00130-277

Comment:

Page 4-654 4.9 Land Use Planning
The LAX Northside area provides for the development of uses that are consistent with airport needs and neighborhood conditions, while also serving as an airport buffer zone (comprised of compatible development and landscape) for the Westchester community. It may also serve as a relocation area for businesses displaced by the implementation of the LAX Master Plan...
Note 481 LAX Northside, part of the LAX Master Plan approved by the City of Los Angeles in 2004, is an approved airport development project that includes future development of 4.5 million square feet of commercial and airport-related industrial land uses to be built on 340 acres of vacant land located north of Runway 6L/24R (the northern most runway at LAX) along and north of Westchester Parkway. Currently, LAWA is engaged in the LAX Northside Plan Update, which is considering development of a different land use mix, including mixed-use, community/civic space, office/education/research space, and airport support uses, on 340 acres.

Question: How can the above uses for the LAX Northside be applied if the existing 1982 Northside Plan was negated by changes assumed in the approval of Alternative D? Is this assuming completion of a new Northside Plan by LAWA? The above paragraph states that it may service as a relocation area for displaced businesses. Must the rezoning of the Northside be completed before this is accomplished?

Response:

The referenced discussion on page 4-654 of the SPAS Draft EIR is based on the existing LAX Plan. The LAX Plan and LAX Specific Plan are the land use regulatory documents applicable to LAX including the LAX Northside area. As described on page 4-39 in Section 4.1 of the SPAS Draft EIR, future development within LAX Northside would be subject to height restrictions, setback requirements, and landscape guidelines as set forth in Appendix A of the LAX Specific Plan, as well as the 1989 LAX Northside Design Plan and Guidelines. The implementation of these conditions would promote a visually open landscaped northern boundary, and setbacks and height limits would reduce aesthetic impacts associated with the airfield modifications. Allowable uses within the LAX Northside area include a variety of commercial, retail, office, business park, research and development centers, hotels, light industrial, and open spaces uses, as delineated in Appendix A of the LAX Specific Plan. This range of allowable uses would permit the types of existing uses displaced by the implementation of the LAX Master Plan. Relative to the SPAS alternatives, Figure 2-11 in Chapter 2 of the SPAS Draft EIR delineates the parcels that would be acquired under the SPAS alternatives and Table 2-5 of the SPAS Draft EIR provides a breakdown of which parcels would be acquired under each of the relevant SPAS alternatives. Existing facilities affected by SPAS alternatives are shown in Figure 2-10 and described in Table 2-3.

Businesses that may be displaced by a SPAS alternative may be able to relocate to a number of other LAWA-owned properties, which could include the LAX Northside. A relocation into the LAX Northside is not contingent on the completion of a new land use plan for LAX Northside (i.e., the Northside Plan Update), as noted in Footnote 481 on page 4-654 of the SPAS Draft EIR, nor would it require rezoning of LAX Northside.

SPAS-PC00130-278

Comment:

Page 4-657 LAX Plan The policies most pertinent to SPAS-related land use issues include:
Land Use - LAX Northside

Question: When quoting the LAX Plan policies why did the DEIR left out P2 and P3 for the LAX Northside as it relates to SPAS? These two policies are P2. Provide community outreach efforts to property owners and occupants through measures such as public notification and public meetings, when new development on airport property is in proximity to, and could potentially affect, nearby residential uses. P3, Orient LAX Northside development to encourage access from Westchester Parkway and other roadways internal to LAX Northside. Since LAWA is stating that this will be used as a relocation site one would expect that these policies would also be adhered to.

Response:

The policies identified in Section 4.9 of the SPAS Draft EIR are those most applicable to SPAS-related land use issues. LAX Northside policies P2 and P3 in the LAX Plan apply to development within LAX Northside, and do not apply to the SPAS alternatives. As indicated in Section 4.9.6 of the SPAS Draft EIR, no changes are proposed to LAX Northside, with the exception of the Lincoln Boulevard realignment under Alternatives 1, 5, and 6. LAWA would adhere to Policies P2 and P3 as development within LAX Northside is proposed, including the LAX Northside Plan Update currently underway as described in Footnote 481 on page 4-654 in Section 4.9. Please see Response to Comment SPAS-PC00130-277 regarding relocation of displaced businesses within LAX Northside.

SPAS-PC00130-279

Comment:

Question: Although policies were not listed in order of the LAX Plan, the DEIR deleted only Safety policy P6. Consult with the Los Angeles Fire Department during the design phase of facilities to review plans and incorporate recommendations that enhance airport safety. Why?

Response:

Pursuant to the thresholds of significance identified in Section 4.9.4 of the SPAS Draft EIR, a significant land use impact would occur if the direct and indirect changes caused by a particular SPAS alternative would result in a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. (See State CEQA Guidelines, Appendix G, Section X(b).) Therefore, the policies identified in Section 4.9 of the SPAS Draft EIR are those that were adopted for the purpose of avoiding or mitigating environmental effects. Safety policy P6 applies to fire protection and was not adopted for the purpose of avoiding or mitigating an environmental effect. This policy is addressed as part of LAX Master Plan Commitment FP-1, LAFD Design Recommendations. LAX Master Plan Commitment FP-1 is applicable to all SPAS alternatives (see pages 4-1003 and 4-1004 in Section 4.11.1 of the SPAS Draft EIR).

SPAS-PC00130-280

Comment:

Question: The DEIR delineated "most pertinent" policies of the LAX plan and failed to list any Security policies such as:
P1. Evaluate, develop and improve, as necessary, Central Terminal Area, Intermodal Transportation Center, and Satellite Terminal FlyAway security - both physical and operational - as part of overall security improvements at LAX.
P2. Develop entry security improvements in the Central Terminal Area by limiting access by non-secure private, public and commercial vehicles.
P3. Design and construct facilities that provide for security of passengers by providing multiple levels of security screening procedures while maintaining ease of use.
P4. Provide law enforcement and fire facilities to enhance the ability to respond to emergency situations and facilitate coordination with other emergency response agencies.
Why does LAWA feel that security policies are not important enough to identify in the document? Why is Circulation and Access also ignored? What about Noise, Hazardous Waste, and Design policies?

Response:

Pursuant to the thresholds of significance identified in Section 4.9.4 of the SPAS Draft EIR, a significant land use impact would occur if the direct and indirect changes caused by a particular SPAS alternative would result in a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. (See State CEQA Guidelines, Appendix G, Section X(b).) Therefore, the policies identified in Section 4.9 of the SPAS Draft EIR are those that were adopted for the purpose of avoiding or mitigating environmental effects. The policies cited by the commentor relate to security, including limits on access and facility design, not environmental effects. Therefore, they were not reviewed in Section 4.9 of the SPAS Draft EIR.

The EIR does analyze security, circulation and access, noise, hazardous waste, and design policies in sections more appropriate for such analysis. Security measures related to the SPAS improvements are addressed in Section 4.11.2 of the SPAS Draft EIR. Appendix I of the Preliminary LAX SPAS Report also assesses the security characteristics of the SPAS alternatives in comparison to existing conditions. These conclusions are summarized in Section 6.3 of the Preliminary LAX SPAS Report.

Chapter 2 and Sections 4.12.1 and 4.12.2 of the SPAS Draft EIR describe project components that are related to Circulation and Access policies regarding direct links between Airport Airside and Airport Landside facilities, regional mobility, transit ridership, and other improvements proposed under the SPAS alternatives.

Sections 4.9 and 4.10.1 of the SPAS Draft EIR describe applicable project components and LAX Master Plan commitments and mitigation measures directly related to Noise policies, including updating and expanding LAWA's ANMP, updating facilities to accommodate new large aircraft (NLA), and using over-ocean procedures during nighttime, when weather permits.

Section 4.7.3 of the SPAS Draft EIR addresses the handling of hazardous materials and presents applicable LAX Master Plan commitments in conformance with Hazardous Waste policy P1. Section 4.1 of the SPAS Draft EIR presents relevant Design policies on page 4-11 of the SPAS Draft EIR.

SPAS-PC00130-281

Comment:

Page 4-663 LAX Street Frontage and Landscape Development Plan Update

Question: Has LAWA ever distributed or circulated this Plan for comment or is it considered an internal policy statement only? The one objective listed in the DEIR of "Enhance LAX's compatibility with adjacent land uses, neighborhoods, and communities." is laudable, but what other things does this plan call for? Since it hasn't been updated since 2005, are there any updates?

Response:

Please see Response to Comment SPAS-PC00130-223 regarding the LAX Street Frontage and Landscape Development Plan Update. The LAX Street Frontage and Landscape Development Plan Update was cited in footnote 40 of the SPAS Draft EIR, is included in the administrative record, and was available upon request at LAWA's Capital Programming and Planning Division (formerly Facilities Planning Division), Room 208, One World Way, Los Angeles, California and continues to be available for review upon request to LAWA (SPAS Contact Person Diego Alvarez, as indicated on SPAS public notices and SPAS website). The LAX Street Frontage and Landscape Development Plan Update was not distributed for public review and comment as it is an internal policy document that does not require public input. However, the Plan includes applicable LAX Master Plan commitments identified in the LAX Master Plan Draft EIR and Supplement to the Draft EIR, which were circulated for public review and comment in 2001 and 2003, respectively. There have not been any updates to the LAX Street Frontage and Landscape Development Plan since March 2005. As described in Response to Comment SPAS-PC00130-223, LAWA has been and continues to implement a LAX Beautification Enhancements Program to improve the image, function, and circulation of the airport.

Additional components of the LAX Street Frontage and Landscape Development Plan Update, including objectives, standards, and planning areas, are presented on pages 4-11 through 4-13 in Section 4.1 of the SPAS Draft EIR.

SPAS-PC00130-282

Comment:

Page 4-664 4.9.3.3 Existing Incompatible Land Uses
Aircraft Noise Mitigation Program
The City of Los Angeles, as the airport proprietor, addresses incompatible land use within the communities surrounding LAX pursuant to the land use compatibility requirements of the California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq.). LAX operates under a variance to the California Airport Noise Standards (Noise Standards) that was effective February 13, 2011 and was issued for a period of three years.487 The variance remains in effect so long as LAWA submits another application one month prior to the expiration date and continues to demonstrate that programs are being implemented to reduce noise impacts. Under the variance, LAWA...

Question: What penalties occur if LAWA fails to adhere to the four items listed? Has LAWA provided the quarterly reports within the prescribed 45 days? Several other variance conditions were stipulated such as the requirement for hush houses for maintenance/testing of aircraft. How has this provision and others not listed been incorporated into the program level plans? If not, why not?

Response:

The commentor discussed LAWA's commitment to comply with the specific requirements imposed by conditions of the current noise variance for LAX. As part of the provision to the California Airport Noise Standards, LAWA is required to comply with the conditions related to the Aircraft Noise Mitigation Program (ANMP) as outlined on pages 4-664 through 4-667 in Section 4.9.3.3 of the SPAS Draft EIR. As part of the program, LAWA continues to submit to the State of California Department of

Transportation (Caltrans) and the County of Los Angeles the required Quarterly Reports which depict the noise impact area, and report on the incompatible land uses along with the daily and annual CNEL values at each monitoring station (this aspect of the variance procedure is not relied upon to reduce or avoid impacts). Quarterly Report submittal for LAX is currently behind schedule due to a backlog that was created when LAWA installed a new noise monitoring system. This new system was approved for use by Caltrans in 2010, and LAWA was some six quarters behind in submitting these reports at that time. LAWA has been in contact with the County and State, as oversight agencies, informing them of the issues and the schedule for catching up with the backlog. LAWA is diligently working to get caught up with the backlogs and will make the quarterly reports available to the public on the LAX Noise Management website (http://www.lawa.org/welcome_lax.aspx?id=1090) as soon as practical.

SPAS-PC00130-283

Comment:

Page 4-665 Noise Variance

As summarized in the ANMP tables updated for 2010,491 all incompatible land uses within the 1992 fourth quarter 65 CNEL noise contour or within 65 CNEL areas extending beyond the 1992 contour based on the most recent quarterly report, are eligible for participation in the ANMP. Although the area significantly impacted by noise has been reduced since 1992, and a number of parcels within the 1992 contour are no longer exposed to noise levels of 65 CNEL and higher, all incompatible residential, school, church, and hospital parcels within the 65 CNEL noise contours defined above are eligible for mitigation under the ANMP.492

Question: Has the FAA notified LAWA of changes to the applicability of the 1992 contour? How is this included in the baseline and subsequent comparisons of noise impacts?

Response:

The commentor inquires about the use of the 1992 contours for the existing Aircraft Noise Mitigation Program (ANMP) at LAX.

The FAA notified LAWA in 2010 that any amendment to the existing sound insulation passenger facility charge (PFC), or any new application for PFCs for the purpose of sound insulation, would need to utilize the current FAA approved noise contour; in this case, the Alternative D 2015 65 CNEL contour. The FAA also established a transition period during which LAWA could spend its own revenue within a current program area through the end of 2015 - so long as those properties were also within the FAA's current 60 CNEL contour.

Title 21 of the California Code of Regulations, Subchapter 6 (also known as the California Airport Noise Standards) requires that LAWA have a program in place to bring into compatibility those properties that are part of the Noise Impact Area. The Noise Impact Area is defined within Title 21 as those incompatible land uses within the 65 CNEL contour, and such area is presented in the airport's most current Quarterly Report. Therefore, as discussed on page 4-665 of the SPAS Draft EIR and as consistent with the notification received by LAWA from the FAA, properties located within the latest Quarterly Report contour are potentially eligible for participating in the mitigation program.

In early 2011 LAWA, staff met with the staff for each of the affected programs, including the City of El Segundo, City of Inglewood, and the County of Los Angeles, to discuss the fact that "the clock was ticking" on the existing programs. LAWA's intention was to maximize the number of dwellings within each jurisdiction that could be insulated prior to the end of 2015.

The baseline noise contours are not impacted by the 1992 contour referenced in the comment letter. (See Section 4.10.1.3 of the SPAS Draft EIR for discussion of baseline.) See Sections 4.10.1.7 and 4.10.1.8 of the SPAS Draft EIR for discussion of post mitigation significance conclusions.

SPAS-PC00130-284

Comment:

Page 4-666 Noise Variance
...As presented in the ANMP tables, of the 33,165 residential units identified within the ANMP contours at that time, approximately 12,402 previously incompatible dwelling units were made compatible.

Residential sound insulation had been completed for 1,241 units in unincorporated Los Angeles County; 4,827 units in the City of Los Angeles; 677 units in El Segundo; and 2,971 units in Inglewood. Dwelling units have also been made compatible through land recycling, including approximately 816 units in Inglewood and 1,870 units in the City of Los Angeles. El Segundo's residential sound insulation program also includes additional units within the 60 CNEL noise contour identified for the approved LAX Master Plan and is funded by the FAA through the end of 2015.493 The number of units receiving sound insulation under El Segundo's program is not formally published.49...

Question: How many units remain unmitigated? If jurisdictions in El Segundo, LA County, and Inglewood are allowed to include air conditioners as part of the mitigation, why is the FAA opposed (and LAWA not fighting for) this for LA residents?

Response:

Under the LAWA Aircraft Noise Mitigation Program (ANMP) as of July 1, 2012, the total number of units unmitigated is 14,543, which includes areas around LAX as well as areas around Ontario International Airport (i.e., City of El Segundo 3,265; City of Inglewood 4,620; City of Los Angeles 1,867; Los Angeles County 3,976; and City of Ontario 815).

Regarding whether air conditioners are included as part of the mitigation program, the FAA had been opposed to air conditioners in Climate Zone 6, which is a State-appropriated climate zone. Climate Zone 6 is the area for homes at/adjacent to the ocean, west of I-405. The reasoning was that temperatures at the beach were cooler than areas inward from the beach and did not justify the cost of installing air conditioning when positive ventilation systems would suffice. The jurisdictions in the noise mitigation program are in Climate Zone 6 (City of El Segundo, parts of the City of Los Angeles - Westchester, Playa del Rey), Climate Zone 8 (City of Inglewood, parts of the City of Los Angeles - South LA, LA County), and Climate Zone 10 (City of Ontario). The City of Los Angeles, for the areas of Westchester and Playa del Rey, which are in Zone 6, did not receive air conditioning as it was not approved at that time under the FAA guidelines. The City of Los Angeles residents in South Los Angeles did however, receive air conditioning as they are in Climate Zone 8.

The City of El Segundo, which is also in Climate Zone 6, independently pursued a practice of installing air conditioning units instead of installing positive ventilation systems. The City of El Segundo terminated that practice in 2010 to maximize the use of exiting funds for sound insulation work.

SPAS-PC00130-285

Comment:

Question: The same section discusses a Part 161 Noise Study. Why has it not been completed? Does the Part 161 Noise Study use the same aircraft fleet mix assumptions as the noise contour studies? If not, why not?

Response:

Please see Response to Comment SPAS-PC00130-131 regarding the status of the Part 161 Study. The LAX Part 161 Study and the SPAS Draft EIR analyzed two different forecast years, 2017 and 2025, respectively. Therefore, no valid comparison could be drawn because 8 years separate the two forecast.

SPAS-PC00130-286

Comment:

Page 4-667 LAWA Voluntary Residential Acquisition/Relocation Program

Question: Footnote 498 lists a BOAC action to establish the Voluntary Acquisition Project for both Manchester Square and Belford Square. How does one get a copy of this very old item since it's not on-line? Most people were aware of the MS aspects, but few, if any knew Belford Square was a part as it was never shown in other documents or even Alt D. It was raised in SPAS early on, but LAWA has not responded to potential uses recommended.

Response:

The Relocation Plan for the Voluntary Acquisition and Relocation Program was the subject of Resolution No. 21093, which was approved by the Board of Airport Commissioners on July 18, 2000. Copies of the Resolution and the Relocation Plan are available for review at LAWA, Capital Program and Planning Division, 1 World Way, Los Angeles, CA. The Resolution authorized the Executive Director to open the voluntary property acquisition program to all property owners and provide relocation services to all owners and tenants in the Manchester Square and Airport/Belford areas. The Plan, the Initial Study/Mitigated Negative Declaration that accompanied the plan, and the Board item all refer to both Manchester Square and Airport/Belford. The LAX Master Plan Final EIR included a detailed description of the voluntary acquisition program on page 4-144, which indicated that the acquisition included units within both Manchester Square and the Airport/Belford area. The Airport/Belford area is addressed in relevant sections of the LAX Master Plan including, most notably, Section 4.2, Land Use. Both the description of Alternative D in Chapter 3, Alternatives (Including Proposed Action), and the land use analysis of Alternative D, indicate no development plans are proposed for the Belford area under Alternative D (pages 3-81 and 4-295 of the LAX Master Plan Final EIR, respectively) and the area was assumed to remain vacant. The Airport/Belford area was not a subject of the SPAS Draft EIR, as the area is unrelated to the Yellow Light Projects or the analysis of alternatives to the Yellow Light Projects.

SPAS-PC00130-287

Comment:

Page 4-668 Land Use and Planning LAX Master Plan Draft Relocation Plan

The Draft Relocation Plan includes parcel-level detail for the properties proposed for acquisition under the approved LAX Master Plan, an assessment of relocation effects, and procedures for implementing LAWA's LAX Master Plan Relocation Assistance Program (RAP) in accordance with applicable laws, regulations, and policies.500,501 The Plan includes an inventory of acquisition and relocation properties, an assessment of acquisition and relocation needs, and an assessment of relocation opportunities. No residential uses are proposed for acquisition. The LAX Master Plan program identifies approximately 34 businesses located on approximately 77 acres that would be acquired to accommodate airport development.

Question: Where are these documents available for review and how do these properties relate to any of the alternatives?

Response:

The LAX Master Plan Draft Relocation Plan is available at: http://ourlax.org/publications.aspx. The LAX Master Plan Relocation Assistance Program is a component of the Draft Relocation Plan. The proposed property acquisition areas identified for 2015 Alternative D of the LAX Master Plan are listed in Table 9-2 and shown in Figure 2.7-1 of the Draft Relocation Plan.

The acquisition areas identified in the LAX Master Plan Draft Relocation Plan include many of the same parcels proposed for acquisition under the SPAS alternatives, as shown in Figure 2-11 and listed in Table 2-4 of the SPAS Draft EIR. Specifically, Table 2-5 and Figures 2-12, 2-13, and 2-14 of the SPAS Draft EIR identify which parcels would be acquired under Alternatives 1, 2, 3, 4, 8, and 9. In addition,

Table 4.9-5 in Section 4.9 of the SPAS Draft EIR presents a comparison of acquisition areas by land use for the applicable SPAS alternatives. As noted in Table 4.9-5, no acquisition is proposed for Alternatives 5, 6, and 7 since these alternatives focus on airfield and terminal components only, although acquisition would be required for the ground access components with which these alternatives would be paired.

Comment:

Page 4-673 Table 4.9-4 Summary of Existing Off-Airport Residential Uses and Non-Residential Noise-Sensitive Facilities in the Study Area

Question: What does Title 21 compatible and Title 24 compliant mean?

Response:

The terms "Title 21 Compatible" and "Title 24 Compliant" parcels are identified in Footnote 2 of Table 4.9-4 on page 4-673 of the SPAS Draft EIR. As described on pages 4-664 and 4-665 in Section 4.9.3.3 of the SPAS Draft EIR, Title 21 Compatible refers to those residential properties within the Noise Impact Area (defined by the 65 CNEL noise contour) that are deemed compatible through either sound insulation to achieve interior noise levels below 45 CNEL, or conversion to a compatible use (e.g., from a residential to industrial use).

Title 24 Compliant means that residential units within the identified parcels were constructed in conformance with the California Noise Insulation Standards (California Code of Regulations, Title 24, Part 2, Appendix Chapters 12 and 12A), which requires that multi-family dwelling units constructed in areas of high noise levels (i.e., greater than 65 CNEL) include sound insulation to reduce interior noise levels to 45 CNEL.

SPAS-PC00130-289

Comment:

Page 4.9 Land Use Planning Westchester-Playa Del Rey Community Plan
... Most of the topography is level except for an amount of varied, hillside terrain located in the northwest and west portions of the Plan area where there are significant coastal bluffs. The land use consists primarily of low to low-medium density residential uses, with commercial uses concentrated near the transit corridors of Lincoln Boulevard, Sepulveda Boulevard, and Century Boulevard. Residential land uses account for approximately 2,357 net acres with approximately 22,794 dwelling units, of which 49 percent are multi-family units. Concentrations of multifamily residential uses are located near La Tijera Boulevard and Manchester Avenue.524... (underline for emphasis)

Question: Many of the areas within Westchester as well as PDR are also hilly with peaks and valleys which amplify sound from aircraft. The DEIR characterization is inaccurate. How has this been used in the evaluation for sound impact?

Response:

The commentor states that the characterization of the Westchester and Playa del Rey topography in the SPAS Draft EIR is inaccurate. The description of topography, as provided on page 4-680 in Section 4.9.3.4 of the SPAS Draft EIR. It is acknowledged that other areas within Westchester and Playa del Rey are hilly with peaks and valleys; however, this generalized description was not used to evaluate noise impacts, but rather, noise impacts were evaluated based on noise exposure contours and grid point analysis, which incorporated digital topographic data from the U.S. Geological Survey into the model input. The noise analysis methodology is described on pages 4-796 and 4-797 in Section 4.10.1.2 of the SPAS Draft EIR. Aircraft noise impacts are analyzed in Sections 4.10.1.6 and 4.9.6 of the SPAS Draft EIR. The commentor is also referred to responses to the same comments/questions posed by ARSAC in Responses to Comments SPAS-PC00130-209, SPAS-PC00130-468, and SPAS-PC00130-937.

SPAS-PC00130-290

Comment:

The concentration of multifamily residential uses is also misleading. It is south of Manchester and east of Airport not as described. How was this description used in the evaluation of impacts?

Response:

The commentor also suggests "the concentration of multifamily residential uses is also misleading. It is south of Manchester and east of Airport not as described." The commentor appears to be referencing language on the top of page 4-680 which states "concentrations of multi-family residential uses are located near La Tijera Boulevard and Manchester Avenue."' (Emphasis added.) The description of multi-family residential uses being near La Tijera Boulevard and Manchester Avenue includes multi-family residential areas south of Manchester Avenue and east of Airport Boulevard. The description in the SPAS Draft EIR is accurate and consistent with the requirements of CEQA. (See State CEQA Guidelines Section 15125(a) ["the description of the environmental setting shall be no longer than is necessary to an understanding of the significant environmental effects of the proposed project and its alternatives."]

However, as discussed under Responses to Comments SPAS-PC00130-209, SPAS-PC00130-289, SPAS-PC00130-468, and SPAS-PC00130-937 much more detailed topographic information was used for modeling aircraft noise. Furthermore, the actual concentration of residential uses in the land use and the noise analyses was based on LAWA data as updated by 2010 census data. As analyzed in Section 4.9.6 for Alternatives 1 through 7, some noise-sensitive uses in Westchester-Play del Rey would be newly exposed to high noise levels and would be significantly impacted prior to completion of sound insulation.

SPAS-PC00130-291

Comment:

Page 4-684 Land Use 4.9.4 Thresholds of Significance

A significant land use impact would occur if the direct and indirect changes in the environment caused by the particular SPAS alternative would result in one or more of the following future conditions:
- Conflict with any applicable land use plan, policy, or regulation (including, but not limited to, the general plan, specific plan, local coastal program or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.
- Create physical incompatibility with existing land uses through increased aircraft noise exposure.

Question: Please define what the second bullet "create physical incompatibility" means.

Response:

As stated on page 4-684 of the SPAS Draft EIR, per the second threshold of significance referenced by the commentor, a SPAS alternative would "create physical incompatibility" through increased aircraft noise exposure that would conflict with existing land uses, as defined by State and federal standards. Based on these standards, described on pages 4-641 and 4-642, and as further analyzed in Section 4.9.6 of the SPAS Draft EIR, incompatible land uses would result when residential and non-residential noise sensitive facilities are newly exposed to noise levels of 65 CNEL or higher; increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours; or outdoor private habitable areas, parks, or schools newly exposed to noise levels of 75 CNEL or higher under Alternatives 1, 2, 3, 4, 5, 6, and 7 compared to 2009 baseline conditions.

SPAS-PC00130-292

Comment:

Page 4-692 Consistency with Land Use Plans - On-Airport Land Table 4.9-5
General Comparison of Acquisition Area Land Use - SPAS Alternatives
No acquisition is proposed under Alternatives 5, 6, and 7 since these alternatives only include airfield and terminal components.

Question: The DEIR indicates no acquisition is anticipated by the DEIR. When will LAWA acknowledge that movement of runways north will require acquisition of a significant portion of the Westchester Business District and some homes? How will these costs be accounted for in the SPAS report which is a part of the DEIR by reference?

Response:

The content of this comment is similar to that of comments SPAS-AL00007-26 and SPAS-AL00007-27; please refer to Responses to Comments SPAS-AL00007-26 and SPAS-AL00007-27.

SPAS-PC00130-293

Comment:

Section 4.10 Noise

Question: It appears that the 1992 Contour was not used and that a new baseline contour was recalculated. Is that correct?

Response:

The commentor is correct. The "1992 Contour" was not used in the SPAS Draft EIR. As described in Section 4.10.1.1.4 of the SPAS Draft EIR and in Appendix J1-1 of the SPAS Draft EIR, the aircraft noise analyses conducted for the SPAS Draft EIR included an evaluation of baseline (2009) conditions.

SPAS-PC00130-294

Comment:

Question: Table 4.10.1-5 lists schools expected to be impacted by above 55 interior dBA. Why is St. Bernards not listed despite being in the 65 CNEL contour. Why?

Response:

Contrary to the suggestion in the comment, Table 4.10.1-5 on page 4-822 of the SPAS Draft EIR does not show "schools expected to be impacted." This table shows the Time Above (TA) 84 dBA noise metric under baseline conditions. The TA-84 metric is the number of minutes per school day that exceed an exterior noise level of 84 decibels Lmax which equates to an interior noise level of 55 dBA Lmax at a grid point. Saint Bernard High School does not have any TA-84 value listed in the table despite being in the 65 CNEL for the following reasons. First, the aircraft CNEL noise contour is calculated based on annual conditions with average operations occurring in a 24 hour period including day, evening, and nighttime. Second, the TA-84 metric for Saint Bernard High School is computed only for daytime operations (8:00 a.m. - 4:00 p.m.) and the INM model did not generate any reportable values at this location. Saint Bernard High School is discussed, however, in Table 4.10.1-6 of the SPAS Draft EIR.

SPAS-PC00130-295

Comment:

Question: What does Alt 1 "no additional improvements" mean? Alt 1 moves 24R 265' north and Table 4.10.1-9 matches earlier population exposure increase numbers. "No additional improvements" is more equivalent to LAX upgrade alternatives 3 or 4 of the Plan. Alt 2 is correctly described as no greater

separation but with 24L extended east. What is the true meaning of the referenced "no additional improvements"?

Response:

As described on page 4-796 in Section 4.10.1.2 of the SPAS Draft EIR, an alternative with "no additional improvement" would include only a runway extension for compliance with the Runway Safety Area (RSA) regulations, which would not materially change the operating conditions of the existing airfield. Alternative 4 of the SPAS represents a "Future (2025) Conditions Without Airfield Improvements" scenario, also referred to as "2025 'No Additional Improvements' Conditions."

SPAS-PC00130-296

Comment:

Question: The ANSI Awakening Probability figures look like the CNEL noise contours, but at night the aircraft are operating in "over ocean" about 80% of the time. Explain the reason for the % probabilities mirroring the contours. What explains the drop in awakenings in 2025? Is this based on Leq8 instead of CNEL and that changes differently than CNEL?

Response:

As described in Section 4.10.1.2.3.1 of the SPAS Draft EIR, the nighttime awakenings prediction methodology used for the SPAS analysis is the American National Standards Institute (ANSI), "Quantities and Procedures for Description and Measurement of Environmental Sound-- Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes," ANSI S12.9-2000/Part 6, 2008. As indicated therein, the ANSI methodology accounts for the multiple noise events over the course of an entire night, which is defined as the period between 10:00 p.m. and 7:00 a.m. The LAX Over-Ocean Operations occur only between midnight and 6:30 a.m.; consequently, there are still numerous LAX flight operations occurring over land within the time period addressed under the ANSI methodology. The shapes of the ANSI awakening probability contours presented in Section 4.10.1 of the SPAS Draft EIR are generally comparable to the CNEL contours also presented in that section because both analyses utilize the same fleet mix, flight paths, and operational assumptions in the evaluation of each alternative (limited to the hours of 10:00 p.m. to 7:00 a.m.).

It is unclear what exactly the commentor means by "What explains the drop in awakenings in 2025?" To the extent the commentor is referencing Table 4.10.1-58, this table summarizes the nighttime awakening comparison of the various alternatives to 2025 No Additional Runway Improvements. As shown in this table, there would be some reductions in the probability of awakening under some of the alternatives in comparison to 2025 No Additional Runway Improvements. As described in Response to Comment SPAS-PC00166-1 "[t]he density of the population is not constant across the area exposed to noise above 65 CNEL or higher; consequently while the area of exposure may be similar among alternatives, the numbers of persons, dwellings or non-residential noise-sensitive facilities varies among the alternatives." (SPAS Draft EIR page 1-84.) Similar discussion was also provided in Section 4.10.1.6.8 of the SPAS Draft EIR.

The probabilities of nighttime awakenings are not based on Leq(8), CNEL, or any other standard noise metric, but rather represent a statistical probability of awakening based on the series of single event aircraft noise occurrence occurring at specific times over the course of the night, with certain weighting assumptions applied to specific time periods during the night. For additional details regarding the Nighttime Awakening methodology, please see SPAS Draft EIR Section 4.10.1.2.3.1.

SPAS-PC00130-297

Comment:

Question: Figure 4.10.1-17 is a sample of contours calculated for 60 CNEL et. al. but it's impossible to compare with the baseline condition to see changes. Please provide an overlay with the baseline for each alternative.

Response:

The baseline 60 CNEL contour was provided in Figure 4.10.1-11. Nevertheless, per the request of the commentor, a series of figures (Figures 1 through 7, attached) has been prepared that illustrate the aircraft noise contours associated with each SPAS alternative alongside the aircraft noise contours associated with baseline (2009) conditions for 60 CNEL and higher contour levels.

SPAS-PC00130-298

Comment:

Question: Taking an overview of the contours and awakening the bottom line is that the south gets better, the northeast gets worse most and the north increases about in proportion to the amount the runway moves. This is the basic conclusion from Table 4.10.1-55 regarding CNEL and from Table 4.10.1-57 disruptions are about the same regardless of what alternative is chosen again reinforcing the notion that it doesn't matter which is chosen overall, but the noise is definitely worse on the north regardless of which is chosen. It's not said in these few words, but is this the conclusion we should be drawing?

Response:

The commentor is referred to Section 4.10.1 of the SPAS Draft EIR for discussion of aircraft noise methodology, analysis, and conclusions. As analyzed in Sections 4.10.1.6 and 4.9.6 of the SPAS Draft EIR, noise impacts on surrounding communities vary by alternative and not in proportion to the northward movement of Runway 6L/24R. Please also see Response to Comment SPAS-PC00130-126 for additional explanation of aircraft noise impacts to surrounding communities based on the relocation of Runway 6L/24R northward under Alternatives 1, 5, and 6.

SPAS-PC00130-299

Comment:

Question: Doing a sanity check on the aircraft numbers used for noise needs some clarification. In 2001 68MAP resulted from 800K ops or about 85 passengers per aircraft. Given the increase in load factor and increase in aircraft size that number should increase to about 110 passengers per aircraft or about 78 MAP. Was this the basis for the assumptions made?

Response:

For the purposes of the SPAS Draft EIR aircraft noise analyses, a number of average annual day (AAD) operations was assumed and was derived by dividing the assumed number of total annual operations by 365. Refer to Section 2.3.2 and 3.1.1.4 and subsequent tables in Appendix J1-1 of the SPAS Draft EIR for a discussion of the concept of AAD and the assumed numbers of AAD operations in the 2009 baseline conditions.

Similarly, the number of AAD operations in 2025 was derived by dividing the assumed number of total annual operations in 2025 by 365. The development of the 2025 Design Day Flight Schedule (DDFS), discussed in Section 4 in Appendix F-1 of the Preliminary LAX SPAS Report, resulted in a number of peak month average day (PMAD) total daily operations of 2,053. Note that this number of operations is indicative of a PMAD, as opposed to an AAD number of operations needed to model aircraft noise. In order to convert a PMAD number of operations into an AAD number of operations, the PMAD number was extrapolated to approximately 707,151 annual operations. By dividing the resulting number of annual operations by 365, an AAD number of 1,937.4 operations was identified. As discussed in Section 4.10.1 of the SPAS Draft EIR, the 2025 AAD number was rounded to be 1,937 daily operations.

SPAS-PC00130-300

Comment:

Question: A key assumption raised was over ocean ops from midnight to 6:30 AM however in order to get to 78 MAP there will have to be many more flight late at night because peak hours will be maxed out

around 70 MAP. If over ocean ops ends up turning around at 2 AM instead of midnight then the awakening numbers will change dramatically as well as the CNEL bands because of the night penalty on more flights. How will this impact the contours and the conclusions drawn?

Response:

As described in Section 4.10.1.3.1 of the SPAS Draft EIR, during late night hours (midnight to 6:30 a.m.), Over-Ocean procedures are in place at LAX and route both arrivals and departures over the ocean.

The average annual day operations used for aircraft noise modeling in the future alternatives were developed from the 2025 Design Day Flight Schedule (DDFS) developed for the SPAS Draft EIR (see Chapter 4 in Appendix F-1 of the Preliminary LAX SPAS Report). Therefore, the aircraft noise analyses accounted for the increase in nighttime operations from the baseline (2009) conditions to the projected operations associated with 78.9 million annual passengers (MAP) in 2025. The 2025 DDFS established 2,053 daily operations commensurate to a 78.9 MAP activity level. There is no evidence to support the commentor's statement that "in order to get to 78 MAP there will have to be many more flight late at night because peak hours will be maxed out around 70 MAP."

There is also no evidence to support the remaining portion of the comment regarding "over ocean ops ends up turning around at 2 AM instead of midnight." It is true that changing any of the input variables could result in a change in the aircraft noise contours. However, substantial evidence supports the assumptions relied upon and the conclusions reached in the DDFS.

SPAS-PC00130-301

Comment:

Page 4-930 4.10.1 Aircraft Noise Shifting Noise to Compatible Areas
Shifting Noise to Compatible Areas
Because of obstacles to the direct reduction of aircraft noise levels, it is more effective for airport operators to focus on the noise abatement methods that shift noise from sensitive areas (such as residential neighborhoods) to compatible areas (such as industrial areas). This can be accomplished through changes in runway use and arrival or departure routes or through facility changes on the airport itself, such as the modification of runways or the construction of noise barriers.
Runway Use and Flight Route Changes
The use of particular runways for aircraft landings and takeoffs is dictated by several factors, including the length of the runway, the runway gradient (or slope), the instrument approach procedures available to the runway, the minimum departure climb requirements from the runway, and the wind and weather. It is possible to establish runway use programs that encourage the use of runways that direct aircraft over compatible land uses and away from noise-sensitive areas, although allowances for exceptions must be made in recognition of the many other factors influencing the selection of runways for safe flight operations. LAWA previously established and currently implements the Preferential Runway Use Policy to reduce aircraft noise impacts to noise-sensitive uses (i.e., aircraft departures typically occurring on the inboard runways and aircraft arrivals typically occurring on the outboard runways, thereby placing the noisier of the two types of operations away from noise-sensitive uses).
Subject to certain limitations, aircraft routes can also be altered so that aircraft tend to fly over compatible areas and away from the most noise-sensitive areas. However, numerous constraints on the design of flight routes must be considered before changes are made. In large metropolitan areas with multiple airports, the volume of aircraft alone creates serious constraints. Flight routes must be designed to ensure the safe separation of aircraft and to ensure that arrivals and departures from each airport can be made safely and with relative efficiency. The control of aircraft in flight is the responsibility of the FAA. Thus, if airport operators desire to pursue changes in aircraft flight routes, they must coordinate with the FAA in undertaking the studies required to determine if the modifications are feasible.

Question: Since the FAA So Cal Metroplex redesign is in process, how would these changes impact the contours and the conclusions? Would the approach and take off route changes overshadow that of the runway movements? How about the increase in aircraft? What constitutes a shifting of noise by the definitions fostered by the FAA?

Response:

The commentor in inquiring about the SoCal Metroplex redesign and the potential impacts of such a redesign on the conclusions of the SPAS Draft EIR. The commentor in essence is recommending use of the list of projects approach rather than the projections approach to the cumulative impact analysis. (See State CEQA Guidelines Section 15130(b).) The CEQA lead agency, in this case LAWA, has discretion to determine the appropriate methodology to conduct a cumulative impact analysis. The SPAS Draft EIR used a projections approach for the cumulative aircraft noise analysis which was supplemented with additional information, such as the Average Annual Day Activity Levels (AAD). This approach is consistent with CEQA and was described in Sections 5.2 and 4.10.1.1.4 of the SPAS Draft EIR, and Sections 2.3.2, and 3.2 through 3.8 in Appendix J1-1 of the SPAS Draft EIR. (Please also see Response to Comment SPAS-PC00130-216.)

The SoCal Metroplex redesign (Southern California Optimization of Airspace and Procedures in the Metroplex -- OAPM) is in the early planning stages. No proposed airspace and procedures designs or alternatives have yet been developed. The Southern California OAPM began with the preliminary study phase in August 2011. The design phase of the project began on October 15, 2012. The environmental evaluation of the proposed design will begin in the second half of 2013 and is projected for completion in December 2014. Additional information regarding the OAPM can be downloaded from the FAA's website at: http://www.faa.gov/nextgen/implementation/pbn_initiatives/media/OAPM.pdf. Due to the status of the SoCal Metroplex redesign, it would be speculative to analyze the effects of this project on the conclusions in the SPAS Draft EIR. CEQA does not require analysis of speculative impacts. (State CEQA Guidelines Section 15145.)

Any potential interaction between the environmental effects of the LAX SPAS and the proposed Southern California OAPM design, including changes in approach and departure routes and runway use, will be best considered in the OAPM environmental studies when additional detail is known about the OAPM project.

The FAA has no specific regulatory or policy definitions of "shifting of noise."

Comment:

4.10.2 Road Traffic Noise -skipped
4.10.3 Construction Traffic -skipped

Response:

It is noted that the comment package on the SPAS Draft EIR submitted by ARSAC contains comments related to road traffic noise (comments SPAS-PC00130-134 and SPAS-PC00130-135) and construction traffic (comments SPAS-PC00130-141, SPAS-PC00130-142, and SPAS-PC00130-349).

SPAS-PC00130-303

Comment:

Page 4-955 Figure 4.10.3-1 Construction Noise Analysis
Sensitive Noise Receptor Areas and Potential Construction Staging Areas

Question: Why are none of the construction staging areas on the south/west end of LAX along Pershing near the cement recycle activities since LAWA already modified the Imperial/Pershing intersection islands?

Response:

It is conceivable that the area southeast of the Pershing Drive/World Way West interchange would be used for some construction staging, as it is currently for other projects at LAX. The majority of

improvements proposed under the SPAS alternatives are located in the northern and eastern portions of the airport. Other than the West Employee Parking that would developed under Alternative 3, there are no SPAS-related improvements near the subject area, making it less likely to be used for SPAS-related construction staging than other areas described in the SPAS Draft EIR. As discussed on page 4-950 of the SPAS Draft EIR, the seven potential construction staging areas are located in the general vicinity of the improvements proposed under the alternatives.

Comment:

Page 4-975 Transit noise
Figure 4.10.4-1 provides an overview of several different types of non-project specific noises from transit sources and, for comparison, non-transit sources, and what the typical sound level is in A-weighted decibels (dBA) for those sources. Traffic noise, defined as unwanted sound, is associated with highway/transit projects and is usually in the form of loud or persistent noises from cars, trucks, and buses. Traffic noise, as may occur along the busway proposed under Alternatives 1-2 and 8, is generated primarily from engines/transmissions, mufflers, wind shear, and tire contact with the roadway. APM noise, as may occur under Alternatives 3 and 9, is generated primarily from electric control systems and traction (electric) motors, gear systems, wind shear, and contact between wheels and the rails. While train horns and crossing notification systems can also be typical noise sources for APM/light rail systems, this is not considered to be a concern relative to Alternatives 3 and 9, since the proposed APM systems would be exclusive grade-separated alignments with no vehicle or pedestrian crossings along the routes

Question: 4.10.4.2.1 Transit Noise. This section states that train horns and crossing notifications are not considered because they would be grade separated. The articulated buses will not be grade separated and may have to use their horns as they weave through traffic. Is this considered in the evaluation?

Response:

It is unknown at the current conceptual level of planning whether the LAWA buses that would operate on the elevated/dedicated busway system (Alternatives 1, 2, and 8) would be articulated buses (i.e., a bus with dual rigid passenger compartment sections connected at a common pivot point), standard single-section, or other design.

The occasional use of a vehicle horn, as allowed under Section 27001 of the California Vehicle Code when reasonably necessary to insure safe operation, is not recognized within the FHWA transit analysis guidelines as being a notable noise source requiring analysis, as compared to noise from train horns or other audible notification systems near at-grade crossings. Notwithstanding that occasional vehicle horn noise is not considered a significant noise source, the operation of buses on the SPAS elevated/dedicated busway would be grade-separated with the exception of the west end of the route, within the CTA and on the return leg at Sepulveda Boulevard and 96th Street, where there are no noise-sensitive uses. Further, honking of horns within the CTA is not expected to be noticeable in comparison to existing conditions, nor is this location in close proximity to noise-sensitive receptors.

SPAS-PC00130-305

Comment:

Page 4-990 4.10.4.7.3 Summary of Impacts Transit Noise
Alternatives 1, 2, and 8 would result in significant transit noise impacts at noise-sensitive receptors (hotels) associated with the elevated/dedicated busway system proposed under these alternatives. Although Alternative 8 proposes the same elevated/dedicated busway system as that of Alternatives 1 and 2, the average daily transit noise levels and associated impacts of Alternative 8 would be comparatively greater due to greater number of hourly operations during the daytime hours (i.e., 128 trips per hour versus 54), which is mostly attributable to the CONRAC proposed under Alternative 8.
Alternatives 1 and 2 would result in a significant transit noise impact at two hotels (Four Points Sheraton and Hilton Hotel), while Alternative 8 would result in a significant transit noise impact at three hotels (Courtyard by Marriott, Four Points Sheraton, and Hilton Hotel).

Question: If the rail line (either Green Line or Crenshaw LAX Line) went into the CTA what impacts would be improved? What service level improvements would be seen?

Response:

Regarding the questions of what impacts would be improved and what service level improvements would be seen if the Metro Green Line or Crenshaw/LAX Line went into the CTA, it would be speculative to guess at the answers given that there are currently no approved Metro plans for such scenarios. Metro is currently evaluating options to connect both the Green Line and the Crenshaw/LAX Corridor project to the airport through the Airport Metro Connector Project. This project was identified as a cumulative project in Section 5.3 of the SPAS Draft EIR. However, based on Metro's most recent timelines for a potential project,1 it was determined that is was not reasonably foreseeable that the project would be operational within the SPAS horizon year for the purposes of the SPAS cumulative impact analysis. As discussed on page 4-1199 in Section 4.12.2 of the SPAS Draft EIR, "options to extend the Metro Green Line to LAX are currently being studied by Metro. However, given that this proposed extension to LAX is in its early environmental planning stage, has not been approved, and if approved would not be operational until after the SPAS horizon year, it was not included in the 2010 or 2025 scenarios."

1. Los Angeles County Metropolitan Transportation Authority, Planning and Programming Committee Report: Metro Green Line to LAX, April 18, 2012. This Report identifies a date of 2028 for the Airport Metro Connector Project. The Report states that America Fast Forward would accelerate the date to 2018. However, funding in the America Fast Forward program is limited and Metro, to date, has not applied for funding through that program for the Airport Metro Connector Project. Moreover, Measure J, a local ballot initiative that would have raised funds to accelerate funding and construction of certain Metro projects, was not passed by Los Angeles County voters in November 2012.

Comment:

Page 4-1013 4.11 Fire Protection

Question: The statement is made repetitively that because a center line taxiway will be present the demand on the fire stations will be reduced. However, there will be a substantial growth in passengers at LAX and isn't 95% of all fire department calls for paramedic services? Where is that considered? How much more paramedic services will be required?

Response:

Regarding the statement that the SPAS alternatives would result in substantial growth in passengers at LAX, as stated on page 1-13 of the SPAS Draft EIR, the project would not change the potential for passenger growth at LAX; rather, future passenger activity at LAX is forecast to reach 78.9 MAP at LAX with or without the SPAS alternatives. As discussed in Section 4.11.1 of the SPAS Draft EIR, LAX Master Plan Commitments FP-1, LAFD Design Recommendations, and PS-2, Fire and Police Facility Space and Siting Requirements, as well as enforcement of FAR and state and local fire code requirements, would ensure maintenance of adequate fire and emergency response times, staffing, equipment, facilities, and emergency access.

SPAS-PC00130-307

Comment:

Page 4-1019 4.11 Law Enforcement

Question: The section again mentions general efficiencies plus TSA, and ICE efficiencies will reduce stress on law enforcement. However, as the number of passengers grows doesn't crime and general civil police support increase? Where is that discussed? Also specialized support should go up as the

number of operations continues to increase. Where is that discussed? Why aren't roadway cameras and weight scales mentioned as well as other security enhancing equipment and procedures?

Response:

The efficiencies referenced in the SPAS Draft EIR and noted by the commentor are specific to efficiencies within the north airfield due to airfield improvements associated with the SPAS alternatives. Specifically, Section 4.11.2 of the SPAS Draft EIR concludes that airfield improvements associated with the SPAS alternatives would enhance the safety and efficiency of the north airfield, and ground access improvements would reduce emergency response and the potential for automobile collisions and automobile/pedestrian conflicts, improving the overall safety and security characteristics of the airport. The EIR concludes that there would be decreased demand on law enforcement services associated with airfield accidents and automobile collisions. However, the EIR acknowledges that development of new terminal areas and ground access facilities, and the increase in passenger activity over time, could increase demand for law enforcement services and police functions compared to baseline conditions due to expanded terminal areas and increases in passenger activity over time. (Note that the increase in passenger activity over time would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR.) As stated in Section 4.11.2, significant impacts on law enforcement services due to new facilities and modifications would be avoided with implementation of LAX Master Plan Commitment LE-1, Routine Evaluation of Manpower and Equipment Needs, which would ensure that LAWAPD and LAPD continue to routinely evaluate and provide additional officers, supporting administrative staff, and equipment to keep pace with forecasted increases in activity and development at LAX in order to maintain a high level of law enforcement services. LAX Master Plan Commitment, LE-2, Plan Review, would ensures that LAPD, LAWAPD, and other law enforcement agencies would be consulted to review plans so that, where possible, environmental contributors to criminal activity, such as poorly-lit areas, and unsafe design, are reduced.

Increased needs for specialized support and other security enhancing equipment and procedures related to federal law enforcement agencies at LAX, such as the Transportation Security Administration (TSA), United States Customs and Border Protection (CBP), United States Immigration and Customs Enforcement (ICE), Drug Enforcement Administration (DEA), and the Federal Bureau of Investigation (FBI), would continue to be routinely evaluated by these federal agencies in accordance with existing and future TSA and other pertinent regulatory requirements.

The SPAS Draft EIR evaluates the potential for the SPAS alternatives to affect the provision of law enforcement services at a program-level of detail. The EIR is not required to identify and evaluate the efficacy of specific security measures at the airport.

SPAS-PC00130-308

Comment:

Page 4-1043 4.12.1 On-Airport Transportation

Question: Section 4.12 Page 4-1043 the evaluations use an average day, but shouldn't the calculations be done to see what happens on a peak day as well? Doesn't capacity have to be able to handle the peaks?

Response:

The on-airport traffic analysis for the SPAS Draft EIR was prepared to assess the anticipated traffic operations during the peak hours of an average busy day of the peak month (i.e., Peak Month Average Day (PMAD)). As shown in Table 4.12.1-2 on page 4-1057 on the SPAS Draft EIR, this activity level typically represents a busy day in the peak month of August for LAX.

The generally accepted practice for analyzing roadway systems is to evaluate conditions during a busy peak period that is lower than the absolute peak hour. This is because the conditions during the absolute peak hour would occur for a brief period during the year. Designing facilities for this type of rare occurrence (i.e., expected to occur periodically, but only for brief periods) is generally not considered good practice or a wise use of resources. It is an acceptable trade-off to plan facilities such

that additional congestion would be experienced during peak-seasonal conditions such as Thanksgiving and Christmas when passengers will expect some additional level of congestion. Furthermore, analyzing impacts using traffic conditions that would be expected on an absolute peak day (or hour) at some point in the remote future would not provide decision-makers with useful information, because these conditions would far exceed the actual activity levels that would be experienced during the peak hours occurring in the years leading up to that future year.

SPAS-PC00130-309

Comment:

Page 4-1043 4.12.1 On-Airport Transportation
659 As further described in the introduction to Chapter 4, "baseline conditions" used in the analysis of certain environmental topics, such as air quality, aircraft noise, and traffic, were based on a full year's worth of airport operations data in order to best delineate the relevant existing operational characteristics of the airport. The Notice of Preparation (NOP) for the SPAS EIR was published in October 2010 and while that time period is used to define "baseline conditions" for most other topics in the EIR impacts analysis, that specific point in time does not account for the fluctuations in airport activities that typically occur through the course of a year and would not accurately represent the existing conditions relevant to air quality, aircraft noise, and traffic. As such, LAX activity data for Calendar Year 2009 (i.e., a full year's worth of airport activity data prior to publication of the NOP) is taken into account in defining "baseline (2009) conditions" for the On-Airport Transportation analysis.

Question: Note 659 discusses baseline conditions and the desire for a full year of data. The argument is that a full calendar year would be from start of 2009, but why, for instance was it not July to July or something closer to the 2010 NOP date?

Response:

Please see Response to Comment SPAS-PC00130-52 regarding the use of 2009 as the baseline year for aviation activity levels. As explained in that response, use of a full year's worth of aircraft activity data allows for the development of the peak month average day activity, which is required for modeling purposes.

SPAS-PC00130-310

Comment:

Page 4-1044 On-Airport Transportation
This comparison is provided for the purpose of identifying impacts pursuant to the requirements of CEQA; however, it is hypothetical in nature given the underlying assumption that all of the ground access improvements proposed to be completed by 2025 under each alternative theoretically exist today and apply to the baseline (2009) condition.

Question: 4.12.1 states (highlighted) "does not include any increase in on-airport traffic from natural growth in passenger activity levels anticipated to occur at LAX by 2025." How is this even a logical situation since LAWA has stated throughout the document that they expect 2025 to have 78.9 MAP regardless of alternatives chosen or no improvements?

Response:

CEQA requires consideration of a project's impacts relative to existing (baseline) conditions. Given that components of the SPAS alternatives (i.e., the project) include transportation system improvements, such as the ITF, the GTC, an elevated busway or APM system, etc., that would change travel modes and trip distribution at the airport, the SPAS on-airport traffic impacts analysis includes a scenario that focuses on how existing (baseline) traffic conditions would change strictly as a result of those improvements. While the on-airport traffic analysis also includes a scenario that evaluates future (2025) traffic conditions with the SPAS alternatives ground transportation improvements, the inclusion of airport activity growth between 2009 and 2025 in that analysis makes it difficult to distinguish traffic impacts that are attributable to the SPAS improvements from traffic impacts that are attributable to the airport

growth occurring independent of SPAS. The analysis scenario described above whereby the SPAS improvements are assumed but the future growth is not included enables the reader and decision-makers to better understand how the SPAS-related improvements alone would affect existing (baseline) traffic conditions.

SPAS-PC00130-311

Comment:

Page 4-1044 On-Airport Transportation
That future (2025) scenario does not include any of the ground access improvements proposed under the various SPAS alternatives, and also does not include any increase in on-airport traffic from natural growth in passenger activity levels anticipated to occur at LAX by 2025. Rather, that "Future (2025) Without Alternative" condition assumes the same 2009 passenger activity levels daily flight schedules as in the baseline (2009) condition, and serves as the basis for comparison for the "Future (2025) With Alternative" condition scenario. The Future (2025) With Alternative traffic condition scenarios consists of: (1) the baseline (2009) physical conditions and configuration of the CTA plus reasonably foreseeable on-airport ground access system improvements anticipated to occur by 2025, independent of, and separate from, SPAS; (2) the 2025 passenger levels and daily flight schedules; (3) reasonably foreseeable regional (nonairport) programmed improvements and ambient growth in off-airport traffic, as may affect on-airport traffic; and (4) the proposed SPAS improvements associated with each of the alternatives. It is important to note that the impacts analysis associated with comparing the Future (2025) With Alternative condition to the Future (2025) Without Alternative condition is very conservative, because the increase in on-airport traffic volumes assumed for each with-alternative scenario would actually be attributable to natural growth in passenger activity predicted to occur at LAX by 2025 regardless of SPAS. (underline for emphasis)

Question: 4.12.1 states (highlighted) "does not include any increase in on-airport traffic from natural growth in passenger activity levels anticipated to occur at LAX by 2025." How is this even a logical situation since LAWA has stated throughout the document that they expect 2025 to have 78.9 MAP regardless of alternatives chosen or no improvements?

Page 4-1046 On-Airport Transportation
On-Airport Traffic Data Collected in 2009 - As noted above, data collected for the Bradley West Project EIR was supplemented with additional data collected in 2009. This included data from the in-pavement vehicle loop detector system which records the volume of all traffic entering and exiting the CTA and the AVI system which uses transponders to record the number and types of AVI equipped commercial vehicles entering and exiting the CTA. These counts representing baseline (2009) conditions were collected for Fridays in August 2009. Since August is considered to be the peak month for airport-related passenger and traffic activity at LAX, and Fridays are typically the busiest day of the week for the airport roadway system, the new intersection turning movement counts were collected for the departures level on Friday, August 14th and for the arrivals level on Friday, August 21st and 28th during the a.m., mid-day, and p.m. commuter peak periods. Video from August 2008 obtained at the entrance to the CTA and at the departures level roadway in front of the Tom Bradley International Terminal (TBIT) from the airport's Closed Circuit Television (CCTV) system was also used to serve as a source for traffic counts and vehicle classification.

Question: P 4-1046 how was the 2006 data compared with and combined with the 2008 data as well as the August 2009 data? Were there significant differences in the older data from the Oct 2 and Oct 9 2009 data? What were they?

Response:

2006 traffic data was not used in the SPAS Draft EIR. The reference to 2006 data on page 4-1046 of the SPAS Draft EIR refers to the 2006 LAX Air Passenger Survey. The information from the 2006 LAX Air Passenger Survey was used to obtain general passenger characteristics related to vehicle mode of access, regional approach patterns, origin and destination (O&D) percentages, and passenger show up profiles that would not change significantly over the period of time analyzed. Footnote 665 on page 4-1046 of the SPAS Draft EIR explains that the 2006 survey provides a reasonable representation of the current conditions and that use of the 2006 O&D data for estimating the traffic activity for the SPAS alternatives provides a more conservative impact assessment than would have occurred if more recent O&D data from 2011 were used for the analysis.

As discussed on page 4-1046 in Section 4.12.1.2.1 of the SPAS Draft EIR, traffic data from 2008 was used as supplemental information for purposes of refining the primary data set from 2009. Specifically, videos from the Closed Circuit Television (CCTV) camera system was collected in 2008 and used to determine the percentage of various vehicle modes using the Central Terminal Area (CTA) roadways. The percentage of vehicle modes observed in 2008 was then applied to 2009 total traffic volumes to estimate the volume of vehicles by mode accessing the CTA in 2009. There were no major transportation improvements or operational modifications that would create a significant change in vehicle allocation between 2008 and 2009; therefore, it can be reasonably assumed that the 2008 observations remain valid for 2009.

As discussed in Section 4.12.1.2.1 of the SPAS Draft EIR, data from October 2009 were also used to supplement the primary August 2009 data set and to provide additional refinement for use in preparing detailed mode-specific analysis. The traffic volumes from the October 2009 data set were generally lower than the traffic volumes from August 2009. This is logical because passenger activity is lower in October as compared to the peak month of August. To account for this difference in magnitude and as stated on page 4-1047 of the SPAS Draft EIR, all data collected in October was adjusted to represent peak month August activity using available airline passenger schedules, Automatic Vehicle Identification (AVI) counts, and in pavement loop detector counts. It is a reasonable and accepted practice to obtain and use supplemental data sources to supplement and refine a primary data set.

SPAS-PC00130-313

Comment:

Page 4-1046 On-Airport Transportation
Note 665 Applied Management & Planning Group, 2006 Air Passenger Survey Final Report Los Angeles International Airport, December 2011. The 2006 survey is the most recent complete published passenger survey for LAX. Although an updated passenger survey was undertaken in 2011, the survey results are still in the process of being compiled and reviewed. Preliminary results of the 2011 survey data, subject to further review and confirmation, show an increase in connecting passenger percentages, suggesting that LAX is becoming less of an "Origin and Destination" (O&D) airport, which, in turn, reduces vehicle trips to and from the airport. For the purposes of this EIR analysis, the information contained in the 2006 survey is still considered to be reasonably representative of the existing airport traffic conditions and trip generation, which provides a more conservative impacts analysis than if airport trips were reduced based on lower proportions of O&D activity.

Question: Note 665 states that LAWA is relying on a 2006 survey. Since economic conditions were much worse in 2006 and traffic was lower along with changes in the Open Skies conditions how is this six year old study whose data is necessarily earlier a valid use?

Response:

The passenger activity levels at LAX in 2006 were not substantially different from those in 2011. Specifically, the passenger activity level at LAX in 2006 was approximately 61.0 million annual passengers (MAP) and the passenger activity level at LAX in 2011 was 61.9 MAP, a difference of only about 1.5 percent. This minor difference in passenger activity levels between 2006 and 2011 is consistent with, and supportive of, the statement on page 4-1046 of the SPAS Draft EIR that "the information contained in the 2006 survey is still considered to be reasonably representative of the

existing airport traffic conditions and trip generation." Any changes in economic and "Open Skies conditions" between 2006 and 2011 would have been reflected in the 2011 passenger activity level.

Regarding the commentor's concern about "Open Skies conditions," the United States began pursuing Open Skies agreements in 1979, and, by 1982 it had signed twenty-three bilateral air service agreements worldwide, mainly with smaller nations, and that was followed in the 1990s by agreements with individual European states.1 In addition to bilateral Open Skies agreements, the United States has negotiated two multilateral Open Skies accords: (1) the 2001 Multilateral Agreement on the Liberalization of International Air Transportation (MALIAT) with New Zealand, Singapore, Brunei, and Chile, later joined by Samoa, Tonga, and Mongolia; and (2) the 2007 Air Transport Agreement with the European Community and its 27 Member States (http://www.state.gov/e/eb/tra/ata/index.htm - accessed on December 22, 2012). Two additional multilateral agreements with Asian counties were signed in 2009, calling for a calibrated and gradual implementation in each contracting state (http://en.wikipedia.org/wiki/Open_skies - accessed on December 22, 2012). In summary, Open Skies agreements have existed for over 30 years and it is reasonable to assume that any resultant changes in international passenger activity at LAX would be already be accounted for in the passenger activity levels at LAX in both 2006 and 2011. As noted above, there is not a significant difference in the MAP levels for each of those years.

Please refer to Response to Comment SPAS-PC00130-312 for additional explanation of the use of the 2006 LAX Air Passenger Survey.

Additionally, the 2006 LAX Air Passenger Survey was not directly used to determine traffic volumes but rather to estimate passenger behavior and the result effect that this behavior would have on the traffic activity within the Central Terminal Area (CTA). For example, these data were used to determine percentage of passengers that use specific vehicle modes, where passengers park their vehicles, number of passengers within each travel group, and the distribution of time that a passenger arrives before their departing flight, among other information. While changes in economic conditions compared with 2006 could produce an effect on overall passenger activity accessing the airport, the passenger behavior metrics derived from the survey and used for the SPAS Draft EIR analysis would not be expected to change as a result of changes in the economic conditions.

SPAS-PC00130-314

Comment:

To further supplement the existing data sets, additional data were collected during field surveys conducted on Friday, October 2nd, 2009, and Friday, October 9th, 2009 between 10:30 a.m. and 12:30 p.m. on the departures level, and between 8:30 p.m. and 10:30 p.m. on the arrivals level. Specifically, the following surveys were conducted:
Intersection turning movement counts - for intersections along Center Way
- Vehicle classification survey - at lower level entrance to the airport
- Vehicle dwell time survey - at Terminals 1, 4, and 7
- Vehicle license plate survey - at Terminal 1 and Terminal 7 lower level curbsides
- Public parking garage entry counts - Parking Garages 1, 3, and 7

The survey data represents activity on a typical busy day on the CTA roadways and curbsides at LAX. Survey times were established based on the peak passenger activity in the CTA which was determined from the 2008 (design day) gated passenger schedule. After reviewing and compiling the field data, the results were adjusted from October 2009 conditions to August 2009 conditions using multiple control data sources including passenger schedules, AVI, and inpavement loop detector data as well as turning movement volumes.

Question: The above section talks about vehicle dwell time at Terminals 1, 4, & 7. Were there differences in dwell time by lime of day? How did the number of traffic officers change the amount of dwell time? Was there a difference in dwell time noted for passengers with or without baggage to be

checked? Were the differences significant? Was a preponderance of the traffic due to business travel or personal? Did dwell times change significantly when buses were competing for the same curb space?

Response:

As discussed on page 4-1047 in Section 4.12.1.2.1 of the SPAS Draft EIR, dwell time information collected in October 2009 was obtained during peak roadway activity periods. Dwell time data collection was limited to peak periods to provide a representation of the dwell times that would be expected during the peak hour conditions analyzed in the SPAS Draft EIR. These peak period dwell times generally reflect the level of enforcement that was in place during busy periods, the times required to actively load and unload a vehicle, and the effects of vehicle congestion that may impede a vehicle from departing a curbside location. Non-peak periods were not analyzed for the SPAS Draft EIR and, therefore, dwell time information was not collected during those non-peak periods. Consequently, a comparison of peak period dwell times with dwell times from other times during the day cannot be provided.

Dwell times represent the total time a vehicle is waiting at the curbside to either pick up or drop off a passenger. These commercial vehicles will be accommodating passengers carrying different amounts of baggage and with different trip purposes (business and personal travel). Dwell time data cannot be directly correlated with baggage and trip purpose and, therefore, cannot be reported. However, the dwell time data collected during the peak period does provide a composite of the dwell time for vehicles loading and unloading passengers with baggage and with different trip purposes. The composition of passengers with baggage and by trip purpose is not assumed to vary in the future to the extent that the dwell time required to actively load and unload a vehicle during the peak hour would change.

The active dwell times required to load and unload a vehicle in the peak hours are not expected to change in the future conditions. However, with additional traffic volume, the non-active dwelling or waiting for the curbside space will increase and is considered as a part of the curbside analysis. For example, for commercial vehicle curbside loading, all commercial vehicles must load from the lane adjacent to the curbside which is defined as single lane loading in on page 4-1074 in Section 4.12.1.3.13. Therefore under these circumstances, any utilization above 100 percent represents vehicles either waiting for space or choosing to load/unload passengers from the adjacent non-curbside lane.

SPAS-PC00130-315

Comment:

Page 4-1047 On-Airport Transportation
666 In probability theory, a Poisson process is a stochastic process which counts the number of events and the time that these events occur in a given time interval. The time between each pair of consecutive events has an exponential distribution with parameter ʎ and each of these inter-arrival times is assumed to be independent of other inter-arrival times.

Question: P 4-1047 CTA Traffic Conditions Baseline Was there any changes in signage between the survey times? Was there any construction or changes to where the buses and taxis were instructed to stop? How would a change in airlines location from one terminal to another impact the numbers calculated?

Response:

There were no known signage changes or construction activity during the data collection period that would have had an effect on bus and taxicab operations or other baseline conditions defined in the SPAS Draft EIR.

As discussed on page 4-1047 in Section 4.12.1.2.1 of the SPAS Draft EIR, the baseline trip generation and trip distribution models were correlated to the airline schedules that were in place at that time. Future airline schedules that include expected changes in the distribution of airline passengers between terminals are a direct input into the future trip generation and trip distribution models. Therefore,

anticipated changes in airline passenger activity, including the relocation of activity between terminals, are reflected in the traffic analyses prepared for the SPAS Draft EIR.

SPAS-PC00130-316

Comment:

Page 4-1048 Prepare Level of Service Analysis
Prepare Level of Service Analysis - The roadway model provides a quantitative representation of the traffic operations associated with the CTA curbsides, CTA roadways, and CTA intersections as needed to assess the potential effects of project traffic. Model outputs were post-processed to calculate the Level of Service (LOS) for each terminal building curbside and curbside roadway segment during each peak period analyzed. This model uses peak hour vehicle volumes combined with average dwell time by vehicle mode to estimate the demand for curbside frontage on both the departures and arrivals levels. To account for non-uniform arrival rates during the peak-hour, the model applies a statistical "surge" factor based on a Poisson666 arrivals distribution to obtain an estimate of occupied "spaces" during the peak hour. These estimated space requirements are multiplied by the average length of the vehicle (including a buffer to represent the space between two parked vehicles and lost space due to parking inefficiencies) to determine the demand for curbside frontage in linear feet. The linear distance representing these stopped vehicles was then divided by the linear curbside length along the terminal frontages to calculate a ratio that is used to define curbside LOS which is further discussed in Section 4.12.1.3.13 below.

Question: P4-1048 4.12.1 On-Airport Transportation How would a backup of traffic going into the CTA impact the traffic dwell time? IE As traffic builds up the parked car may not stop all the way next to the curb in order to be able to get out after dropping off the passenger. This reduces the amount of practical, usable curb space. How was this considered in the calculations?

Response:

The effects of a backup of traffic entering the Central Terminal Area (CTA) are dependent upon the location and cause of the backup. For example, a constraint at the traffic signal in advance of Terminal 1 could create a condition that could meter or otherwise reduce the rate at which traffic reaches the downstream curbside. This metering effect could potentially decrease the total dwell time at the curbsides as compared to what would be expected if the true demand were accommodated.

In order to provide a conservative approach, the curbside analysis does not consider any decrease in curbside traffic dwell times that could result as a result of any upstream congestion. As discussed in Section 4.12.1.2.1 of the SPAS Draft EIR, the dwell times used for the SPAS Draft EIR are based on data that were collected during busy curbside periods and are representative of the order-of-magnitude that would be expected during peak periods.

The effects of varying levels of curbside activity, vehicles not parking directly at the curbside, and the impact on curbside operations and the adjacent through lanes are measured by the curbside utilization factors that are used to define curbside roadway levels of service. Section 4.12.1.2.1 of the SPAS Draft EIR discusses the preparation of the level of service analysis.

Please see Response to Comment SPAS-PC00130-149 regarding estimated curbside demand.

SPAS-PC00130-317

Comment:

If cars have to go around multiple times to pick up or drop off a passenger how does this impact the calculations due to the increase in lane changes that will be necessary?

Response:

Vehicles that pass the Central Terminal Area (CTA) curbside multiple times before picking up an arriving passenger are classified as "recirculating vehicles" in the trip generation model.

As discussed in Section 4.12.1.2.1 of the SPAS Draft EIR, license plate surveys conducted in October 2009, traffic volumes on the airport ramps, northbound East Way and West Way were used to calculate the percentage of the CTA traffic that recirculates. Experience shows that the volume of recirculating traffic can vary depending upon many factors including the level of enforcement at the curbside, weather delays, and the availability and location of alternative waiting areas such as cell phone lots. Recirculating vehicles create additional inefficiency in curbside operations by increasing the total volume passing the curbside and by creating turbulence related to driving slowly and pausing in the through lanes or even intermittent stops at the curbside. These trip types have been estimated from data and the additional trips generated by these recirculating vehicles have been reflected in the analyses prepared for the SPAS Draft EIR. The effects of recirculating traffic on CTA roadway and curbside operations are captured by the increased volume from recirculating traffic that is subsequently used to calculate curbside utilization.

Please refer to Response to Comment SPAS-PC00130-149 for discussion of curbside utilization.

For purposes of estimating future traffic conditions in the SPAS Draft EIR, it was assumed that the proportion of recirculation traffic would be similar to existing (baseline) conditions.

SPAS-PC00130-318

Comment:

Page 4-1048 Prepare Level of Service Analysis
Note 669 The on-airport transportation analysis includes Alternatives 1, 4, 8, and 9. The on-airport transportation analysis results for Alternative 1 are identical to those for Alternatives 2, 5, 6, and 7, and any reference to results from Alternative 1 can be consider valid for Alternatives 2, 5, 6, and 7. Alternative 3 was not considered for the on-airport transportation analyses.

Question: Footnote 669 on future traffic conditions page 4-1048 states that results for Alt 1 are same as those for Alts 2, 5,6, or 7. Since 5,6,7 do not include a busway or APM but Alts 1,2 use a busway, how is this justified?

Response:

Alternatives 5, 6, and 7 could be paired with the ground transportation system improvements proposed under either Alternatives 1, 2, 8, or 9. Although Alternatives 5, 6, and 7 focus on airfield and terminal improvements, they are not "stand alone" alternatives, as explained in on page 2-8 in Section 2.3.1 and in the Footnote 660 at the bottom of page 4-1043 of the SPAS Draft EIR.

The statement in footnote 669 on page 4-1048 in Section 4.12.1.2.2 of the SPAS Draft EIR refers to the on-airport traffic analysis which is limited to an evaluation of the Central Terminal Area (CTA) roadways, curbsides, and intersections. For the alternatives analyzed in the SPAS Draft EIR, the difference in traffic volumes within the CTA occurs as a result of the redistribution of traffic to various off-site SPAS development components such as the Intermodal Transportation Facility (ITF), Ground Transportation Center (GTC), and Consolidated Rental Car (CONRAC). In Alternatives 1, 2, 5, 6, and 7 all off-site components proposed as a part of SPAS are identical. The implementation of a bus way would redirect a proportion of the buses that would otherwise access the airport from Century Boulevard ramps and Skyway ramps. However, once they reach the on-airport roadways, the traffic levels are essentially identical for Alternatives 1, 2, 5, 6, and 7 within the CTA. Therefore, the analyses and any resulting traffic impacts would be identical with Alternatives 1, 2, 5, 6, and 7.

SPAS-PC00130-319

Comment:

Page 4-1050 4.12.1.3.2 On-Airport Landside Facilities
The on-airport landside facilities are comprised of the CTA curbsides, roadways, and public parking facilities. The two-level on-airport curbside and roadway network is accessed from the following three off airport roadways:

- Century Boulevard
- Sepulveda Boulevard
- 96th Street Bridge/Sky Way

Question: Sec 4.12.1.3.2 On-Airport Landside Facilities lists three accesses: Century, Sepulveda, and 96th St Bridge. During SPAS briefings we were told that traffic entering the CTA was 1/3 from Century, 1/3 from Sepulveda south and 1/3 from Sepulveda north (which would include 96th St bridge). We were also told that the amount of traffic from the three entry sources differed substantially by time of day. Were the time of day studies completed? What were the results? How will they impact back up of traffic in the CTA? How does this specifically impact terminal 1? Are the terminal 1 impacts different from points further into the CTA? The "annual traffic studies" recently posted on the LAWA website do not address this critical question that is necessary to assess what mitigations can work most effectively.

Response:

As discussed in Section 4.12.1.3.9 of the SPAS Draft EIR, hourly traffic volumes accessing the Central Terminal Area (CTA) by time-of-day were analyzed to evaluate peak hour conditions for the on-airport roadway system within the CTA occurring on an average day of the peak month (PMAD). Separate peak hour conditions were analyzed to represent the peak hour conditions that would occur on the CTA departures level curbside roadway system as well as the peak hour condition that would be expected to occur on the arrivals level of the CTA. The peak departures period occurs from 9:59 a.m. to 10:59 a.m.; the peak arrivals period occurs from 10:59 a.m. to 11:59 a.m. These peak hour conditions represent the highest total traffic within the CTA for the PMAD condition and, therefore, provide a conservative condition for addressing the potential on-airport transportation impacts that would be expected to occur under the various SPAS alternatives.

Please see Response to Comment SPAS-PC00130-308 for a discussion of the PMAD condition. The traffic conditions adjacent to Terminal 1 were analyzed as a part of the SPAS Draft EIR and the results of level of service analysis is presented in Table 4.12.1-18 and Table 4.12.1-19 starting on page 4-1110 of the SPAS Draft EIR.

In addition to the on-airport transportation analysis, which is based on peak activity during the peak departures and peak arrivals periods, the off-airport transportation analysis, documented in Section 4.12.2 of the SPAS Draft EIR, was conducted to assess potential project-related impacts on the off-airport roadway system, including intersections along Century Boulevard and Sepulveda Boulevard that carry traffic using the ramps referenced in the comment. These off-airport analyses were prepared for the a.m. and p.m. commuter peak hours as well as the airport mid-day peak hour.

SPAS-PC00130-320

Comment:

Page 4-1057 4.12.1.3.7 Peak Month Activity
Monthly traffic data in the vicinity of LAX over the past eight years were reviewed to identify the typical peak month of traffic activity associated with airport operations. The average daily traffic (ADT) volumes accessing the CTA by month for January 2003 through December 2010 are provided in Table 4.12.1-2. As shown in bold within Table 4.12.1-2, CTA traffic reached peak activity during the summer months of July and August. August is typically the peak month for airport roadway traffic followed closely by July. For the purpose of this analysis, August 2009 was used as the peak month for traffic data.

Question: Table 4.12.1-2 CTA Average Daily Traffic Volume shows an average day in each month and then a total which includes only one day of the month! When these numbers are extrapolated to corrected totals the number of trips into the CTA is still less than 0.5 per passenger. Is there a breakdown of types of vehicles to match this table (ie bus which holds 10, bus that holds 30, van or taxi holding 4) so that a reasonable number of trips into the CTA matches with the MAP?

Response:

The commentor's concern that Table 4.12.2.1-2 "includes only one day of the month" suggests that the commentor may be misinterpreting how average daily traffic volumes within the CTA are used in the

table. In Table 4.12.2.1-2, an average daily traffic volume is presented for each month in the year. In order to calculate the average daily traffic volume for each year represented in the table, the monthly average daily traffic volumes are added together, and divided by twelve. Table 4.12.1-2 is provided to illustrate monthly Central Terminal Area (CTA) traffic activity for the purposes of identifying the peak months for which airport-related traffic is highest and to show year-to-year changes in the average daily traffic volume. The million annual passengers data are shown for informational purposes and to illustrate a general correlation between airline passenger activity and CTA roadway traffic activity.

As discussed in Section 4.12.1.2.1 of the SPAS Draft EIR, the on-airport traffic analyses provided in the SPAS Draft EIR are based on peak hour activity on an average day of the peak month (PMAD). Direct correlation of peak hour traffic volumes with annual passenger data are not assumed in this study and are not relevant to the analysis; therefore, these data are not provided in the SPAS Draft EIR.

SPAS-PC00130-321

Comment:

Page 4-1067 Figure 4.12.1-5 Arriving and Departing Passenger Flow at Curbside Baseline and Figure 4.12.1-9 2025 Arriving and Departing Passenger Flows at Curbside for SPAS Alternatives

Question: The numbers of vehicles in this chart are inconsistent with those from other sections and seem low. Translating the baseline into specific hourly numbers results in a total annual count of 139250 monthly or about 50 MAP instead of the 61 MAP in 2009. The values for 2025 is closer and calculates to about 73 MAP. How were these values determined and if they are off how does it impact the LOS conclusions? Even if they are off, however, it is noted that there is substantial congestion now and it will continue in 2025. The future estimate of arrivals and departures appears to represent about 72-73 MAP not the 78.9 listed for all alternatives in the summary section. If this is low, are the calculations for impact also low which will result in worse than predicted levels of service?

Response:

The passenger flow profiles provided in the Figures 4.12.1-5 and 4.12.1-9 of the SPAS Draft EIR represent the rolling hourly volume of origin and destination (O&D) passengers on an average day of the peak month (PMAD) shown at the time of day they would be anticipated to be served at the Central Terminal Area (CTA) curbside. The activity represented in these charts does not include connecting passengers who do not access the landside and consequently do not require ground transportation services. The million annual passenger (MAP) levels the commentor is attempting to compare with the data in the charts includes connecting activity, which needs to be accounted for to make an accurate comparison of these charts. As discussed on pages 2 and 3 in Appendix F-3 of the Preliminary LAX SPAS Report, O&D passenger percentages are derived from data collected for U.S. Department of Transportation T-100 Segment Airline Traffic reporting. As Table 3 in Appendix F-3 indicates, a modest decrease in the percentage of domestic connecting passengers for 2025 is projected, and the percentage of connecting international passengers is expected to stay the same.

Peak hour data cannot be accurately correlated with MAP levels given the high level of variability in peaking during the day. Furthermore, the relationship between peak hour activity and daily activity may not hold constant over time as airline schedules change and react to capacity considerations by developing additional peaks within the day or even flatten peaks by filling in the shoulder hours adjacent to a peak period. For those reasons, it is more accurate to compare the growth in daily passenger activity depicted in the chart with growth in MAP levels (with consideration of any changes in connecting passenger activity between 2009 and future MAP levels). The information in Figure 4.12.1-5 of the SPAS Draft EIR represents a condition where 67,408 daily arriving passengers and 68,784 departing passengers were processed on the 2009 PMAD. The information in Figure 4.12.1-9 of the SPAS Draft EIR represents a future condition where 95,453 daily arriving passengers and 96,948 departing passengers would be processed on the 2025 PMAD. By comparing the growth in daily passenger activity between 2009 and 2025, it is estimated that arriving passenger activity on a PMAD will increase by 40.9 percent and departing passenger activity on a PMAD will increase by 41.6 percent. The percentage growth in MAP levels from 2009 (61 MAP) and 2025 (78.9 MAP) is approximately 29 percent which represents the growth in annual passenger activity. The design day flight schedule used in this analysis represents passenger activity volumes expected on a PMAD at LAX and is expected to

be representative of a higher growth rate (approximately 41 percent) when compared to annualized growth in passenger volumes (approximately 29 percent).

SPAS-PC00130-322

Comment:

Page 4-1073 4.12.1.3.12 Vehicle Trip Generation and Distribution Model Calibration
The purpose of developing the vehicle trip generation and distribution model is to have a tool that accurately projects future vehicle volumes based on a future passenger volume. Before the model could be used to project future peak hour traffic volumes, it was necessary to calibrate the model to ensure that the results would reliably predict actual observed baseline traffic conditions as represented by the balanced roadway volumes. This process involved comparing model output for the CTA's departures and arrivals peak hours with roadway and curbside traffic data from the balanced roadway network. A review of the passenger data for August 2009 indicated that, for model validation purposes, the departures peak hour occurred between 9:59 a.m. - 10:59 a.m., and the arrivals peak hour occurred between 10:59 a.m. - 11:59 a.m.

Question: 4.12.1.3.12 Model Calibration What was the percentage off of 2009 actuals to the 2009 predicted? In other words, what accuracy was determined for the model prediction?

Response:

The trip generation model discussed in Section 4.12.1.3.11 on pages 4-1062 and 4-1073 of the SPAS Draft EIR is calibrated to within 6 vehicle trips based on inbound traffic volumes from actual turning movement counts collected during the design day calibration hour. This equates to difference in actual inbound traffic volumes compared to model generated inbound traffic volumes of 0.3 percent and 0.2 percent respectively for the upper and lower level World Way North and Sky Way intersections during the Departures and Arrivals level peak hours based on turning movements provided on page 4-1115 in Table 4.12.1-20 of the SPAS Draft EIR.

Further, the trip distribution model is calibrated to be within +/- 24 vehicles on any of the major links within the CTA. For the purpose of this analysis, a "major link" would be defined as any portion of World Way North, World Way South, East Way, West Way, or Center Way. Based on link traffic volumes provided in Table 4.12.1-12 beginning on page 4-1084 of the SPAS Draft EIR, the calibration error for a low volume major link such as Link CF (Center Way South, east of P4 exit on the lower level) could be as much as 8.57 percent, while the calibration error for a high volume major link such as Link UE (Westbound Would Way North, west of East Way intersection on the upper level) could be as much as 1.0 percent. Based on these comparisons, the model outputs calibrate well to the observed traffic conditions within the CTA.

The higher error of 8.57 percent was on a low volume link and equates to a low actual vehicle volume error when considered on a macroscopic level. For example, on a link with an actual volume of 10 vehicles and a modeled output of 5 vehicles, the error would equate to 50 percent. For Link CF, with an actual volume of 327 vehicles and modeled volume of 280 vehicles, the actual volume error is 27 vehicles. Compared to a network wide volume of 2,709 vehicles, these 27 vehicles would not affect calibration or the level of service calculations.

SPAS-PC00130-323

Comment:

Page 4-1083 Table 4.12.1-10 Peak Hour CTA Signalized Intersection Turning Movement Volumes and Level of Service Analysis -Baseline (2009) Conditions

Question: General question regarding methodology is that this effort is only done during a couple peak hours. In the SPAS meetings we're told that entry into the CTA is about 1/3 Sepulveda going south, 1/3 Sepulveda going north, and 1/3 Century going west. The issues is that it is not consistent by time of day where during the day Century is frequently empty as opposed to later in the evening when it is totally backed up. The assumption is that it has to do with 405 congestion encouraging people to get off the

freeway before getting to Century. How can this be taken into account with the modeling? What will it take to get representative answers about level of service during peak arrival or departure hours when total traffic including non-airport traffic results in a shift of total traffic peak hours?

Response:

As discussed in Section 4.12.1.3.13, beginning on page 4-1074, of the SPAS Draft EIR, the on-airport intersection analysis, like the on-airport curbside and roadway analyses, focused on both the arrivals and departures peak hours for the hours and intersections listed in Table 4.12.1-10. As discussed on pages 4-1076 and 4-1077 of the SPAS Draft EIR, off-airport congestion is among the factors that may limit the number of vehicles entering the CTA. However, to provide a conservative analysis, the SPAS Draft EIR assumes that an unconstrained environment such that all future (2025) demand desiring access to the CTA roadway system will be able to access the CTA. Using this SPAS Draft EIR traffic modeling assumption, congestion on the I-405 Freeway would not impact vehicles entering or exiting the CTA, nor would it shift the peak hours.

The SPAS Draft EIR conducted a program-level traffic impact analysis. Please see Responses to Comments SPAS-PC00139-142 and SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic environmental review conducted for the SPAS project. Should one of the alternatives for SPAS be approved, a more detailed project-level planning and CEQA analysis would be conducted using micro-simulation to assess the performance of the individual projects for that alternative, including on-airport intersections for additional time periods. Also, to evaluate the traffic impacts of constrained conditions, the micro-simulation model used to evaluate on-airport conditions may be extended off-airport to include at least one signalized intersection to the north and south along Sepulveda Boulevard and two signalized intersections to the east along Century Boulevard to better assess the impacts of off-airport traffic on vehicles both entering and exiting the CTA.

SPAS-PC00130-324

Comment:

Page 4-1139 CTA Intersection Impacts
Table 4.12.1-29 delineates the contribution of Alternative 1-2 to cumulative impacts by comparing the signalized intersection operations for the Future (2025) With Alternative 1-2 traffic conditions measured against the Future (2025) Without Alternative traffic conditions. As shown in Table 4.12.1-29, implementation of Alternative 1-2, in conjunction with other cumulative projects, would not result in a change to the volume to capacity levels of on-airport intersections that exceeds the aforementioned thresholds, with the exception of the World Way South and Center Way intersection (Intersection #9) during the arrivals level peak hour. The cumulative impact to this intersection is considered to be significant, and the contribution of Alternative 1-2 to this cumulative impact would be cumulatively considerable. This impact is unavoidable as potential measures to mitigate this impact are infeasible, as explained in Section 4.12.1.10.2 below.

Question: Generally, there are not a lot of changes to the CTA configuration so it is expected that vehicle traffic LOS will remain poor. Has the amount of curb space been calculated to ensure good LOS? How do "non-SPAS" projects such as Terminal 1.5 or Terminal 2.5 fit into the calculations? Were they included? Is there a summary list of these projects? What are they?

Response:

As discussed in Section 4.12.1.6, the SPAS Draft EIR identifies a series of improvements and mitigation measures that are expected to produce future operating conditions that provide acceptable operating conditions along the Central Terminal Area (CTA) curbside roadways. These improvements include off-site facilities such as the Intermodal Transportation Facility (ITF), Ground Transportation Center (GTC), and Consolidated Rental Car Facility (CONRAC) that would allow for a reduction in traffic activity within the CTA with resulting operational benefits. This improvement in performance is explained as a part of the Response to Comment SPAS-PC00130-326.

The amount of curbspace and the effects on CTA curbside and roadway Level of Service (LOS) has been calculated and considered in the analysis. Refer to Response to Comment SPAS-PC00130-149 for information related to curbside utilization and the effect on level of service.

The future configuration of the CTA is expected to change significantly with the addition of non-SPAS improvements such as the Midfield Satellite Concourse Processor, Terminal 1.5, and Terminal 2.5 as described on pages 4-1094 through 4-1096 in Section 4.12.1.6.2 of the SPAS Draft EIR. Non-SPAS improvements are listed in that section. These non-SPAS improvements are considered in the on-airport traffic analysis of the CTA roadways where traffic has been distributed to these facilities for future year analyses.

SPAS-PC00130-325

Comment:

Page 4-1167 Table 4.12.1-40 Public Parking Demand - Capacity

Question: If the demand is as low as predicted, is it still possible that there are times of the day that the lots will be full? What is planned to level out demand?

Response:

Table 4.12.1-40 on page 4-1167 of the SPAS Draft EIR provides the Baseline (2009) and Future (2025) public parking supply, demand and requirements for Alternatives 1, 2, 4, 8 and 9. As noted in the table, the future parking demand is assumed to be 85 percent of the parking requirements. Additionally, Section 4.12.1.6.2 on page 4-1094 explains that the construction of a proposed Midfield Satellite Concourse (MSC) passenger processor building would require the existing parking structures P2B and P5 be demolished. However, depending on the configuration of the future processor building, some replacement parking may be constructed as part of that project.

As stated in Section 4.12.1.9.3 on page 4-1165 of the SPAS Draft EIR, and based on assumptions developed by the LAWA SPAS Draft EIR team, the future public parking demand was assumed to be 15 percent greater than the space demand to account for fluctuation in vehicle arrivals in the facilities. [Even with this assumption there is still approximately 12.2 percent of the parking spaces available to account for any minor fluctuations in parking demand. The level of detail provided in the SPAS Draft EIR is consistent with the requirements of CEQA. (See also San Joaquin Raptor Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645 ["[Plaintiffs'] argument is essentially that greater specificity was needed [for the traffic analysis] --i.e., that the EIR should have specified whether trucks sometimes enter and leave the site "unevenly" over time. We hold that such minute detail was not required in the analysis in question."]; see also Merced Alliance for Responsible Growth (2012) 2012 WL 5984917 [Unpublished; "[Petitioner] wrote that sales of consumer shopping goods in some months are vastly higher than in August, and the peak month of the year for shopping centers is as much as 39 percent higher than in August. [Petitioner] reasoned that movement in and out of Wal-Mart distribution centers likely would be higher by about the same proportion. 'Hence,' [Petitioner] argued, 'the trip generation estimates, particularly the estimates of truck traffic, do not represent a peak or 'design level' or necessarily even an average trip generation for the Project.'… The EIR stated that the time period used was 'representative of average conditions.' To the extent [Petitioners] claim that traffic studies must use a project's peak period of operation to estimate project-generated trips, and CEQA bars the alternative method of using an average or representative period of operation, the challengers offer no authority for this position. This appears to be no more than a disagreement between experts over methodology."] Additionally, as noted in Footnote 662 on page 4-1045 in Section 4.12.1.2 of the SPAS Draft EIR, "A shortfall in parking spaces is not considered an environmental impact for the purposes of CEQA, nevertheless this Draft EIR addresses this issue."

SPAS-PC00130-326

Comment:

Page 4-1168 Table 4.12.1-41 Summary of Curbside impacts

Question: The impacts shown in the chart are "no" for virtually everything, yet we know that the CTA is already gridlocked during peak hours and the passenger handling need will be increased dramatically by 2025. How is this reconciled with the observation that LOS is already poor and traffic will be increasing substantially as the number of passengers increases.

Response:

The comment states that "the CTA is already gridlocked during peak hours" and suggests that impact summary Table 4.12.1-41 contains inconsistencies. While existing conditions are important issues for LAWA, existing conditions are not impacts of the proposed SPAS alternatives. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a); see also Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App. 4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far beyond its scope"].)

As discussed in Section 4.12.1.9.2 of the SPAS Draft EIR, under all alternatives, future curbside activity would decrease relative to baseline conditions in a number of areas as a result of the relocation of certain commercial modes to off-site facilities such as the Intermodal Transportation Facility (ITF), Ground Transportation Center (GTC), and Consolidated Rental Car facility (CONRAC) and a 5 percent reduction of private vehicles (POV) demand to remote "kiss-and-ride" facilities for passenger pick up and drop off. The passengers using these relocated modes would be consolidated into high-capacity buses or APM for transport into the CTA which results in a net decrease in total traffic using the Central Terminal Area (CTA) roadways and curbsides. Consequently, the relocation of these modes results in a reduction of curbside activity compared to baseline conditions which translates into an improvement curbside operations.

Furthermore, as explained in Section 4.12.1.6.2 on pages 4-1094 through 4-1096 of the SPAS Draft EIR, with the construction of the Midfield Satellite Concourse Passenger Processor, Terminal 1.5, and Terminal 2.5, the passenger activity on all CTA curbsides was redistributed and the total available linear footage of curbsides in the airport was increased. Also in the future (2025), rental car shuttles and private parking shuttles, were consolidated and split into three routes with one route serving Terminals 1 and 2 and the Passenger Processor, a second route serving Terminal 3, TBIT, and Terminal 4, and a third route serving Terminals 5, 6, and 7. This operation produces a reduction of the number of shuttles accessing the individual curbsides and an improved curbside level of service as compared with the baseline.

Please see Section 4.12.1.2 of the SPAS Draft EIR for detailed discussion of the methodology for the on-airport curbside traffic impact analysis.

SPAS-PC00130-327

Comment:

Page 1183 4.12.2 Off-Airport Transportation
4.12.2.1 Introduction
The off-airport transportation analysis for the SPAS alternatives addresses traffic-related impacts outside the airport boundaries, including arterial roads, highway segments, and ramps that serve traffic approaching and departing the airport environs. This analysis also considers remote facilities that serve airport-related functions, such as parking and offairport cargo. The impacts of passengers, employees, cargo, ancillary, and collateral development (nonairport activities on airport property) on off-airport roads are also included. Impacts to on-airport transportation associated with operation of the SPAS alternatives are addressed in Section 4.12.1, On- Airport Transportation.
The primary focus of the analysis presented in this section is on changes in existing (baseline) traffic conditions that would result from the ground access improvements proposed under each SPAS alternative. Additionally, the off-airport transportation analysis completed for the SPAS alternatives accounts for increases in airport-related traffic that would occur in conjunction with increases in airport

passenger activity projected to occur by 2025, the buildout horizon year for the SPAS alternatives. Such future growth in passenger activity levels at LAX is independent of the SPAS alternatives and would occur even if no improvements were implemented.

Question: Page 4-1183 Off-Airport Transportation states that the growth in passenger activity levels is independent of SPAS and would occur regardless of projects to the same 78.9 maximum. The question, then, is what traffic capacity enhancements are proposed that will reduce the impacts on airport service and surrounding communities. This section appears to imply that there isn't much to do to improve the situation. Is that correct? What if the traffic were spread to other regional airports? Would service levels improve? What about mass transit improvements? Will that improve the level of service?

Response:

The discussion in Section 4.12.2.1 on page 4-1183 discloses the fact that growth in airport passenger activity levels that is anticipated to occur at LAX by 2025 irrespective of the SPAS alternative will result in increased traffic at the airport. Section 2.3 of the SPAS Draft EIR describes the ground transportation system improvements associated with each SPAS alternative that are intended to better accommodate existing and future traffic at and around the airport and improve traffic conditions.

As indicated in Section 2.3 of the SPAS Draft EIR, all of the SPAS alternatives, except for Alternative 4, include ground transportation improvements that would be integrated with the future Metro Crenshaw/LAX Transit Corridor and Station, which would enhance the use of public transit to and from LAX and, in turn, reduce airport-related vehicle trips. Section 4.12.2 provides an analysis of off-airport traffic for each alternative, and identifies mitigation measures to further reduce the impacts of airport-related traffic on surrounding communities. Please see Topical Response TR-SPAS-T-1 for further discussion regarding transit options into LAX. Additionally, those alternatives, again with the exception of Alternative 4, include the development of an elevated/dedicated busway or APM system to help reduce airport-related traffic impacts in and near the CTA. Alternatives 3, 4, 8, and 9 include development of a proposed CONRAC, which would include a single consolidated shuttle system to replace the number of individual rental car company shuttles that currently operate at the airport. This is also intended and designed to reduce local impacts from airport-related traffic. Regarding spreading traffic to other airports in the region, please see Topical Response TR-SPAS-REG-1. Traffic impacts that would occur at these airports are discussed in Section 6.2 of the SPAS Draft EIR.

SPAS-PC00130-328

Comment:

Page 4-1183 Off-Airport Transportation
Footnote 679 The airfield and terminal improvements associated with Alternatives 5 through 7 could ostensibly be paired with the ground access improvements proposed under Alternatives 1-2, 8, or 9. Given that Alternatives 5 through 7 would accommodate the same passenger loads as all other alternatives, the traffic impacts associated with Alternatives 5 through 7 would be the same as addressed herein for Alternatives 1-2, 8, and 9, depending on which set of ground access improvements one of those alternatives is paired with.

Question: Footnote 679 page 1183 states that "...Given that Alternatives 5 through 7 would accommodate the same passenger loads as all other alternatives, the traffic impacts associated with Alternatives 5 through 7 would be the same..." This is saying that there is no capacity improvement for any of the runway alternatives! So why spend the major dollars for no improvement since the Northside Safety Study showed that the safety improvement is minuscule when the percentage improvement is tied to the degree of safety.

Response:

The commentor misconstrues the statement in footnote 679 on page 4-1183 of the SPAS Draft EIR. While it is true that all the alternatives would accommodate the same passenger loads (i.e., 78.9 MAP), a lack of capacity change does not equate to a lack of airfield operational improvement. For instance, the alternatives propose different changes and modifications that increase safety and efficiency of the north airfield, consistent with the project objectives. (See Section 1.2.1 of the SPAS Draft EIR.)

Section 2.2 of the SPAS Draft EIR describes existing problems associated with the outdated airfield design, which include, but are not limited to, the following:

- LAX does not have an airfield, in either the north complex or the south complex, that is fully designed for the largest aircraft types currently in service (i.e., Aircraft Design Group (ADG) V aircraft, such as the Boeing 747-400, and ADG VI aircraft, such as the Airbus A380).
- The north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase aircraft delay.
- The primary north airfield departure runway (6R/24L) is too short for certain larger aircraft (e.g., fully-loaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield, resulting in less efficient operations and disproportionate environmental impacts.
- The outdated airfield design creates a situation where aircraft are at increased risk of hazards. Those hazards include potential collisions with other aircraft, such as when a landing aircraft might move in the path of a departing aircraft (incursion). Other potential hazards include, but are not limited to, insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways and aircraft on nearby taxiways. Such hazards contribute to the potential for conflicts between taxiing aircraft and ground vehicles on runways, taxiways, and nearby service roads.
- With one exception, the north airfield configuration does not comply with FAA Runway Safety Area (RSA) requirements.
- The north airfield high-speed taxiways are not in compliance with FAA Engineering Brief No. 75.
- The north airfield does not provide sufficient areas at the end of the runways for holding arriving flights and sequencing departing aircraft.
- The existing Runway Protection Zone (RPZ) associated with Runway 6L/24R includes residential uses.

The discussion in Section 2.2 goes on to describe what LAWA seeks to address those problems, including improvements that:

- Are consistent with FAA design standards for the largest aircraft types currently in service and anticipated for the future (ADG V and VI aircraft) for all weather conditions;
- Minimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service;
- Reduce the potential for airfield hazards, including incursions, and enhance the overall safety of airfield operations through runway and taxiway design;
- Accommodate a greater percentage of departing aircraft, thereby increasing airfield efficiency;
- Provide sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft; and
- Minimize or eliminate the extent to which Runway Protection Zones overlay residential areas.

The impacts of the various alternatives on the ability of large aircraft to land at the north airfield, the efficiency of operations at the north airfield, and other alternative-based impacts are discussed throughout the SPAS Draft EIR.

Comment:

Page 4-1201 Table 4.12.2-6 Estimated Project Alternative Transit Demand
Footnotes: 1Assumes an Average Vehicle Ridership Factor of 1.4. 2Assurnes a 5% public transit mode share.

Question: What is the basis of these two assumptions? Wasn't a factor of 1.7 determined by LAWA in the past? Isn't public transit currently only 3% or does this include taxis, shuttles, et. al. not just buses and trains?

Response:

The methodology for estimating future transit demand is described on pages 4-1200 and 4-1201 of the SPAS Draft EIR. As stated therein, the use of the 1.4 average vehicle ridership factor is consistent with

the assumptions provided by Metro on page D-5 of the 2010 Congestion Management Program for Los Angeles County. The 2006 LAX Air Passenger Survey (dated December 2007) showed approximately 1 percent of air passengers use public transit to access the airport, and that all airport-related trips had an average of 1.7 riders per vehicle. The 2006 survey indicated that 1 percent of LAX passengers use public transit (transit buses and light rail transit) to access the airport, a percentage that does not include private transit (taxis and shuttles). The assumptions used in the SPAS Draft EIR analysis provide a more conservative estimation of future year 2025 transit trips than would the assumptions stated in the comment, given the anticipated increase in transit demand due to the planned connection to the Crenshaw/LAX Light Rail corridor and continued expansion of Metro's transit services in the study area. Further, in order to provide a conservative analysis, no reductions to the project trip generation estimates presented in Section 4.12.2.2.4 of the SPAS Draft EIR were made in the traffic impact analysis to account for potential increases in transit ridership above the current level of approximately five percent. Please also see Response to Comment SPAS-AL00003-11.

Comment:

Page 4-1204 Figure 4.12.2-2 LAX SPAS Traffic Model Components
Peak Period to Peak Hour Factors Derived from Traffic Counts...

Question: Were the off airport peak hours chosen based on the airport traffic or the rest of the traffic patterns? Since there is limited north-south capacity that is generally full whether LAX is at peak or not this should be evaluated and solutions sought.

Response:

As discussed on page 1195 of the SPAS Draft EIR, the morning and afternoon peak commute hours were based upon the localized peak conditions (the highest one hour periods between 7:00 and 9:00 a.m., and between 4:00 p.m. and 6:00 p.m.). During these traditional morning and afternoon commuter "rush" hours, background traffic is typically highest. The peak hour of airport-generated traffic, the mid-day peak hour (the highest one hour period between 11:00 a.m. and 1:00 p.m.) was also analyzed to ensure that the potential traffic for impacts associated with the SPAS alternatives was fully evaluated and, to the extent feasible, mitigated.

The comment also states "since there is limited north-south capacity that is generally full whether LAX is at peak or not this should be evaluated and solutions sought." Existing conditions were disclosed in Section 4.12.2.3.2 of the SPAS Draft EIR. The impact analysis of the SPAS alternatives on off-airport intersections was provided in Section 4.12.2.6 and mitigation measures identified in Section 4.12.2.7.2. To the extent the commentor is suggesting mitigating existing conditions, this is beyond the scope of the SPAS EIR and the requirements of CEQA. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a); see also Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App. 4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far beyond its scope"].) To the extent the commentor is suggesting analysis of a time period outside of the AM, MD, or PM peak hours, this additional analysis is not required. Such impacts would be expected to be similar to or less than those disclosed during the three peak hours (the peak hour of background traffic and the peak hour of the generator), and would therefore not provide additional useful information. (See State CEQA Guidelines Section 15204(a); see also San Joaquin Raptor Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645 ["[Plaintiffs'] argument is essentially that greater specificity was needed [for the traffic analysis] --i.e., that the EIR should have specified whether trucks sometimes enter and leave the site 'unevenly' over time. We hold that such minute detail was not required in the analysis in question."]

SPAS-PC00130-331

Comment:

Page 4-1205-6 Table 4.12.2-7 and text "As shown in Table 4.12.2-7, the LAX SPAS Traffic Model meets and exceeds the guidelines for model accuracy in the a.m., m.d., and p.m. peak hours for unconstrained roadways;" and "As shown in Table 4.12.2-8, the model demand volume estimates

closely match count volumes for uncongested locations (i.e., model volumes only higher by 4 percent or less). For congested locations, the model's peak hour demand volumes are higher than the constrained peak hour counts by 24 percent and 18 percent in the a.m. and p.m. peak hours, respectively. Therefore, the LAX baseline year (2010) traffic model is considered to be valid to 2010 traffic conditions and acceptable for forecasting future year traffic volumes.... Reasonably foreseeable and funded improvements were included if they would be constructed by 2025 (see Appendix K2-1).

Question: If the model assumes unconstrained roadways is this a valid assumption? Why?

Response:

The comment states that the model assumes unconstrained roadways and asks if this is a valid assumption. The travel demand forecasting model does not make assumptions, but rather relies on input data, compiled by traffic modeling experts consistent with methods and practices accepted among professional traffic consultants, and mathematical algorithms in order to forecast traffic demand on roadways. 1

The roadways contained within the model structure are not unconstrained. The roadway inputs to the model reflect parameters such as speed and capacity that result in volume forecasts reflecting the built environment. These forecasts can then be used in a traffic operations analysis to forecast level of service (LOS) etc. This approach is intended to provide analysis results that are accurate and sensitive with respect to the actual roadway network. Details regarding the traffic modeling methodology assumptions on the roadway network are available in Section 4.12.2.2.2 on page 4-1202 through 4-1205 of the SPAS Draft EIR.

1. California Transportation Commission, 2010 California Regional Transportation Plan Guidelines, April 12, 2010 and Transportation Research Board, National Cooperative Highway Research Program Report 716 Travel Demand Forecasting: Parameters and Techniques, Washington DC 2012.

SPAS-PC00130-332

Comment:

Question: How sensitive is the traffic around LAX to the number and location of the parking slots? Can the model be used to recommend changes? Was this done? When calculating LOS values for the intersections the value of use/volume capacity is shown. If a street has major traffic on one street and limited to none on the second is the LOS artificially better? Even if "accepted practice" allows this can this be reviewed and solutions sought?

Response:

The comment asks how sensitive traffic patterns around LAX are to the number and location of parking spaces, whether the model can be used to recommend changes and if it was used to do so. The comment also asks how the level of service methodologies used in the SPAS Draft EIR traffic analysis calculate volume-to-capacity ratios at an intersection when traffic is heavier on one street than on another.

The development and use of the travel demand forecasting model developed for the traffic analysis is described in Section 4.12.2.2.2 of the SPAS Draft EIR. As stated, the model represents LAX as a series of traffic analysis zones (TAZs) where trip generators within the airport are, or would be, located (the Ground Transportation Center, the Central Terminal Area, parking lots, air cargo facilities, etc.). The model is used to evaluate alternative configurations of these elements and, in fact, the SPAS Draft EIR fully evaluates a range of alternatives that included different locations for major project elements, including public parking. For example, Alternative 4 includes relocation of parking for private cars as described on page 4-1214 of the SPAS Draft EIR. The level of service methodologies used in the traffic analysis are described on pages 4-1194 through 4-1196 of the SPAS Draft EIR. As stated therein, the Circular 212/Critical Movement Analysis (CMA) and Intersection Capacity Utilization (ICU) methodologies use the traffic volumes and lane capacities on the conflicting, or critical, movements to calculate the overall volume-to-capacity ratio of an intersection, which is then used to identify its

operating level of service (LOS A through LOS F). The Highway Capacity Manual (HCM) methodology is similar but calculates average vehicle stopped delay for the most constrained approach or movement at stop-controlled intersections and then relates that delay to the operating level of service. The detailed level of service worksheets in Appendix K2-6 of the SPAS Draft EIR show these calculations for each of the 200 study intersections for each analyzed scenario and for each SPAS alternative, including which movements and which approaches carry the heaviest traffic volumes. This information was used in the development of the recommended mitigation measures that are presented in Section 4.12.2.7 of the SPAS Draft EIR.

SPAS-PC00130-333

Comment:

Page 4-1307 4.12.2.7.2 Recommended Mitigation Program
Implementation of LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-20, ST21,716 and ST-22 and LAX Master Plan Mitigation Measure MM-ST-14 would reduce construction-related off-airport transportation impacts associated with Alternatives 1-2, 3, 4, 8, and 9. No additional measures are available to address construction-related off-airport transportation impacts at this stage of planning. There would be significant impacts to some CMP arterial monitoring intersections and freeway monitoring stations under Alternatives 1-2, 3, 4, 8, and 9. Physical mitigation is available for Intersection 26 (La Cienega Boulevard and Centinela Avenue) as shown below under MM-ST (SPAS)-10. No additional measures are feasible and available to address the impacts to other impacted arterial and freeway facilities.

Question: Since LAX is only allowed to pay for improvements in proportion to the traffic directly from/to LAX is there any estimate how much money would be required to implement the mitigations identified even if not all can be identified at this time? What is the total cost? What is LAWA's share?

Response:

The comment correctly recites the traffic mitigation measures that are recommended in Section 4.12.2.6.3 and Section 4.12.2.7 of the SPAS Draft EIR to address the identified impacts in the construction and operation periods of each alternative. LAWA is committed to mitigating traffic impacts as feasible and appropriate. Detailed cost estimates for the identified mitigation measures have not yet been prepared and are not required to be prepared in connection with environmental review under CEQA. Implementation of mitigation measures that lie outside the City of Los Angeles would require the review and approval of other agencies, as stated on page 4-1285 of the SPAS Draft EIR, and would be dependent on that approval. The final set of traffic mitigation measures for the SPAS project depends on which SPAS alternative is ultimately selected by the decision-makers, if any. Cost estimates will be prepared as specific improvement projects are implemented at the project level.

SPAS-PC00130-334

Comment:

The mitigations all relate to intersections. How about signage to direct airport traffic onto LaCienega to Century during the day when both streets are relatively empty?

Response:

The comment is incorrect in stating that the traffic mitigation measures all relate to intersections. The traffic mitigation program presented in Section 4.12.2.7.2 of the SPAS Draft EIR includes a Transportation Demand Management Program (Mitigation Measure MM-ST (SPAS)-1), which provides for the promotion and expansion of LAWA's successful vanpool program to reduce airport-related traffic.

The comment suggests that changeable signage could be used to "direct airport traffic onto La Cienega Boulevard to Century during the day when both streets are relatively empty." Based upon the wording of the comment (1) it is unclear whether the commentor is suggesting diverting drivers onto La Cienega Boulevard or Century Boulevard, (2) the commentor does not specify which drivers are suggested for

diversion (i.e., the source of the diverted drivers), and (3) the commentor does not specify whether this suggestion is relevant to all of the alternatives or one of the alternatives.

At this time, there is no evidence to suggest that providing additional changeable signs farther from the airport would reduce or avoid a significant impact. As discussed in Section 4.12.2.2.1 of the SPAS Draft EIR and further described in Response to Comment SPAS-PC00130-34, La Cienega Boulevard and Century Boulevard are already two of the key roadways providing access to LAX. Static guide signs are currently posted along the major approach and departure routes in the LAX areas to assist motorists in locating LAX and the freeway network. There is also a permanent, overhead changeable message sign on westbound Century Boulevard east of Airport Boulevard. In addition, LAWA owns and operates portable changeable message signs that are deployed for various incidents, construction detours, or special events, These signs provide information regarding airport security alerts, accidents, lane closures and other unexpected traffic conditions (information that is often not well conveyed by common GPS navigation systems).

Many drivers also already have access to GPS navigation systems (either mounted in the car or accessible by cell phone), which provide real time traffic conditions which enable drivers to make personalized routing decisions based upon traffic conditions.

To the extent the commentor is also suggesting changeable signs in other locations, other infeasibility factors are also relevant. The commentor raised similar suggestions in 2009 on the Bradley West Project Draft EIR. As LAWA explained in Response to Comment BWP-PC00011-45, in some locations the suggestion is socially infeasible:

"In 2005, the Los Angeles Department of Transportation, as part of their Westchester Intelligent Transportation System improvement project, planned to install permanent, overhead changeable message signs on the approaches to LAX. LAWA and LADOT staff discussed the possibility that LAWA could request LADOT to display electronic messages on these signs during unique occurrences at the airport, such as airport security alerts and information regarding alternate parking locations if CTA parking was full. LADOT planned to use the signs to inform drivers of accidents, lane closures due to construction, and other unexpected traffic conditions. These signs were planned to be located away from the CTA entrances in order for drivers to have time to process the messages and change their routes accordingly. The proposed locations were southbound Lincoln Boulevard near La Tijera Boulevard, southbound Sepulveda Boulevard south of 76th Street/77th Street and westbound Century Boulevard west of Concourse Way. However, public opposition to the proposed signs, culminating with a public meeting held on January 17, 2006 at which several area residents expressed their view that the signs would lead to additional traffic through their community, resulted in LADOT withdrawing its plans to install changeable message signs on Lincoln and Sepulveda Boulevards."

Nevertheless, if and when a SPAS alternative is selected, and site specific development progresses, an appropriate program of on-site and off-site signage will be developed to assist motorists consistent with LADOT's transportation planning functions (see Los Angeles Administrative Code Section 22.481(a).). Please also see Responses to Comments SPAS-PC00130-360 and SPAS-AL00004-29 regarding the programmatic nature of SPAS.

SPAS-PC00130-335

Comment:

Page 4-1330 4.13.1 Energy
LAWA operates a CUP at LAX, which provides heating and cooling to the Central Terminal Area (CTA). The CUP houses a co-generation system that generates electrical power, which is sold to the City of Los Angeles Department of Water and Power (LADWP). In addition to producing electricity, the CUP's cogeneration729 facility reduces fuel usage by 10 to 30 percent compared to separate electricity and heat processes. 730 Additional information regarding the CUP is provided below.

Question: The Scattergood Power Generation Plant is about to change over the next five years and there will be significant excess natural gas generated at Hyperion Water Treatment Plant which was being provided to Scattergood. Has LAX explored using some of that gas to support its power needs?

When will solar panels be installed on the roofs of all buildings? Has LAWA investigated low profile wind turbines near the runways?

Response:

Please see Response to Comment SPAS-PC00130-480 regarding the use of alternative energy at LAX, including solar and wind power, and the availability of energy supplies to serve the SPAS improvements. Please also see Response to Comment SPAS-AR00002-8 regarding the use of solar power at LAX. During planning for the LAX Central Utility Plant Replacement Project, LAWA was considering the use of digester gas from the Hyperion Treatment Plant (HTP) as an alternative energy source for use in the replacement CUP. However, use of digester gas from HTP was found to be infeasible for the CUP. The City of Los Angeles Department of Public Works (LADPW) currently has alternative plans for use of the digester gas generated at HTP. LADPW's Wastewater Capital Improvement Program for Fiscal Year 2011/2012 through 2020/2021 includes a digester gas co-generation facility that will self-generate power at HTP for internal use at the treatment plant to offset use of power from the City of Los Angeles Department of Water and Power.1

1. City of Los Angeles, Department of Public Works, Bureau of Sanitation, Wastewater Capital Improvement Program - Fiscal Years 2011/12 - 2020/21, page 184.

Page 5-2 Cumulative Impacts Table 5-1 Summary of Cumulative Land Use Assumtions

Question: Table 5-1 Westchester-PDR area is a bedroom community with considerably more people during the day and is a major thru way for transportation from the South Bay to West LA/Santa Monica (with people stopping here. How was this considered? See the W-PDR Community Plan EIR for details.

Response:

As described on pages 5-1 and 5-2 of the SPAS Draft EIR, CEQA requires a discussion of cumulative impacts, which includes a list of past, present, and reasonably anticipated future projects producing cumulative impacts, or a summary of projections contained in an adopted general plan or related planning document designed to evaluate regional or area-wide conditions. The purpose of Table 5-1 is to provide background for the evaluation of cumulative impacts based on the adopted growth projections set forth in the Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for population, households, and employment. The reasonably foreseeable growth occurring in the SPAS study area, including Westchester and Playa del Rey, is based on the demographic projections adopted by SCAG as extrapolated for 2025, the year of project buildout. SCAG's forecasts are developed in consultation with jurisdictions such as the City of Los Angeles and are derived in part from the potential buildout of communities pursuant to their approved land use plans. The adopted growth projections are used by SCAG to identify regional transportation improvements, including those in the Westchester-Playa del Rey area.

Section 4.12.2 of the SPAS Draft EIR analyzes the traffic impacts of the SPAS alternatives on affected intersections and roadways in the Westchester-Playa del Rey area (as well as other off-airport locations). Traffic added by the SPAS alternatives is evaluated by comparison to both existing traffic conditions and future without-alternative traffic conditions.

SPAS-PC00130-337

Comment:

Page 5-12 Cumulative Impacts

Question: Only one of the office buildings #121 is shown in the list for Howard Hughes yet there are half a dozen approved including a dozen story building. Why are these not included?

Response:

Please see Response to Comment SPAS-PC00130-216 regarding the related projects, including the Howard Hughes Center, considered in the off-airport transportation analysis for the SPAS alternatives.

SPAS-PC00130-338

Comment:

Page 5-17 5.3.1 Airfield-Related Improvements

Question: Where is the additional RONs listed in previous EIRs or the 3 Hush hangers previously promised and required in 2015 by the CalTrans noise variance? What about new projects like the Runway Status Lights (there are many upcoming improvements on this). What about control tower projects/changes to address the several non-visibility issues that remain and new ones created by the TBIT design? What improvements to the remote gates are planned? As outsiders it is not for us to guess what LAWA has in mind.

Response:

Section 5.3 of the SPAS Draft EIR identifies reasonably-foreseeable projects that, in conjunction with implementation of SPAS, have the potential to result in cumulative impacts. The list of LAX development projects includes projects that are in the planning or implementation stages at this time and about which sufficient information is known to determine cumulative impacts.

It should be noted that the proposed West Aircraft Maintenance Area is proposed to include a RON apron area and a ground run-up enclosure (i.e., GRE, referred to by the commentor as a "hush hangar"), as stated in the description of this project on page 5-17 of the SPAS Draft EIR. Installation of Runway Status Lights is also identified as a cumulative project (see page 5-18). Five RON spaces were included in the development of Taxiway R (also known as the Crossfield Taxiway Project), and addressed in the EIR for this project, which is also identified as a cumulative project on page 5-17. Please also see Response to Comment SPAS-PC00130-132 regarding previous commitments and requirements pertaining to the provision of ground run-up enclosures at LAX.

Under the Bradley West Project, improvements to the FAA-operated Airport Traffic Control Tower (Control Tower) to address line-of-sight issues, such as the installation of additional cameras, are being implemented. As part of the future Midfield Satellite Concourse project, FAA and LAWA will evaluate the need for additional facilities to address line-of-sight issues. As such future facilities have not yet been identified, specific projects are not reasonably foreseeable and, therefore, were not included in the list of cumulative projects in Chapter 5 of the SPAS Draft EIR.

Regarding improvements to the remote gates, no improvements are planned, with the exception of upgrades to LAWA-owned passenger boarding bridges, which are being implemented airport-wide (see page 5-17 of the SPAS Draft EIR).

SPAS-PC00130-339

Comment:

Page 5-18 5.3.2 Terminal-Related Improvements

Question: The list presented fails to mention the parking structure bridges or terminal 0 add-ons or cargo improvements or terminal 1.5 or terminal 2.5. As outsiders it is not for us to guess what LAWA has in mind.

Response:

Section 5.3.2 of the SPAS Draft EIR identifies past, present, and reasonably foreseeable terminal-related projects at LAX whose impacts are considered in the SPAS Draft EIR, in conjunction with the impacts of the SPAS alternatives, as part of the cumulative analysis. As described in Section 2.3 and depicted in Figures 2-1, 2-2, 2-5, 2-6, and 2-7 of the SPAS Draft EIR, Terminal 0 is a component of SPAS Alternatives 1, 2, 5, 6, and 7 and, therefore, is not included on the list of cumulative projects identified in Section 5.3.2. However, Section 5.3.2 does identify the north terminals improvements, also referred to as Terminals 1.5 and 2.5. Cargo improvements considered in the cumulative impacts analysis are included in the list of miscellaneous projects in Section 5.3.3 of the SPAS Draft EIR, as are ongoing parking structure repairs. The commentor's reference to "parking structure bridges" appears to be a reference to existing pedestrian bridges that connect parking structures to terminals. Modifications to pedestrian bridges are considered ongoing maintenance and miscellaneous improvement projects and are identified as miscellaneous terminal improvements for purposes of the cumulative impact analysis in the SPAS Draft EIR. Please see pages 5-17 through 5-22 for a description of the ongoing and planned maintenance-related improvements at LAX. Please also see Response to Comment SPAS-PC00130-756 regarding maintenance of parking structures and pedestrian bridges.

SPAS-PC00130-340

Comment:

Question: When is LAWA going to create a comprehensive list and generate a ROM cost estimate for all of these projects so that BOAC can actually plan on how it can finance them?

Response:

A financial plan for all of the airport-related development projects identified in Chapter 5 of the SPAS Draft EIR is beyond the scope of the SPAS project and is not required by CEQA. However, as explained in Section 8.5 of the Preliminary LAX SPAS Report, and detailed in Table 8-1, a rough-order-of-magnitude cost estimate is provided for LAX Base Development Projects for Fiscal Year 2012 through Fiscal Year 2025, as well as for each of the SPAS alternatives. Chapter 8 identifies funding sources and estimates financial impacts associated with the SPAS alternatives.

Page 5-22 5.3.4 Land Development and Miscellaneous Improvements
Manchester Square/Belford - In conjunction with residential acquisition occurring under the Aircraft Noise Mitigation Program, voluntary land acquisition within the Manchester Square and Belford areas will continue on an ongoing basis and involve the demolition of acquired structures. Following demolition, properties are fenced, landscaped, and maintained.

Question: What is planned in these locations so that impacts can be assessed and included?

Response:

Land uses are planned in Manchester Square as part of all of the SPAS alternatives with the exception of Alternative 4, as described in Chapter 2 of the SPAS Draft EIR. Specifically, under Alternatives 1 and 2, Manchester Square would be used for airport-related parking. Under Alternative 3, a Ground Transportation Center would be constructed in Manchester Square. Under Alternatives 8 and 9, Manchester Square would be used for a CONRAC and parking. Although Alternatives 5, 6, and 7 focus on airfield improvements only, these alternatives would be paired with the ground access features of Alternative 1, 2, 8, or 9. Please see Response to Comment SPAS-PC00130-175 regarding speculation about future land uses in the Belford area.

Comment:

Page 1655 Cumulative Impacts 5.5.2 Air Quality

Question: When will the three year late air quality apportionment study be released? Why is none of the first two phases considered in the evaluations for this DEIR?

Response:

This content of this comment is similar to comment SPAS-PC00130-36; please refer to Response to Comment SPAS-PC00130-36.

SPAS-PC00130-344

Comment:

The questions in this attachment are in addition to those previously attached that came from various members for LAWA to answer and are in no particular order:

Question: The Master Plan is to allow for future LAX growth and effectiveness within a regional network. How was HSR or other major rail considered in the design to facilitate accesses?

Response:

The question regarding High Speed Rail (HSR) was also raised in comment SPAS-PC00130-194; please refer to Response to Comment SPAS-PC00130-194.

SPAS-PC00130-345

Comment:

Question: How does this DEIR account for AC150/5300-13A changes (the draft released several months ago and went into effect September 30, 2012) that increased space requirements for ADG V and VI? Similarly, the FAA is starting phase 2 of the Southern California Metroplex airspace redesign in October 2012. How has this been considered in the design of the airport since it can modify approach paths and change environmental impacts?

Response:

Tables 3-6, 3-7, and 4-1 of FAA Advisory Circular (AC) 150/5300-13A detail the runway-taxiway and taxiway-taxiway separation standards for Aircraft Design Group (ADG) V and VI aircraft. The separation standards are equivalent to those which were found in previous FAA AC 150/5300-13.

Please refer to Response to Comment SPAS-PC00130-301 regarding the Southern California Metroplex airspace redesign.

SPAS-PC00130-346

Comment:

Question: Please confirm that any building or facility in Lot C will be no higher than one floor and fulfills the runway safety area and runway protection zone areas requirements without waiver.

Response:

As depicted in Figures 4.7.2-6, 4.7.2-8, 4.7.2-10, 4.7.2-12, 4.7.2-14, 4.7.2-16, and 4.7.2-18 in Section 4.7.2.6 of the SPAS Draft EIR, the Runway Safety Areas (RSA) for Alternatives 1 through 7 do not extend into Lot C. As such, Lot C is not required to meet the RSA object clearing criteria defined by the Federal Aviation Administration (FAA) in Advisory Circular (AC) 150/5300-13A, Airport Design.

The figures noted above also depict the Runway Protection Zones (RPZ). As seen in the figures, the RPZs do not encompass the entirety of Lot C. Any portion of Lot C outside the RPZ boundary would not be subject to the FAA standards for above-ground objects defined by AC 150/5300-13A. For those portions of Lot C that fall within the RPZs, the FAA states that is "desirable to clear the entire RPZ of all above ground objects." However, RPZ clearance is not mandated. As such, there is no one-story limit within the RPZ as suggested by the commentor.

The FAA does not grant waivers for RPZs that do not comply with FAA guidance.

Comment:

Question: Please address the potential consequences in the table below:

Action
Removal or mitigation of the 1960s six lane, 740' Manchester tunnel that was to extend from Lincoln on the north to El Segundo was decommissioned because it was destabilizing the runways. It remains under the current runways.
Potential Consequence
LAWA estimated $14M whereas it was $1 OM to add a "welcome to LAX sign" in the median of Sepulveda. We're told it could be several $billion to do it right. Not doing it right could cause major sink hole problems. It's related to an unknown underground water source.
There's also a concern of leeching contamination from the airfield or from the Park One (Garrett and Rocketdyne did fuel and rocket testing on the north areas).
During the years the tunnel was built they had to run an artesian well. There was steam and water in the tunnel during the drought. LAWA has refused to check the tunnel since the rains.

Response:

The commentor has not provided any substantial evidence or factual basis supporting the assertion that the SPAS alternatives could cause major sink hole problems or that there is an unknown underground water source. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to as the Manchester tunnel by the commentor). Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX and Response to Comment SPAS-PC00130-265 regarding groundwater contamination. Please see Response to Comment SPAS-PC00096-2 regarding funding for the SPAS improvements.

SPAS-PC00130-348

Comment:

Action
The Major Hyperion sewer lines goes right where they want to put the runway.
Potential Consequence
They may need to move the sewers. It will be a long, expensive process because they don't know the precise locations.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of outfall sewers beneath LAX. There are two outfall sewers that lie beneath the north airfield, the NCOS and NORS. These are the same outfall sewers that lie beneath the portion of Lincoln Boulevard that would be relocated under Alternatives 1, 5, and 6. Although the north airfield lies farther south than Lincoln Boulevard, the depth to these outfall sewers beneath the north airfield is similar to their depth beneath Lincoln Boulevard (i.e., approximately 65 feet). Construction of the north runway improvements would not require relocation of these outfall sewers.

SPAS-PC00130-349

Comment:

Action
Realignment north of the runway necessitates Lincoln Blvd movement by LAWA or CalTrans. The DEIR calls for Lincoln into a tunnel or below grade plus a new interface with Sepulveda Blvd.
Potential Consequence
Major loss of N-S traffic capacity for extended period, 405 already gridlocked. Again, cost is a major factor along with interruption of traffic and Westchester Business District (if it survives).

Response:

Please see Response to Comment SPAS-PC00046-3 regarding impacts to the off-airport transportation system to the north of the airport.

SPAS-PC00130-350

Comment:

Action
Argo Flood Channel (they call ditch) would need to be turned into a covered, limited capacity flow channel.
Potential Consequence
Messing with this area could cause changes to the underground water. Inadequate capacity could flood the runways or north into Westchester. It might even impact the north terminals after a major 50 or 100 years storm. Is the permeable covering on the ditch strong enough to hold a fully loaded A380? If not, what technology will be used to ensure that it is?

Response:

Please see Response to Comment SPAS-PC00130-169 regarding the design capacity of the Argo Drainage Channel improvements proposed under Alternatives 1, 5, and 6. As noted in this response, the design of the facility would provide sufficient capacity to meet the design storm flow for the tributary area. If the capacity of the channel were exceeded, no impacts to the north terminals or to Westchester would result. Rather, the area upstream of the culvert inlet would be affected for a short time until water that had temporarily ponded upstream could be drained back into the channel once the peak of a large storm had passed. The commentor provides no evidence to support the claim that converting the open channel to a box culvert would modify underground water in the area. As noted on pages 2-10, 2-29, and 2-33 of the SPAS Draft EIR, the concrete box culvert would be designed to support the weight of aircraft, including a fully-loaded A380.

SPAS-PC00130-351

Comment:

Question: What capacity must the people mover be capable of handling from the Consolidated Rental Car facility to the CTA?

Response:

The APM systems proposed as a part of Alternatives 3 and 9 have been developed at a program level of planning. Should one of these alternatives with an automated people mover (APM) be approved, further design and analyses for both the consolidated rental car facility (CONRAC) and the APM would be undertaken to more precisely determine the peak passenger demand levels associated with the CONRAC and the necessary capacity of the APM to accommodate the CONRAC demands along with the demands of the other airport-related transportation facilities that are also served by the APM (i.e., the Intermodal Transportation Facility and future Metro Crenshaw/LAX Transit station under Alternative 9 and the Intermodal Transportation Center under Alternative 3).

In general terms, however, relative to the commentor's question of "What capacity must the people mover be capable of handling from the Consolidated Rental Car facility to the CTA," the peak hour demand of the CONRAC can be roughly approximated by multiplying the peak hour passenger activity level projected for LAX in 2025 by the rental car mode splits. In other words, by taking the estimate of how many passengers would be arriving at or departing from LAX during peak hours, as estimated at "curbside" (i.e., passengers within the terminal area that are on connecting flights and would not utilize surface transportation at LAX were not counted), and multiplying that number by the mode split percentage estimated for rental cars (i.e., the percentage or passengers that would be utilizing a rental car for transportation to or from the airport, instead of by private vehicle, or shared-ride shuttles, or bus, etc.) the number of rental car passengers traveling on the APM system can be generally estimated. As indicated on page 4-1096 of the SPAS Draft EIR and shown in Figure 4.12.1-9 on the next page, it is estimated that 7,197 passengers would be at curbside during the arrivals peak hour at LAX in 2025 and 6,610 passengers would be there during the departures peak hour. Table 4.12.1-15 on page 4-1103 of the SPAS Draft EIR delineates the passenger transportation mode splits estimated for the arriving peak hour and the departing peak hour in 2025, with 9.5 percent and 10.8 percent of passengers utilizing rental cars during those respective peak hours (Note: Although those percentages are shown in the table relative to rental car shuttles under Alternatives 1, 2, 4, and 8, which are the alternatives that do not propose an APM, the use of those percentages multiplied against the peak hour passenger estimates provides an indication of the approximate number of passengers utilizing rental cars regardless of whether they use a shuttle or an APM to get between the CTA and the rental car company lot). Based on those calculations, approximately 684 rental car passengers would be utilizing the APM during the arriving peak hour and 714 rental car passengers would be utilizing the APM during the departing peak hour. To account for rental car company employees or other related staff that may also be traveling during those times, an additional ten percent ridership can be assumed, bringing the totals to 752 APM riders during the arriving peak hour and 785 APM riders during the departing peak hour. Again, as indicated above, these estimates are only rough approximations based on information developed at the program level of planning, and more precise demand estimates and corresponding capacity requirements would be determined in conjunction with more detailed planning and analysis for both the CONRAC and the APM in the future, should Alternative 3 or 9 be selected for approval.

SPAS-PC00130-352

Comment:

Question: When applying the SIMMOD model did LAWA take the numbers of each type of aircraft and plug them in to predict which runways for landing and takeoff they would logically be assigned to by the FAA? Is the model validated to ensure safe spacing distances and to match available runway capacity?

Response:

As stated on page 3 in Appendix F-2 of the Preliminary LAX SPAS Report, the Design Day Flight Schedule (DDFS) was simulated independently for each modeled runway operating configuration. As such, the aircraft type for each operation is entered into the model and allows for individualized ground and airspace procedures to be applied. Specifically, the separation standards specified in the Los Angeles Tower Local Control Standard Operating Procedures (SOP) were applied.

As discussed in Section 1.4.2 in Appendix F-2 to the Preliminary LAX SPAS Report, the SIMMOD model used for the SPAS Draft EIR analyses was originally developed and calibrated using actual performance data in 2005. It was subsequently verified and revalidated in 2007 and 2009 based upon updated operational performance data.

In response to this comment, the following sentence has been added to the end of the second bullet on page 3 of Appendix F-2 of the Preliminary LAX SPAS Report: "The simulation model was subsequently verified and revalidated in 2007 and 2009 based upon updated operational performance data." Please see Chapter 3 of the Final LAX SPAS Report.

Following FAA Air Traffic Control procedures, runway assignment for each SIMMOD model was initially determined by the route flown, which is based on the geographic location of the destination or arrival city. In some instances, aircraft routing was adjusted by the model due to metering related to operational demand. For more information, see Section 1.4.5 of Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-353

Comment:

Question: What "special handling" was necessary for the north or south complex since the specific aircraft available for inclusion is airline gate assignment dependent and since they appear to have used the "black box" method of not using specific gate locations how does the model know if an aircraft was destined for a gate on the north or south or for that matter specific area of gates since not all aircraft fit into all gate locations?

Response:

Sections 4.3.2 and 4.3.3 of Appendix F-1 of the Preliminary LAX SPAS Report describes the methodology and assumptions utilized for assigning terminals and gates to each flight in the Design Day Flight Schedule (DDFS). This assigned terminal and gate for each operation was entered into the SIMMOD model. SIMMOD is a planning tool used to recreate air traffic operations for, among other things, the terminal area airspace. It is a network-based model in which airspace and ground facilities and routes are described as a composite of nodes and links.

Upon an aircraft's arrival at LAX, the SIMMOD model checks that the assigned gate is available. In the event that the aircraft's assigned gate is occupied, the model identifies other suitable gates that the aircraft may use. Parameters used for identification of a suitable alternative gate included being located in the same terminal (serving as a geographical proxy for airline location), type of aircraft that can be accommodated, and blocking of adjacent gates. In the event that no suitable alternative gate is available, aircraft were taxied to predetermined holding locations until such time that a suitable gate became available. In response and to provide additional information regarding the gate assignment of aircraft in SIMMOD, this paragraph has also been added to page 42 in Section 2.1.1.2 of Appendix F-2

of the Preliminary LAX SPAS Report. Please see Chapter 4, Corrections and Additions to the Preliminary LAX SPAS Report.

The assumptions upon which the DDFS and SIMMOD relied were reasonable, and supported by substantial evidence in the SPAS Draft EIR.

SPAS-PC00130-354

Comment:

Question: Appendix matrix J1-1 Aircraft Noise Technical Analysis Table 7 et.al.contain specific tracks assumed. Alts 1, 5, 6, and 7 are predicted to be exactly the same in 2025 but very different from the 2009 Baseline percentages. How is this explained?

Response:

The commentor is inquiring about differences among flight track use percentages recorded in 2009 and those assumed in 2025 under each SPAS alternative. Flight track use percentages were generated in a large database. The tables included in Appendix J1-1 of the SPAS Draft EIR, starting with Table 2 on page 4-12, display percentages of each flight track for each runway of the total number of day, evening, and night operations. For instance, first row of Table 2, 0.01 percent of all daytime operations were assumed to operate on Runway 6L Flight Track ID #LN_CIV1.

As addressed under the discussion of runway utilization under each alternative (starting in Section 3.2.1 in Appendix J1-1 of the SPAS Draft EIR with Alternative 1), the runway use percentages assumed under each SPAS alternative may vary from the 2009 baseline conditions depending upon the SIMMOD simulation results and airfield characteristics of each alternative. As discussed in Section 3.2.1 in Appendix J1-1 of the SPAS Draft EIR, "The function of the SIMMOD model is to assign individual flights to specific runways based largely on minimizing separation requirements between various aircraft types and assign aircraft to runways based on traffic demand to maintain operational efficiency and reduce delay." Therefore, the flight track utilization percentages may differ between the 2009 and 2025 results as runway use percentages vary.

However, an important assumption made in the SPAS Draft EIR aircraft noise analyses was the assumption to maintain the use of each flight track constant (unique to each runway) by time of day and aircraft type in 2009 baseline and 2025 conditions. Accordingly, using the same example as above, for each runway and unique flight track assigned to that runway (for instance, to Runway 6L Flight Track #LN_CIV1), the percentage of operations by time of day and aircraft type (for instance day time and LNB) were assumed to remain constant (in this instance, 30.3 percent). See Section 3.2.2 and 3.2.3 in Appendix J1-1 of the SPAS Draft EIR for further details. Similar discussion is provided for the other alternatives in the subsequent sections of the Appendix J1-1.

SPAS-PC00130-355

Comment:

Question: A chart of the annual number of operations was presented to the LAX-Community Roundtable. 2009 is about 10% less when compared with 2011(with 2009 at a low point). How would this impact the noise and pollution analysis results?

Response:

Aircraft operations at LAX in 2009 were 9.5 percent lower than they were in 2011. When comparing conditions in 2025 with implementation of the SPAS alternatives to a 2009 baseline year, the increase in noise levels and air quality emissions and concentrations is greater than it would be were a 2011 baseline year used. Therefore, use of 2009 baseline year for operational data in the SPAS Draft EIR provides for a conservative analysis.

SPAS-PC00130-356

Comment:

Question: Since LAWA is attempting to move aircraft and facilities closer to communities what biological contamination precautions are being improved?

Response:

It is unclear what is meant by "biological contamination precautions" in the comment. The emissions from the airport sources are not biological contaminants such as molds, fungus, and bacteria. The Section 4.2.5 (pages 4-103 through 4-108) of the SPAS Draft EIR outlines approximately 34 mitigation actions that will be implemented to potentially reduce construction and operational air pollutant emissions from project sources. These include, among other actions, installing diesel particulate filters on construction equipment, fugitive dust controls, administrative controls to limit hours of operation of on-road and off-road vehicles and equipment, provide FlyAway connections in strategic locations and otherwise encourage transit ridership to the airport, improve roadway and highway traffic systems around the airport, encourage use of low-emission vehicles, convert the LAWA fleet to alternative vehicles, conserve energy, and support the conversion of ground support equipment to alternative fuels or battery power.

SPAS-PC00130-357

Comment:

Question: Several 2007 runway safety studies are mentioned in the DEIR/SPAS Report. Several technical improvements such as runway safety lights are available and RSL are installed at some, but not all intersections. None of those studies seems to have assumed that any of the technical improvements were to be implemented. If they are all implemented, what is the impact on runway safety? What is the perceived cost?

Response:

The installation of runway status lights would enhance airfield safety by providing pilots with an additional information source regarding whether to cross a runway. As described on page 4-502 of the SPAS Draft EIR, installation of such a system at LAX is underway. Please refer to Response to Comment SPAS-PC00096-5 for a discussion of the safety improvements analyzed in the SPAS Draft EIR.

SPAS-PC00130-358

Comment:

Question: Regarding DEIR meeting outreach: What list of people or organizations did LAWA notify? At one of the hearings we noted the scarce attendance and asked who had received postcards. We were told that LAWA couldn't find the lists or prior meeting participants to which to send postcards. Many of those initial lists are published in the preliminary SPAS report! We did a quick survey at the last two Westchester Neighbors Assn general meetings and found that only two people had received postcards our of approximately 60 at each meeting (approximately 3/4 in attendance had attended prior LAX meetings).

Response:

LAWA undertook an extensive process to notify public agencies and members of the public of the availability of the SPAS Draft EIR for review and the three open house/public meetings that were held in late August 2012 during the public comment period. As required by CEQA, a Notice of Completion was filed with the State Clearinghouse and the Notice of Availability (NOA) was posted with the County Clerk. In addition to providing information about the availability of the SPAS Draft EIR, the length of the public review period, and the process for providing comments, the NOA listed the three open house/public meeting dates. In addition, a mailer was sent to 7,080 individuals with information regarding the availability of the SPAS Draft EIR and the open house/public meetings. The mailing list included names in the LAX Master Plan Stakeholder Liaison's database, which was originally compiled

during preparation of the LAX Master Plan EIS/EIR. In addition, 1,500 postcards were distributed, along with supplemental Spanish-language materials where appropriate. These postcards were distributed in person at Terminal 1 (baggage claim), the Westwood FlyAway, Union Station FlyAway, and Van Nuys FlyAway. Notices announcing availability of the SPAS Draft EIR and the open house/public meetings were also published in area newspapers, including the Los Angeles Times, Argonaut, Daily Breeze, La Opinion, and Hoy. Meeting information was also published in LA Streets Blog, and onsite advertisements appeared in the Los Angeles Times, Daily Breeze, and Daily News. LAWA posted several press releases announcing the open house/public meetings on its website (www.lawa.org) and distributed press releases to over one dozen travel- and airport-related media outlets. The press releases also notified the public of the virtual meeting platform, which enabled the online audience to access information that was presented at the open house/public meetings and submit comments. Finally, the meetings were announced via LAWA's social media platforms (i.e., Facebook and Twitter).

SPAS-PC00130-359

Comment:

Question: When LAWA did a security analysis, did it take into consideration all of the RAND studies? What perimeter assumptions and accesses did LAWA assume? What controls into the CTA and also what airfield (and through the fence) assumptions were made? Who actually conducted the study and who approved the contractor?

Response:

Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan.

The Security Assessment was prepared by TranSecure, who was selected by LAWA in consultation with the petitioners from the LAX Master Plan litigation. The security consultant reviewed and considered previous security studies prepared for LAX, including the RAND studies. The purpose of the Security Assessment was to provide a preliminary review of facilities included in the SPAS alternatives on a conceptual basis. The study looked at all of the facilities included in the SPAS alternatives, including those on current airport property as well as those on land that would have to be acquired. The access assumed for each alternative is as defined for that alternative in Chapter 2 of the SPAS Draft EIR. The study did not make any assumptions regarding security beyond existing physical facilities and security practices.

No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-360

Comment:

Question: What kinds of safety studies were conducted? Was it assumed that all structures were sound and in good repair? If not where are cost estimates and identification of the refurbishments that will be needed?

Response:

Structural assessments were not conducted for the SPAS Draft EIR analysis, given that such analysis is more appropriate for, and would be undertaken at, the more detailed project level of planning and review. As discussed on page 4-3 of the SPAS Draft EIR, the Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-

level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4).) Program EIRs are commonly used in conjunction with the tiering process, which is "the coverage of general matters in broader EIRs (such as general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs…concentrating solely on the issues specific to the EIR subsequently prepare." (State CEQA Guidelines Section 15385.) Under CEQA's tiering principles, it is proper for a lead agency to focus a first-tier EIR on only the program's general impacts, "leaving project-level details to subsequent EIRs when specific projects are being considered." (State CEQA Guidelines Section 15152(c); In re Bay-Delta (2008) 43 Cal.4th 1143, 1174-1175.)

The CEQA Guidelines establish several additional principles related to the level of detail appropriate for a first-tier program EIR. For example, an EIR project description should be "general" and "not supply extensive detail beyond that needed for an evaluation and review of the environmental impacts." (State CEQA Guidelines Section 15124.) Also, the degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated. (State CEQA Guidelines Section 15146(b).) An EIR's sufficiency is reviewed in the light of what is "reasonably feasible." (State CEQA Guidelines Section 15151.)

SPAS-PC00130-361

Comment:

How many vehicle accidents are assumed to occur at LAX and was this accounted for in the traffic analyses?

Response:

The on-airport traffic analyses in Section 4.12.1 of the SPAS Draft EIR were prepared to provide analyses of the peak hour traffic conditions on the upper-level roadways of the CTA and the peak hour conditions on the arrivals-level roadways during an average day of the peak month (PMAD). These conditions represent a busy typical condition for the purposes of assessing existing and future traffic operations related to the SPAS. Please refer to Response to Comment SPAS-PC00130-308 for additional discussion related to the selection of the PMAD and the validity of using PMAD as a basis for conducting the on-airport transportation analyses. The occurrence of traffic accidents, and their effect on operation, is unpredictable and represent an atypical operating condition. Therefore, an assumption of traffic accidents would be very speculative and would not provide meaningful information relative to the various SPAS alternatives. Therefore, such an assumption was not incorporated into the SPAS on-airport traffic analyses.

SPAS-PC00130-362

Comment:

Was taxiway and gate locations considered as part of the safety studies? What about line of sight issues (and non-visibility areas) in all areas of the airside?

Response:

To the extent that taxiway and gate locations are accounted for in SIMMOD airfield modeling, those studies that utilized SIMMOD in evaluating airfield safety, such as in the case of the North Airfield Safety Study (NASS), do take those features into considerations. However, because the SPAS Draft EIR is a program EIR, is it not required to analyze the impacts of specific construction projects included in the program at a project-specific level of detail.

The safety studies do not address line-of-sight issues, as such specific considerations are normally addressed in conjunction with more detailed levels of project planning, engineering, and design for airfield and terminal improvements, which will be subject to project-specific environmental review under CEQA.

SPAS-PC00130-363

Comment:

Are sink holes considered a safety issue? How often and to what extent have sink holes limited regular flow of vehicles and aircraft on the airside?

Response:

Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX.

SPAS-PC00130-364

Comment:

What other landside safety evaluations were conducted? What were the results?

Response:

No other landside safety evaluations were conducted, given that such considerations are more appropriately addressed at the project level of planning -- see Response to Comment SPAS-PC00130-360.

SPAS-PC00130-365

Comment:

Question: The DEIR states that the project would, " provide a better balance between north and south airfields." Does the DEIR ever state the current balance and how it intends to improve this balance? Since there are differing numbers of gates on the two complexes does balancing equally make operations less efficient when aircraft are moved to the complex away from their gate location? How does the existence of cargo operations concentration on the south complex impact the definition of "balanced?" Since the Stipulated Settlement called for resolving the issues addressed by the yellow light project, how is this applicable except to be a noble objective to "share the impacts equally?"

Response:

The content of this comment is similar to comments SPAS-PC00130-511 and SPAS-AL00007-57; please refer to Response to Comment SPAS-PC00130-511 and Response to Comment SPAS-AL00007-57.

SPAS-PC00130-366

Comment:

Question: Table 4.7.3-8 compares many runway spacing characteristics. The distance between taxiway and runway is particularly interesting and is LESS than runway spacing between runways for EVERY alternative when a centerline taxiway is installed. There appears to be controversy between FAA and NTSB about the proper spacing between runways, runway-taxiways, and runway-objects. The ACRP Airport Cooperative Research Program studies addressing lateral deviation of aircraft during landing and take offs away from the runway centerline show potential safety problems. Also, there are numerous reports of erroneous landings on a taxiway in error. Does the parallel nature of runway-taxiway create another failure mode that can lead to an air disaster? How is this accounted for? Fifteen years ago the FAA changed its emphasis from right angle taxiway exits from runways to high speed turn offs and is not going back to right angle exits. What does LAWA anticipate will be the next change? The standards changed during the reconstruction of the South Airfield Project so that NLAs like the A380 are now discouraged from the south. Instead these larger aircraft operate on the north where LAWA/FAA management initially told us that these aircraft could not safely land. In view of all of these reversals of standards and opinion of what is the safest method of operation and knowing that the runway-taxiway spacing requirements of AC150/5300-13A was just invoked this month, what IS the best design that we should plan for?

Response:

As described in Section 4.7.2 of the SPAS Draft EIR, numerous studies address safety of the north airfield. A significant number of these studies concluded that the addition of a centerfield runway, together with increased separation between runways, would eliminate existing risks.

The FAA document DOT/FAA/AR-TN07/54 Identification Techniques to Reduce Confusion Between Taxiways and Adjacent Runways provides techniques for airport operators in response to pilots landing on taxiways adjacent to runways. These techniques can also be found in FAA Advisory Circulars (AC) 150/5300-13A Airport Design and 150/5340-1K Standards for Airport Markings. Additionally, the north runways in all alternatives would provide Instrument Landing System (ILS) approach capability, allowing pilots to better align themselves with the runways.

Due to the acceptance of Airport Improvement Program (AIP) funding and Passenger Facility Charge (PFC) funds, LAWA is required to adhere to current FAA guidance for airport design standards incorporated in the FAA Advisory Circulars. LAWA cannot predict what changes to future ACs may be and is only able to design based on current ACs until new revisions are released. However, a reasonable range of alternatives has been presented, and it is up to the LAWA Board of Airport Commissioners to decide on the appropriate course of action. The SPAS Draft EIR was prepared with a sufficient degree of analysis to provide the decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.)

SPAS-PC00130-367

Comment:

Question: Section 4.5 Cultural Resources (page 4-349) indicates the prior EIR was relied upon. There have been sections of historical roadway identified by local residents that remain within the airfield boundaries. Are any of these roads that date back to the late 1800s into the 1930s a potential source of artifacts or cultural information? Since they were not identified earlier and LAWA now intends to tear up some of these areas shouldn't they be more completely scrutinized? Why not? Has LAWA consulted the Centinela Valley Historical Society to find out about older artifact locations? If not, why not?

Response:

None of the roadways within the SPAS study area are presently considered historically significant roads. The roadways have been altered and repaved over the years and therefore do not retain integrity or possess significance as historic resources either individually or as contributors to a historic property or district. There is little to no potential for the roads within the SPAS study area to contain subsurface artifacts or cultural information. However, Section 4.5 of the SPAS Draft EIR acknowledges the potential for encountering previously unidentified archaeological resources during construction. Mitigation Measure MM-HA (SPAS)-4 is proposed to address this impact. Compliance with this mitigation measure would reduce impacts to previously unidentified archaeological resources that may be discovered during construction of all of the SPAS alternatives to a level that is less than significant. (See Section 4.5.8.2 of the SPAS Draft EIR.)

The Centinela Valley Historical Society was not contacted during the cultural resource study. Per industry standards, the cultural resources records search was conducted through the South Central Coastal Information Center at California State University, Fullerton.

SPAS-PC00130-368

Comment:

Question: The impact of the reconfiguration of Runway 6R/24L eastward to meet FM runway safety requirements seems to have the biggest noise impact, since Alternative 4 would result in the greatest number of newly exposed units and population. However, this impact seems to be overwhelmed in the other alternatives that also have this extension but relocate runways. So relocating runways north tends to obscure the significant impact to our neighbors to the east.

Question: Is this your understanding of the finding? What is the definition of the term "newly exposed" in either the report or Appendices J1-1 or J1-2? Where is, and/or please provide, the data used to calculate the number of units or population exposed by the various alternatives that supports the findings?

Response:

As presented in Table 1-16 on page 1-83 of the SPAS Draft EIR, Alternative 4 would result in the greatest number of population and residential units newly exposed to 65 CNEL or higher noise levels and the greatest number of residential units newly exposed to 75 CNEL. The relocation of Runway 6L/24R northward under Alternatives 1, 5, and 6 does not obscure significant impacts. Significant impacts are clearly presented in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-126 regarding how population density changes depending upon the geographic location.

The commentor also asks "[w]hat is the definition of the term 'newly exposed'…" The meaning of this phrase depends upon the context. For example, page 4-831 of the SPAS Draft EIR states "The area depicted by the magenta line indicates areas newly exposed to increases larger than 1.5 decibels and above 65 CNEL dBA." In this context "newly exposed" refers to areas that are above 65 CNEL under Alternative 1 2025 conditions and which experience an increase of 1.5 decibels in comparison to 2009 conditions. This methodology was clearly described in SPAS Draft EIR Section 4.10.1.4 ("Thresholds of Significance for Aircraft Noise") and 4.10.1.2 ("Noise Analysis Methodology"). To the extent the commentor is referencing other portions of the SPAS Draft EIR, the meaning of this phrase can be ascertained in context, or through a review of the SPAS Draft EIR methodology discussion (Section 4.10.1.2) and the significance threshold discussion (Section 4.10.1.4).

Please see Response to Comment SPAS-AL00006-8 regarding an explanation of the data used to calculate the number of units or population that would be exposed to high noise levels under Alternatives 1 through 7 and SPAS-PC00130-209 regarding noise modeling assumptions.

SPAS-PC00130-369

Comment:

Question: Is "newly exposed" the best or only noise impact metric to use in comparing alternatives. Newly exposed would seem to indicate how many people would suffer certain unacceptable levels of noise that wouldn't have that exposure without the change. What factors result in Alt 5 scoring so well with that metric?

Response:

Please see Response to Comment SPAS-PC00130-368 regarding the term "newly exposed." As discussed in Response to Comment SPAS-PC00130-126, additional noise metrics and criteria were used in the aircraft noise analysis, including discussion of single event aircraft noise. See SPAS Draft EIR Section 4.10.1.2 for discussion of the methodology and noise metrics in the aircraft noise analysis and Section 4.10.1.4 for discussion of the thresholds of significance applied in the aircraft noise analysis.

Please see Response to Comment SPAS-AL00007-22 regarding the noise exposure effects of Alternative 5 in comparison with the other SPAS alternatives.

SPAS-PC00130-370

Comment:

Question: What would be the ranking of the alternatives if cost impact of mitigation measures, such as additional soundproofing, were used?

Response:

The costs of mitigation measures, such as soundproofing, depends on such factors as the size of the structure, the number of window and door openings, and the type of ventilation. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, which includes costs of project-related improvements such as mitigation.

SPAS-PC00130-371

Comment:

Question: In the section on noise impacts LAWA created some interesting charts on % awakening. What assumptions were made on these comparative alternatives? Was the condition of over ocean operations assumed for all nights? If not, why not? If yes, why are the numbers so imbalanced?

Response:

The fleet mix, flight paths, and aircraft operational assumptions used for the aircraft noise analyses, including both the CNEL analysis and the single event noise analyses, such as for speech interference at schools and nighttime awakenings, for each alternative are presented in Appendix J1-1 of the SPAS Draft EIR. Please see Responses to Comments SPAS-PC00130-130 and SPAS-PC00130-296 regarding ANSI noise modeling assumptions and Over-Ocean Operations.

SPAS-PC00130-372

Comment:

Question: What is the basis for the 15% assumption for midsized jets moved over from the south to the north?

Here's a spreadsheet with assumptions and base numbers presented overall...

	Newly Exposed SFH	MFH	POPULATION	1.5 DB INCREASE SFH	MFH	POPULATION	
Alt 1	4120	9325	13445	9937		13608

Alt 5	799419038	27032
Alt 6	743519162	26597
Alt 7	849325165	33658

Response:

The tabular data presented in the comment were taken from the results of the aircraft noise analyses presented on page 4-703 in Table 4.9.6 of the SPAS Draft EIR related to newly exposed areas. The data are related to newly exposed residential population (by single family home and multi-family home), with 1.5 dB increase and total additional impacts.

The commentor inquired about "the basis for the 15% assumption of midsized jets moved over from the south to the north," as discussed in Section 4.10.1.6 of the SPAS Draft EIR, beginning on page 4-829 under each alternative. The comment refers to an assumption listed in Section 4.10.1.6 of the SPAS Draft EIR, under each of the Alternatives 1, 2, 5, 6, and 7. As stated, it was assumed that a number of

small wide-body aircraft would use the north runways 15 percent more than the south runways under Alternatives 1, 2, 5, 6, and 7 when compared to the baseline (2009), as facilitated by the north airfield and terminal improvements. It is important to note that several additional assumptions, as discussed in Section 4.10.1.6 of the SPAS Draft EIR, were used to derive the aircraft noise analysis results, and not just the 15 percent assumption.

The runway use percentages used in the SPAS Draft EIR aircraft noise analyses were derived based on the airfield and airspace simulations analyses conducted for the SPAS Draft EIR. It was assumed that the air traffic controllers would assign aircraft to either the north or south runway complex based on which airspace fix an aircraft is assigned to. However, if necessary, it was assumed that the traffic might be reassigned to an alternate runway complex to balance airfield operations. It was also assumed that, as the number of operations increases in the future scenarios, the runway use is balanced by dynamically metering the runway assignments. For more information regarding the airspace simulation, refer to Appendix F-2 of the Preliminary LAX SPAS Report.

SPAS-PC00130-373

Comment:

Question: Turning to the Off-airport Transportation Analysis, the "bottom line" seems to be captured on page 4-1242, where the report concludes that "all of the alternatives would result in significant impacts relative to Future (2025) conditions. This conclusion is supported on page 4-1318, where many of the significant Westchester intersections have "N.F.M." (no feasible physical mitigation) under all the scenarios.
Interestingly Alternatives 5, 6, and 7 weren't studied, since they have no changes to ground transportation. Moreover, although the report claims that Future (2025) conditions were studied with and without alternatives, where is the report of the 2025 impacts without Alternatives.

Response:

The comment incorrectly indicates that off-airport transportation impacts associated with Alternatives 5, 6, and 7 were not studied in the SPAS Draft EIR and asks where the analysis of future conditions without Alternatives is presented.

Although Alternatives 5, 6, and 7 focus on airfield and terminal improvements, they are not "stand alone" alternatives, as explained on page 2-8 in Section 2.3.1 and in the text and footnote 679 on page 4-1183 of the SPAS Draft EIR, and therefore cannot serve as a baseline for traffic impact comparisons. Alternatives 5, 6 and 7 would not, by themselves, result in off-airport transportation impacts. However, because Alternatives 5, 6, and 7 could be paired with the ground transportation system improvements proposed under Alternatives 1, 2, 8, or 9, analysis of off-airport transportation impacts associated with those alternatives addresses impacts of Alternatives 5, 6, and 7.

Analysis of future conditions without any of the SPAS alternatives is analyzed in the SPAS Draft EIR. The methodology for this analysis is discussed in Section 4.12.2 of the SPAS Draft EIR. As discussed on page 4-1208 of the SPAS Draft EIR, the SPAS Draft EIR analyzed future conditions to provide a conservative analysis. The SPAS Final EIR presents a comparison of (1) Future (2025) with Alternative Scenario to (2) Future (2025) without Alternatives scenario that includes the natural growth at LAX (as well as other reasonably foreseeable improvements as described on page 4-1208), but does not include the physical changes proposed under the analyzed SPAS alternatives. With the inclusion of projected natural growth at LAX in the Future (2025) without Alternative scenario, impacts would be reduced in comparison to the impacts disclosed in the SPAS Draft EIR. The analysis supporting this conclusion is provided in Response to Comment SPAS-AL00003-3.

As stated in Response to Comment SPAS AL00003-3, the additional comparison of (1) Future (2025) with Alternative Scenario to (2) Future (2025) without Alternatives scenario requested by Comment SPAS-AL00003-3 does not result in new significant impacts, does not result in an increase in the severity of impacts, and does not trigger recirculation under any of the criteria provided in CEQA. This conclusion is consistent with the recent decision Merced Alliance for Responsible Growth v. City of Merced (2012, 5th App. Dist., Case F062602) [Publication Request Pending]. In Merced, petitioners alleged that "…the city's late-submitted information on traffic impacts triggered the requirement that the

EIR be recirculated." (Slip Opinion at 65.) "[The Lead Agency] prepared a response that explained in detail why the methodologies used in its traffic study were sound.

In addition, to allay [Plaintiff's] concern, [the Lead Agencies consultants] conducted an analysis of the study intersections using the baseline [Plaintiffs] suggested-the existing condition plus project-generated trips. This analysis showed that 'there would be no new findings compared to the DEIR traffic analysis.' The challengers argue that, because the respondents cited [the Lead Agency's] analysis to defend the EIR before the superior court, this must have been significant new information that required recirculation. Once again, their recirculation argument fails. The [lead agency's] response letter and new analysis did not disclose a new significant impact, increase the severity of an impact, identify a feasible project alternative or mitigation measure, or 'deprive the public of a meaningful opportunity to comment upon a substantial adverse environmental effect ….' (Laurel Heights II, supra, 6 Cal.4th at p. 1129.) The letter and analysis were prepared especially to respond to [Plaintiff's] concerns, not to change any aspect of the project, mitigation measures, or findings and conclusions in the EIR." (Slip Opinion at 77-78.)

SPAS-PC00130-374

Comment:

Question: Numerous suggestions were made during the SPAS meetings led by LAWA. Why are none of them referenced or identified and analyzed? For instance, more than 5 yrs ago an off site passenger check in was suggested for location near the 405 Freeway in Howard Hughes Center with a bus or people mover to improve the CTA. This commuter passenger option at Howard Hughes, was suggested so that their single vehicle transportation need not drive all the way from the freeway to LAX. Howard Hughes passengers would be taken by mass transit instead. It's nowhere in the DEIR. Why not?

Response:

As described in Chapters 4 and 5 of the Preliminary LAX SPAS Report, LAWA obtained, reviewed, and considered input from the community and the SPAS Advisory Group in formulating the SPAS alternatives. The development of what would amount to a new LAX FlyAway station at the Howard Hughes Center is unlikely to draw a substantial amount of passengers/riders, given that it is only about two miles from LAX and would primarily serve areas to the north of the airport. Therefore, this suggestion was not evaluated in detail in the SPAS Draft EIR. Please also see Response to Comment SPAS-PC00130-957 for additional discussion regarding FlyAway planning.

SPAS-PC00130-375

Comment:

Question: LAWA acknowledges what we've concluded in the first paragraph (underlined) below that a solution is not known and the direct passenger growth is larger than any of the options' impact. Aren't there changes that can be made? What about mass transit? What flyaway's were assumed in the analysis? What about benefits of regionalization?

Page 1183 4.12.2 Off-Airport Transportation
4.12.2.1 Introduction
The off-airport transportation analysis for the SPAS alternatives addresses traffic-related impacts outside the airport boundaries, including arterial roads, highway segments, and ramps that serve traffic approaching and departing the airport environs. This analysis also considers remote facilities that serve airport-related functions, such as parking and offairport cargo. The impacts of passengers, employees, cargo, ancillary, and collateral development (nonairport activities on airport property) on off-airport roads are also included. Impacts to on-airport transportation associated with operation of the SPAS alternatives are addressed in Section 4.12.1, On-Airport Transportation. The primary focus of the analysis presented in this section is on changes in existing (baseline) traffic conditions that would result from the ground access improvements proposed under each SPAS alternative. Additionally, the off-airport transportation analysis completed for the SPAS alternatives accounts for increases in airport-related traffic that would occur in conjunction with increases in airport passenger activity projected to

occur by 2025, the buildout horizon year for the SPAS alternatives. Such future growth in passenger activity levels at LAX is independent of the SPAS alternatives and would occur even if no improvements were implemented.

Response:

Please see Response to Comment SPAS-PC00130-327 regarding the ground access improvements proposed under certain SPAS alternatives, including improvements that would be integrated with Metro transit systems, that are intended and designed to reduce traffic impacts; also, please see Topical Response TR-SPAS-T-1 regarding transit as it relates to the SPAS alternatives. Please see Response to Comment SPAS-PC00130-231 regarding FlyAway assumptions.

Regarding spreading traffic to other airports in the region, please see Topical Response TR-SPAS-REG-1. Traffic impacts that would occur at these airports are discussed in Section 6.2 of the SPAS Draft EIR.

SPAS-PC00130-376

Comment:

Question: http://navigatela.lacity.org/index.cfm allows for review of the sewers impacted by the movement of Lincoln Boulevard. So does the attached picture so one of the three outfall sewers. Sections 1 and 2 (i.e. page 1-18 and table 2-3)is where nominal, incomplete information is located for the realignment and tunneling of Lincoln is discussed. This is in an area of highly concentrated utilities including major outfall sewers which can't be moved. What depth is anticipated for this realigned roadway? How will it interface with Sepulveda and where?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-377

Comment:

How much more impact on other roadways and traffic should be expected during construction and afterwards? Creating a new tunnel brings all kinds of new and interesting problems, not just from construction, but also operation.

1. Will the tunnel height restrict certain vehicles from entering?
2. If there are height restrictions where will trucks go to get around the tunnel? (Probably Sepulveda and Manchester)
3. Will there be hazardous materials restrictions for the tunnel?
4. How will the tunnel be ventilated? Who will operate and maintain the ventilation system?
5. Will there be emergency evacuation areas or exits? How many and where? Call boxes?
6. Will there be traffic controls such as stop lights and electronic signage to warn drivers not to enter the tunnel? Will the electronic signage offer alternate routes? What will those alternate routes be?
7. The Sepulveda Tunnel is dirty from automobile pollution and graffiti. What are the plans to clean the proposed Lincoln Boulevard tunnel on a regular basis?

Response:

Please see Topical Response TR-SPAS-LR-1 regarding the realignment of Lincoln Boulevard. Under Alternatives 1, 5, and 6, modifications to Runway 6L/24R would require realignment of a portion of Lincoln Boulevard but there would be no capacity reduction following construction. Section 4.12.2.5 of the SPAS Draft EIR lists the LAX Master Plan commitments and mitigation measures that are applicable to the SPAS alternatives, including those related to minimizing construction-related traffic effects. Section 4.12.2.6.3 of the SPAS Draft EIR discusses temporary traffic impacts to the off-airport transportation system during construction.

As explained in the topical response, details regarding design elements, construction, and operation aspects inquired about in the comment have not yet been determined. If the tunnel were to remain under the jurisdiction of Caltrans, the tunnel would be constructed in a manner consistent with the standards set forth in the current edition of the California Highway Design Manual (Caltrans), including height, ventilation, emergency exits, traffic controls, signage, and lighting. Restrictions may be placed on its use by vehicles carrying hazardous materials, subject to a determination by LAWA and Caltrans. Responsibility for maintenance of the tunnel, should it be constructed, would be determined as part of a maintenance agreement between the City of Los Angeles and Caltrans.

SPAS-PC00130-378

Comment:

Question: Why is the totality of the Master Plan not addressed? Elements such as Terminals 1.5 and 2.5 are referred to in the DEIR, but never explained. The DEIR states that these are outside of SPAS. These elements, however, are not in the approved 2004 Alternative D Master Plan. In which portions of the environmental assessments were these projects included? Which version of gate alignment and size were assumed? How will this be incorporated into the Master Plan?

Response:

Please see Response to Comment SPAS-PC00130-30 for an explanation of why the SPAS Draft EIR does not need to address the totality of the LAX Master Plan as well as a discussion as to how any approved SPAS alternative, if it is other than Alternative 3, would be incorporated into the LAX Specific Plan. It should be noted that past, present, and reasonably foreseeable elements of the LAX Master Plan are identified in Chapter 5 of the SPAS Draft EIR and are considered in the analysis of cumulative impacts. Specifically, the North Terminals Improvements Project (also referred to as Terminals 1.5 and 2.5) is an LAX Master Plan project. The North Terminals Improvements Project is consistent with the new north linear concourse under Alternative D. This project is identified as a cumulative terminal-related project in Section 5.3.2 of the SPAS Draft EIR, and the cumulative impacts of this project, in conjunction with SPAS and other cumulative projects, are analyzed in Chapter 5. Gate layouts developed for SPAS are provided in Appendix F-1 of the Preliminary LAX SPAS Report. As discussed in Appendix F-1, detailed information developed for SPAS Alternatives 1 through 4 enabled the analysis to provide reasonable estimates for Alternatives 5 through 7; gating analysis was not developed for Alternatives 8 or 9 because these alternatives do not include terminal or airfield improvements.

SPAS-PC00130-379

Comment:

Question: Traffic issues are generally noted as significant and not mitigatable and/or not addressed. Adequate alternative plans as well as cumulative impacts are understated because several key major projects are not fully listed such as planned buildout of several Howard Hughes towers. Mass transit into and/or around LAX would significantly impact businesses but are not addressed. None of the mass transit alternatives have capacity for more than a few million annual passengers. How will the rest of the passengers be serviced?

Response:

The traffic impact analyses presented in Sections 4.12.1 and 4.12.2 fully analyzed potential traffic impacts associated with a range of alternatives. Analysis periods included not only normal peak AM and PM commute hours but also the midday peak hour, when airport-related traffic peaks. The impact analysis considered impacts relative to both Existing (2010) Baseline conditions and Future (2025) Without Alternatives conditions. The latter conditions, as stated on pages 4-1208 and 4-1211 of the SPAS Draft EIR, conservatively analyze the projected "natural" passenger growth at LAX from 2010 to 2025 as incremental project traffic. (See Response to Comment SPAS-PC00130-373 for additional discussion of the methodology used to evaluate off-airport transportation impacts.)

The comment asserts that mass transit into and/or around LAX would significantly impact businesses but is not addressed but provides no supporting facts or evidence for this assertion. The SPAS Draft

EIR traffic model for 2025 does assume the completion of the Crenshaw/LAX light rail line connecting the Expo light rail line with the Green Line. The impacts of this project are included in the cumulative impact analysis presented in Chapter 5 of the SPAS Draft EIR. Metro, as the lead agency for the Crenshaw/LAX line, has developed an EIR which describes in detail the anticipated impacts and proposed mitigation measures for this project. It is unclear which other mass transit projects the commentor is referencing.

For a discussion of how background traffic growth was estimated, including traffic associated with the Howard Hughes property, please see Response to Comment SPAS-PC00130-216.

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-PC00130-380

Comment:

Question: Not all reasonable traffic routings were assessed. What additional studies will be done to reduce traffic (and attendant congestion, noise and pollution) in residential neighborhoods?

Response:

The comment states that the traffic analysis in the SPAS Draft EIR does not assess all "reasonable traffic routings" and asks what additional studies will be done to reduce traffic in residential neighborhoods. However, the comment does not specifically identify any routes or residential streets that are of concern, or suggest specific studies for traffic reduction in residential neighborhoods. CEQA does not require a lead agency to conduct every recommended test or study recommended by commentors. (State CEQA Guidelines §15204(a).) The SPAS EIR provides sufficient analysis to enable decision-makers to intelligently take account of environmental consequences related to off-airport transportation impacts, as well as other impacts.

Traffic on residential streets is composed of locally-destined traffic and non-local traffic. The location of each street within the surrounding street network, its connectivity and the level of congestion on arterial streets affects traffic in residential neighborhoods.

The off-airport traffic analysis in Section 4.12.2 of the SPAS Draft EIR employed a focused travel demand forecasting model to assist in estimating the routes that airport-generated traffic would use, as well as the routes of other traffic in the vicinity. Primary access routes include both freeways and arterial streets. The location of LAX within the immediately surrounding streets and the lack of connectivity of residential streets in the area, make local residential streets inefficient to access the airport. It is noted that some residential land uses occupy streets that do provide access to the airport, however, the traffic impact analysis in Section 4.12.2 assessed impacts at 200 study intersections during three peak hours for each SPAS alternative and proposed mitigation where feasible.

SPAS-PC00130-381

Comment:

Question: "Section 4.11.2 Law Enforcement talks about staff reduction facilitated by improved scale of efficiency, but as the number of travelers, service vendors, and gate facilities and more terminals increase won't there be an increased need for staff? Will there not be increased crime due to the sheer increase in numbers of people passing through LAX?

Response:

The content of this comment is similar to comment SPAS-PC00130-307; please refer to Response to Comment SPAS-PC00130-307.

SPAS-PC00130-382

Comment:

As traffic increases and the number of entries into the CTA remain large how will staffing be increased to adequately support security as well as traffic control? Doesn't more traffic mean more vehicle accidents as well? How will these needs be met?"

Response:

LAWA is committed to providing and maintaining adequate staffing levels required to promote the safe and efficient operation of the Central Terminal Area (CTA) curbside and roadway system. As such, curbside enforcement staffing levels and assignment locations are routinely adjusted to address daily and hourly fluctuations of CTA traffic activity and to respond to traffic incidents when they arise. LAWA will continue to provide adequate staffing and supplement these services commensurate with the level of traffic activity that is being accommodated within the CTA today and in the future.

The comment does not present any facts or evidence that traffic accidents would increase under the SPAS alternatives. As explained in Response to Comment SPAS-PC00130-361, traffic accidents are not predictable and, therefore, it would be speculative to attempt to estimate the number of future accidents in the SPAS Draft EIR.

SPAS-PC00130-383

Comment:

Question: How does the DEIR address ensuring the law enforcement staffing numbers of LAWAPD will do better than merely keeping up with attrition because growth in numbers are needed to keep up with the anticipated growth of LAX?

Response:

Please see Response to Comment SPAS-PC00130-307 regarding the provision of adequate law enforcement staffing.

SPAS-PC00130-384

Comment:

Question: What is LAWA doing to ensure that staffing of LAPD resources do not again violate in whole or in part either Los City Charter Sections 635 or 636 or any other parts of the FAR pertaining to federal revenue diversion as we have seen in years plan?

Response:

This comment requests information about LAPD staffing, potential violation of Los Angeles City Charter provisions, and potential issues related to federal revenue diversion. All of these issues are beyond the scope of the EIR and no response is required pursuant to CEQA as the comment does not address significant environmental issues or the adequacy of the SPAS Draft EIR. CEQA does not require an EIR to address purely social impacts, such as those with which the comment is concerned, only physical environmental impacts. (State CEQA Guidelines Section 15064(e).)

Nevertheless, LAWA works closely with all of its law enforcement partners including the Los Angeles Police Department. LA officers and detectives provide important expertise to address crime problems and security threats. For example, LAPD's bomb squad responds to reports of suspicious items that may contain explosives and LAPD detectives assist in the investigation of criminal rings that often involve suspects and evidence located outside the confines of LAX. LAWA maintains strict compliance with all federal regulations promulgated by the Federal Aviation Administration and the Transportation Security Administration and will continue to do so in the future.

SPAS-PC00130-385

Comment:

Question: How does proper staffing at LAWA impact the staffing of LAPD resources which are vital and are much needed elsewhere in the City of Los Angeles and are part of the Mayor's promise to have 10,000 LAPD officers on the streets of LA?

Response:

Please note that the SPAS Draft EIR is not required to address law enforcement staffing levels, since they are a purely social impact rather than a physical environmental impact subject to CEQA. (State CEQA Guidelines Section 15064(e).) Nevertheless, LAWA constantly re-evaluates its personnel and security needs and makes adjustments to deployments as needed. Over the past several years, LAWA has hired additional police officers for its Police Division and has reduced the number of LAPD officers assigned to LAX. LAWA will continue to use LAPD resources where necessary in close coordination and partnership with LAWA's Police Division.

SPAS-PC00130-386

Comment:

Section 4.7.1 Health Risk Assessments
...These estimates show that program-related cancer risks for all evaluated receptors (residential adults, residential children, school children, and adult workers) are predicted to be below the threshold of significance of 10 in one million for Alternative 1 and are expected to result in decreases in cancer risks due to anticipated decreases in DPM emissions. Therefore, cancer risk impacts to human health under Alternative 1 would be less than significant and would be beneficial. As noted above, these beneficial impacts are primarily due to ongoing implementation of more stringent motor vehicle emissions standards, cleaner future fleet mixes, and the decrease in stationary source emissions attributable to the replacement CUP, currently under construction. These reductions in future emissions, particularly those associated with future motor vehicle emissions, are anticipated to more than offset the estimated increases in other types of emissions, such as from aircraft, APU, and GSE....

Question: What is the basis for saying that LAWA additional emissions are compensated for by future vehicle reductions per vehicle? Where is this assumption scoped and demonstrated?

Response:

The emission factors associated with automobile, truck, and ground support equipment engines decline over time as the fleets of these mobile sources turn over - meaning that new vehicles (or equipment) are purchased to replace old, worn-out vehicles. The new vehicles comply with the more stringent emission standards.

The emission standards for vehicle and equipment engines have phase in periods. In addition, the equipment fleets are not replaced immediately when a new emission standard becomes effective. Therefore, the fleet average emission factors for a given calendar year for these sources will be slightly lower than factors in the previous calendar year and slightly higher than factors in the next calendar year. The reduction in fleet average emission factors between the SPAS baseline period and the future alternatives horizon year (2025) is substantial. This reduction in emission factors between baseline period and 2025 more than compensates for the increase in vehicle and equipment activity between the same two periods. The decrease is of such magnitude that when combined with the increase from aircraft emissions the overall affect is that emissions of several key pollutants decrease by 2025 under all alternatives. It should be noted that the automobile, truck, and ground support equipment included in the SPAS Draft EIR air quality impact analysis are only those units that are associated with airport operations (vehicles with trips that begin or end at LAX and ground support equipment located at LAX).

The emission factors used in the air quality impact analysis for the SPAS Draft EIR were developed by the California Air Resources Board and approved by the U.S. Environmental Protection Agency. The

emission factors are included in the CARB EMFAC and OFFROAD models, as noted in Section 4.2.2 of the SPAS Draft EIR.

SPAS-PC00130-387

Comment:

1.1.1 Research (Phase 1)
Any conditions completed in Dec. 1995 will not include any impacts established by the terriristic attack on 9/11/01. Therefore should be completely redone including the new model of security and the difficulties with the downturn in economic conditions the number of operations is actually down and the million annual passengers capped at 79 not 98 million annual passengers.

Response:

The section of the SPAS Draft EIR noted in this comment provides background information pertaining to the development of the LAX Master Plan and EIR, specifically, the initial phase of the LAX Master Plan completed in December 1995. The information developed at that time was not used as a basis for analysis of the SPAS alternatives nor was it incorporated into the SPAS Draft EIR. As noted on page 1-9 of the SPAS Draft EIR, the SPAS alternatives are designed to accommodate a practical capacity of 78.9 MAP. The reference to 98 MAP in the noted section of the SPAS Draft EIR merely identified the forecasted activity level in the early stages of the LAX Master Plan formulation. Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-388

Comment:

Concept development (Phase II)
Any study before the 2004 lawsuit should be rendered mute. There is now a legal settlement in place that supercedes anything before the SPAS agreement. Please explain why?

Response:

Based on the comment heading "Concept development (Phase II)," it is believed that the commentor is referring to the discussion at the bottom of page 1-1 of the SPAS Draft EIR. The subject discussion is part of the project background description that summarizes the three main phases of the LAX Master Plan formulation and includes an overview of the concept development process for the LAX Master Plan. While it provides some background and context related to the LAX Master Plan, it is not related to the technical analyses completed for the SPAS Draft EIR. The commentor's implication that any studies completed prior to execution of the LAX Master Plan Stipulated Settlement are now moot by virtue of the Stipulated Settlement is incorrect. Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. However, the Stipulated Settlement identifies the terms and conditions agreed to by all parties for continued implementation of the LAX Master Plan, including the requirement that the Yellow Light Projects be restudied through the SPAS process, but does not invalidate or render moot the studies completed in conjunction with the LAX Master Plan.

SPAS-PC00130-389

Comment:

Environmental Review and Approval (Alt D) (Phase III)
Final Environmental Impact Reports were highly flawed, contradicted itself and nomitigations were ever built. See 2003 lawsuit and the 17,000 page EIR/EIS. Where in the Alt D have you listed migations that have since been installed? What changes were made to community intersections to change traffic flow? How have toxic fugitive dust been mitigated from construction? Since 1995 explain why there hasn't been a train added to the CTA to help lower community traffic?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, the following information is provided in response to the questions raised.

Annual progress reports that provide a status update on implementation of the mitigation measures and plans outlined in the LAX Master Plan Mitigation Monitoring and Reporting Program are available at ourlax.org under "Archived Documents," "Master Plan Mitigation Monitoring & Reporting Program (MMRP)."

With respect to off-airport transportation mitigation improvements, as indicated on page 28 of the 2010 MMRP Annual Progress Report, in accordance with LAX Master Plan MM-ST-10, Modify Signal Phasing, as a traffic mitigation measure for the Bradley West Project, traffic signal timing at the intersection of Imperial Highway and Main Street was modified by LADOT at LAWA's request when construction at the intersection reduced the number of travel lanes. As indicated on page 26 of the 2011 MMRP Annual Progress Report, in accordance with LAX Master Plan MM-ST-6, Add New Traffic Lanes, in 2011, construction was completed at the intersection of Imperial Highway and Main Street to install an additional westbound left-turn lane, and at Imperial Highway and Pershing Drive to install an additional westbound right-turn lane. These improvements were completed as construction traffic mitigation for the Bradley West Project. Other off-airport traffic mitigation measures for the Bradley West Project will be implemented when the number of international passengers at LAX reaches certain levels. For example, Mitigation Measure MM-ST (BWP)-8, Modify the Intersection of La Tijera Boulevard and Sepulveda Boulevard, will be implemented once there are 18.7 million annual international passengers at LAX. (In 2011, there were 16.7 million annual international passengers.) Intersection improvements at Airport Boulevard and Manchester Avenue, Imperial Highway and Sepulveda Boulevard, and Sepulveda Boulevard & 76th/77th Street will be implemented when there are 19.7 million annual international passengers at LAX, in accordance with Mitigation Measures MM-ST (BWP)-4, MM-ST (BWP)-6, and MM-ST (BWP)-9, respectively. Intersection improvements at Arbor Vitae Street and Aviation Boulevard and La Cienega Boulevard and I-405 Ramps north of Century Boulevard will be implemented once there are 20.7 million annual international passengers in accordance with Mitigation Measures MM-ST (BWP)-5 and MM-ST (BWP)-7, respectively. It should be noted that a number of mitigation measures to the off-airport transportation system identified in the LAX Master Plan MMRP are related to development of the Ground Transportation Center (GTC), one of the "Yellow Light Projects" being addressed as part of SPAS. As the GTC has not been constructed, and alternatives to the GTC are being considered as part of SPAS, the associated LAX Master Plan mitigation measures to the off-airport transportation have appropriately not been implemented.

Regarding air pollutant emissions during construction activities, as indicated on page 37 of the 2011 MMRP Annual Progress Report, LAWA completed a Construction-Related Mitigation Plan that set forth specific implementation requirements for the measures outlined in the LAX Master Plan MMRP under Mitigation Measure MM-AQ-2. As described on page 4-104 in Section 4.2 of the SPAS Draft EIR, MM-AQ-2 is complete and was adopted by the Board of Airport Commissioners in December 2005. The mitigation measures specified in MM-AQ-2 were implemented during construction of the South Airfield Improvement Project, Crossfield Taxiway Project, Bradley West project (construction ongoing), and will

be implemented during construction of all future projects at LAX, including implementation of the individual components of the selected SPAS alternative.

SPAS-PC00130-390

Comment:

We would like to see a solid 20 foot block wall along the north and east side perimeters to help contain ground generated particulates within the airport flight field. Where is the study? Why has no action occured for 17 years?

Response:

Installing a solid 20-foot block wall along the north and east sides of the airport would not noticeably reduce the particulate matter concentrations in the surrounding communities. The particulate matter concentrations in these communities come from a variety of mobile and stationary sources, many of which are not associated with the airport or are not located within the confines of the airport property line. Please refer to Response to Comment SPAS-PC00043-2 regarding particulate matter deposition, and Response to Comment SPAS-PC00130-225 regarding ultrafine particles. Construction of such a wall would be subject to CEQA review and could have potentially adverse impacts on aesthetics, traffic circulation, and biological resources, among others.

It is not clear to what study or lack of study the commentor is referring. The LAX Air Quality and Source Apportionment Study (AQSAS) is ongoing, with the final report due out in the spring of 2013. Please refer to Response to Comment SPAS-PC00130-36 for a discussion of the LAX AQSAS status. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. (State CEQA Guidelines Section 15204.)

It is also not clear to what action or lack of action the commentor is referring. As noted above, the LAX AQSAS final report is due out in the spring of 2013. Since 1995, the airport has instituted or expanded numerous measures and programs to reduce emissions from ongoing airport activity. Examples of several of these actions include, among others:

- Converting LAWA fleet vehicles to alternative fuels. LAWA's fleet is the largest Alternative Fuel Vehicle (AFV) airport fleet in the nation and includes over 590 AFVs. Currently, over 63 percent of LAWA's fleet vehicles and equipment at LAX are AFV's. Additionally, 100 percent of the LAX courtesy shuttle fleet is powered by natural gas. LAWA has designed and built a state-of-the-art, high-technology liquefied natural gas/compressed natural gas (LNG/CNG) fueling station at LAX and acquired over $5 million in grant funding to offset the differential cost of AFVs.

- Promoting electric automobile use. LAWA has partnered with the Department of Water and Power to install 32 public access electric vehicle charging stations at LAX.

- Encouraging use of transit and carpools. LAWA's Rideshare Program saves over 8 million vehicle miles, over 600,000 gallons of gasoline, over 8 billion pounds of air pollutants, thousands of dollars in insurance and vehicle depreciation costs, and countless hours spent driving on Southern California's over-burdened streets and freeways. LAWA's multi-faceted Rideshare Program includes 66 vanpools, 88 carpool program participants, 320 free monthly transit passes, and numerous marketing and advocacy activities to recruit and retain program participants. Currently, about 26 percent of LAWA's employees are participating in the Rideshare Program, saving over 1,000 vehicle trips to LAWA facilities every day.

- Operating direct LAX buses from strategic locations. Throughout 2011, LAWA operated four FlyAway routes between LAX and remote boarding locations at Van Nuys, Union Station, Westwood/UCLA, and Irvine Station. In 2011, the network realized an average daily ridership of 3,790 passengers, reduced vehicle emissions by almost 24 tons per day, and removed 3,221 vehicles trips per day (i.e., approximately 1,175,700 trips over the course of the year), traveling a combined total of 65,505 miles per day on roads approaching LAX.1 The operation of the FlyAway site at the Irvine Transit Center was suspended on August 31, 2012 due to low ridership.

- Installing gate power and preconditioned air at passenger gates. LAWA has recently completed the installation of grid power and preconditioned air at all passenger gates in the Central Terminal Area. This equipment will allow aircraft parked at the gates to use electrical power to run onboard systems and air conditioning without operating the auxiliary power unit engines.

This a short list of the activities that LAWA has undertaken in the last 17 years to minimize air pollutant emissions from airport sources.

SPAS-PC00130-391

Comment:

1.1.2 The stipulated settlement agreement
Westchester, Playa del Rey, was promised a return of street lights the faa removed. Where are the documents that show how this was approched with the faa? Since this was an airport related activity and part of the settlement agreement show where this exsists in the current document?

Response:

The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR. Notwithstanding, LAWA has already provided the commentor with a copy of the letter from LAWA to the FAA requesting the expenditure of $1 million for the subject street lighting and also provided the commentor with a copy of the letter from the FAA rejecting the request. The commentor's receipt of both of those letters is clearly acknowledged in comment SPAS-PC00130-25.

SPAS-PC00130-392

Comment:

Figure 1-2
Why doesn't the map of the exsisting airport include reference to all of the underground tunnels? Please redo map including tunnels, sewers, hot oil pipes, and explain why they exist and how to mitigate them?

Response:

The purpose of Figure 1-2 in the SPAS Draft EIR is to show the existing LAX facilities and the property surrounding LAX. The SPAS Draft EIR is a programmatic document and specific locations of all the utilities that would be affected by the SPAS alternatives have not been identified at this level of planning. Project-level impacts to utility infrastructure associated with implementation of individual SPAS components would be assessed in future CEQA documents. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-393

Comment:

Figure 1-3
Why aren't the maps made to scale?

Response:

No scale was provided in Figure 1-3 as the map is an illustrative presentation of improvements associated with the approved LAX Master Plan (i.e., Alternative D), rather than an engineered drawing showing the precise dimensions of the improvements. Other maps throughout the SPAS Draft EIR that do show specific improvements include a scale.

SPAS-PC00130-394

Comment:

Explain why green lighted projects okayed during settlement agreements were not built? Projects including the ground transportation center, tunnel, associated structures and equipment was a "yellow lighted" project however the automated people mover was still designated a green lighted project. Why have the Spas committee not seen plans for said project in eight years?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR; therefore no further response is required. (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, the response below is provided for informational purposes.

LAWA has completed or begun a number of Master Plan projects, including the South Airfield Improvement Project, the Crossfield Taxiway Project, and the Bradley West Project. LAWA has not constructed all of the improvements approved as part of the LAX Master Plan, including a number of projects that were not Yellow Light projects, such as the APM that would connect the approved ITC and CONRAC to the CTA because such projects are integral parts of the overall ground transportation system planned for LAX, which is being reevaluated as part of the SPAS process. The need for the ITC and an APM connecting the ITC and CONRAC to the CTA, as proposed in the LAX Master Plan and is reflected in SPAS Alternative 3, is predicated on the assumption that the CTA is closed to private vehicles, whereas the ground transportation system proposed under the other SPAS alternatives keep the CTA open to private vehicles, which alleviates the need for the ITC and associated APM. As outlined in Chapter 2 of the SPAS Draft EIR, many of the non-Yellow Light projects would be eliminated under the SPAS alternatives. The completion of the SPAS process will help guide LAWA's decisions regarding the nature and timing of various improvements at LAX.

SPAS-PC00130-395

Comment:

We as part of Spas have not seen any practical modernization plans that manage environmental impacts on the surrounding communities. Please list and show drawing of all such plans.

Response:

The LAX Master Plan included a comprehensive set of LAX Master Plan commitments and mitigation measures to reduce or eliminate significant impacts, many of which were directed at managing environmental impacts on surrounding communities. These measures were included in the LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP). LAWA prepares an annual MMRP progress report that provides a status update on applicable mitigation activities, policies, and programs that have been implemented by LAWA to ensure compliance with mitigation measures identified in the MMRP. As discussed in Chapter 1 of the SPAS Draft EIR, the SPAS process is intended to identify amendments that, among other things, minimize environmental impacts on the surrounding communities. Mitigation measures that would address the impacts of the SPAS alternatives are identified throughout the SPAS Draft EIR. All adopted mitigation measures would be incorporated into the SPAS MMRP.

SPAS-PC00130-396

Comment:

Since 2008 lawa has done nothing to encourage airlines to go to other lawa owned facilities, Please list and describe 20 conditions that Lawa intents to enact to each of her other properties that will relieve LAX of at least 25% of flights, cargo. Why have not of the conditions been met? Why are you 8 years out of compliance?

Response:

Please see Topical Response TR-SPAS-REG-1 regarding LAWA's involvement in efforts to promote regionalization of air travel demand in Southern California.

SPAS-PC00130-397

Comment:

Since the flight field at LAX has a capacity of 120 MAP as a currently constructed, Why are you adding more capacity? Who benefits from this?

Response:

The commentor provides no basis or supporting documentation for the claim that the existing "flight field at LAX has a capacity for 120 MAP as a (sic) currently constructed." Page 1-10 in Section 1.2 of the SPAS Draft EIR states that "the SPAS process also includes identification of potential amendments to the LAX Specific Plan that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP while enhancing safety and security, minimizing environmental impacts on the surrounding communities and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA." Section 1.2.1 of the SPAS Draft EIR identifies the project objectives for the SPAS project. The Project Objectives section discusses the reasons underlying the SPAS project, as well as the benefits of the SPAS project.

SPAS-PC00130-398

Comment:

What new technology has LAWA implemented in the last 8 years to move Traffic out of LAX ajacent communities? How many vehicles has LAX removed? Why is LAX allowing so many empty buses to circulate in the CTA? Why hasn't LAX made the rental car agencies that use LAX to use only 1 consolidated vehicle every 15 minutes?

Response:

Regarding new technology implemented at LAX, in December 2010, LAWA opened its Airport Response Coordination Center (ARCC) which is a centralized operations center developed to serve the LAX community with round-the-clock operational support, facility management, flight information, and security coordination. It is staffed with personnel from LAX Airport Operations, LAX Airport Police, Facilities Management Group, and the Transportation Security Administration. Together, these agencies are able to obtain situational awareness of security and operational activities at LAX through the use of new technologies that integrate videos, alarms, sensors, and communications. This heightened awareness allows staff to quickly respond to disruptions that negatively impact airport operations at LAX. This includes traffic incidents within and near the Central Terminal Area (CTA) that could, if not dealt with quickly and effectively, result in queuing and delays of traffic on the off-airport street network. Please also see Response to Comment SPAS-PC00130-389 for a discussion of the status of implementation of transportation mitigation improvements identified in the LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP). In addition, widening of World Way across from TBIT will be completed as part of the Central Utility Plant Replacement Project and is scheduled for construction in the first half of 2013.

Regarding removed vehicles, LAWA has no information as to the number of vehicles removed from adjacent communities due to actions taken by the ARCC in responding to traffic incidents.

The commentor is inquiring about empty buses circulating in the CTA, but did not specify which types of buses. Regarding hotel shuttles, in December 2006, the Board of Airport Commissioners approved a program which required all hotels to reduce their LAX shuttle trips by 35 percent from the number of trips that they made during 2004. Financial penalties were imposed for non-compliance ($10 per trip for the first 15 percent over the allowed number of trips and $5 for each trip over 15 percent of the trip allocation). Mostly due to this program, several hotels consolidated their shuttle operations and the

overall number of hotel shuttles in the CTA was significantly reduced. Therefore the suggestion is considered repetitive of existing requirements. Regarding rental car company buses, rental car companies are given an annual number of trips that they are allowed to make into the CTA. The number of trips varies depending on their market share. If they exceed their allotted number of trips, they are subject to financial penalties per excessive trip. To the extent the suggestion is recommending more stringent requirements, the suggestion is considered infeasible. Individual companies may experience differing peaking characteristics or greater demand than other companies, and therefore need more than 1 trip per 15 minutes. Mechanically assigning such values without consideration of market share or actual demand, would result in an inefficient transportation system, and therefore would be inconsistent with the project objective of improving the ground access system."

The table below shows the annual number of outbound shuttle trips at LAX. As a result of the programs discussed above, the number of outbound rental car shuttle trips decreased by 29.8 percent between 2003 and 2010. In addition, the number of outbound hotel shuttle trips decreased by 50.6 percent between 2003 and 2010.

LAX Numbers of Annual Outbound Shuttle Trips by Industry

Year	Rental Cars	Hotels	Off-Airport Parking
2000	1,126,946	682,512	536,309
2001	1,010,994	627,929	650,086
2002	1,014,120	612,561	659,023
2003	985,738	537,976	632,810
2004	909,757	600,332	635,262
2005	897,813	544,697	691,632
2006	803,133	417,335	693,532
2007	779,681	333,185	696,274
2008	764,241	205,203	773,661
2009	639,565	214,099	782,949
2010	691,773	265,784	735,745
2003-2010 Percentage Reduction	29.8%	50.6%	-16.3%

Regarding the consolidation of rental car agency vehicles, since the existing car rental agencies that serve passengers in the CTA are located in separate facilities in the LAX area (Alamo/National and Advantage are located in the City of Inglewood), it is infeasible to establish a consolidated busing operation under the current configuration of the airport that would serve all the various companies.

However, as indicated under the heading of "Ground Access Improvements" on pages 2-21, 2-25, 2-38, and 2-41 in Chapter 2 of the SPAS Draft EIR, SPAS Alternatives 3, 4, 8, and 9 include a Consolidated Rental Car Facility, or CONRAC, that would relocate rental car companies into a single location that would lend itself much more easily to a consolidated bus operation. As discussed on page 4-3 of the SPAS Draft EIR, the current SPAS alternatives are conceptual in nature and the Draft EIR provides a programmatic analysis. These types of operational changes will be considered, depending upon the selection of the alternatives, at a time where specific development proposals are made. It should be noted, however, that one consolidated vehicle every 15 minutes would not provide sufficient seating capacity to serve the rental car customer demand.

SPAS-PC00130-399

Comment:

Why hasn't LAWA completed its settlement of 10 flyaway buses? Why are they asking funds from the flying public when the idea was to cut traffic? How many car trips have been cut since the institution of the exsisting flyaway service? Why haven't similar services been instituted at Ontario, Van Nuys, and Palmdale?

Response:

LAWA currently operates three FlyAway routes between LAX and remote boarding locations at Van Nuys, Union Station, and Westwood/UCLA to serve airport customers and reduce the number of vehicle trips to and from the airport. The operation of a fourth FlyAway site at the Irvine Transit Center was terminated on August 31, 2012 due to low ridership which was resulting in greater emissions from FlyAway buses traveling the 100-mile round trip between LAX and the Irvine Transit Center several times per day with very few, or often no, passengers than would occur if those few passengers drove directly or utilized a shared-ride van/shuttle service.

LAWA is not obligated to operate 10 FlyAway routes, as the commentor indicates. Item C., Air Quality Mitigation, in Exhibit A of the Stipulated Settlement states:

"LAWA shall develop at least eight FlyAway sites with service similar to the service provided by the Van Nuys FlyAway currently operated by LAWA. The intent of these FlyAway sites will be to reduce the number of vehicles going to and from LAX by providing regional locations where LAX employees and passengers can pick up an LAX-dedicated, clean-fueled bus that will transport them from a FlyAway closer to their home or office into LAX and back. Final selection of the FlyAway sites must be completed on a schedule that allows for property acquisition or leasing, terminal design, construction and implementation of all sites by 2015. LAWA shall also implement a public outreach program to inform users of the terminals about their existence and their locations."

The next FlyAway service, connecting LAX with the Metro Exposition light rail line at its Expo/LaBrea station, was approved by the LAWA Board of Airport Commissioners in October 2012 and is expected to begin service in spring 2013. Other potential LAX FlyAway locations which LAWA staff is currently evaluating for service include Santa Monica, Long Beach, Torrance, Hollywood, and Glendale. Regarding public outreach, LAWA provides detailed information on the LAWA website about the FlyAway program and other alternative modes of transportation to and from LAX (lawa.org/welcome_LAX.aspx?id=132) and also provides FlyAway information brochures at transit centers, such as Union Station, and to major employers upon request as part of their transportation demand management/trip reduction programs.

The current FlyAway operations are funded by LAWA's general fund and fares charged to customers to use the service. The funding support provided by LAWA enables the FlyAway costs to passengers to be substantially lower than those of other airport transportation services. Prices currently range from $7 one-way for the Van Nuys and Union Station routes and $10 for the Westwood route. By comparison, the fare from Van Nuys to LAX for shared-van service, with multiple stops (i.e., passenger pick-ups), is typically over $30, from Union Station to LAX is typically over $15, and from Westwood to LAX is typically over $20.

The number of vehicle trips reduced by LAWA's FlyAway shuttles is presented on Page 38 in Table 1, "CY 2007/2008/2009/2010/2011 LAX FlyAway Network Emissions Reduction Summary" of the LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP) 2011 annual progress report dated October 2012.1

Similar FlyAway services at other airports such as LA/Ontario International Airport (Note: Van Nuys Airport is a general aviation airport, which would not have a need for, or a benefit from, FlyAway service, and Palmdale Regional Airport is no longer in operation) have not been developed as LAWA is focused on developing the eight LAX FlyAway sites required by the Stipulated Settlement. Additional FlyAway sites require significant investment with no guaranteed ridership. A primary concern of LAWA

regarding site selection is the investment and/or lease cost for new sites combined with the experimental nature of the service. Revenue generated by the current LAX FlyAway service does not provide sufficient funds to sustain its operations, and is dependent on funding from LAWA's general fund.

1. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP), 2011 Annual Progress Report, October 2012, Available: http://www.lawa.org/uploadedFiles/OurLAX/LAX_MP/MMRP%20Annual%20Report%202011_final_10-11-12.pdf, accessed January 3, 2013.

SPAS-PC00130-400

Comment:

How many van pools for employees exsist from LAWA airports to other airports?

Response:

There are no existing LAWA-sponsored employee vanpools from LAWA airports to other airports. However, the LAWA rideshare and vanpool program is comprehensive, offering financial incentives and discounts to participating employees. There are approximately 68 existing LAWA employee vanpools, 62 eight-passenger vanpools to LAX (496 seats), 5 eight-passenger vanpools to ONT (40 seats) and 1 eight-passenger vanpool to VNY (8 seats). The vanpool program alone saves over 5,500,000 commute miles per year and approximately 390,000 gallons of gasoline annually. For more information about the vanpool program, please see the LAWA Rideshare website at http://www.lawa.org/rideshare.aspx?id=1498.

Should such a program be operated, the implementation of a vanpool program to shuttle employees between airports would not reduce any impacts created by the SPAS Alternatives because there currently is not a need for employees to commute between on a scheduled basis.

SPAS-PC00130-401

Comment:

Project Objectives
1. Provide north Airfield Improvements that Support the Safe and Efficient Movement of Aircraft at LAX. The study completed by Nasa Aims and the 6 university experts deemed the north complex safe. Expansion of the runways would provide a statistically insignificant improvement in safety.

Response:

Please refer to Response to Comment PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel involved in that study.

SPAS-PC00130-402

Comment:

By placing a centerline taxiway on the north with an A380 located on it how much closer would the aircraft be? Would moving the runway cause more blind spots from the tower?

Response:

It is understood that the commentor is inquiring about how close aircraft operating on Runways 6L/24R or 6R/24L would be to an Airbus A380 operating on the proposed centerfield taxiway. Many variables would affect the distance in between an aircraft operating on a north airfield runway (Runways 6L/24R or 6R/24L) and one operating on the proposed centerfield taxiway, such as the positions of the aircraft during taxiing on or off the runway and taxiway centerlines; turning onto high-speed exits or taxiway connectors; or the relative position of an aircraft on the centerfield taxiway while the other aircraft is

either taking off or landing on a runway. As discussed and depicted in Section 2.3.1 of the SPAS Draft EIR, the range of runway-taxiway separation in the north runway alternatives is between 400 feet to 550 feet. These separation standards meet the minimum design guidelines put forth by the FAA in Tables 3-6 and 3-7 of FAA Advisory Circular 150/5300-13A Airport Design. Compliance with these minimum design guidelines ensures that there would be sufficient distance between an aircraft operating on Runways 6L/24R or 6R/24L with an A380 operating on the centerfield taxiway.

Please see Response to Comment SPAS-PC00130-998 regarding tower line of sight.

SPAS-PC00130-403

Comment:

How does the airport plan to operate at full levels while both north runways are closed for tunnel repairs? cover huge overcrowding on the south runways? How does LAWA plan to co-ordinate repair of the 2 tunnels, 3 sewers, hot oil pipes, movement of Lincoln Blvd., closure of Sepulveda at Lincoln? How will this be paid for?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding phasing of project improvements. As noted in that response, construction phasing plans have not yet been developed for the SPAS alternatives, therefore, information regarding necessary runway closures has not been determined. Please see Topical Response TR-SPAS-LR-1 regarding impacts associated with the realignment of Lincoln Boulevard, including impacts to sewers, oil pipelines, and Sepulveda Boulevard. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements.

SPAS-PC00130-404

Comment:

Since LAWA has such poor relations with Caltrans, DWP, Dot and local communities, How many studies will LAWA produce to make sure any new runway or any old runway will be safe during the moving of sewers, movement of streets, water issues etc.?

Response:

This comment is noted. Prior to implementation of any individual SPAS project, LAWA will conduct the requisite studies concerning the relocation of infrastructure and utilities. The engineering analysis for each project will also evaluate construction issues, such as soils, contaminated materials, and perched water. These studies will be conducted during the design stage for each individual SPAS project.

SPAS-PC00130-405

Comment:

How does LAWA intend to pay DWP for the redevelopment of 3 new major sewers currently under the northern runways? How long will this take? How long is LAWA expecting full closure of northern complex? With the Saip taking little more than a year we expect DWP to take 3 years to reroute new sewers. 1 year for planning and at least 2 years for building will the close Sepulveda, Lincoln, Manchester, and Weschester Parkway? If so how long? Will it come before or after the other repairs? Who is paying for all this?

Response:

Please see Response to Comment SPAS-PC00130-348 regarding the presence of outfall sewers beneath the north airfield. As indicated in that response, there are only two outfall sewers beneath the north airfield. Due to the depth of these sewers, implementation of north airfield improvements would not require relocation of these outfall sewers. Please see Response to Comment SPAS-PC00130-41

regarding phasing of project improvements. As noted in that response, construction phasing plans have not yet been developed for the SPAS alternatives, therefore, information regarding necessary runway or roadway closures has not been determined. While LAWA will pay for the improvements associated with the selected SPAS alternative, funding and economic questions need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Therefore, because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.)

SPAS-PC00130-406

Comment:

FAA people have informed us that by improving the taxi ways next to the northern complex will increase through put 20% or more. Why hasn't LAX built a fully standard group 6 taxiway next to the northern complex? How much cheaper would the taxiway be than the moving of the runway? If ground vehicles are interferring with taxing aircraft on nearby service roads, why not move the service road out of aircraft taxiways?

Response:

The SPAS Draft EIR analyzed a reasonable range of alternatives, including options that move the improved existing taxiways and relocate existing service roads, sufficient to provide the decision-makers with information necessary to make an intelligent decision. Various Aircraft Design Group (ADG) VI taxiway options and various options for the ground vehicle service road are included in a number of alternatives presented in the SPAS Draft EIR. Please see pages 1-18 through 1-26 in Section 1.2.2 of the SPAS Draft EIR for an overview of each alternative, and Section 2.3.1 of the SPAS Draft EIR for a more detailed discussion of the characteristics of each alternative. The performance of the SPAS alternatives is further discussed in Appendix F of the Preliminary LAX SPAS Report.

Regarding the latter part of the comment, there may be a misunderstanding as to the relationship between taxiways and vehicle service roads, in that ground vehicles are not allowed on aircraft taxiways and taxiing aircraft are not allowed on vehicle service roads; hence, that is not a problem that SPAS is attempting to resolve. The problem relates to the required safety clearance distances between taxiways and service roads. Due to limited space between Runway 6R/24L and the ends of the concourses for Terminals 1, 2, and 3 and Tom Bradley International Terminal, placement of a Group VI taxiway adjacent to that runway is not feasible without a negative impact to other taxiways/taxilanes such as Taxilane D or Taxiway E or to the vehicle service road. Alternatives 1, 2, 3, 5, 6, and 7 include moving the vehicle service road (VSR) from its current location between Taxiway E and Taxilane D to a more suitable location (i.e., typically south of Taxilane D). However, also due to the aforementioned limited space between Runway 6R/24L and the north concourses, the new location of the VSR affects the available spacing between the taxilanes, taxiways, and runway. In short, the ability to accommodate an ADG VI taxiway adjacent to Runway 6R/24L and the ability to relocate the existing vehicle service road is subject to the space constraints described above.

Estimated costs for the SPAS alternatives are provided in Section 8.5 of the Preliminary LAX SPAS Report.

SPAS-PC00130-407

Comment:

LAX Master Plan Improvements again have been covered in the Nasa Aims report, proving the north airfield has extremely high safty standards.

Response:

Please refer to Response to Comment SPAS-PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel.

SPAS-PC00130-408

Comment:

Please explain how putting more aircraft, closer together, further from the tower will improve safty? How many safty issues world wide have been caused by center line taxiways? Besides the accident landings on centerline taxiways what other types of accidents have occurred? If centerline taxiways prevent incursions why are there still incursions on the south complex?

Response:

Federal Aviation Administration (FAA) runway-runway separation standards are different than runway-taxiway standards. Per FAA Advisory Circular (AC) 150/5300-13A, the runway-runway separation standard is 700 feet. As discussed and depicted in Section 2.3.1 of the SPAS Draft EIR, none of the airfield alternatives provide a separation less than 700 feet. Alternatives 1, 3, 5, 6, and 7 increase the separation between the two runways. Alternatives 2 and 4 keep the separation between the runways at 700 feet. The new centerfield taxiway for the various alternatives would meet FAA runway-taxiway separation guidelines for Group V and/or VI aircraft. For additional information on runway-taxiway separation standards, please see Response to Comment SPAS-PC00130-63.

Please see Responses to Comments SPAS-PC00130-362 and SPAS-PC00130-577 regarding ATCT line-of-sight.

Please see Response to Comment SPAS-PC00130-366 regarding errant landings on taxiways parallel to the intended runway.

Please see Response to Comment SPAS-PC00130-160 regarding runway incursions on the south airfield.

SPAS-PC00130-409

Comment:

Why remove remote gates? If there isn't sufficient space to hold arriving flights?

Response:

As indicated under the heading of "Terminal Facilities" on pages 2-10, 2-17, 2-21, 2-30, 2-33, and 2-37 in Chapter 2 of the SPAS Draft EIR, under Alternatives 1, 2, 3, 5, 6, and 7 the west remote gates would be eliminated upon completion of the airfield and terminal improvements. This assumption was also included in the LAX Master Plan.

The relationship drawn between the commentor's first question (answered above) and second question is unclear: "If there isn't sufficient space to hold arriving flights?" Although it may happen, the sole purpose of the west remote gates is not to be used to "hold arriving flights." Currently, the west remote gates accommodate not only passenger operations (deplaning, boarding, and busing of passengers to terminals) but also remain all day and remain overnight operations for aircraft that cannot be accommodated for long periods of time at terminal gates. In the future, as discussed in Section 2.3.1 of the SPAS Draft EIR, the west remote gates would be removed upon the completion of the airfield and terminal improvements. Passenger activity would no longer be accommodated at the west remote gates. However, LAWA might reserve the west remote gates for remain all day or remain overnight operations.

SPAS-PC00130-410

Comment:

2. Improving Ground Access

How does LAWA intend to stop blocking curb areas with ie. smokers, people waiting for pick up, cabs, shuttles, and how is LAWA going to implement emergency [text indecipherable]? How is LAWA planning on intergating the people mover and the green line train to all nine of the terminals? Will Lawa be paying for the train? If so what percentage and out of what pot of money? How will these 2 items effect pedestrian traffic and how will they change the plan to accommodate handicap people.

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including extension of the Green Line into the CTA. The topical response also provides a summary of the ground access improvements associated with each of the SPAS alternatives.

Under all of the alternatives, new ground access facilities located outside the CTA would reduce the number of private vehicles and shuttles in the CTA. However, only those alternatives with an APM system (i.e., Alternatives 3 and 9), would reduce passenger accumulation on the curbsides by diverting passengers from the curbside to APM stations within the CTA.

The APM has been developed at a program level of planning for SPAS. The final APM system, including the number and placement of stations within the CTA, has not yet been defined. The SPAS Draft EIR is a programmatic document, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. However, there are no plans to include APM stations at every terminal. Similarly, the effect on pedestrian traffic has not yet been determined, but would be analyzed in a project-level environmental document. The APM would be fully compliant with the requirements of the Americans with Disabilities Act and all other applicable laws. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR, including costs of proposed improvements. A general discussion of the costs associated with each alternative is provided in Section 8 of the Preliminary LAX SPAS Report.

SPAS-PC00130-411

Comment:

What plans in detail does LAwa have to repair the structural nature of the upper roadway? Who will pay for this and how? How long will the upper roadway be closed in order to eliminate issues with the bridge (upper roadway) and the structural damage due to creeping rust? Who insures this part of the airport? Who would be responsible incase of catastrophic failure? Where would the money come from? If it were to fail how long would access to central terminal area be denied?

Response:

The CTA Second Level Roadway Expansion Joint and Deck Repairs project was identified as a cumulative infrastructure improvement project in Section 5.3.3 of the SPAS Draft EIR. LAWA is currently collaborating with Caltrans' Division of Maintenance, Structure Maintenance and Investigations, to ensure that all structures and bridges at LAX are maintained and safe. Ongoing improvements are designed to address maintenance and wear deficiencies identified by Caltrans' Structure Maintenance and Investigations unit and confirmed by LAWA's design engineers. As part of the on-going design process, LAWA's design engineers conducted a structural and seismic analysis of the roadway. The analysis confirmed that the roadway, which in the early 1990s had seismic improvements to its support columns, is structurally sound. However, many of the expansion joints that form a smooth transition between the bridge segments need to be replaced. These joints, which expand and contract in response to changes in temperature, have surpassed their useful life, resulting in uneven road conditions between segments. LAWA is not aware, and the comment does not provide any evidence, of any structural damage to the second level roadway due to creeping rust. The project will include roadway resurfacing, replacement of certain bearing pads, drainage, and other miscellaneous improvements. LAWA anticipates that construction work would start in the summer of 2013 and take approximately 18 months to complete. While the construction will necessitate the closing of traffic lanes during certain hours of the day, there are no plans to close the upper level roadway during construction. Detailed traffic control plans are currently being developed and will be approved by LAWA staff prior to start of construction. The project is funded by LAWA.

The comments and questions related to insurance and financial responsibility in case of structure failure, as well as information on the amount of time the CTA would be closed should structure failure occur, are speculative and beyond the scope of the EIR. No response is required pursuant to CEQA because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-412

Comment:

Since LAWA is using public streets during peak access times how much money is LAWA reimbursing LADOT and Caltrans? Where is the money coming from? What percent is LAWA currently reimbursing? Is LAWA paying AQMD for the extra idil times associated with waiting cars? Has LAWA implemented any programs to lower the amount of excessive pollution caused by idiling cars waiting to access the CTA? If so what plans are currently in effect? Where have they been implemented? Who at AQMD is encharge of this program? Where does the money come to pay for this? How does LAWA intend to handle these issues as they worsen? Has LAWA started a medical fund for employees, and Local public who have been effected by excessive exposure to pollution? If so who is paying for this? How would some one gain access?

Response:

Please note that no response is required because this comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, streets and freeways that passengers, employees, and commercial vehicles use to access LAX are free to all members of the public. Neither LAWA nor vehicle owners are required to pay any fees for airport-related use of public streets. Similarly, there are no fees assessed to LAWA or vehicle owners for emissions associated with vehicle trips. LAWA has instituted a number of programs to reduce vehicle idle times, and associated air emissions, within the CTA. For example, LAWA established a cell phone waiting lot on the northwest corner of 96th Street and Vicksburg Avenue where motorists meeting arriving passengers can wait for free, for up to two hours, until passengers call to say they are ready to be picked up, thereby decreasing the likelihood that these motorists will drive around the CTA multiple times to pick up their passengers.1 In an effort to encourage the use of electric vehicles, free parking is available for electric vehicles at charging stations located in Parking Structure 1 (SPAS Draft EIR page 4-420). Electric vehicles do not emit any pollutants within the CTA.

1. City of Los Angeles, Los Angeles World Airports, LAX Parking -- LAX Cell Phone Waiting Lot, Available: http://lawa.org/welcome_LAX.aspx?id=64, accessed November 10, 2012.

SPAS-PC00130-413

Comment:

Who covers the liability of travelers on public roads trying to access the CTA in case of a terroristic attack? Where does the money come from? Who covers the liability of travelers, on public roads trying to access the CTA in case of earthquake? Who is managing these funds and how were they accumulated?

Response:

Please note that no response is required because this comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, LAWA is not liable for injuries to motorists on public roads traveling to LAX, including injuries related to a terrorist attack or natural disasters such as earthquakes and flooding.

SPAS-PC00130-414

Comment:

Who at LAWA covers the liability of travelers on public streets, in and around the airport in case of flooding? If neighbors, northside buildings, cargo, public streets, homes, are effected by poor engineering of surface water, aquifers, the argo ditch and sewer malfesence will LAWA be able to manage the liability and how will this effect the ability of LAWA to sell bonds and not damage its credit rating.

Response:

Please see Response to Comment SPAS-PC00130-413 regarding liability related to flooding. Improvements associated with the SPAS alternatives, including airport buildings, roads, and the conversion of the Argo Drainage Channel to a box culvert, would be designed in accordance with the Uniform Building Code and all required standards.

SPAS-PC00130-415

Comment:

LAWA state curbside demand is unevenly distributed. How will LAWA rearrange Airlines, cargo, and take off and landings so that during peak hours curbside demand is no longer unevenly distributed.

Response:

The distribution of airline passenger and curbside traffic activity along the curbfront is a direct result of the distribution of airline passenger activity among terminals and the airline passenger schedules that determine the hourly patterns of passenger arrivals and departures. These schedules are primarily developed based on the business decisions of the individual airlines. The variation in schedules and passenger activity among airlines and terminals results in an inherent imbalance of activity among terminals. As such, a complete balance of activity among terminals and, consequently, along the curbsides cannot be obtained because the peaking characteristics and passenger activity levels vary widely among airlines. In addition, the unique characteristics of the passenger terminals and the available curbside will affect how the curbside demand is accommodated. Refer to Section 4.12.1.3.9 on page 4-1058 and Section 4.12.1.7.1 on page 4-1099 of the SPAS Draft EIR for discussions of the unique passenger peaking characteristics assumed in the various flight schedules under the 2009 and 2025 conditions, respectively. In terms of passenger activity assignment to terminals among the various SPAS alternatives, see Section 4.12.1.6.1 beginning on page 4-1091 of the SPAS Draft EIR.

The future on-airport traffic operations analyzed for SPAS include the benefits offered by Terminal 0, as well as non-SPAS improvements such as a new Midfield Satellite Concourse (MSC) Passenger Processor, Terminal 1.5 and Terminal 2.5 described on pages 4-1094 through 4-1096 in Section 4.12.1.6.2 of the SPAS Draft EIR. These new facilities will provide additional curbside capacity that will allow for the redistribution of curbside activity.

SPAS-PC00130-416

Comment:

How is LAWA looking to redesign the access roadway to efficiently accommodate security screening? How does lawa expect to pay for these improvements? What does the TSA have to say about how effective current models are? LAWA has been paying an Israeli team for their expertise on terror what have they recommended and why haven't any of these procedures been implemented.

Response:

As indicated on page 21 of Appendix E2-1 of the Preliminary LAX SPAS Report, the relocated upper and lower Sky Way roadways could be designed with security checkpoints prior to traffic reaching World Way North. As a non-SPAS project, LAWA is considering improvements to the security checkpoint on

westbound Century Boulevard that could be also be incorporated into other traffic checkpoints on the approaches to the CTA.

Security is not an environmental impact and is, therefore, not required to be discussed in the SPAS Draft EIR under CEQA or any other law. However, a security assessment of the SPAS alternatives is included in Appendix I of the Preliminary LAX SPAS Report to comply with the Stipulated Settlement and Section 7.G(2) of the LAX Specific Plan. Please see Response to Comment SPAS-PC00130-152 regarding the findings of the Security Assessment relative to the redesigned entry roadway. Please see Response to Comment SPAS-PC00096-2 regarding funding sources for SPAS improvements. Details regarding the security measures considered and implemented by LAWA and/or TSA are considered Sensitive Security Information under federal law and therefore are not subject to disclosure. (49 CFR Part 1520)

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-417

Comment:

Since LAWA expects to use both the Crenshaw and Green line trains what percentage of these projects is LAWA paying for? Are they buying and/or providing land? If so which land? How is it being paid for? If issues between passenger cars and metro trains occur which agency will be in charge and whose insurance will cover the liability? Should a traveler be hurt or killed by a metro train on LAWA property who will be responsible? Do both agencies put in excess funds into the LA citys general fund to cover any insurance issues?

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. LAWA does not plan to use Metro trains, as stated by the commentor; however, LAWA passengers and employees may choose to use Metro transit to access the airport. Metro's Crenshaw/LAX Transit Corridor would not be located on airport property. Future plans for the Airport Metro Connector Project are currently under consideration by Metro, which is the lead agency for that project. Some of the alternatives associated with this project would enter the CTA whereas others would not. Therefore, details regarding the location of a possible Metro station on airport property are not currently available. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR, including costs of proposed improvements. Insurance associated with events at the airport is purely a socio-economic concern, and thus is not required to be analyzed under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PC00130-418

Comment:

3. Where does the study that says LAX is the premier International gateway? How is LAX supporting and/or Advancing economic growth? LAX has not supported vitality of the Los Angeles region There has not been any effort on LAX's part to revitalize freeways, Access roads, terminals, and neighboring communities. Why if the goal is to revitalize the city of Los Angeles hasn't LAX made areas surrounding it appealing to tourists? Open space, walkable districts, off ramps that are used to help support traffic to LAX and public streets used to support access should be maintained by the airport! How are they planning on doing this? Where are the funds coming from?

How does LAX expect to maintain a key role when they have removed thousands of jobs, (Alternative D), thousands of homes, (manchester square, and the area now considered the northside, and the southern homes of Play del Rey). How does LAX expect to renew those areas, replace the schools and open at least long term jobs to the people who lost their positions?

Response:

As described in Section 1.2.3 of the LAX Master Plan Final EIR, LAX is recognized as a key international gateway. Please see page 1-12 of the SPAS Draft EIR for a discussion of the regional economic impact of LAX. LAWA is not aware of any other major transportation facility in Southern California that provides the level of economic and employment benefits associated with international travel as that indicated by the LAEDC for LAX. Given that those benefits are reaped directly and indirectly by businesses throughout the region, particularly as related to tourism and international trade, the continued operation of LAX does support the economic vitality of the region. LAWA does provide improvements to the street system around LAX, as evidenced by the intersection improvements completed in the last couple of years at Imperial Highway and Main Street, at Imperial Highway and Pershing Drive, and the new intersection on Pershing Drive just south of World Way West. Additionally, LAWA funded tree planting programs that occurred in Inglewood and at Westchester Park between October 2010 and June 2012. LAWA has long supported educational and jobs training programs in the local area and has been involved in a number of community benefits programs.

Economic/social impacts, such as employment, are not required to be evaluated under CEQA. (State CEQA Guidelines Section 15064(e)). The commentor provides no basis for the claim that LAX has "removed thousands of jobs." With regard to the acquisition of properties in Manchester Square, that voluntary acquisition program was initiated at the request of homeowners and property owners therein, whereby they preferred that LAWA acquire their properties instead of receiving soundproofing. Where acquisition of properties with homes or businesses has occurred by LAWA, affected property owners and businesses have received relocation assistance from LAWA.

SPAS-PC00130-419

Comment:

LAX is already accommodating newer larger aircraft. The SAIP was said to be done to accomdate the NLA and none of the new EIR options fit the new FAA accommodations so still no group 6 field. This was shown a way to get a full group 6 airfield on the north in the Nasa study please show that option.

Response:

As described on page 4-488 of the SPAS Draft EIR, ADG VI aircraft, also known as new large aircraft, such as the Airbus A380 currently operate at LAX, but are subject to certain restrictions and special operations requirements, especially during poor visibility conditions. As indicated in the project objectives discussion in Section 2.2 of the SPAS Draft EIR, LAWA seeks improvements to the north airfield that meet FAA design standards for ADG V and VI aircraft. The SPAS Draft EIR addresses a broad range of airfield improvement alternatives, each of which has different characteristics relative to the extent that it does, or does not, meet those design standards. Alternative 5 is considered to be the most responsive to meeting ADG VI design standards, followed by Alternative 3. Additional discussion of how each of the alternatives responds to FAA airfield design standards is provided in Section 4.7.2 of the SPAS Draft EIR.

It should be noted that the LAX South Airfield Improvement Project (SAIP) was done primarily to provide a centerfield parallel taxiway in the south airfield, which would benefit all aircraft group sizes. While that new taxiway was designed to meeting FAA ADG VI design standards in effect at that time, there were, and still are, restrictions on existing Taxiways B and C that do not meet ADG VI standards. It was always intended that the north airfield be improved to meet ADG VI standards, as indicated in Section 2.1 of the Final LAX Master Plan and illustrated in Figure 2.1-1 of that document.

SPAS-PC00130-420

Comment:

It is very nice that LAX is supplying alot of jobs. Show how many more jobs would be created if all of LAWA airports were fully developed. Did the LA EDC have any studies showing employment at the other LAWA airports? Where are they and who was responsible for them?

Response:

LAWA owns and operates LAX, LA/Ontario International Airport, and Van Nuys Airport. LAWA no longer holds an operating permit for Palmdale Regional Airport. It is unclear what the commentor means by "how many more jobs would be created if all of LAWA airports were fully developed." Each of LAWA's airports accommodates the existing market demands specific to each airport. The suggestion that further developing each airport would automatically create more jobs at each airport does not reflect the reality that the number of jobs at each airport is tied more to the aviation activity levels at each airport, which are driven by market demand at each airport, and are not a matter of "build it and they will come." LAWA is not aware of any LAEDC studies showing employment at LAWA airports other than LAX.

No further response is required because employment impacts are purely economic impacts, which are not required to be evaluated under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PC00130-421

Comment:

LA city owns LAX and we would like to know how many of the permanent jobs are going to the citizens of Los Angeles? How many are new jobs?

Response:

Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR, including job creation. LAWA is pleased to provide a variety of employment opportunities within the Los Angeles region, including both construction-related jobs and permanent positions. Construction and operation of the SPAS improvements would continue the role of LAX as a major source of jobs in the region. According to a recent report by the Los Angeles County Economic Development Corporation, LAX operations in 2011 supported 294,000 jobs in Los Angeles County, with an additional 19,400 jobs in neighboring counties. Of these, 25,540 jobs are directly on airport property. According to the report, modernization efforts at LAX in the preceding fiscal year created 10,700 new jobs in Los Angeles County and an additional 1,000 jobs in neighboring counties. Future capital improvement projects in the next 10 to 15 years are anticipated to create 98,800 jobs throughout the region, with 90,500 of those jobs in Los Angeles County.1,2

1. Los Angeles County Economic Development Corporation, Economic and Policy Analysis Group, Los Angeles International Airport in 2011: Economic Impact Analysis, August 2012.
2. Los Angeles World Airports, News Release: Economic Study Finds Los Angeles International Airport Generates 294,400 L.A. County Jobs, $39.7 Billion in Economic Output, $2.5 Billion in Local and State Tax Revenues, August 20, 2012.

SPAS-PC00130-422

Comment:

During construction of the cross field taxiway and Bradley West huge piles of toxic earth have been piled on the perimeters of LAX. They have been in exsistence for over a year and been inadequately kept intact creating huge quanties of fugitive toxic dust. What will these tons of toxic earth cost to mitigate? Has LAWA involved the department of toxics? If so will they remain on hand while new work is being done on the remaining toxic soil? What involvement has the AQMD had with the fugitive toxic dust? What are LAWA's plans to mitigate the fugitive toxic dust in the neighboring communities? Is LAWA running air samples in their child care facility next to the piles toxic fugitive dust? What are the liabilities associated with fugitive toxic dust? Who will be responsible? Does LAWA have special insurance to cover this?

Response:

Please see Response to Comment SPAS-PC00130-265 regarding testing of soil associated with past construction activities at LAX. As indicated in that response, LAX Master Plan Commitment HM-2 addresses the handling of contaminated materials encountered during construction. This commitment also applied to the Bradley West Project and the Crossfield Taxiway Project. Excavated soils from these construction projects were handled in accordance with LAWA's Procedure for the Management of Contaminated Materials Encountered During Construction, which was developed pursuant to LAX Master Plan Commitment HM-2, and in accordance with federal, state, and local laws and regulations. As a result, contaminated soils encountered during excavation associated with the Bradley West Project and Crossfield Taxiway Project are not stockpiled on-site and do not pose a risk of generating fugitive toxic dust.

SPAS-PC00130-423

Comment:

4. There are more than 153 passenger gates as present. Remote gates were not included in the passenger gate count. How many passenger gates including the remote gates does LAX have?

Response:

Figure A, entitled "Gate Positions 2009 Baseline Conditions," within Attachment A to Appendix F-1 of the Preliminary LAX SPAS Report indicates a total of 159 passenger gates under the 2009 baseline conditions. It included 19 west remote gates (identified as "West Gates" in Figure A) that allowed passenger to board and deplane aircraft.

As indicated in Section 1.2.1 of the SPAS Draft EIR, one of the objectives of the SPAS is to: "Plan improvements that do not result in more than 153 passenger gates at 78.9 MAP." This objective is consistent with the requirements of the LAX Master Plan Stipulated Settlement, which call for a reduction in the number of passenger gates compared to present conditions (i.e., see Section IV, Passenger Gate Provision, of the Stipulated Settlement, which acknowledges that LAX had 163 total passenger gates in 2005 when the agreement was drafted and identifies the terms and conditions for reducing the total number of passenger gates to 153).

SPAS-PC00130-424

Comment:

5. Eight years into the spas process LAX has not completed any extra security recommended by the Rand company study of 2004. Explain why? Also recommendations of blast glass in the frontage of all terminals was never studied, why not?

Response:

LAWA has implemented many of the recommendations contained in the RAND Corporation's studies of LAX including enhanced screening procedures for LAX badge holders, increased capabilities to detect explosives, perimeter fence upgrades, and other infrastructure improvements. LAWA has reviewed and analyzed recommendations from RAND and other critical infrastructure experts regarding the use of various forms of blast-resistant glass in conjunction with other methods to mitigate the impact of a vehicle-borne improvised explosive device. Details regarding the security measures considered and implemented is considered Sensitive Security Information under federal law and is therefore not subject to disclosure.

The SPAS Security Assessment is provided in Appendix I of the Preliminary LAX SPAS Report. This assessment identifies blast suppression films on exposed glass surfaces as a potential security measure for all alternatives.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the

adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-425

Comment:

6. To minimize environmental impacts on surrounding communities why hasn't LAX removed the toxic fugitive dust?

Response:

Please see Response to Comment SPAS-PC00130-422 regarding toxic fugitive dust at the airport.

SPAS-PC00130-426

Comment:

Why hasn't looked to filter the ambient water coming from the flight field?

Response:

As described on page 4-607 of the SPAS Draft EIR, stormwater from the portion of the airfield that lies within the Pershing sub-basin flows to a water quality retention basin, where dry weather flows and "first flush" storm water flows are filtered before being discharged to Hyperion Treatment Plant. All industrial activities at the airport, including areas outside of the Pershing sub-basin, are subject to the LAX SWPPP, as described on page 4-610 of the SPAS Draft EIR.

SPAS-PC00130-427

Comment:

Why haven't local schools been equiped with indoor air filters? Why hasn't the airport flight field been surrounded with extra high solid fences to keep in particles generated by aircraft on the ground?

Response:

LAWA has committed to providing funding for the installation of air filtration systems at qualifying public schools with air conditioning systems in place (LAX Master Plan Commitment AQ-2, as presented in the LAX Master Plan Mitigation Monitoring and Reporting Program).1 The qualifying schools will be determined based upon review of the conclusions and recommendations of the LAX Air Quality and Source Apportionment Study (AQSAS). LAWA will initiate the process of identifying qualifying schools following completion of the LAX AQSAS, anticipated in the spring of 2013.

Please refer to Response to Comment SPAS-PC00130-390 regarding the suggestion to construct a 20-foot block wall around the airport for particulate matter control.

1. City of Los Angeles, Los Angeles World Airports, Alternative D Mitigation Monitoring and Reporting Program, September 2004, Available: http://ourlax.org/pub_MMRP.aspx, accessed January 8, 2013.

SPAS-PC00130-428

Comment:

Why hasn't LAX installed a berm to lessen noise pollution on the north?

Response:

As described on page 4-29 and shown in Figure 4.1-4 (Photograph U) in Section 4.1.3.21 of the SPAS Draft EIR, LAWA has constructed 20-foot high buffers between LAX Northside and residential

development to the north, consisting of 12-foot-high sound walls on the crest of 8-foot-high landscaped berms on 88th Street and 88th Place between Sepulveda Westway and the Westchester Golf Course. There are also sound walls along portions of La Tijera Boulevard which range in height from 8 to 20 feet. The purpose of these buffers and barriers is to reduce airport-related ground noise in nearby residential areas and to reduce noise impacts from traffic on adjacent roadways.

Furthermore, as described on page 4-654 and shown in Figures 4.9-3, 4.9-4, and 4.9-5 of the SPAS Draft EIR, LAX Northside serves as an airport buffer zone between the airport and the Westchester community to the north. Please also see Response to Comment SPAS-PC00130-737 for an additional description of the LAX Northside buffer area which would serve to reduce noise impacts to the north.

In addition, as discussed in Response to Comment SPAS-PC00130-919, acoustical barriers are only useful for reducing noise impact from aircraft ground activities, and their benefits are greatly affected by surface topography and wind conditions. The effectiveness of a barrier depends on the distance of the noise source from the receiver and the distance of each from the barrier itself, as well as the angle between the ends of the berm and the receiver. While noise berms and noise walls can attenuate noise, they would be largely ineffective for attenuation of aircraft overflight noise. As the noise levels at LAX are dominated by the noise of aircraft in flight, the reduction of ground noise by berms is not considered effective for noise abatement. Therefore, the installation of berms in additional locations is not expected to result in a noticeable decrease in noise at land uses located within Westchester at greater distances from the airport. Section 4.10.1.7 of the SPAS Draft EIR discusses various abatement and mitigation techniques of aircraft noise at LAX to reduce the impacts of the SPAS alternatives.

SPAS-PC00130-429

Comment:

7. Explain how airport improvement grants work. Where does the money originate? Explain where passenger facility charges are applicable. What is the top and bottom limits of the PFC's? Who is responsible for bond sales? If the projected amounts of funds is 10 times higher than estimated how will those funds be raised? Are the bonds insured? If so by what entity? What other expenses associated with the 9 Alternatives will other agencies be responsible for? Is Metro, Dot, DWP, public works, Caltrans, AQMD, suetes, right of ways, closures of neighboring businesses, moving of sewers, groundwater issues, black outs, department of toxics and movement of hot oil pipes. If the airport fails to raise enough funds how will these things be paid for? If blind spots or construction cause devastation who is responsible?

Response:

The questions raised in the comment go beyond the scope of what is required in an EIR prepared pursuant to CEQA, and no further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, LAWA provides the following response for informational purposes.

Chapter 8 of the Preliminary LAX SPAS Report presents a thorough and detailed discussion of funding sources for the alternatives and variations analyzed. The Airport Improvement Program (AIP) provides grants to public agencies and, in some cases, to private owners and entities, for the planning and development of public-use airports that are important to public transportation and contribute to the needs of civil aviation, national defense, and the Postal Service. The AIP program is discussed in detail in Federal Aviation Administration Order 5100.38C (available at http://www.faa.gov/airports/resources/publications/orders/media/aip_5100_38c.pdf (accessed on November 20, 2012)). The description of eligible grant activities is described in the authorizing legislation and relates to capital items serving to develop and improve the airport in areas of safety, capacity, and noise compatibility. Eligible projects include those improvements related to enhancing airport safety, capacity, security, and environmental concerns. Projects related to airport operations and revenue-generating improvements are typically not eligible for funding. Operational costs, such as salaries, equipment, and supplies, are also not eligible for AIP grants. Airport sponsors who accept a grant offer are also accepting conditions and obligations associated with the grant assurances. These include obligations to operate and maintain the airport in

a safe and serviceable condition, not grant exclusive rights, mitigate hazards to airspace, and use airport revenue properly. AIP grants are issued by FAA. The Airport and Airway Trust Fund provides the revenues used to fund AIP projects. The Trust Fund was established to provide a stable funding source whereby users pay for the services they receive. Various taxes support the Trust Fund, including but not limited to domestic passenger ticket taxes, frequent flyer taxes, commercial fuel taxes, and general aviation fuel taxes.

The uses of Passenger Facility Charges (PFCs) are slightly more expansive than those of AIP grants. The PFC program is discussed in detail in Federal Aviation Administration Order 5500.1 (available at http://www.faa.gov/documentLibrary/media/Order/PFC_55001.pdf (accessed on November 20, 2012)). Also, Section 8.6.3 of the Preliminary LAX SPAS Report discusses the applicability of the PFC program to LAX. PFCs may be used to pay for projects that enhance airport safety, airport security, or airport capacity and may include terminal improvements, airfield improvements, acquisition of land for aeronautical purposes, noise mitigation, and other uses as approved by the FAA. Collections are approved on a project-by-project basis through a prescribed application process involving the airport, the FAA, and the passenger air carriers serving the airport. Charges for different projects may be approved at different collection rates, ranging between $1 and $4.50 per passenger, at the discretion of the FAA. These charges are collected from passengers by the airlines and remitted to the airport sponsor. Currently PFC collections at LAX are limited to $4.50 per enplaned passenger, the maximum allowable by the FAA.

LAWA is responsible for all bond sales benefitting the airport. Bond sales may be initiated on either a competitive or negotiated basis following the approval by the Board of Airport Commissioners and City Council and are subject to the provisions of the Master Senior and Master Subordinate Trust Indentures. The amount of bonds that LAWA can issue may be limited by an "additional bonds test" defined in the bond indenture that requires LAWA to demonstrate its ability to generate sufficient revenues in the future to support the bonds or by market demand for bonds issued by LAWA. Should additional bonding capacity not be available for either of these reasons, LAWA would need to raise funds through other sources, such as grants, PFCs, customer facility charges, and internal revenue generation. None of LAWA's outstanding bonds have been insured due to the small pool of viable insurance companies issuing bond insurance and the unfavorable economics associated with its purchase. LAWA has no knowledge as to whether bond insurance will be available in the future, what entities might offer such insurance, or if its use will be cost effective at the time future bonds are issued.

LAWA would be responsible for the costs associated with the construction of the SPAS improvements. All construction would be conducted in accordance with applicable laws and regulations, and would include precautions associated with construction activities. All cost estimates for construction projects at LAX include contingency for unforeseen items that may arise during construction.

As described in Section 8.6 of the Preliminary LAX SPAS Report, if the assumed funding sources are not available in the future, certain projects would need to be deferred until funds become available or users or tenants agree to support funding of the projects or other sources. It would require significant speculation to analyze whether the deferral of specific projects could create "blind spots" that could lead to construction and operation problems.

If the commentor is referring to general liability for individual construction projects associated with the alternatives analyzed in the Preliminary LAX SPAS Report and SPAS Draft EIR, that is outside the scope of CEQA. CEQA requires that a lead agency provide an analysis of the project's significant physical impacts on the environment; it does not require a discussion of liability. (State CEQA Guidelines Section 21068.)

SPAS-PC00130-430

Comment:

1.2.2 What waivers of operations are currently in effect at LAX? If LAWA builds a specific alternative and the FAA once again changes it standards and refuses operational waivers what would be the consequences? Who would be responsible for the expense? What is the current separation between the north airfield runways at both the east end and the west end? What base assumptions of taxiways

were these alternatives generated? Does it include taxiways called for in Alt D yet not yet completed or both cross field taxiways although only 1 is complete? Has money already been put aside for missing taxiways?

Response:

The existing Modifications of Standards (MOS) applicable to the north airfield are described in the footnotes at the bottom of Table 4.7.2-8 on pages 4-514 and 4-515 of the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-435 regarding changes to airport design standards published by the Federal Aviation Administration (FAA). Because future design standards are not available, LAWA must ensure compliance with the existing standards. It would be highly speculative to attempt to analyze what would happen if new standards were promulgated and no waiver or MOS were granted to LAX. CEQA does not require a lead agency to perform all research, study, and experimentation recommended or demanded by commenters. (CEQA Guidelines Section 15204.) Additionally, as provided on page 2-2 of the SPAS Draft EIR, LAWA is seeking to provide north airfield improvements that support the safe and efficient movement of aircraft and that minimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service. LAWA is unable to ascertain to what expense commenter is referring. Nevertheless, expenditures are not an environmental impact that needs analysis under CEQA.

As described in Section 4.7.2.3 on page 4-488 of the SPAS Draft EIR, the existing north airfield runways are 700 feet apart.

LAWA is unable to ascertain what commenter means by "what base assumptions of taxiways were these alternatives generated?" Please see Response to Comment SPAS-PC00130-523 regarding Taxiway E and Taxilane D and financial information related to the development of the SPAS alternatives. Again, expenditures and economic considerations are not environmental impacts that require analysis under CEQA.

SPAS-PC00130-431

Comment:

Wouldn't construction of a center line taxiway place aircraft closer together then on the existing field? Even at the highest separation mentioned in the 9 alternatives with inclusion of a centerline taxiway fail to meet new FAA requirements and therefore still require waivers. How many new blind spots on runway 24 R will be created for each of the alternatives?

Response:

The commentor is correct that construction of a centerfield taxiway under all alternatives would place aircraft closer together than they are under the current configuration. However, FAA Advisory Circular 150/5300-13A (AC 150/5300-13A) provides different standards for runway-to-runway separation and runway-to-taxiway separation. The runway-to-taxiway separation standards are provided in Table 3-6 and 3-7 of AC 150/5300-13A.

700 feet currently separates the existing north airfield runway centerlines. (See page 2 of Appendix H-3 of the Preliminary LAX SPAS Report and Table 4.7.2-8 of the SPAS Draft EIR.) As discussed in Section 2.2 of the SPAS Draft EIR, the current north airfield configuration requires non-standard operating procedures. All of the alternatives that propose a centerfield taxiway also reconfigure the existing runways in a manner that creates a greater runway-to-runway centerline separation distance. (See section 2.3 of the SPAS Draft EIR.) Alternative 1, for example, while it would decrease the separation between aircraft, due to the addition of a centerline, would comply with the runway-to-taxiway separation standards promulgated in AC 150/5300-13A. It would provide a centerline taxiway distance of 500 feet to Runway 6L/24R and 460 feet to Runway 6R/24L. (See Section 2.3.1.1.1 of the SPAS Draft EIR.) Alternative 1 would also increase the separation distance between runways to 960 feet. (See Section 2.3.1.1.1 of the SPAS Draft EIR.) Like Alternative 1, Alternatives 3, 5, 6, and 7 all increase centerline separation distances of the runways and include the addition of a centerfield taxiway. Please see Chapter 2 of the SPAS Draft EIR for a discussion of the specific runway

movements under each alternative and the separation distances between the relocated runways and the centerfield taxiway. (Also see Table 4.7.2-8 of the SPAS Draft EIR).

Please see Table 4.7.2-8 of the SPAS Draft EIR for a summary of north airfield runways and centerfield taxiway compliance with FAA design standards for each SPAS alternative.

Please also see Response to Comment SPAS-PC00130-402 for additional discussion regarding discussion regarding runway to separation distances. Please see Response to Comment SPAS-PC00130-998 regarding tower line of sight.

SPAS-PC00130-432

Comment:

How long would Lincoln Blvd and Sepulveda have to be closed to traffic during modification? Who will do the modifications on Lincoln or/and Sepulveda? Will the airport pay for all of the modifications?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-433

Comment:

How long would the Argo water channel be closed to incorporate modifications? If the surrounding area begin flooding what entity is responsible for damage? Who is doing the modification of the Argo flood channel? Has the army corp of engineers been consulted on the flood channel alteration? In case of flooding what is being done to prevent flight field toxics from polluting ground water? If flooding is severe what is being done to prevent pollution in the Santa Monica bay? If pollution occurs who will be responsible for the cost of cleanup? If the flight field floods would the runways need to be closed? How much of a cost would it be if one or both runways needed to be closed? If the rains are extensive would the airport be able to survive the financial hit for 1 month? How long could the financial health of the airport survive without use of the north airfield?

Response:

The modifications to Argo Drainage Channel, proposed as a part of Alternatives 1, 5, and 6, have been developed at a program level of planning for SPAS. Final culvert design and construction schedule have not been determined. These details will be addressed at the project level, should one of these alternatives be approved. The modifications would be undertaken by LAWA. Issues regarding liability for damage associated with events at the airport are not germane to environmental issues, are not required to be addressed under CEQA, and are beyond the scope of the SPAS Draft EIR.

The Argo Drainage Channel is not under control of the U.S. Army Corps of Engineers (USACOE), although USACOE has regulatory authority over jurisdictional areas associated with the Argo Drainage Channel and mitigation for impacts. Please see Response to Comment SPAS-PC00130-201 regarding USACOE jurisdiction.

Please see Response to Comment SPAS-PC00130-169 regarding the design capacity of the Argo Drainage Channel improvements proposed under Alternatives 1, 5, and 6. As noted in this response, the design of the facility would provide sufficient capacity to meet the design storm flow for the tributary area. If the capacity of the channel were exceeded, no impacts to the north airfield, the terminals, the Dunes, or offsite areas including Westchester would result. Rather, the area upstream of the culvert inlet would be affected for a short time until water that had temporarily ponded upstream could be drained back into the channel once the peak of a large storm had passed. No impacts to water quality within the north airfield or Santa Monica Bay would occur, nor would the north airfield be subject to closure as a result of Argo Drainage Channel design.

The comments regarding clean-up costs and runway closures are noted, are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-434

Comment:

If runway 24L is extended 1,250 feet west where will you move the holding lot? Because of the proximity to the 98th Street bridge will new safety requirements be installed? Will the bridge need to be moved?

Response:

Because none of the alternatives propose extending Runway 6R/24L 1,250 feet west, it is assumed that the commentor intended to ask about extension of the runway east (Runway 6R/24L would be extended 1,250 feet east under Alternatives 1, 2, 5, 6 and 7; See Table 2-2 in Chapter 2 of SPAS Draft EIR). As stated on page 2-55 of the SPAS Draft EIR, the commercial vehicle holding lot would be relocated to the easternmost portion of the area currently occupied by the Park One parking facility under Alternatives 1, and 5 through 9. Under Alternative 3, the commercial vehicle holding lot would be relocated within the Ground Transportation Center (GTC). Under Alternative 4, the taxi holding lot would likely be relocated to Park One of Parking Lot C and other commercial vehicle holding lots would remain in their current locations.

As described and depicted in Section 2.3.1 of the SPAS Draft EIR, an elevated/dedicated busway along 98th Street, with a bridge over Sepulveda Boulevard will be developed under Alternatives 1, 2, and 8. The eastward extension of Runway 6R/24L does not necessitate the implementation of additional safety requirements beyond those described in Section 4.7.2 of the SPAS Draft EIR.

SPAS-PC00130-435

Comment:

How often does the FAA change standards associated with runway protection zones?

Response:

The Federal Aviation Administration (FAA) does not publish Advisory Circular (AC) 15/5300-13A, Airport Design, on a regular basis. Additionally, every standard within the AC is not updated every time an update is released. As such, LAWA cannot predict what changes to future ACs may be and is only able to design based on current ACs until new revisions are released.

SPAS-PC00130-436

Comment:

Moving outboard runways west will increase the impact of homes in Playa del Rey. How does the airport plan on mitigating that? It will also damage property values on southern Playa del Rey will the airport pay landowners the difference in values? If not willing to make residents whole will the airport have to pay the city general fund for the tax decreases? Or pay the state?

Response:

Please see Responses to Comments SPAS-PC00130-167 and SPAS-PC00130-758 regarding the westerly extension of Runway 6L/24R. As indicated in those responses, displaced thresholds would preserve existing aircraft landing heights for aircraft arriving from the east. Therefore, changes in noise impacts associated with the SPAS alternatives are not associated with the westerly extension of the runway but, rather, from primarily the increases in aircraft operations that occur under all alternatives and, to a lesser degree, by the northerly relocation of Runway 6L/24R under certain SPAS alternatives.

A discussion of aircraft noise impacts on homes in Playa del Rey under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. Please see Sections 4.10.1.5 and 4.9.3.3 of the SPAS Draft EIR for discussion of LAWA's mitigation measure and commitments.

Changes to the RPZ due to the relocation of the runways would not affect homes in Playa del Rey, as analyzed in Section 4.7.2.6 of the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00189-4 regarding property values and Response to Comment SPAS-PC00130-730 regarding other economic issues.

SPAS-PC00130-437

Comment:

What staff person wrote about RSA? It isn't explained what it is and the foot notes muddy the explanation further. Please explain RSA declared distances and displaced thresholds. What is surface criteria? Who is responsible for them?

Response:

As stated in Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, the Runway Safety Area (RSA) is a 'defined surface surrounding the runway prepared or suitable for the risk of damage to aircraft in the event of an undershoot, overshoot, or excursion from the runway.' Furthermore, the RSA is required to be clear of all objects, except for those that need to be located within due to their function.

As explained in Footnote 11 on page 1-14 in Section 1.2.2 of the SPAS Draft EIR, declared distances are the distances the airport operator declared available to an aircraft's take-off run (TORA), take-off distance (TODA), accelerate-stop distance (ASDA) and landing distance (LDA) requirement to obtain a standard RSA. The four components of declared distances, TORA, TODA, ASDA and LDA are explained in further detail below.

TORA is the runway length declared available and suitable for the ground run of an aircraft taking off.

TODA is the TORA plus the length of any remaining runway or clearway beyond the far end of the TORA.

ASDA is the runway plus stopway length declared available and suitable for the acceleration and deceleration of an aircraft aborting takeoff.

LDA is the runway length declared available and suitable for landing an aircraft.

The reference to 'surface criteria' in Footnote 12 on page 1-14 in Section 1.2.2 of the SPAS Draft EIR refers to conditions set forth by the FAA in order to meet standards.
The comments regarding authorship of the EIR are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d)' CEQA Guidelines Section 15204(a)).

SPAS-PC00130-438

Comment:

Taxiway E, Taxilane D, service road and aircraft gates, parking positions are not included in the illustrations. Where are they located? What assumtions have been made? What limitations are you referring to? Who wrote this section? Why didn't the airport hire a more capable technical writer?

Response:

Section 2.3.1 of the SPAS Draft EIR contains illustrations for Taxiway E and Taxilane D modifications (see Figures 2-1 through 2-7) and textual descriptions of the ground vehicle service road alignments. Assumptions and limitations for each alternative are also included in Section 2.3.1.

Appendices F-1 and F-2 of the Preliminary LAX SPAS Report contain detailed drawings showing the number and location of gates for Alternatives 1 through 4.

LAWA cannot ascertain the nature or intent of the commentor's question about "limitations." The latter comments are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d), CEQA Guidelines Section 15204(a)).

SPAS-PC00130-439

Comment:

Why will building limit lines differ between alternatives? Why are taxiways diff for alternatives? The accepted alternative right now is D all taxiways and limit building lines should be based on that.

Response:

The Building Restriction Lines (BRL) and Aircraft Parking Limit Lines (APLL) differ between alternatives due to the various taxiway options proposed. Section 213(a) of FAA Advisory Circular (AC) 150/5300-13A Airport Design describes the BRL in more detail. APLL are the safety clearance setback area along runways and taxiways into which no part of an aircraft parked at a gate can extend. For the SPAS Draft EIR, the APLL was located outside of the Taxilane D Object-Free Area and south of the ground vehicle service road. As described on page 1-14 of the SPAS Draft EIR, the northernmost limit of concourse building area and/or aircraft gate parking positions is defined by the southernmost safety clearance distance for the runways and taxiways in the north airfield.

The taxiways proposed in each alternative differ in order to provide several options of varying operational capability for the north airfield at LAX.

SPAS-PC00130-440

Comment:

Having been a part of the spas process I find it interesting that the number of gates that were to be a part of the mid field terminal were to be included in the new TBIT build out. I see that a new mid-field terminal is now to be included. Why would the airport spend the money on building a mid-field terminal when the number of gates is remaining static at 159? What does LAWA think could be gained? Any extra floor space for international travelers could have been done will an extra floor in the new TBIT building. The airport is giving up space for 50 additional concessions, who is making up for the financial difference?

Response:

The LAX Master Plan (Alternative D) always included gates on the west side of TBIT as well as gates at a new Midfield Satellite Concourse (MSC). The additional gates on the west side of TBIT were approved at a project-level detail as part of the Bradley West Project, and are currently under construction. Similarly, the MSC, which is currently in the project-level planning stages, was always part of Alternative D (referred to as the "West Satellite Concourse" in the LAX Master Plan). The MSC is not a component of SPAS. The MSC is identified as a cumulative project in Section 5.3 of the SPAS Draft EIR, and the cumulative impacts of this project, in conjunction with SPAS and other cumulative projects, are analyzed in Chapter 5. The MSC is a component of the new and reconfigured terminal space and aircraft gates at LAX, whose purpose it is to enhance safety and security, increase the level of passenger service, and accommodate the forecast mix of aircraft.1 With the LAX Master Plan, the

existing remote gates at the west pad facility (referred to the in SPAS Draft EIR as the "West Remote Gates"; see Figure 2-10) will be eliminated. The total number of gates following implementation of the LAX Master Plan, including implementation of any of the SPAS alternatives, will be 153. Passenger processing for the MSC gates will be provided in a new passenger processor within the CTA. Please see Response to Comment SPAS-PC00130-409 for further discussion regarding removal of the west remote gates.

Regarding the comment's opinions on project design and finance-related questions, these comments are noted and are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

1. City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004, page 3-75.

SPAS-PC00130-441

Comment:

Again who wrote about the ground access summary? Show what is described as an APM. When alternative D was accepted the technology described did not exist. Has someone at LAWA invented the necessary technology? If so who? Does this process belong to LAWA or some other engineering group? If the patents are in LAWA's name I suggest marketing them to other airports and venues to pay for terminal improvements.

Response:

The evaluation of impacts associated with on- and off-airport transportation in the SPAS Draft EIR was conducted by Ricondo & Associates, Inc. and Fehr & Peers, respectively, in consultation with LAWA. Ricondo & Associates, Inc. is a full-service aviation consulting firm founded in 1989 providing technical consulting services relating to airport facilities planning, airport master planning, environmental planning, ground transportation and parking planning, and other aviation-related services. Ricondo & Associates has been providing consulting services to LAWA since 2004. Fehr & Peers, established in 1985, is a traffic engineering and transportation planning consulting firm that specializes in providing transportation planning and traffic engineering services to public and private sector clients. Fehr & Peers staff include nationally-recognized experts in all aspects of transportation planning and engineering, including land use and transportation planning, traffic engineering, travel demand forecasting, transit planning, and other transportation-related specialties. Fehr & Peers has extensive expertise in traffic consulting and impact analysis in the Los Angeles area. Resumes of key individuals who performed the traffic analyses are available upon request to LAWA (SPAS Contact Person Diego Alvarez as indicated on SPAS public notices and SPAS website).

Regarding the comments concerning the APM, the SPAS Draft EIR includes two alternatives - Alternatives 3 and 9 - that extend an APM system into the CTA. The description of the APM system associated with Alternative 3 is provided in Section 2.3.1.3 of the SPAS Draft EIR. The description of the APM associated with Alternative 9 is provided in Section 2.3.1.9 of the SPAS Draft EIR.

APM technology currently exists and is in operation at many airports in the U.S. and internationally. The technology was in existence when the LAX Master Plan was approved in 2004/2005. LAWA is not involved with the development of APM technologies, not does it currently hold any patents relating to APM technology.

SPAS-PC00130-442

Comment:

What designs are for ITC? Are they included in all options? It was green light 8 years ago why has no progress been made?

Response:

The ITC was approved at a programmatic level as part of the LAX Master Plan. Detailed designs for this project have not yet been developed. This project is only associated with the approved LAX Master Plan, (i.e., SPAS Alternative 3). LAWA has not constructed all of the improvements approved as part of the LAX Master Plan, including the ITC. As discussed in Section 1.2.2 of the SPAS Draft EIR, the non-Yellow Light projects that are integral to the ground access system, including the ITC, are considered in the SPAS. Because these projects are important to the overall ground access system, the SPAS alternatives include proposed modifications to, or proposed deletion of, these non-Yellow Light projects. (Section 1.2.2 of the SPAS Draft EIR.) It should be noted that the ITC would be eliminated under Alternatives 1, 2, 4, 8, and 9.

SPAS-PC00130-443

Comment:

The Consolated rental car has been collecting money from rental car travelers for several years. How much money have they collected? What are the plans for building the conrac? Because Los Angeles is in big need of jobs why hasn't this project gone out to bid? Wouldn't having all the rental cars in one place cut the number of buses in the CTA and optimizing traffic?

Response:

The rental of vehicles near LAX typically includes customer facility charges (CFCs) for the funding of rental car system improvements related to LAX, the amount of which is not pertinent to the environmental analysis of SPAS. While LAWA has considered over the past several years whether to advance conceptual plans for a CONRAC at LAX into detailed design engineering and construction, the formulation of concept options for overall ground transportation system improvements at LAX as part of SPAS provided the basis for further evaluation of the need for, and location of, a CONRAC at LAX. Because the CONRAC is still under review and consideration, LAWA has not yet solicited bids for construction.

The development of a CONRAC under SPAS Alternative 8 would utilize a shuttle bus system to transport customers to and from the CTA via the elevated/dedicated busway and under Alternatives 3 and 9, an APM system would be used to transport rental car company customers. These systems would indeed reduce traffic within the CTA. Please see Section 4.12.1 of the SPAS Draft EIR for a discussion of the traffic and circulation impacts of the SPAS Alternatives. Under Alternative 4, a CONRAC would be developed at Lot C, but would not have a dedicated CTA access system, as in the other alternatives described above; however, the replacement of individual rental car company shuttle buses with a single consolidated shuttle system would still help to reduce traffic in the CTA.

SPAS-PC00130-444

Comment:

What does "fully integrated" mean? Why weren't diagrams of all 9 Alternatives included at this point? Discussion at this point is useless.

Response:

As stated on page 1-17 of the SPAS Draft EIR, "Alternatives 1 through 4 are presented in this EIR as 'fully-integrated' alternatives that include specific improvements in all three categories: airfield improvements, terminal improvements, and ground access improvements." As further explained after

that statement, Alternatives 5 through 7 focus on variations to the airfield improvements, which, in turn, affect the terminal improvements, and Alternatives 8 and 9 focus on variations to the ground access improvements. There is a certain amount of interchangeability between alternatives, as also explained in that discussion within the SPAS Draft EIR. Diagrams of the nine alternatives are included as Figures 1-5 through 1-13 in Chapter 1, Introduction and Executive Summary, and as Figures 2-1 through 2-9 Chapter 2, Project Description, of the SPAS Draft EIR. It is unclear as to what "at this point" is referring to in the comment; hence, no response to that is offered.

SPAS-PC00130-445

Comment:

Alt 1
Again what does "fully integrated" mean? Where is Taxi lane D? Where is Taxiway E where is the service road? Most important where is the plan? Where is terminal D and what modifications to the terminals are you referring to?

What MSC means? How is Sky West being modified? Why was ITF moved from near the 2 closest freeways to next to the closest community? How does LAWA plan to mitigate traffic and pollution due to idoling cars?

Why use a bus when LAWA already owns lots of shuttles? Why wouldn't this dedicated bus help service the hotels?

Looking at the plan for Alt 1 the consolidated car rental is missing why? obviously "not fully integrated". If the consolidated car rental isn't built when will the car rental companies return the money? Who will pay to research who gets their money back? Is LAWA going to pay for the postage? How long do they got to keep the money? Are the car rental people paying back taxes on the money they collected?

Response:

Please see Response to Comment SPAS-PC00130-444 for an explanation of the term "fully integrated." Taxilane D is the southernmost taxilane within the north airfield. It is the taxilane located closest to the terminal concourses and is highlighted entirely in yellow in Figure 1-5 of the SPAS Draft EIR. Taxiway E is located between Runway 6R/24L and Taxilane D within the north airfield. As indicated on page 2-10 of the SPAS Draft EIR, under Alternative 1, the service road, which is currently located between Taxiway E and Taxilane D would be relocated to a location 142 feet south of the Taxilane D centerline to increase the separation between the two taxiways to allow for simultaneous operations with larger aircraft than currently accommodated, improve safety and efficiency, and meet FAA standards. It is unclear what the commentor is referring to when asking "where is the plan?" The improvements associated with Alternative 1 are illustrated in Figure 2-1 and described on pages 2-8 through 2-14 of the SPAS Draft EIR. There is no terminal, existing or proposed, in any of the SPAS alternatives, that is referred to as "terminal D." Modifications to terminals associated with Alternative 1 are described in Section 2.3.1.1.2 of the SPAS Draft EIR. "MSC" stands for the Midfield Satellite Concourse, which is a Master Plan project that is independent of SPAS. This project is considered in the cumulative analysis, and is described on page 5-18 of the SPAS Draft EIR. A description of the proposed modifications to Sky Way under Alternative 1 is provided on page 2-13 of the SPAS Draft EIR. The location of the ITF was selected for its proximity to the CTA and to the proposed ground access facilities in Manchester Square, and its location on a corridor that links both the Manchester Square ground access facilities and the planned Metro Aviation/Century transit station to the CTA. Mitigation of traffic impacts is addressed in Sections 4.12.1.10 and 4.12.2.7 of the SPAS Draft EIR. Mitigation of transportation-related air quality impacts is addressed by LAX Master Plan Mitigation Measure MM-AQ-3, which would apply to the SPAS alternatives. The proposed dedicated busway would transport passengers from the ground access facilities in Manchester Square and the ITF to the CTA. The busway would also provide connectivity with Metro's planned Aviation/Century transit station. Buses would transport more people per trip than would shuttles, which are smaller. Although the dedicated busway would be accessible to hotels that are located near a planned stop, providing transportation for hotel guests to the airport is not a purpose of the dedicated busway. The ground access improvements proposed under each alternative vary from one another. A CONRAC is proposed in Alternatives 8 and 9, but not in Alternatives 1 or 2. Questions pertaining to financing associated with the CONRAC and the CFCs

being collected for the CONRAC are beyond the scope of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic considerations in an EIR. Please also see Chapter 2 of this Final EIR regarding the LAWA Staff-Recommended Alternative, which couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9, and includes a CONRAC.

SPAS-PC00130-446

Comment:

Alt 2
Its interesting that LAWA is proposing high-speed taxiways on the north when it just paid millions of dollars to remove them on the south air complex. Will the results not be the same? Won't the number of incursions increase the way they did on the south airfield with these addition?

Response:

In regards to the removal of high-speed exit taxiways from the south airfield, please refer to Response to Comment SPAS-PC00130-65.

In regards to the number of incursions on the south airfield, pages 4-510 and 4-511 in Section 4.7.2.3 of the SPAS Draft EIR discuss how even though data indicates that the number of Category C incursions on the south airfield increased following completion of the South Airfield Improvement Project (SAIP) compared to prior years, the comparative change is the result of the definition change by the Federal Aviation Administration (FAA) and is not a reflection of actual events.

SPAS-PC00130-447

Comment:

Habitats & Associations
Because loose soil from the flight field contains huge quantities of toxics before any staging could occur the soil must be cleaned of toxics. How does LAWA plan on cleaning the soil? If the soil isn't cleaned and sensitive habitats are effected how would lawa pay for this? What toxics are currently in the soil? How does LAWA intend to handle run off?

Response:

Impacts associated with contaminated soils are addressed in Section 4.7.3 of the SPAS Draft EIR and sites with known contamination are illustrated in Figure 4.7.3-1. There are no sites with known contamination within the north airfield or in the construction staging areas, although it is possible that contaminated soils could be encountered during excavation associated with improvements to the north airfield. Please see Response to Comment SPAS-PC00130-265 regarding testing of soil associated with past activities at LAX. As indicated in that response, LAX Master Plan Commitment HM-2 addresses the handling of contaminated materials encountered during construction. Contaminated soils would be handled in accordance with LAWA's Procedure for the Management of Contaminated Materials Encountered During Construction, which was developed pursuant to LAX Master Plan Commitment HM-2. With implementation of this commitment, impacts associated with contaminated soils would be less than significant and no impacts to sensitive habitats would occur.

SPAS-PC00130-448

Comment:

How does LAWA plan to keep dust, dirt, and debris off of public streets? Will they be hiring a 24 hour team to clean up dirt, insects etc so that there are no incursions into local communities? Especially in the case of large wind storms.

Response:

LAWA has identified approximately 17 mitigation actions that will be implemented during construction of the selected SPAS alternative. These actions are summarized in Tables 4.2-7 and 4.2-8 (pages 4-104 and 4-105 in Section 4.2.5 of the SPAS Draft EIR. With regard to fugitive construction dust, these mitigation actions include: compliance with South Coast Air Quality Management District Rule 403 (Fugitive Dust rule) by watering active construction areas and preventing mud/dust trackout onto public roads, post visible signs with telephone number and contact person to call with dust complaints, cover or treat all ground surfaces to minimize dust prior to final occupancy, and pave all construction roads at least 100 feet on to the site from public roads. These measures will help limit dust emissions even during high wind events. Additional, project-specific mitigation measures would be developed as necessary as specific projects are implemented and analyzed at the project-level.

SPAS-PC00130-449

Comment:

Since LAWA expects to remove mature trees in order to expand why don't they replace those trees with mature (not as old) trees now? That way there would be less impact to nesting raptors. Had this been done when Alt D was granted trees could be up to 30 years old.

Response:

As discussed in Section 4.3 of the SPAS Draft EIR, implementation of mitigation measures MM-BC-3 from the LAX Master Plan EIS/EIR and MM-BIO (SPAS)-11 would reduce impacts to mature trees and nesting raptors to a level that is less than significant. These mitigation measures would be implemented prior to the initiation of construction that would require the removal of mature trees with either active nests or evidence of past raptor nesting. In accordance with the mitigation measure, LAWA would compensate for the loss of such mature trees at a ratio of 2:1 with specimens that are 15 gallons or larger. This is the standard size for mitigation of this nature. It would not be possible to replace trees now as the number of mature trees with either active nests or evidence of past raptor nesting that would require removal cannot be ascertained at this level of planning. Rather, specific impacts to mature trees would be identified as part of the construction-level analysis that would occur prior to implementation of a specific SPAS component. As discussed in the SPAS Draft EIR on pages 4-195 (and 4-297), although the possibility that raptors would utilize mature trees in the study area is low, the mitigation measures discussed above would reduce impacts to nesting raptors to a less than significant level. The mature trees that occur in the study area are primarily ornamental vegetation, which has limited potential to support nesting raptors. It should be noted that LAX Master Plan Mitigation Measure MM-BC-3 has already been partially implemented for impacts to mature trees associated with the Northwest Construction Staging/Parking Area for the Bradley West Project, which coincides with Staging Area A for the SPAS alternatives. Impacts to trees associated with the Bradley West Project occurred in 2010. It should be further noted that the LAX Master Plan (i.e., Alternative D), which includes LAX Master Plan Mitigation Measure MM-BC-3, received final approval in May 2005, seven years ago.

SPAS-PC00130-450

Comment:

Human Health Risk Assessment
What is meant by incremental cancer risks? If incremental cancer occurs in surrounding communities will LAWa be paying for the expense of treatment? If the cancer is untreatable will LAWA be pay death benefits to family members? If so how much? Where will the funds come from?

Response:

The SPAS HHRA, provided in Section 4.7 of the SPAS Draft EIR, examined the difference between existing (baseline) emissions from LAX and emissions projected for future construction and operations associated with each SPAS alternative. The SPAS HHRA uses the difference between baseline emissions of toxic air contaminants (TAC) and emissions associated with each SPAS alternative to estimate the incremental impact of the alternative to human health due to inhalation of TAC. Incremental impacts are appropriate, since emissions from LAX will be ongoing regardless of whether

SPAS is implemented. Thus, incremental cancer risk represents the anticipated change in possible exposure to TAC in emissions from LAX operations for each of the SPAS alternatives compared to current ongoing emissions as estimated for the baseline year of operations at the airport. Because it represents the difference between existing and anticipated future conditions, incremental risk can be either positive or negative. Positive incremental risk indicates that implementation of one or more SPAS alternatives would result in increased TAC emissions during airport operations; negative incremental risk indicates that implementation of one or more SPAS alternatives would result in decreased TAC emissions, and future risks would be lower with implementation of the SPAS alternative than for current baseline operations. As shown in Table 4.7.1-5 of the SPAS Draft EIR, incremental cancer risks for all SPAS alternatives are negative, indicating that each alternative would have a beneficial impact on human health compared to baseline conditions (i.e., cancer risk associated with each alternative would be less than that associated with baseline conditions).

The SPAS HHRA calculated total construction-related risks rather than incremental risks for impacts due to emissions during construction of SPAS. Specifically, baseline construction emissions were assumed to be zero, so that total and incremental risks are the same. Results from assessment of operations and constructions impacts of the SPAS alternatives are provided in Section 4.7.1.6 of the SPAS Draft EIR and in Section 5.3.2 of Appendix G1. Impacts from operations and construction were combined in Section 4.7.1.6 of the SPAS Draft EIR. However, in Appendix G1, cancer risks and non-cancer hazards for the 11-year construction period were calculated separately from operations as part of the uncertainty analysis.

The commentor appears to assume that incremental cancer risk estimates represent a definitive number of actual cases of disease. Current risk assessment methods cannot, however, achieve this level of sophistication. Instead, risk assessment practice uses information on exposure and toxicity to make a conservative estimate of the odds that someone in the population might be affected. (In this case, "conservative" means that risk estimates err on the side of protecting the public and are higher than actual risks for the bulk of the population of people living near LAX.)

In fact, the incidence of disease attributable to airport-related TAC emissions, as distinct from background concentrations of TAC in the South Coast Air Basin, is not known, but could range from zero to some small fraction of disease attributable to the generally poor air quality in the Los Angeles basin. Incremental cancer impacts from the SPAS alternatives would be less, and are anticipated to be beneficial in many instances. That is, implementation of one or more SPAS alternative could reduce total TAC emissions during airport operations, resulting in a negative incremental risk.

Please also see Response to Comment SPAS-PC00201-4 regarding epidemiological studies that have been performed at other airports in large metropolitan areas to help determine whether individuals living near airports have a greater incidence of disease than populations living in other areas.

Finally, regarding the comment that the SPAS Draft EIR include a funding mechanism to pay for cancer treatment costs and death benefits, there are no reported impacts that require or warrant the proposed mitigation. As described in Section 4.7.1.6.5 of the SPAS Draft EIR, and Table 4.7.1-10, cancer risks, chronic non-cancer health hazards, and health effects for on-airport workers were all less than significant. Acute non-cancer health hazards were found to be significant and unavoidable. However, the impact was due to exposure to the TAC acrolein and was only found at or near the fence-line. Acute exposure to acrolein causes mild irritation of the eyes and mucous membranes. Such exposure and impact does not require the extreme measure and costs proposed by the commentor. Therefore, identification of potential sources of funding for treatments is beyond the scope of the SPAS Draft EIR. The SPAS HHRA was prepared in accordance with California Environmental Protection Agency (CalEPA) and U.S. EPA guidance. Neither of these agencies require the actions requested by the commentor. See also Response to Comment SPAS-PC00130-454.

SPAS-PC00130-451

Comment:

What are incremental chronic non-cancer hazards? Please name all non-cancer hazards. Again if someone in the community surrounding LAX will fall subject to one or more of these hazards will LAWA

be paying for the treatment? If said subject dies will LAWA be pay death benefits to family members? Where would the money come from?

Response:

Please see Response to Comment SPAS-PC00130-450 for an explanation of incremental health risks. Although that response addressed incremental cancer risks, incremental non-cancer hazards are defined in an analogous fashion. In summary, incremental non-cancer hazards represent the difference in possible impacts for baseline (current) conditions and conditions anticipated in the future after implementation of SPAS. Incremental hazards are only calculated for LAX operations. Hazards associated with TAC emissions during construction are assumed to be zero for baseline (current) conditions and, therefore, total, not incremental, risks associated with construction-activities are calculated.

Hazards vary considerably across TAC and across concentrations of TAC in air and are discussed in the SPAS Draft EIR. Section 2.3 of Appendix G1 of the SPAS Draft EIR summarizes the toxicity assessment for TAC of concern. Specifically, non-cancer hazards are summarized in Table 3 on page 10 of Appendix G1 of the SPAS Draft EIR and more detailed information regarding non-cancer hazards are described by TAC in revised toxicity profiles provided in Attachment 1 to Appendix G1 of the SPAS Draft EIR.

The commentor seems to assume that incremental non-cancer risk estimates represent a definitive number of actual cases of disease. As with cancer risks, current risk assessment methods cannot, however, achieve this level of sophistication. Instead, risk assessment practice uses exposure and toxicity information to make a conservative estimate of whether people in the population might be affected. (In this case, "conservative" means that hazard estimates err on the side of protecting the public and are higher than actual hazards for the bulk of the population of people living near LAX.) Please see Response to Comment SPAS-PC00201-4 regarding epidemiological studies that have been performed at other airports in large metropolitan areas to help determine whether individuals living near airports have a greater incidence of disease than populations living in other areas.

An explanation of the meaning of hazard quotients is provided on page 4-468 in Section 4.7.1.6.3 of the SPAS Draft EIR. Although this text refers to a hazard quotient of 1 and hazard quotient of 3, the explanation is still applicable when comparing a hazard quotient of 1 to a hazard quotient of 2. Also note that the general concepts apply equally well to acute and chronic non-cancer hazards.
Estimates of non-cancer hazard, whether for acute (short-term) or chronic (long-term) exposure, are not quantitative expressions of the odds of being affected. Instead, hazard estimates are simple comparisons of exposure with exposure levels that are considered safe. At present, these comparisons cannot be used to examine how likely it is that health effects might occur in a population. Thus, it is not possible to describe quantitatively the difference between a hazard index of 1 and a hazard index of 2. In fact, the odds of adverse health effects could be zero in both cases, because hazard indices are calculated in a manner intended to protect the most sensitive individuals. The only meaningful interpretation of hazard indices is that the level of concern increases as hazard estimates increase above 1. Therefore, the SPAS HHRA identified any incremental chronic or acute hazard index greater than, or equal to, one for any target organ system at any receptor location as significant (see Section 4.7.1.4 of the SPAS Draft EIR).

Please see Response to Comment SPAS-PC00130-450 regarding reimbursement of medical treatment and/or death benefits.

SPAS-PC00130-452

Comment:

What are the thresholds of significance? How acute is a significance of 1? How many thresholds are there? Who is measuring? Are passenger's the only people effected?

Response:

Section 4.7.1.4 of the SPAS Draft EIR provides a discussion of the thresholds of significance that were used to reach the significance determinations for the HHRA. Four thresholds are listed. These thresholds are based on Southern California Air Quality Management District (SCAQMD) guidance.

Acute and chronic reference exposure levels (RELs) developed by the State of California were used to characterize acute and chronic non-cancer hazards associated with exposure to TAC. As stated in Section 2.3 of Appendix G1 of the SPAS Draft EIR, "RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature." As stated by the Office of Environmental Health Hazard Assessment (OEHHA), RELs were developed with the intention of protecting nearly all individuals -- including individuals with high susceptibility for chemical injury and sensitive subpopulations (e.g., children, pregnant women, and elderly persons) -- from adverse health effects.1 Note that this definition does not include "hypersensitive individuals (those exhibiting idiosyncratic responses that cannot be predicted from studying health effects of the substance)."

As stated in Section 2.4.3 on page 13 of Appendix G1 of the SPAS Draft EIR, "Acute non-cancer health hazards were then estimated at each grid point by dividing estimated maximum 1-hour TAC concentrations in air by acute RELs. A hazard index equal to or greater than 1, the threshold of significance for acute non-cancer health impacts, indicates some potential for adverse acute non-cancer health impacts. A hazard index less than 1 suggests that adverse acute non-cancer health impacts are not expected." Possible acute health impacts are therefore based on short-term exposure to the highest modeled TAC concentrations, regardless of location at or near the LAX fence-line. Please also see Responses to Comments SPAS-PC00130-451 and SPAS-PC00130-454 regarding the meaning of acute hazard indices.

No actual measurements of air quality at or near the airport can be conducted to support hazard estimates. The SPAS HHRA is based on air quality modeling for future conditions associated with various SPAS alternatives. This modeling considered multiple factors including varying on-airport meteorological data such as temperature, wind speed, wind direction, atmospheric stability, and mixing height parameters based on several years of meteorological (weather) data collected at LAX. Please refer to Section 4.2 of the SPAS Draft EIR for details on the air quality modeling. By definition, the SPAS Draft EIR estimates potential impacts to human health based on projected TAC emissions. Actual measurements of impacts (e.g., maximum fence-line TAC concentrations) are not conducted prior to project implementation.

The SPAS HHRA addresses impacts to the community surrounding LAX. Passengers are not specifically included in the analysis since the focus of the effort is on these communities. The exposure assessment in Section 4.7.1.2.3 of the SPAS Draft EIR describes receptors selected for quantitative evaluation in the HHRA. The receptors evaluated include: off-airport workers, off-airport adult residents, off-airport child residents, and off-airport school children. Each receptor represents a unique population and set of exposure conditions. As a whole, they cover a range of exposure scenarios for people who may be affected by LAX emissions to the greatest extent. These receptors were evaluated with a focus on locations where maximum TAC concentrations are anticipated. This focus results in risk and hazard estimates that represent the upper end of those possible. In essentially all instances, these upper end risks are anticipated only at or near the LAX fence-line, where no one lives, works continuously, or goes to school. Thus, risk and hazards for people in surrounding communities and removed from the LAX fence-line would be lower than those estimated in the HHRA in essentially all situations.

Passengers who visit the airport infrequently and/or for short periods of time are not likely to receive exposures greater than those estimated in the HHRA. For example, nearby residents are assumed to be present at the LAX fence-line for 24 hours a day and 350 days a year and workers are assumed to be present at the LAX fence-line for 10 hours a day for 5 days a week. See Table 1 on page 8 of Appendix G1 of the SPAS Draft EIR. By providing estimates for the most exposed individuals for determination of significance, the general population is protected.

1. California EPA, Office of Environmental Health Hazard Assessment Air Toxics Hot Spots Program Risk Assessment Guidelines, Part III, Technical Support Document for the Determination of Noncancer Chronic Reference Exposure Levels, February 2000.

SPAS-PC00130-453

Comment:

Why hasn't LAWA implemented some form of Air purification in so called "hot spots"? If taxing time for aircraft on the ground is a major source why aren't aircraft being towed by clean air vehicles? Wouldn't airlines save significant amounts of money on fuel by being towed? How much fuel is required in its entirety by taxing? Would fence line hazards be mitigated? By what agency? Who would be measuring?

Response:

It is assumed that the "hot spots" mentioned in the comment are the locations of peak concentration impacts for airport operations included in Section 4.2.6.4 of the SPAS Draft EIR, Figures 4.2-2 through 4.2-8. The mitigation measures that will be used to potentially reduce air quality impacts from airport operations are discussed in Section 4.2.5 of the SPAS Draft EIR, which include approximately 17 mitigation actions. These actions include the ongoing LAX FlyAway Program, encouraged use of transit ridership through the LAWA Rideshare Program, continued conversion of ground support equipment to alternative fuels, and other methods to reduce traffic and parking emissions. Please refer to Response to Comment SPAS-PC00130-390 for a discussion of the ongoing efforts LAWA is making to reduce impacts to air quality. Note that attempting to clean ambient air with an air purification system is not effective since the sources emitting pollutants will continue to impact air quality. Reducing the concentration impacts is best accomplished by measures that control emissions at the sources.

Methods to reduce aircraft emissions during taxiing are being studied by various airlines and aircraft equipment manufacturers. Towing aircraft was briefly attempted by Virgin Atlantic, however potential damage to the landing gear over time has caused them to stop the practice.1 Other issues, such as increased tow tug emissions and safety hazards due to complex communications between the air traffic control tower, aircraft pilot, and tug operator would need to be worked out. Reduced emissions associated with tow tug operations are occurring at LAX relative to the use of alternative fuel tugs. In the 2006 Ground Service Equipment (GSE) survey at LAX, 14 of the 176 aircraft tractors (tugs) in operation at LAX were electric and another two were CNG/LNG powered. Pursuant to the requirement of the LAX Master Plan Community Benefits Agreement, LAWA is continuing ahead with efforts to encourage and further support the conversion of GSE, including aircraft tractors, at LAX to alternative fuels. Other methods to reduce aircraft taxi emissions are being studied, and in some cases utilized. Reduced engine taxiing (operating own fewer engines when taxiing) is currently practiced by many airlines serving LAX, primarily to save fuel. Airlines and aircraft manufacturers are also looking at installing small electric motors on the front landing gear that run off of the aircraft's auxiliary power unit.2,3 These motors would propel the aircraft along the taxiways without needing the operation of the aircraft's main engines, thus substantially reducing taxi mode emissions. Implementation of these nose gear motors would be by airlines and the aircraft manufacturers, if used. LAWA does not have the authority to mandate modifications to aircraft.

Assuming that the fence line hazards in the comment refer to the peak operational concentrations discussed in Section 4.2.6.4 of the SPAS Draft EIR, it is unlikely that reducing aircraft taxi emissions would reduce the significant impacts of nitrogen dioxide (NO2) and particulate matter (PM10 and PM2.5) at the eastern fence line. These pollutant impacts are dominated by aircraft during takeoff, as noted in Section 4.2.6.4, thus would still likely be significant even if taxi emissions were substantially reduced. Commercial aircraft engine emission standards are set by the International Civil Aviation Organization (ICAO) and are adopted by the U.S. Environmental Protection Agency. Earlier this year, U.S. Environmental Protection Agency adopted Tier 6 and Tier 8 large aircraft engine emission standards for oxides of nitrogen (NOx),4 the major contributor to ambient NO2 concentrations. These standards will reduce NOx emissions by approximately 12 percent from engine manufactured after December 2012, and by an additional 15 percent for engines manufactured after 2014, compared to the previous emission standards. The Federal Aviation Administration is responsible for certifying that aircraft engines meet the emission standards, which they accomplish through engine certification testing.

SPAS-PC00130-454

Comment:

How much difference is there between hazard level 1 and hazard level 2? What impacts are expected exactly? How many impact victims does this represent? Why isn't LAWA looking at some form of mitigation that would clean the air going beyond the fence line and providing filtered face masks for all workers exposed?

Response:

Estimates of non-cancer hazard, whether for acute (short-term) or chronic (long-term) exposure, are not quantitative expressions of the odds of being affected. Instead, hazard estimates are simple comparisons of exposure with exposure levels that are considered safe. At present, these comparisons cannot be used to examine how likely it is that health effects might occur in a population. Thus, it is not possible to describe quantitatively the difference between a hazard index of 1 and a hazard index of 2. In fact, the odds of adverse health effects could be zero in both cases, because hazard indices are calculated in a manner intended to protect the most sensitive individuals. The only meaningful interpretation of hazard indices is that the level of concern increases as hazard estimates increase above 1. Therefore, the SPAS HHRA identified any incremental chronic or acute hazard index greater than, or equal to, one for any target organ system at any receptor location as significant (see Section 4.7.1.4 of the SPAS Draft EIR).

An explanation of the meaning of hazard quotients is provided on page 4-468 in Section 4.7.1.6.3 of the SPAS Draft EIR. Although this text refers to a hazard quotient of 1 and hazard quotient of 3, the explanation is still applicable when comparing a hazard quotient of 1 to a hazard quotient of 2. Also note that the general concepts apply equally well to acute and chronic non-cancer hazards. As stated on page 4-468, "The acute REL for acrolein has an uncertainty factor of 60.1 This factor indicates a moderate uncertainty in the REL based on specific sources of variability not addressed in the toxicological studies, such as individual variation and interspecies differences. Although maximum acute hazard quotients for acrolein after build-out of Alternative 1 are greater than 1, it should be noted that the acute REL is set at or below a level at which no adverse health impacts are expected for the majority of the population. Hence, it represents the tail-end of a distribution and not a specific "bright line" beyond which adverse effects are certain; instead any adverse acute non-cancer health effects (mucous membrane irritation) would be part of a complex probabilistic process. Although the maximum acute hazard quotient estimated as 3.0 is above the threshold of significance of 1, the value is still close to the threshold for acute effects, given the uncertainty in the toxicity factor, and may represent minimal actual acute non-cancer health hazards. Thus, an acute hazard quotient of 3.0 does not mean that adverse effects would definitely occur in the receptor population; rather, it indicates that such effects cannot be ruled out on the basis of current knowledge."

Regarding the impacts that would be expected to occur, non-cancer impacts are described in Section 2.3 of Appendix G1 of the SPAS Draft EIR. This section summarizes the toxicity assessment for TAC of concern. Specifically, the non-cancer hazards are summarized in Table 3 on page 10 of Appendix G1 of the SPAS Draft EIR. More detailed information regarding non-cancer hazards are described by TAC in toxicity profiles provided in Attachment 1 of the SPAS Draft EIR.

The primary TAC of concern associated with emissions from LAX with respect to chronic and acute non-cancer hazards are acrolein and formaldehyde. As noted in Section 4.7.1.6.3 of the SPAS Draft EIR, acute exposures to acrolein may result in mild irritation of eyes and mucous membranes. Acute

exposures to formaldehyde typically include irritation to the eye and respiratory system and possibly adverse effects to the immune system. The HHRA makes no predictions concerning whether adverse effects will occur. It is possible that incremental impacts to the population living in communities surrounding LAX will be zero, or that people in some areas will see an improvement in air quality (lower concentrations of TAC from LAX). Risk and hazard estimates in the HHRA should not be used to suggest that adverse effects from exposure to TAC from LAX would occur.

The commentor seems to indicate that hazard estimates indicate a definitive number of actual cases of impact rather than the relative likelihood that an adverse health effect may occur. In fact, impacts attributable to airport TAC emissions, as distinct from background concentrations of TAC in the South Coast Air Basin, are not known, but could range from zero to some small fraction of risks that are attributable to poor air quality in the basin in general. As indicated in Section 4.7.1.6.1 of the SPAS Draft EIR, incremental impacts from the SPAS alternatives would be less, and could even be beneficial (i.e., implementation of one or more SPAS alternatives could reduce total TAC emissions during airport operations, see).

With respect to linking health effects in the surrounding communities to emissions from LAX, the SPAS HHRA cannot be used to attribute health issues for individuals to TAC emissions from LAX. Please see Response to Comment SPAS-PC00201-4 regarding epidemiological studies that have been performed at other airports in large metropolitan areas to help determine whether individuals living near airports have a greater incidence of disease than populations living in other areas.

Regarding mitigation of TAC, many of the mitigation measures that LAWA has committed to as part of the LAX Master Plan with respect to air quality impacts, and that would be applicable to the SPAS alternatives, aim to reduce exhaust emissions from construction equipment (MM-AQ-2) and mobile sources such as aircraft and ground support equipment (MM-AQ-4), and reduce traffic congestion near the airport (MM-AQ-3). These mitigation measures focus on reducing emissions from the source before they even go beyond the fence-line rather than trying to capture and treat the air containing TAC as it passes the fence-line. Treating the source is more effective and efficient in that such a single measure would ultimately benefit a larger number of potential receptors and reduce the amount of TAC that are emitted from LAX.

In assessing any health and safety issue, the hierarchy for instituting protective measures is: elimination, substitution, engineering controls, administrative controls, and lastly personal protective equipment (PPE). Usually the higher the control in the hierarchy, the more effective it is as a control that offers protection. However, worker health and safety is regulated under the Office of Safety and Health Administration (OSHA) and workers at LAX, including contractors hired by LAWA for construction or other tasks, fall under these regulations. If exposures might exceed protective workplace levels (i.e., permissible exposure limits (PELs)) and cannot be controlled in any other way, personal protective equipment (PPE), including respiratory protection, is provided. The type of respiratory protection is dictated by TAC of concern and airborne concentrations of these TAC. Compliance with OSHA safety and health standards is necessary for airport construction and operations.

1. California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Technical Support Document for the Derivation of Noncancer Reference Exposure Levels, December 2008.

SPAS-PC00130-455

Comment:

Your plan states there are no defined cumulative health risk impacts available. What has happened to the 12 year study that was supposed to define the dangers? Why has this plan not been completed? Why haven't measures recommended so far been instituted? Who at LAX is responsible of the study? What individual thresholds of cancer risk does LAWA consider significant? If LAWA doesn't consider any of this significant then we suggest that all upper level LAWA employees be housed in offices near the fence line. They could use their individual health markers as to whether they are of significance.

Buildings is this area would help block the neighborhoods from lower emissions and tell how high real thresholds are. What difference is there to the community between thresholds of less than 1 to over 3

Response:

Please refer to Section 5.5.7.1 of the SPAS Draft EIR for a detailed discussion of cumulative health risk impacts associated with the SPAS alternatives. Section 5.5.7.1 does not state that "there are no defined cumulative health risk impacts available." It accurately states, "no standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts." The discussion in this section provides a semi-quantitative analysis of the cumulative health risk impacts of the SPAS project based on the Multiple Air Toxics Exposure Study for the South Coast Air Basin (MATES-III)1 and USEPA predictions2 for annual average acrolein concentrations.

Regarding the 12-year study referred to in this comment, it is assumed that the commentor is referring to the Air Quality and Source Apportionment Study (AQSAS). As part of the AQSAS, LAWA is evaluating the contribution of on-airport aircraft emissions to off-airport air pollutant concentrations, addressing several criteria and toxic air pollutants. Please see Response to Comment SPAS-AR00002-45 for additional discussion regarding the AQSAS.

Regarding the thresholds of significance for cancer risk, Section 4.7.1.4 of the SPAS Draft EIR provides a discussion of the thresholds of significance that were used to reach the significance determinations. As indicated in that section, a significant incremental impact to human health relative to cancer risk would occur if changes in airport operations following implementation of a SPAS alternative would result in an increased incremental cancer risk greater than, or equal to, 10 in one million (10 x 10E-06) for potentially exposed off-site workers, residents, or school children. In this context, the term "significant" is used as defined in CEQA regulations and does not imply an independent judgment of the acceptability of the risk. This threshold is based on Southern California Air Quality Management District (SCAQMD) guidance.

Please refer to Section 4.1.1 of Appendix G of the SPAS Draft EIR for a discussion of health effects for on-airport workers. Health and safety of on-airport workers is regulated under CalOSHA and no risk or hazards were estimated for these workers; instead TAC emission estimates were used to provide additional perspective on possible impacts of operational emissions. Fence-line concentrations of TAC represent the highest or near-highest concentrations that could be considered "off-airport" and were used to evaluate exposure for off-airport receptors. The presence of buildings at the fence-line would have little to no impact on the air dispersion modeling, and construction of new buildings on the fence-line would have additional environmental impacts. Please refer to Section 4.2.2 of the SPAS Draft EIR for a discussion of the emission sources and the dispersion modeling assumptions.

Please see Response to Comment SPAS-PC00130-454 regarding the difference between non-cancer hazard indices of 1 to over 3.

Comment:

Safety
Your document states there is no solid waste facility within 10,000 ft of LAX. What facilities do exist in 5' under LAX that could cause contamination and leaching of toxics into the water table?

Response:

Please see Response to Comment SPAS-PC00130-113 regarding the identification of contaminated sites within the hazardous materials study area, which consists of the airport property and SPAS alternatives acquisition areas. Appendix G3 contains additional information regarding known soil and/or groundwater contamination sites located within the hazardous materials study area. As shown in Table 4.7.3 1 of Section 4.7.3 of the SPAS Draft EIR, there are 32 sites at LAX where hazardous materials releases have resulted, or may have resulted, in groundwater and/or soil contamination. Of these 32 sites, seven have significant soil and/or groundwater contamination and are undergoing remediation activities under LAFD or RWQCB supervision. In addition to the sites listed in Table 4.7.3 1, there is the potential for unidentified contamination within the hazardous materials study area from past activities involving hazardous materials or substances. With implementation of existing LAX Master Plan commitments and LAWA procedures, including the Procedure for the Management of Contaminated Materials Encountered During Construction, prepared in accordance with LAX Master Plan Commitment HM-2, impacts associated with soil and groundwater contamination from hazardous materials would be less than significant.

SPAS-PC00130-457

Comment:

How does covering the Argo flood channel add to ponding in & near the airfield?

Response:

Converting the Argo Drainage Channel from an unlined earthen channel to a concrete box culvert would not add to ponding in or near the airfield. Please see Response to Comment SPAS-PC00130-433.

SPAS-PC00130-458

Comment:

How would the LAX northside development cause Part 77 when there is no development now? Just plan whatever development not to interfer with FAR part 77.

Response:

The LAX Northside Plan Update has taken into account the existing Part 77 airspace surface and potential Part 77 airspace surfaces related to all north airfield alternatives to ensure that development does not penetrate those surfaces. As part of the LAX Northside Update, which is a separate and independent project subject to its own environmental review process, building heights will be limited to 45 and 60 feet and will not penetrate the existing Part 77 surfaces and potential Part 77 surfaces related to any SPAS alternatives.

SPAS-PC00130-459

Comment:

Hazardous Materials
Your document says that LAX would require excation in areas of known contamination. Where are area's of known contamination? How many are there? Is any of the soil piled up west of the Westchester business those know sites been mitigated? Do any of those sites effect the water table? Do any of the known contamination show up in current run off? Have you found any contamination in the Argo flood channel? If so what contaminates? Are any of the contaminates contagious with the neighboring communities? What are the known health hazards associated with those contaminants? Does the department of health or any other department have records showing clusters of people suffering from those health hazards? If so, has the airport approached those people, the city or county in which they live and offered to pay for treatment or death benefits?

Response:

Sites with known contamination within the study area are identified in Section 4.7.3.3 of the SPAS Draft EIR. These sites are listed in Table 4.7.3-1 and illustrated in Figure 4.7.3-1. As indicated on the table, there are 32 sites on airport property and 4 sites within the acquisition areas. The sites with impacts to groundwater are identified in the table. Many of these sites are closed cases, indicating that remediation has been completed or that investigations found that no remediation was required. Groundwater investigation is underway or anticipated at four sites, and is in progress at eight sites. Monitoring is conducted at sites undergoing remediation, as necessary, to ensure that contamination does not migrate off-site. As indicated on page 4-597 of Section 4.7.3, implementation of LAX Master Plan Commitment HM-1, and compliance with the Procedure for the Management of Contaminated Materials Encountered During Construction, developed in accordance with LAX Master Plan Commitment HM-2, would ensure that impacts related to sites with known contamination associated with Alternatives 1 through 9 would be less than significant. Water quality impacts associated with runoff from the airport are addressed in Section 4.8 of the SPAS Draft EIR. Section 4.8.3 discusses the type and nature of surface runoff contaminants, and Table 4.8-4 quantifies estimated stormwater pollutant loads (i.e., contaminants) delivered to receiving water bodies from the hydrology and water quality study area (HWQSA).

Please see Responses to Comments SPAS-PC00130-265 and SPAS-PC00130-190 regarding soils stockpiled at LAX. No contamination has been found in the Argo Drainage Channel.

Health hazards associated with hazardous substances vary widely depending upon the contaminant. LAWA does not have any information pertaining to and is not aware of any evidence of cancer clusters in the airport area. Regarding LAWA's liability for medical expenses of individuals living in the community, this issue is outside the scope of CEQA. CEQA requires that a lead agency provide an analysis of the project's significant physical impacts on the environment; it does not require a discussion of liability. (State CEQA Guidelines Section 21068.) Health hazards associated with the SPAS alternatives are addressed in Section 4.7.1 of the SPAS Draft EIR. As noted in that section, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

SPAS-PC00130-460

Comment:

Hydrology
What mitigations for hydrology are you implementing? Flooding seems to be a major issue in all but Alt 3, why? Are you having major issues with flooding now? If so is the Santa Monica Bay effected? If so how is it effected? Why hasn't LAWA moved forward to mitigate pollution to local watersheds? How does the Manchester tunnel figure into airport flooding? Where is the water source currently in the Manchester tunnel currently coming from? Is the water in the tunnel polluted? What pollutants have been identified in the tunnel? What health risks are associated? Does airport flooding impact the runways with sink holes? If so since the last flight field improvements (north runway) how many sink holes have occurred? How much money has been spent repairing sink holes? How many aircrafts have been damaged because of sink holes and flooding? How much money has this cost?

Response:

Mitigation for impacts relating to hydrology and water quality is identified in Section 4.8.7 of the SPAS Draft EIR. As indicated in that section, for every alternative except for Alternative 3, MM-HWQ (SPAS)-1 is recommended, which would require LAWA to revise and update the CDP to account for changes in the planned improvements as a result of the selected SPAS alternative. Flooding is not a "major issue" associated with these alternatives. Rather, the SPAS Draft EIR acknowledges that the existing CDP was developed with a certain set of improvements in mind (i.e., Alternative D, referred to in SPAS as Alternative 3), and these plans would need to be revised to apply to a different set of improvements. As indicated on page 4-607 of the SPAS Draft EIR, localized flooding can occur on the airport in low elevation areas or in areas where debris accumulates, thus blocking flow. As indicated in Section 4.8.6 of the SPAS Draft EIR, with implementation of MM-HWQ (SPAS)-1, revisions to the CDP would be made to reflect the specific characteristics the alternative, and the hydrology and flooding impact would be less than significant.

As noted on pages 4-604 and 4-605 of the SPAS Draft EIR, stormwater from the western portion of LAX (west of Sepulveda Boulevard) discharges to the Santa Monica Bay, whereas stormwater from the eastern portion of the airport discharged to San Pedro Bay. The exception is dry weather flows and "first flush" stormwater flows within the Imperial drainage sub-basin, which are captured by a water quality retention basin and treated at the Hyperion Treatment Plant. Regulatory programs that address water quality are identified on pages 4-606 through 4-612 of the SPAS Draft EIR. As indicated in that discussion, LAWA has a number of programs that reduce impacts to water quality, including a Stormwater Pollution Prevention Program.

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to as Manchester tunnel by the commentor). As indicated in that response, the tunnel segment is sealed and, therefore, does not contribute to flooding. Please see Response to Comment SPAS-PC00130-51 regarding sink holes at LAX.

SPAS-PC00130-461

Comment:

Why are the new designs being made from all impervious materials? Please list all reasons impervious materials are being used? Please list all unimpervious materials considered acceptable for runways and taxiways? Under LA's green building code what percentage of land must be left as open space to use impervous materials? Exactly how many square feet will be covered by impervious materials in each alternative?

Response:

It is unclear why the commentor believes that "new designs [are] being made from all impervious materials." As indicated in Section 2.3.1 of the SPAS Draft EIR, the improvements associated with the SPAS alternatives have been developed at a program level of planning. Specific design features of these facilities, such as drainage facilities, Best Management Practices, and materials that would be used in construction, have not been determined. Details regarding drainage design and the use of pervious versus impervious materials would be determined during the planning and engineering design of individual project components. Runways and taxiways would be designed to comply with FAA design standards for these facilities, including the use of required materials. The facilities would also comply with SUSMP requirements and the City's LID Ordinance.

Section 4.8.2 of the SPAS Draft EIR estimated the amount of land area within the Hydrology and Water Quality Study Area (HWQSA) that would be impervious under each alternative as compared with baseline conditions. Resulting impacts associated with these impervious areas are included in Section 4.8.6 of the SPAS Draft EIR. This analysis was conducted at a program-level of detail. In the analysis, all areas that would be paved were assumed to be impervious. However, as stated above, the actual materials that would be used in construction have not been determined. During engineering design, it may be determined that pervious materials may be feasible for some SPAS improvements. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-462

Comment:

Should storm water capacity be exceeded where would the excess water move to? Would all excess water remain on the flight field? If not would LAWA pay for flooding damage to adjacent areas? Cover closing of businesses? If flooding proceded into terminal areas would LAWA's insurance plan be sufficient to cover all the damages? Where does the LAWA escrow account for insurance exsist? Who runs it? How much money is in the account?

Response:

Please see Response to Comment SPAS-PC00130-433 regarding storm water flows and flooding associated with conversion of the Argo Drainage Channel to a concrete box culvert.

The comments regarding the economic costs of flooding damage and LAWA's insurance plan are noted, are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-463

Comment:

Who designed the LAX Conceptual Drainage plan? Has the Army corp of engineers been consulted? How about the engineers of caltrans and LA city DOT? Has LAWA approached the Los Angeles Department of Water and Power about storage of excess storm water? If so what plans have been put forward?

Describe in detail the MM-HWQ Conceptual Drainage Plan Division and updates. Does the plan include pollution controls?

Response:

The Conceptual Drainage Plan (CDP) was prepared by LAWA in 2005 in accordance with LAX Master Plan Commitment HWQ-1. The CDP provides the basis by which detailed drainage improvement plans will be designed in conjunction with site engineering specific to each LAX Master Plan improvement project. No consultation with the U.S. Army Corps of Engineers, Caltrans, or the City of Los Angeles Department of Transportation was required in conjunction with this plan. However, the CDP was developed in accordance with FAA guidelines and LADPW methods and design criteria. As indicated in Table 4.8-5 of the SPAS Draft EIR, implementation of the SPAS alternatives would result in very minor changes in the amount of impervious area at LAX, ranging from 0.5 percent under Alternative 4 to 3.4 percent under Alternative 3. As explained in Section 4.8.6 of the SPAS Draft EIR, previous studies indicate that the SPAS alternatives would result in a very small net increase in peak flow within the Argo and Imperial sub-basins, which could cause one or more existing on-site or off-site storm drains to reach or exceed their design capacity. Similarly, increases within the Dominguez Channel sub-basin, which is currently over capacity off-site and downstream from LAX, would add to the capacity deficiency, which would be a significant impact. As described in Section 4.8.7 of the SPAS Draft EIR, a new mitigation measure, MM-HWQ (SPAS)-1 is proposed to tailor the CDP recommendations to the specific characteristics of the selected SPAS alternative, if an alternative other than Alternative 3 is selected. The CDP update, if required, would address both drainage and water quality and would reduce flooding impacts associated with the SPAS alternatives to a level that is less than significant. With implementation of this mitigation measure, the SPAS alternatives would not generate excess stormwater that would require storage.

SPAS-PC00130-464

Comment:

What mitigations for each of the alternative for errosion has LAX planned for? What are those mitigations?

Response:

Please see Response to Comment SPAS-PC00130-463 regarding the new mitigation measure, MM-HWQ (SPAS)-1, that is proposed to tailor the CDP to the specific characteristics of the selected alternative. As indicated in the text of proposed Mitigation Measure MM-HWQ (SPAS)-1 on page 4-638 of the SPAS Draft EIR, the CDP revision and update would provide the basis and specifications by which detailed drainage improvement plans would be designed in conjunction with site engineering specific to each improvement associated with any selected SPAS alternative, including, if necessary, improvements to address increased erosion and sedimentation.

SPAS-PC00130-465

Comment:

How would flooding effect the sensitive land areas next to LAX? Which plants and endangered species would be effected should the changes to Argo flood channel fail?

Response:

Please see Response to Comment SPAS-PC00130-433 regarding stormwater flows and flooding associated with conversion of the Argo Drainage Channel to a concrete box culvert. As indicated in Response to Comment PC00130-350, if the capacity of the channel were exceeded, the area upstream of the culvert inlet would be affected for a short time until water that had temporarily ponded upstream could be drained back into the channel once the peak of a large storm had passed. No plants or endangered species would be affected if peak flows could not be accommodated by the channel following conversion to a concrete box culvert, as there are no plants or endangered species located in the area immediately upstream of the inlet to the Argo Drainage Channel.

SPAS-PC00130-466

Comment:

What is the LAX storm water pollution prevention plan?

Response:

A Stormwater Pollution Prevention Plan (SWPPP) is a comprehensive, facility-specific document prepared by any facility covered under the State Water Resources Control Board General Industrial Stormwater Permit to address and control pollutants in stormwater runoff. A SWPPP describes the facility and drainage pathways and systems, identifies potential pollutant sources, prescribes a set of Best Management Practices to prevent generation and/or minimize discharges of pollutants to receiving waters, and identifies a monitoring and reporting program. Information about the LAX SWPPP is provided on page 4-610 of the SPAS Draft EIR. As indicated in the SPAS Draft EIR, more detailed information about the LAX SWPPP is provided in Technical Report 6 of the LAX Master Plan Final EIR (pages 31 and 32). The LAX SWPPP covers all industrial activities at LAX, including those of LAWA and its tenants.

SPAS-PC00130-467

Comment:

Table 1-14 is less than useless. How can massive expansion plans absolutely no impacts? How did LAX come to these conclusions?

Response:

Table 1-14 of the SPAS Draft EIR presents a summary of land use and planning impacts. A complete and thorough analysis of land use and planning impacts associated with the SPAS alternatives, and which are summarized in Table 1-14, is provided in Section 4.9.6 of the SPAS Draft EIR. As described in Section 4.9.6 of the SPAS Draft EIR, a consistency analysis for the SPAS alternatives was presented for the following on-airport land use plans: the LAX Plan, LAX Specific Plan, Los Angeles Airport/El Segundo Dunes Specific Plan, LAX Street Frontage and Landscape Development Plan Update, and acquisition identified within the LAX Master Plan Draft Relocation Plan. A consistency analysis was also presented for the following off-airport land use plans: SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), SCAG 2012-2035 RTP/SCS Aviation and Airport Ground Access Appendix, SCAG 2004 Compass Blueprint Growth Vision, Los Angeles County Airport Land Use Plan, 2011 Caltrans California Airport Land Use Planning Handbook, Los Angeles Citywide General Plan Framework, City of Los Angeles Transportation Element, City of Los Angeles Bicycle Plan, City of Los Angeles Noise Element, Westchester-Playa del Rey Community Plan, South Los Angeles Community Plan, and West Adams-Baldwin Hills-Leimert Community Plan. As stated on page 4-684 in Section 4.9.4 of the SPAS Draft EIR, the determination of consistency was based on the potential for the SPAS alternatives to "conflict with any applicable land use plan, policy, or regulation . . . adopted for the purpose of avoiding or mitigating an environmental effect." Furthermore, as stated on page 4-689 in Section 4.9.6 of the SPAS Draft EIR, "a project is consistent with a general plan and related planning documents, if considering all its aspects, it will further the objectives and policies of the general plan or not obstruct their attainment. Nevertheless, in certain instances, amendments to the various plans are proposed to ensure precise consistency."

As described on page 4-775 in Section 4.9.6 of the SPAS Draft EIR, with implementation of applicable LAX Master Plan commitments, LAX Master Plan mitigation measures and SPAS mitigation measures, and amendments to some plans to ensure precise consistency, impacts would be less than significant.

The statement that massive expansion plans are proposed is inaccurate. As stated on page 1-13 of the SPAS Draft EIR, the project would not change the potential for passenger growth at LAX; rather, future passenger activity is forecast to reach 78.9 MAP at LAX with or without the SPAS alternatives. In addition, the proposed improvements under the SPAS alternatives, including acquisition areas, are within the boundaries of the LAX Plan and LAX Specific Plan and therefore are generally consistent with these plans. Furthermore, as no SPAS improvements are proposed outside of the City of Los Angeles, no associated inconsistencies with plans in other jurisdictions would occur.

SPAS-PC00130-468

Comment:

Table 1-15 has no details. Explain how cnel was calculated? Explain the relationship CNEL Has with Topography? Where are the noise monitors for Playa del Rey, westchester and north Inglewood located? How does CNEL modeling account for spacing issues and course corrections?

Response:

Table 1-15 in Section 1.2.3 of the SPAS Draft EIR, which is specifically designated as the "Introduction and Executive Summary" section of the EIR, is intended to provide only the summary of land use and noise impacts. Sections 4.9 and 4.10.1 further describe the methodology, impacts, and mitigation measures associated with the aircraft noise analyses for the SPAS alternatives, including discussion of CNEL methodology.

The commentor also asks about the relationship between CNEL and topography. The commentor is referred to responses to the same comments/questions posed by ARSAC in Responses to Comments SPAS-PC00130-209 and SPAS-PC00130-937. As discussed therein, the noise analysis incorporated digital topographic data from the U.S. Geological Survey. Thus, the results of the noise modeling reflected the effects of topographic variations in the study area.

Regarding the question of where are the noise monitors for Playa del Rey, Westchester, and north Inglewood located, the locations of all the LAWA noise monitors around LAX are delineated on the LAX noise contour maps on LAWA's website -- see http://lawa.org/welcome_lax.aspx?id=1090.

It is assumed that the commentor referred to aircraft spacing and flight paths when inquiring about "how does CNEL modeling account for spacing issues and course corrections." Together, air traffic controllers and pilots ensure and maintain proper spacing between aircraft, based on appropriate vectors provided for arriving and departing aircraft. LAX radar data used in the SPAS Draft EIR analyses reflected a multitude of flight paths followed by aircraft traversing through the airspace. Radar data for the arrival and departure flights at LAX was used as the basis for creating the flight tracks for aircraft noise modeling purposes in the INM model. For additional information on this issue, please see Appendix J1-1 of the SPAS Draft EIR and Response to Comment SPAS-PC00130-354.

SPAS-PC00130-469

Comment:

1-84 states that implementation of the Spas alternatives would have a considerable contribution to future aircraft noise impacts on existing & potential future noise-sensitive uses within the 65 CNeL noise contour. How will each of the Spas Alternatives effect surrounding areas to the 65 CNEL area? Will there be special attention to schools, old age homes, hospitals, or open air recreation areas? Please list all of the schools, old age homes, hospitals or open air recreational areas that will be either impacted (65 CNEL) or effected (near CNEL) within 10 miles and explain for each alternative how they would be impacted.

Response:

The language referenced by the commentor is included in the "Introduction and Executive Summary" of the SPAS Draft EIR. The commentor is directed to the detailed noise impact analysis for the SPAS alternatives which is included in Sections 4.9 and 4.10.1 of the SPAS Draft EIR. For discussion of impacts to schools (i.e., "Classroom Disruption") the commentor is directed to SPAS Draft EIR Section 4.10.1.4.3 (for discussion of the impact analysis methodology) and Section 4.10.1.6 (for the impact analysis). As also discussed in Section 4.10.1.2.2. of the SPAS Draft EIR, the analysis "provides a comprehensive list of grid points, including a set of regularly spaced points throughout the aircraft noise study area, and the locations of identified non-residential noise-sensitive facilities, such as schools, places of worship, hospitals, nursing homes 'hospital convalescent,' parks, and libraries. Table 1 in Appendix J1-2, Grid Point Noise Levels, lists the grid point types and locations. The locations, by type, are also illustrated in Figure 4.10.1-6 through Figure 4.10.1-9." Impacts to noise-sensitive land uses are discussed in Section 4.10.1.6 of the SPAS Draft EIR, which also summarizes impacts by land use (e.g., Table 4.10.1-9). The level of detail provided in the SPAS Draft EIR is consistent with Section 15151 of the State CEQA Guidelines.

A more detailed listing of noise-sensitive uses (including schools, convalescent hospitals, and hospitals) for Alternatives 1 through 7 is provided in Appendix I-2. For example, Table 10 in SPAS Draft EIR Appendix I-2 of the SPAS Draft EIR provides a detailed listing of noise-sensitive uses under Alternative 1 in comparison to existing conditions.

The comment also suggests using a geographic scope of "10 miles." The geographic scope for the CNEL aircraft noise analysis in Section 4.10.1 is shown in Figure 4.10.1-6. The geographic scope was selected to include all areas that could potentially be affected by the SPAS alternatives, consistent with State CEQA Guidelines Sections 15125(a), 15126.2(a), 15204(a). As stated on pages 4-641 through 4-645 in Section 4.9.2.2 of the SPAS Draft EIR, significant noise impacts are primarily associated with exposure to noise levels of 65 CNEL or higher, which does not extend to areas as remote as 10 miles from LAX. As shown in Figure 4.10.1-14, the Alternative 1 65 CNEL contour to the north is approximately .47 mile north at its farthest point from the northernmost runway. The level of detail provided in the aircraft noise analysis permits "decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." (State CEQA Guidelines Section 15151.)

SPAS-PC00130-470

Comment:

Please explain why Alternative 6 page 1-83 would have the least impacts? Then on page 1-84 you state Alt 5 would result in the least change followed by Alt 1, Alt 6, Alt 7, Alt 3, Alt 2 & Alt 4. Why do these studies disagree with each other? How can moving runways compare to not moving runways in new impacts? Explain in detail how these results were reached? Who did the studies?

Response:

As shown in Tables 1-16 and 1-18 of the SPAS Draft EIR, Alternative 6 would have the least impacts for the number of residential units, population, and non-residential noise-sensitive facilities that would experience a noise increase of 1.5 CNEL or higher within the 65 CNEL or higher noise contours.

As shown in Table 1-17 and described on page 1-84 of the SPAS Draft EIR, Alternative 5 would result in the least change in number of dwelling units exposed to 65 CNEL compared to baseline 2009 conditions. Thus, Tables 1-16 and 1-18 are referring to noise increases while Table 1-17 is referring to the change in contour area. However, the text describing Table 1-17 incorrectly refers to Table 1-18; in response, page 1-84 of the SPAS Draft EIR has been revised. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-126 regarding moving the runways and noise impacts on surrounding communities under Alternatives 1 through 7.

Please see Response to Comment SPAS-PC00130-209 regarding the noise model and assumptions that were used and Response to Comment SPAS-AL00006-8 regarding the calculation of population and dwelling units used for GIS. The studies were prepared by Ricondo & Associates and PCR Services Corporation based on input from LAWA.

SPAS-PC00130-471

Comment:

Lawa says page 1-96 that there will be no cumulative transit noise or vibrations from either the Spas Alternatives or the Crenshaw Metro LAX line. Since LAWA has no idea which Alternative they will use or what the Metro LAX line will look like how can they say that it won't be noisy and/or have vibrations? Who is responsible for this data?

Response:

The discussion of cumulative transit noise and vibration impacts cited by the commentor is only a brief summary of the more complete analysis provided in Section 5.5.10.4 for the SPAS Draft EIR. As described therein, the cumulative impacts analysis for the combination of SPAS alternatives that have a busway or APM transit system and the Metro Crenshaw/LAX Transit Corridor and Station is based on the respective alignments of each system and basic system design assumptions that are recognized in the FHWA Transit Noise and Vibration Impact Assessment Manual that is referenced in the analysis.

SPAS-PC00130-472

Comment:

Fire
LAX SPAS states "Airfield improvements under alternatives 1-7 would enhance the safety & efficiency of the airfield compared to base line conditions." How would Alt 1-7 enhance potential need for emergency fire response? Please explain each alternative separately. What improvements to fire stations is LAX planning? What are the LAPD Design recommendations? What does PS2 have to do with fire safety response? How does Fire and Police Facility space and sitting requirements increase response time? What is FAR? How does FAR ensure maintenance of adequate staffing?

Response:

Enhancements in the safety and efficiency of the airfield under Alternatives 1 through 7 would have a beneficial effect on emergency fire response as the enhancements would address current limitations in airfield design that place aircraft at an increased risk of hazards. Such hazards include, but are not limited to, potential collisions with other aircraft and insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways and aircraft on nearby taxiways. By reducing the potential for such hazards, demand for fire services and emergency response in the event of such hazards would also be reduced. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR.

As discussed in Section 4.11.1 of the of the SPAS Draft EIR, improvements to existing LAFD stations are not planned under SPAS Alternatives 1 through 9. However, as stated on page 4-1001 in Section 4.11.1, Fire Station 80 located at LAX was recently expanded to better serve future airport operations and Fire Station 5 was substantially increased in size when it was relocated in 2006.

LAFD Design Recommendations are described in LAX Master Plan Commitment FP-1, LAFD Design Recommendations, on pages 4-1003 and 4-1004 in Section 4.11.1 of the SPAS Draft EIR. As further described therein, prior to initiating construction of an LAX Master Plan component, LAWA would work with the LAFD to prepare plans that contain appropriate design features to ensure adequate emergency access, adequate fire flow, adequate street dimensions, building heights, and construction access.

LAX Master Plan Commitment PS-2, Fire and Police Facility Space and Siting Requirements, would ensure that, early in the design phase for implementation of LAX Master Plan elements affecting on-airport fire facilities, LAWA and/or its contractors would consult with LAFD and other agencies as appropriate, to evaluate and refine as necessary, program requirements for fire facilities. This coordination would ensure that final plans adequately support future facility needs, including space requirements, siting, and design. Consideration of siting and design is important to ensure that fire facilities are located optimally to facilitate emergency response and maintenance of adequate response times.

As indicated on page 4-994 of the SPAS Draft EIR, FAR refers to Federal Aviation Regulations that mandate many aspects of fire protection and emergency response services at LAX, including equipment types, personnel training, vehicle response times, and readiness. Regarding how FAR ensures maintenance of adequate staffing, as further discussed on page 4-994 in Section 4.11.1 of the SPAS Draft EIR, LAFD Station 80, located at LAX, is an Aircraft Rescue and Fire Fighting (ARFF) facility regulated under FAR. Fire Station 80 is mandated to meet three-minute response times to airfield emergencies in accordance with ARFF requirements. In addition, FAR 139.315-319 requires the provision of sufficient rescue and fire fighting personnel capable of meeting response times, minimum fire suppressant agent discharge rates, and maintenance of emergency access roads.

SPAS-PC00130-473

Comment:

LAX Spas states "Construction of ground access improvements under Alt 1, 2, 3, 4, 8 & 9, would reduce traffic congestion & curb front demands", How? In reading of the alternatives I have seen no improvements to widening streets, removing buses, moving cabs or even improving side walk space for pedestrians, Why? Without measures to access from behind, between, & in front I don't see an improved traffic flow, why didn't LAWA put in an emergency vehicle only access?

Response:

The SPAS Draft EIR defines a series of alternatives that have been analyzed to assess anticipated operations at the 78.9 million annual passenger (MAP) traffic activity levels, identify potential impacts, and define appropriate mitigation measures to address impacts within the Central Terminal Area (CTA). As described in Section 4.12.1.9.5 of the SPAS Draft EIR, the SPAS alternatives would not have significant impacts on curbside operations compared to baseline (2009) conditions. As described in

Section 4.12.1.10.2 of the SPAS Draft EIR, the SPAS alternatives would have cumulatively considerable impacts on curbside operations compared to 2025 future conditions, but these impacts can be mitigated to less than cumulatively considerable levels by Mitigation Measures MM-ST(OA) (SPAS)-1 and MM-ST(OA) (SPAS)-2, neither of which would require expanding the amount of curbside space. MM-ST(OA) (SPAS)-1 would provide additional curbside frontage for private vehicles to pick up passengers by relocating the existing taxi loading zone at TBIT to the curved portion of the curbside between TBIT and Terminal 4. MM-ST(OA) (SPAS)-2 would reduce the total number of shuttles accessing both the arrivals and departures level curbsides by implementing single level busing operations as described in Section 4.12.1.10.2 of the SPAS Draft EIR. For example, by converting rental car shuttles to a single level operation on the departures curbside, these shuttles would no longer operate on the arrivals level curbside, thereby reducing the number of vehicle trips on the arrivals level curbside. Similarly, converting the current dual level hotel shuttle bus operation to single level operation on the arrivals level would reduce the number of trips on the departures level as hotel shuttles would no longer use the Departures level roadways.

As described in Section 4.12.1.6 of the SPAS Draft EIR, all of the SPAS alternatives seek to reduce the CTA traffic by redistributing traffic to various off-site facilities such as the Intermodal Transportation Facility and the Consolidated Rental Car Facility (CONRAC). Section 4.12.1.6.1 discusses the key elements of each SPAS alternative related to on-airport transportation. Please also see Responses to Comments SPAS-PC00130-150 and SPAS-PFA00001-4.

SPAS-PC00130-474

Comment:

Law Enforcement
LAX-Spas states page 1-97 "Airfield improvements under Alt 1-7 would enhance safety and efficiency of the airfield compared to base line conditions, thereby decreasing demand on law enforcement services & personel associated with airfield accidents." I thought that the entire purpose of making airfield improvements was to handle more planes, passengers, and cargo thereby increasing demand on law enforcement. If airfield improvements bring no further business and the nasa-aims study shows the airfield safe why pay billions of dollars to save the cost of a police officer's salary?

Response:

As detailed in Section 2.2 of the SPAS Draft EIR, the purpose of the airfield improvements associated with the SPAS alternatives is to support the safe and efficient movement of aircraft at LAX. The commentor is correct that the summary of law enforcement impacts on page 1-97 of the SPAS Draft EIR concludes that increased airfield safety would decrease demands on law enforcement service and personnel associated with airfield accidents. Although this is a benefit of the airfield improvements, it is not the purpose of these improvements. The statement by the commentor that greater numbers of passengers would increase demands on law enforcement is consistent with the findings of the SPAS Draft EIR. Section 4.11.2.6 of the SPAS Draft EIR concludes that development of new terminal areas and ground access facilities, and the increase in passenger activity over time, could increase demand for law enforcement services and police functions compared to baseline conditions. (Note that the increase in passenger activity over time would occur with or without the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR.) Please also see Response to Comment SPAS-PC00130-307 regarding law enforcement services. Please refer to Response to Comment SPAS-PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel.

SPAS-PC00130-475

Comment:

How do you explain the reduction in curb-front demands? Are all collisions, automobile/pedestrian conflicts due to curb-front demands? Where did the study information come from? How did you reach these conclusions?

Response:

Reductions in curbside demands would result from the implementation of certain physical and operational improvements that would reduce the overall traffic activity accessing the Central Terminal Area (CTA) and redistribute these demands within the CTA curbside. Please refer to Response to Comment SPAS-PC00130-326 for additional information on the SPAS Draft EIR methodology used to analyze curbside operations impacts.

Automobile collisions can be the result of many factors, including driver inattention and carelessness; therefore, all automobile collisions and automobile/pedestrian conflicts are not due to curb-front demands. Please refer to Response to Comment SPAS-PC00130-361 for additional information pertaining to automobile collisions and considerations related to the on-airport traffic analysis for SPAS.

SPAS-PC00130-476

Comment:

Where would LAX be placing the new LAX public safety building? Has that added traffic been added to the LAX traffic plan?

Response:

As discussed in Section 1.4 on page 1-98 of the SPAS Draft EIR, under the heading of "Law Enforcement," at the time the SPAS Draft EIR was prepared, the location, timing and characteristics of the replacement LAX Public Safety Building and Supporting Facilities have yet to be determined.

Therefore, traffic associated with the replacement LAX Public Safety Building and Supporting Facilities was not specifically included in the SPAS Draft EIR ground access analyses; however, given that the proposed facilities would replace existing facilities already located at and near the airport (i.e., associated trips are already in the baseline conditions), and travel to and from both the existing facilities and the proposed facilities would largely be internal or local to the airport, it is not expected that inclusion or exclusion of the LAX Public Safety Building and Supporting Facilities would have a material effect on the SPAS traffic analysis.

SPAS-PC00130-477

Comment:

Curbside Operations
It appears that only curbside operations at the TIBIT have been analyzed, why? Does LAWA not expect any other increases at the other 10 terminals? Why not? It appears that the concerns are only at the arrival levels not at departures?

Response:

Both arrival and departures level curbside operations at each terminal have been analyzed under all alternatives in Section 4.12.1 of the SPAS Draft EIR. The SPAS Draft EIR addresses the curbside operations analysis in Section 4.12.1.8.1. As described in Section 4.12.1.9.5 of the SPAS Draft EIR, the SPAS alternatives would not have significant impacts on curbside operations compared to baseline (2009) conditions. As described in Section 4.12.1.10.2 of the SPAS Draft EIR, the SPAS alternatives would have cumulatively considerable impacts on curbside operations compared to 2025 future conditions, but these impacts can be mitigated to less than cumulatively considerable levels by Mitigation Measures MM-ST(OA) (SPAS)-1 and MM-ST(OA) (SPAS)-2, neither of which would require expanding the amount of curbside space.

As described in Section 4.12.1.6 of the SPAS Draft EIR, all of the SPAS alternatives seek to reduce the CTA traffic by redistributing traffic to various off-site facilities such as the Intermodal Transportation Facility and the Consolidated Rental Car Facility (CONRAC). Section 4.12.1.6.1 discusses the key elements of each SPAS alternative related to on-airport transportation. Please also see Responses to Comments SPAS-PC00130-150 and SPAS-PFA00001-4.

SPAS-PC00130-478

Comment:

Intersections p 1-96
Says only intersections impacted is World Way South & Center Way and yet in many of the SPAS alternatives they speak of realigning Lincoln Blvd and bigrating of Sepulveda why weren't these intersections studied?

Response:

The comment appears to refer to a statement on page 1-98 summarizing the finding of the SPAS Draft EIR on-airport transportation analysis that only one on-airport intersection would be significantly impacted under the SPAS alternatives. (Page 1-96 is cited in the comment; however, the statement appears on page 1-98 of the SPAS Draft EIR.) The comment asks why changes to Lincoln Boulevard and Sepulveda Boulevard were not studied. The intersection of Lincoln Boulevard and Sepulveda Boulevard (study intersection 108) was among the 200 intersections analyzed in the SPAS Draft EIR in Section 4.1.2.2 (Off-Airport Transportation). The intersections studied in the off-airport transportation analysis are listed in Table 4.12-2-1. Under Alternatives 1, 5, and 6, runway modifications would require the realignment of a portion of Lincoln Boulevard but, following construction, there would be no capacity reduction on Lincoln Boulevard and no impact to the intersection of Lincoln and Sepulveda Boulevards from any alternative under any scenario.

SPAS-PC00130-479

Comment:

Off Airport Transportation (1-99)
Table 1-24 chart makes no sense. New studies should be run and someone who speaks english should write a more comprehensive set up. Please explain what CMP stands for? Why aren't numbers that represent vehicle shown? Why aren't more mass transit answers added in? Why hasn't LAX complied with the rest of the flyaways required by their settlement agreement? Free or extremely cheap mass transportation could cut traffic and free up parking places. Construction workers could be picked up at remote locations and bussed to work. They could be safety cleared at other than LAX.

Response:

Table 1-24 in the SPAS Draft EIR provides a summary comparison of the results of the off-airport transportation impact analysis for each SPAS alternative. It is similar in format to many other summary tables presented in Chapter 1, which delineate whether specific types of impacts associated with each alternative are Significant and Unavoidable (SU) or Less Than Significant (LS). In the case of Table 1-24, the number of intersections/facilities with impacts that are Significant and Unavoidable is also indicated in parentheses beside each SU designation. "CMP" stands for Congestion Management Program, and as indicated on page 4-1196 and in Chapter 10, Acronyms, of the SPAS Draft EIR, is also commonly referred to as "Congestion Management Plan." Vehicle trip generation estimates for the Existing (2010) Baseline and Future (2025) Alternatives are presented in Table 4.12.2-10, with additional detail provided in Appendix K2-8. Estimates of potential increases in public transit use are related to the total estimated vehicle trips under each scenario and are presented in Table 4.12.2-6 on page 4-1201 of the SPAS Draft EIR.

Regarding additional FlyAway service required under the LAX Master Plan Stipulated Settlement, please see Response to Comment SPAS-PC00130-399.

The comment speculates that free or reduced price public transit could reduce traffic generated by LAX. The fare structure of public transit service is a policy matter determined by each transit operator. It should be noted that transit fares seldom cover the full costs of providing service and that reducing fares would require additional outside funding. The location of construction worker parking is addressed in LAX Master Plan Commitment ST-21, which is also applicable to the SPAS alternatives, described on

page 4-1229 of the SPAS Draft EIR, and seven potential locations for construction staging are described on pages 2-57 and 2-71 and depicted in Figure 2-15 of the SPAS Draft EIR.

SPAS-PC00130-480

Comment:

Energy
Because more passengers use more power, water, and natural gas, why hasn't LAX put in solar & wind power the flat roofs should make enough to cover not only the needs of the airport but some of the surrounding areas? Why haven't they switched from natural gas to electric and use solar & wind turbine power?

Response:

As described in Section 4.13.1.3 of the SPAS Draft EIR, LAWA has an ongoing commitment to increasing energy efficiency and implementing energy conservation measures at its airports. Measures implemented to promote energy efficiency and conservation are outlined in Section 4.13.1.3. As discussed therein, "energy conservation initiatives have resulted in a 7 percent decrease in per passenger energy consumption at LAX between 2008 and 2009." Furthermore, as discussed on page 4-1331 of the SPAS Draft EIR, LAWA purchases its power from the LADWP, which generated 20 percent of its power from renewable resources in 2010, and is planning to increase this value to 33 percent by 2020. LADWP's renewable energy sources include solar, wind power, and other renewable sources described in the SPAS Draft EIR. Please see Response to Comment SPAS-AR00002-8 regarding on-site solar power.

LAWA does not currently have any plans to install wind turbines at LAX. As with solar power generation, wind power requires a large amount of land, as well as appropriate wind conditions. In addition, installation of low profile wind turbines near the runways would need to be consistent with FAA requirements pertaining to Runway Safety Areas, Object Free Areas, and Obstacle Free Zones. Specifically, a 1.5 megawatt (MW) wind turbine of a type frequently seen in the United States has a tower 80 meters (260 feet) high.1 A 1.5 MW wind turbine, which is on the smaller side of the range of commercial wind turbines currently in operation around the world, which range from approximately 0.6 MW to 8.0 MW (based on a list of the different models of wind turbines from the top 10 wind turbine manufacturers),2 would typically have a rotor diameter (i.e., the area swept by the turbine blades) of approximately 70 meters (230 feet), as in the case of a 1.5 MW GE Model 1.5i wind turbine.3 As such, the total height of a 1.5 MW wind turbine would be approximately 375 feet. The base elevation of LAX is approximately 125.5 feet above mean sea level (MSL), which means that the installation of a 1.5 MW wind turbine at LAX would reach of height of approximately 500 MSL (125.5 feet MSL base elevation plus 375 feet). Figure 4.7.2-1 of the SPAS Draft EIR illustrates the Federal Aviation Regulation (FAR) Part 77 Imaginary Surfaces associated with any commercial runway, indicating the various imaginary surfaces within which any penetration of those surfaces represents a potential concern relative to the safe operation of aircraft at and around the runway. For LAX, the transitional surfaces at the ends of the runways extend up to approximately 276 feet MSL (125.5 MSL base elevation plus 150 feet), which means that placement of such a wind turbine near the ends of the runways would penetrate that imaginary surface by more than 224 feet. Similarly, the Horizontal Surface illustrated in Figure 4.7.2-1, which extends well around the sides of LAX is also set at the 276 feet MSL elevation, which means placement of the wind turbine anywhere to the side of the runways would also penetrate that imaginary surface by 224 feet. In moving farther away from the airport and into the Conical Surface illustrated in Figure 4.7.2-1, per the Airport Master Plan Airport Layout Plan, a 500-foot tall object would have to be more than approximately 14,000 feet (2.65 miles) from the runways in order to not penetrate that surface.4 Such a wind turbine placement would be well beyond the limits of the airport property.

As indicated in Section 4.13.1 6 of the SPAS Draft EIR, a sufficient supply of electricity and natural gas is expected to be available to serve the SPAS improvements.

SPAS-PC00130-481

Comment:

I know LAX uses gray water for their land scaping but they sit on top of one of the largest springs in southern California why aren't they tapping that water, cleaning it and using it to support their own water supply?

Response:

As discussed on page 4-1380 in Section 4.13.4 of the SPAS Draft EIR, Los Angeles Department of Water and Power (LADWP) provides water service to the LAX area. LADWP obtains its water supplies from (1) the Owens Valley and Mono Basin via the Los Angeles Aqueduct; (2) northern California and Colorado River imports purchased from the Metropolitan Water District of Southern California; and (3) local groundwater basins. In order to determine whether the increase in water use associated with the SPAS alternatives would be significant, projected water demands were compared with LADWP's projections regarding future water supply. As described in the SPAS Draft EIR, LADWP projects that there will be adequate water supply to meet City demands through 2035, including demands associated with LAX. There are no municipal water wells at LAX.

SPAS-PC00130-482

Comment:

Transportation-Related Fuel
LAX states that on page 1-101 that a substantial portion of the increase in fuels is associated with an increase in flight operations. Why hasn't LAWA required the use of more fuel efficient planes? Why hasn't solar power been substituted for other fuels? More efficient forms of organization also can save fuel like grouping all of the LAX office people together and using car pool type shuttles. Electric vehicles to shuttle employees in the airport and passengers in the terminal areas supported by solar energy and or wind makes greater fuel unnecessary. Why hasn't LAWA investigated more environmental means of expansion?

Response:

LAWA does not have the legal or practical authority to set aircraft design standards such as aircraft fuel efficiency, which are controlled by the federal government, the FAA, and aircraft manufacturers. Furthermore, as discussed on page 4-1330 of the SPAS Draft EIR, airplanes are becoming more fuel efficient: "New aircraft are 70% more fuel efficient than 40 years ago and 20% better than 10 years ago. Airlines are aiming for a further 25% fuel efficiency improvement by 2020. Modern aircraft achieve fuel efficiencies of 3.5 liters per 100 passenger kilometers. The [Airbus] A380 and [Boeing] B787 are aiming for 3 liters per 100 passenger kilometer [approximately 78 miles per gallon]."

The commentor also asks why solar has not been substituted for other fuels. To the extent the commentor is referring to electricity generation for use at on-site facilities, please see Responses to Comments SPAS-PC00130-480 and SPAS-AR00002-8. To the extent the commentor is referring to incorporation of solar power into airplanes, such a suggestion is infeasible to fully power multi-passenger commercial aircraft. As described in the previous paragraph, LAWA does not have the legal authority to mandate plane design, nor would solar power on passenger planes provide sufficient energy to noticeably offset fuel consumption since the weight of such panels would offset any energy they produce.

LAWA has an ongoing commitment to increasing energy efficiency and implementing energy conservation measures at its airports. Please see Response to Comment SPAS-PC00130-390 regarding programs undertaken at LAX to reduce emissions from ongoing airport activity, including converting LAWA fleet vehicles to alternative fuels, promoting electric automobile use, and encouraging

use of transit and carpools/vanpools. Please see page 4-417 of the SPAS Draft EIR and Response to Comment SPAS-AR00002-19 for discussion of LAWA's existing employee carpool/vanppol program.

SPAS-PC00130-483

Comment:

Do they have programs for mulching of paper products and recycling of plastic? If so why aren't such programs detailed? Do you have some program from the concessions? If so please describe? What are the largest sorces of solid waste from LAX?

Response:

Please see Response to Comment SPAS-PC00130-210 regarding recycling programs at LAX. According to a waste characterization study conducted in 2000, the largest solid waste sources at LAX were construction and demolition generators (27 percent) and terminal areas (26 percent).1 Paper and organics were the largest components of the solid waste stream, accounting for 42.8 percent and 32.7 percent of the overall waste stream by weight, respectively. Cardboard, metals, and wood pallets are the largest constituents of the recycled waste stream.

1. City of Los Angeles, Los Angeles World Airports, LAX Waste Characterization and Quantification Study - Final Report, prepared by Cascadia Consulting Group, Inc., Mary Loquvan Consulting, Sky Valley Associates, and TerraStat Consulting, January 2002.

SPAS-PC00130-484

Comment:

Wastewater Generation
LAX states that on page 1-102 "The projected wastewater generation for each alternative could be accommodated by existing wastewater treatment facilities at the Hyperion Treatment Plants" Is LAX increasing their payments to hyperion? Is LAWA giving extra land to Hyperion to expand their facilities?

Response:

As discussed on page 4-1368 in Section 4.13.3 of the SPAS Draft EIR, Hyperion Treatment Plant (HTP) has a design capacity of 450 million gallons per day (mgd). Currently, there are no plans to expand the design capacity of HTP before 2025. Also, as discussed in Section 4.13.3 of the SPAS Draft EIR, the projected wastewater generation for each alternative could be accommodated by existing wastewater treatment facilities at HTP. LAWA and/or LAX tenants pay fees for wastewater disposal just like any other user.

SPAS-PC00130-485

Comment:

Water Supply
LAX states demand for water would be increased, why hasn't LAWA developed their own water source? By removing LAX water needs the city of Los Angeles would have less need to conserve and/or ration.

We appreciate the maximum use of reclaimed water, However we believe that LAX should supply their own water sorce.

Response:

Please see Response to Comment SPAS-PC00130-481 regarding water supply to LAX. As indicated in that response, LADWP projects that there will be adequate water supply to meet City demands through 2035, including water demands associated with LAX. Please also see Table 4.13.4-1 on page 4-1383 of the SPAS Draft EIR, which sets forth the percentage of LADWP water demand represented by LAX, both under baseline (2010) and projected (2025) water use for all of the SPAS alternatives. Therefore,

City of Los Angeles will not need to ration its water supply. LAWA will continue to implement and enhance water conservation measures at LAX, in fulfillment of LAX Master Plan Commitments W-1, Maximize Use of Reclaimed Water, and W-2, Enhance Existing Water Conservation Program, which would serve to reduce water use under the SPAS alternatives. In addition, development at the airport will be consistent with the LAX Street Frontage and Landscape Plan Update and Sustainable Airport Planning, Design and Construction Guidelines, which include a number of objectives and guidelines pertaining to water use at LAX.

SPAS-PC00130-486

Comment:

Evaluation of Amendments to the Specific Plan
What kind of administrative amendments to the specific Plan is LAX planning? Please describe each amendment for each alternative.

Response:

A description of potential Administrative amendments to the LAX Specific Plan are described in Section 6.1.2 of the SPAS Draft EIR and Section 7.2 of the Preliminary LAX SPAS Report. Such amendments include updating Municipal Code references to make sure they are consistent with the current Code, updating the Definitions section of the LAX Specific Plan to delete references to the Ground Transportation Center (GTC), Intermodal Transportation Center (ITC), and the like if a SPAS alternative other than Alternative 3 is selected, clarifying the LAX Plan Compliance Review process requirements, and other such changes as described in the sections cited above.

SPAS-PC00130-487

Comment:

Page 32

1.5 Environmentally Superior Alternative
North Airfield Improvements
1 The south complex was expanded to cover newer larger aircraft, then the FAA changed these qualifications. Although the north is currently handling the newer larger aircraft none of the alternatives as stated would accomplish the new FAA qualifications. Please explain the new FAA qualifications for the newer larger aircraft?

Response:

Alternative 5, as proposed in the SPAS Draft EIR, meets the minimum design requirements for a full Aircraft Design Group (ADG) VI airfield, including an ADG VI Category II/III outboard runway and an ADG VI Category I inboard runway. Taxiway E and Taxilane D dimensions would meet ADG VI standards. Section 2.3.1 of the SPAS Draft EIR provides the airfield characteristics for each of the north airfield reconfiguration options (Alternatives 1 through 7).

Additionally, please see FAA Advisory Circular (AC) 150/5300-13A Airport Design for more information on airport design standards for ADG VI aircraft.

SPAS-PC00130-488

Comment:

Why wasn't a one runway alternative considered? Explain why the only way to handle the newer larger aircraft would have been 1 runway with unmoved taxi ways.

Response:

The concept of having only one runway in the north airfield, leaving LAX with a three-runway system is described and evaluated in Section 2.3.2.3, Three-Runway Airfield, of the SPAS Draft EIR. This section

presents several operational problems associated with this alternative and indicates that it would likely result in environmental impacts comparable or greater to the alternatives evaluated in detail in the SPAS Draft EIR. Please also see Response to Comment SPAS-PC00130-1033 for additional discussion regarding operational problems and infeasibility of this airfield concept. The comment does not indicate any environmental advantages of a three-runway system relative to the alternatives evaluated in the SPAS Draft EIR. Therefore, this alternative was not evaluated in detail in the Draft EIR.

SPAS-PC00130-489

Comment:

Please describe FAA Engineering Brief No 75

Response:

Federal Aviation Administration (FAA) Engineering Brief (EB) No. 75, Incorporation of Runway Incursion Prevention into Taxiway and Apron Design, provides strategies for taxiway and apron design in order to help prevent runway incursions. The guidance provided within the EB was only a recommendation. However, since the publication of the EB, the guidance has been incorporated into FAA Advisory Circular (AC) 150/5300-13A, Airport Design. Paragraph 203 of the AC states that "the airport designer must keep basic concepts in mind to reduce the probability of runway incursions through proper airport geometry."

SPAS-PC00130-490

Comment:

What are ADG V and VI aircraft?

Response:

The acronym "ADG" stands for Aircraft Design Group and is used to group and characterize the various sizes of airplanes, ranging from ADG I, the smallest size including airplanes such as a Cessna 150, up to ADG VI, the largest size including airplanes such as the Airbus A380. As described on page 2-2 of the SPAS Draft EIR, the largest aircraft types currently in service in the U.S. are ADG V aircraft, such as the Boeing 747-400, and ADG VI aircraft, such as the Airbus A380.Table 1-2 of FAA Advisory Circular (AC) 150/5300-13A Airport Design outlines the tail height and wingspan requirements for Airplane Design Group (ADG) I through VI aircraft. Additionally, a table of aircraft and their representative ADG group can be found in Table A1-1 of Appendix 1 of FAA AC 150/5300-13A Airport Design. The AC also details airport design standards for ADG-V and ADG-VI aircraft.

SPAS-PC00130-491

Comment:

Why are you looking to accommodate a larger percentage of departing aircrafts? Before the South Air field project the airfields together could accommodate 100 MAP, now they can accommodate 120 MAP with out improvement, why spend billions of dollars when the airport is capped at 78.9 map?

Response:

The content of this comment is similar to comment SPAS-PC00130-397; please refer to Response to Comment SPAS-PC00130-397.

SPAS-PC00130-492

Comment:

Ground Access System

So far documents haven't stated how the roadway would be improved. Please explain the improvements? How do you plan on reducing "bottlenecks" and congestion? How are you planning to reduce the volume of private vehicles? What other alternative drop off and pick up areas are you developing? How much is LAWA counting on the metro Crenshaw station to reduce traffic?

Response:

Page 4-1094 through and 4-1096 in Section 4.12.1.6.2 of the SPAS Draft EIR describes the non-SPAS roadway improvements associated with the implementation of the Midfield Satellite Concourse (MSC) Passenger Process, Terminal 1.5, and Terminal 2.5. Page 4-1178 in Section 4.12.1.10 of the SPAS Draft EIR describes Mitigation Measures MM-ST(OA) (SPAS)-1 and MM-ST(OA) (SPAS)-2 that would address SPAS-related impacts within the Central Terminal Area (CTA). In addition, Section 4.12.1.6 describes the improvements that would be in place under each of the SPAS alternatives. As described Section 4.12.1.11.2, the implementation of these improvements and operational changes would address the existing "bottlenecks" and anticipated congestion such that traffic-related impacts on the CTA departures-level and arrivals-level curbsides would be less than significant after mitigation.

Table 4.12.1-15 on Page 4-1103 of the SPAS Draft EIR shows the mode split assumptions for the on-airport traffic analyses. As shown in the table, it is anticipated that the volume of private vehicle volumes accessing the CTA would be reduced by 5% (calculated as 2.55% of 51.96% of total private vehicle traffic using the curbside in the arrivals peak hour) for certain SPAS alternatives due to the provision of "kiss-and-ride" facilities at the Intermodal Transportation Facility (ITF) and at the Ground Transportation Center (GTC) or Consolidated Rental Car Facility (CONRAC) near Manchester Square. Airline passengers would be dropped off or picked up at these locations remote from the CTA and then transported between the remote location and the CTA via a dedicated bus or Automated People Mover (APM).

The on-airport traffic analysis for the SPAS Draft EIR was prepared using a conservative assumption that transit (which includes rail associated with the Metro Crenshaw line) mode split would increase by 1.91% as compared with baseline conditions (i.e., from 0.59% to 2.50%). The assumption regarding the future use of rail was intentionally held to a low value for traffic analysis purposes in order to provide a conservative estimate of future roadway traffic volumes and potential impacts associated with CTA roadway traffic. As such, any increase in transit mode share above the nominal rate assumed in the analysis will provide additional CTA roadway benefits beyond those analyzed in the SPAS Draft EIR; however, the additional benefit of using this conservative approach is that LAWA is not "counting on" the Metro Crenshaw line to reduce traffic activity and associated impacts.

Comment:

Maintaining LAX's position
How has it been determined that LAX serves a key role in the region's economy? Since LAWA is providing jobs in the region, why hasn't LAWA completed the rest of the green lighted improvement projects?

Response:

Please see Response to Comment SPAS-PC00130-725 regarding the impact of LAX on the region's economy and Response to Comment SPAS-PC00130-394 regarding LAWA's progress towards implementation of non-Yellow Light LAX Master Plan projects.

SPAS-PC00130-494

Comment:

On improvements 153 passenger gates 2-4
This section makes no sense at all. How is LAWA making terminals 123 consistent? Are they all to be the same size? Are they to look the same?

Response:

It appears that the commentor is referring to the following statement under Section 2.2 "Project Objectives," Object 4 "Plan Improvements That Do Not Result in More than 153 Gates:" "In identifying and evaluating alternatives to the demolition of Terminals 1, 2, and 3, LAWA is seeking to maintain consistency with the LAX Master Plan design for a total of 153 passenger gates, which was based on a future passenger activity level of 78.9 million annual passengers (MAP) at LAX in 2015."

This statement does not indicate that Terminals 1, 2, and 3 would be the same size or designed to look the same, as suggested by the commentor, but rather the objectives associated with completion of the SPAS project to fulfill Section 7.H of the LAX Specific Plan in accordance with the Stipulated Settlement. As indicated in Section 2.2 of the SPAS Draft EIR, the demolition of portions of Terminals 1, 2, and 3 is a Yellow Light Project being addressed as part of SPAS. As indicated in Section 2.3.1.3.2 and depicted in Figure 2-3 of the Draft EIR, under Alternative 3, which represents implementation of the LAX Master Plan as originally envisioned, portions of Terminals 1, 2, and 3 would be demolished and replaced by a linear concourse. As indicated in Table 2-2, Summary of SPAS Alternatives, and depicted in Figures 2-1, 2-2, 2-5, 2-6, and 2-7, Alternatives 1, 2, 5, 6, and 7 all include demolition of a portion of the Terminal 1 concourse and demolition and reconstruction of the Terminal 3 concourse and associated gates.

SPAS-PC00130-495

Comment:

Enhance Safety
When is LAWA planning on putting into effect the rand projects to 2004 solutions to safety? Why hasn't LAWA put in blast glass? Why hasn't LAWA installed a license plate reader at all egresses of the airport? Why aren't there more camera's in the CTA?

Response:

Please see Response to Comment SPAS-PC00130-424 regarding blast-resistant glass. LAWA's Police Division utilizes automated license plate reader (ALPR) technology throughout the airport and has made numerous arrests as a result of ALPR notifications. In addition, LAWA has expanded the number of close circuit television cameras throughout the airport, including within the CTA, to enhance security measures, manage traffic congestion, and increase situational awareness. Please see the SPAS Security Assessment provided in Appendix I of the Preliminary LAX SPAS Report for additional information on the security features of the SPAS alternatives.

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-496

Comment:

Minimize Environment Impacts
Easy way to minimize local environmental impacts is develop the other airports!

SPAS-PC00130-498

Comment:

Knowing that rental cars are a huge problem why hasn't LAWA built a consolidated car rental?

Response:

Please see Responses to Comments SPAS-PC00130-185 SPAS-PC00130-443 for discussions of how certain SPAS alternatives include the development of a CONRAC.

SPAS-PC00130-499

Comment:

Why hasn't LAWA offered discounts to airlines who lessen their peak times take offs and/or landings?

Response:

In general, the Federal Aviation Administration (FAA) requires that airport operators make assurances that their facilities are available to airlines "on reasonable conditions without unjust discrimination." 49 U.S.C. 47107(a)(1). This policy restricts the ability of airport sponsors to lower fees for airlines that restrict their operations during peak times. While the FAA does allow an exception to this policy for certain congested airports, LAX does not meet the criteria for such an exception as set forth in 49 U.S.C. 47107(q).

SPAS-PC00130-500

Comment:

7. Producing an Improvement Program pg 2-4
The document says improvements are a major undertaking, our experts are saying that LAWA is majorly underestimating costs, construction time, and starting with the most dangerous of the projects. If the experts are correct and the amount to fund the projects is over 100% more than predicted how does LAWA plan on paying for the projects? If severe damage is done because of the manchester tunnel, or the Argo flood channel how does LAWA plan on paying for that? How much money exsists in the current insurance policy? Could the current insurance cover 35 billion? How long would it take LAWA to sell bonds to cover 35 billion? How sustainable would LAX be? How does this situation keep LAX fiscally responsible? How long is LAWA guessing that the north airfield will be closed? Can the south airfield handle all of the traffic currently on the north airfield? If so for how long? If terminals 1,2 and 3 aren't approachable from the north or south airfield what is LAWA's plan for those airlines currently using those terminals?

Response:

The questions raised in the comment go beyond the scope of what is required in an EIR prepared pursuant to CEQA, and no further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the

SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, LAWA provides the following response for informational purposes.

Please note that the comment presents personal opinions about the costs, construction time, and phasing of the SPAS alternatives that are not supported by facts or evidence. A detailed discussion of the estimated costs and funding sources for the alternatives is provided in Section 8 of the Preliminary LAX SPAS Report. As described therein, if assumed funding sources are not available in the future, certain projects would be deferred until funds become available. If the commentor is referring to general liability for individual construction projects associated with the alternatives analyzed in the Preliminary LAX SPAS Report and SPAS Draft EIR, that is outside the scope of CEQA. CEQA requires that a lead agency provide an analysis of the project's significant physical impacts on the environment; it does not require a discussion of liability. (State CEQA Guidelines Section 21068.)

Please see Response to Comment SPAS-PC00130-41 regarding phasing. As discussed in that response, the SPAS Draft EIR is a programmatic document. Therefore, because there are no specific improvement or modification designs, the nature or length of restrictions on the north airfield are unknown. A project-level environmental review would be conducted for individual projects prior to construction, including impacts associated with restricting operations on the north airfield during construction, should an alternative that proposes north airfield construction be chosen. North airfield construction would be phased to minimize disruption to the north airfield and north airfield terminals.

SPAS-PC00130-501

Comment:

2.3.1 Alternatives Addressed in Draft EIR
Other than a quick mention of Alt D I haven't seen any plans for development of the ground transportation Center. Where are the plans for the GTC? What plans are being made for the baggage tunnel? In the original Alt D most of the GTC safety was based on non-esxistent technology what is LAWA planning on instead? What are the associated structures and equipment you are referring to?

Response:

As described in Section 2.3.2 of the SPAS Draft EIR, the primary focus of the SPAS is on potential alternatives to the LAX Master Plan improvements defined in the Stipulated Settlement as the Yellow Light Projects. One of the Yellow Light Projects is the development of the Ground Transportation Center (GTC), including the baggage tunnel, associated structures and equipment. As such, all of the SPAS alternatives, with the exception of Alternative 3 which represents the implementation of the LAX Master Plan (Alternative D), propose alternatives or "options" to the GTC. Such options to the GTC are described under the heading of "Ground Access Facilities, in the descriptions of Alternatives 1, 2, 4, 7, and 8 in Section 2.3.1 of the SPAS Draft EIR. (Alternatives 5, 6, and 7 focus on airfield and related terminal improvements which can be paired with the ground access improvements under Alternative 1, 2, 8, or 9) The GTC is discussed in Section 2.3.2.2 of the 2004 LAX Master Plan. The LAX Master Plan was a programmatic document, and the improvements contemplated do not have project-specific details, and would require further environmental review.

As described on page 2-6 of the SPAS Draft EIR, under the LAX Master Plan, the function of the GTC is to replace CTA curb front for drop off and pick up of passengers and to replace a portion of the private vehicle parking area and all of the commercial vehicle (e.g., taxis, shuttle vans, and limousines) staging area. The GTC was designed to allow closure of the CTA to private vehicle access and provide the curb front function at a location well-removed from the main terminal area to enhance security within the CTA. The GTC, in conjunction with the Intermodal Transit Center (ITC) and other parking facilities proposed as part of the LAX Master Plan, also provided replacement parking for the existing parking that would be eliminated under the LAX Master Plan, such as in the CTA and Parking Lots C and D.

As discussed on page 2-8 of the SPAS Draft EIR, "The nine SPAS alternatives addressed within this Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives." The specific design, for the GTC, baggage tunnel and associated facilities are all considerations that will be determined and addressed at the project level, should Alternative 3 be approved. It is appropriate

for a first-tier, program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.). Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

The commentor provides no indication of what is meant by "In the original Alt D most of the GTC safety was based on non-existent (sic) technology…", consequently it is not possible to respond to that comment.

SPAS-PC00130-502

Comment:

The automated people mover is currently in Alt 9 as well as Alt 3 what are the differences? Where are the stations and related facilities & equipment going to be? How will the check in center for the new mid-field project effect the people mover?

Response:

The most notable difference between the APM system in Alternative 9 and the APM system in Alternative 3 is in the basic function of the APM, which translates into different designs for the APM system in the two alternatives. Under Alternative 3, the CTA would be closed to private vehicles and only FlyAway buses would have direct access to and from the CTA. As such, an extensive APM system is proposed under Alternative 3 to link the CTA with several new major transportation facilities where the vast majority of LAX passengers would be dropped-off, picked-up, or park. Under Alternative 9, the CTA remains open to private vehicles and a less extensive APM system, compared to Alternative 3, would be used to link the CTA with new transportation facilities designed to offer alternative access into the airport, reducing traffic within the CTA and encouraging use of public transit. The differences in the basic design of the APM system of the two alternatives are summarized below.

The APM system in Alternative 3, shown in Figure 2-3 on page 2-20 of the SPAS Draft EIR, consists of two separate APMs, one connecting the CTA to a CONRAC in the current Lot C area and to the ITC in Continental City, and the other connecting the CTA to the GTC in Manchester Square. The APM proposed for Alternative 9, as shown in Figure 2-9 on page 2-43 of the SPAS Draft EIR, is a single system connecting the parking and CONRAC at Manchester Square to the CTA, with a stop at the ITC and connectivity with the planned Metro Aviation/Century light rail station. The APM systems for both Alternative 3 and Alternative 9 extend into the CTA and will include multiple stations within the CTA for passengers to access the APM from different terminals. At the current program level of planning and evaluation, the exact number and locations of APM stations within the CTA have not yet been determined, but would be determined in conjunction with more detailed project planning in the future should Alternative 3 or 9 be selected for approval. This also applies to where and how passenger access would occur between the APM and the future Midfield Satellite Concourse passenger processor within the CTA, which has not yet been designed. Such is also the case relative to determining the specific alignment of the APM within the CTA, the system capacities during peak hours, and the APM system technologies to be utilized.

It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program, such as the APM and MSC Passenger Processor, to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

SPAS-PC00130-503

Comment:

Why is terminal 3 being demolished in all of the alternatives? What is the plan to deal with the black mold currently in terminal 3? Where will LAWA put the airlines currently using terminal while the terminal is out of commission? How long does LAX expect terminal 3 to be unusable? Will it take longer than the eight years that the TBIT is taking? What assumsions have been made regarding

terminal 3? Has the black mold progressed to the underground tunnel between terminal 3 and the Bradley?

Response:

As discussed in Section 2.3.1 under the section heading of "Terminal Improvements" on page 2-7 of the SPAS Draft EIR, under all of the alternatives except Alternative 4, a westerly realignment of the Terminal 3 concourse is proposed to provide a wider alleyway between the concourses at Terminals 2 and 3 for aircraft to taxi and operate. Please refer to the discussion of the assumed improvements to the Terminal 3 concourse in Section 2.3.1.1.2 on page 2-10 of the SPAS Draft EIR, and under the respective sections for the other alternatives within the section titled "Terminal Facilities."

As a program-level document, the SPAS Draft EIR does not include project-specific detailed information related to improvements of the Terminal 3 concourse, including airline assignment during construction, project duration, and other assumptions regarding Terminal 3. Such details would be evaluated in a project-level EIR for Terminal 3. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

Please refer to Response to Comment SPAS-PC00130-514 regarding allegations of "black mold" at Terminal 3.

It should be noted that the Bradley West Project has not been underway for 8 years. The NOP for the Bradley West EIR was published in December 2008 and the Final EIR was completed in September 2009. Construction began later that year, or approximately 3 years ago. Construction of the new concourses in the Bradley West Project is expected to be complete in 2013 and associated taxiway improvements, demolition of the old (existing) concourses, and relocation of existing gates to the east side of the new concourses are anticipated to occur by the end of 2015.

SPAS-PC00130-504

Comment:

What road improvements are associated with the development of the GTC and the APM? I haven't seen any list or chart detailing any of the improvements, why?

Response:

SPAS is designed to focus on potential alternatives to the Yellow Light Projects, which include on-site road improvements associated with development and construction of the GTC and APM. (See Section 2.3.1 of the SPAS Draft EIR.) Therefore, each alternative proposes different methods of fulfilling the goals of the Yellow Light Projects. Alternative 3 is the "no project" alternative and represents what would reasonably be expected to happen under the LAX Master Plan. Alternative 3 is the only alternative that includes both a GTC and APM, and the on-airport improvements associated with these faculties are discussed in Section 2.3.1.3 of the SPAS Draft EIR. The other alternatives provide for improvements that would serve as a replacement to the on-site road improvements associated with the development and construction of the GTC and APM. A discussion of the improvements associated with each alternative is provided in Section 2.3.1 of the SPAS Draft EIR.

As indicated in in Table 2-2, beginning on page 2-45, of the SPAS Draft EIR, only Alternative 3 includes a GTC and only Alternatives 3 and 9 include an APM. That table provides a summary of the SPAS alternatives and shows in matrix-format which elements are present in each alternative.

As stated on page 2-22 of the SPAS Draft EIR, two APMs would be constructed under Alternative 3, one "between the ITC and the GTC, along Aviation Boulevard and 96th Street, with a stop at the CONRAC" and another "between the GTC and the CTA, along Century Boulevard." Under Alternative 3, a new roadway system would be developed at the eastern end of the airport, and the existing access to the CTA via Sky Way and 96th Street would be removed. The new roadway system at the eastern end of the airport associated with the GTC, ITC, and parking facilities under Alternative 3 are depicted by purple lines in Figure 2-3 of the SPAS Draft EIR.

As stated on page 2-41 of the SPAS Draft EIR, the APM under Alternative 9 would be elevated and would operate "between Manchester Square and the CTA, primarily using the 98th Street corridor, including a bridge over Sepulveda Boulevard and stops at the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards and the new Intermodal Transportation Facility (ITF). Within the CTA, the APM would be located on an elevated guideway above the upper level roadway, existing parking structures, or Center Way." Improvements would be made to Sky Way under Alternative 9, as described on page 2-38.

As discussed on page 2-8 of the SPAS Draft EIR, "The nine SPAS alternatives addressed within this Draft EIR were formulated at a programmatic level of conceptual planning, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives." Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-PC00130-505

Comment:

Problems North Airfield assumptions
What parts of LAX meet FAA standards for ADG V and VI Aircraft without waivers? How does a centerline taxiway help with weather restrictions? If no centerline taxiway results in less incursions than why does the south airfield with a centerline have more incursions and larger rated than the north airfield?

Response:

LAX does not have an airfield, in either the north complex or the south complex, that is fully designed for the largest aircraft types currently in service (i.e., Aircraft Design Group (ADG) V and VI). Some taxiways or taxilanes, or a portion of a taxiway or taxilane, meet Federal Aviation Administration (FAA) standards for ADG V or VI aircraft. However, none of the runways at LAX are fully compliant with FAA standards, and Modifications of Standards (MOS) or waivers are in place.

The existing MOS or waivers applicable to the north airfield are described in the footnotes at the bottom of Table 4.7.2-8 of the SPAS Draft EIR.

There are numerous safety benefits of a centerline taxiway. For a detailed discussion of the safety and operational benefits of a centerline taxiway, please see Responses to Comments SPAS-PC00130-63, SPAS-PC00130-260, and SPAS-PC00135-2. While the addition of a centerline taxiway does promote safety, it does not necessarily help with weather restrictions. Instead, runway-to-taxiway and runway-to-runway separation requirements govern the types of aircraft that may operate on runways in good and poor weather. (See Table 4.7.2-8 of the SPAS Draft EIR.)

Please see Response to Comment SPAS-PC00130-160 regarding the reduction in incursions on the south airfield following the completion of the South Airfield Improvement Project. The commentor does not provide any evidence in support of the conclusion that the south airfield has more incursions. Moreover, as described in the EIR, the addition of taxiways to the north airfield would improve its ability to accommodate large aircraft and reduce risk levels. (See Section 4.7.2 of the SPAS Draft EIR.) Please also see Response to Comment SPAS-PC00130-260 for a discussion of the decrease in runway incursions on the south complex due to the addition of a centerfield taxiway.

SPAS-PC00130-506

Comment:

The Nasa-Aims safety report says that the runways as operational now are safe and the operation restrictions would be satistically insignificant. So why would LAWA want to risk 50 billion for little benefit? We've been told by experts that repairing of taxiways would improve operations as much as 20% and still be under 1 billion in expenses why is there no chart showing those improvements?

Response:

Please refer to Response to Comment SPAS-PC00130-168 regarding the North Airfield Safety Study and the opinion of the academic panel. The comment does not raise any environmental issue or address the adequacy of the environmental analysis included in the SPAS Draft EIR. Rather, it raises funding and economic questions, which need not be discussed because economic effects of a project shall not be treated as significant effects on the environment. (State CEQA Guidelines Section 15131(a).) Because a lead agency need only respond to comments that raise significant environmental issues, no further response is required. (State CEQA Guidelines Section 15204.) In any event, the commentor provides no substantial evidence in support of its assertions regarding cost, in particular the reference to risking $50 billion. Chapter 8 of the Preliminary LAX SPAS Report provides a financial analysis of the SPAS alternatives including cost estimates for each alternative. As summarized in Table 8-2 of that report, the cost estimates for the SPAS alternatives range from $1.66 billion for Alternative 4 up to $16.8 billion for Alternative 3. The commentor provides no identification of, or supporting analysis and facts from, the "experts" that indicated repairing of taxiways would improve operations by as much as 20 percent and be under one billion dollars.

SPAS-PC00130-507

Comment:

If the GTC is not being built replacement parking is an unnecessary expense, who pays to rebuild parking?

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-325 regarding parking demand. LAWA would pay for parking facilities associated with the SPAS alternatives.

SPAS-PC00130-508

Comment:

Where is the SPAS document written by Cindy Missokski? Please repeat this document.

Response:

It is unclear what document is being referenced in this comment. Former Councilwoman Cindy Miscikowski was involved in the approvals for the LAX Master Plan and, in coordination with Mayor Hahn and others, developed the "Consensus Plan," which essentially constituted revisions to the LAX Specific Plan and LAX Plan to add a greater emphasis on regionalism; greater monitoring and oversight in regards to project implementation and traffic and passenger activity; provisions concerning stakeholder participation and annual reporting; and requirements pertaining to SPAS. The "Consensus Plan" was not a set of physical improvements; rather, it was a set of policies and requirements that were incorporated into the LAX Plan and LAX Specific Plan, both of which were adopted by the City Council in December 2004. The LAX Plan and the LAX Specific Plan are available at www.ourlax.org.

SPAS-PC00130-509

Comment:

To what extent would Lincoln blvd. need to be moved, changed, and/or closed? What else would need to change? Who would do the work on Lincoln Blvd? Would the sewer be moved while the street was closed? Would Sepulveda Blvd have to be closed while the sewer is being moved?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-510

Comment:

You mention covering part of the Argo flood channel, how much of the channel are you covering? If it floods who is responsible for damages?

Response:

As noted on pages 2-10 and 2-29 of the SPAS Draft EIR, under Alternatives 1 and 5, the entire length (9,857 linear feet) of the Argo Drainage Channel would be covered. As noted on page 2-33 of the SPAS Draft EIR, under Alternative 6, 1,400 linear feet of the channel would be covered.

Issues regarding liability for damage associated with events at the airport, including flooding, are not germane to environmental issues and are beyond the scope of the SPAS Draft EIR. The comments are noted, are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-511

Comment:

By extending 1,200 eastward 6R/24L how would this balance large aircraft to the south airfield? Heavier aircraft are usually loaded with cargo and the cargo is located on the south would it increase taxi time and be an air pollution problem?

Response:

As discussed on page 5-80 in Section 5.5 of the Preliminary LAX SPAS Report, some long-haul passenger airline departures at Maximum Gross Take-off Weight (MGTOW) must bypass the north airfield in order to use the longer runway length available on the south airfield. The objective of balancing north and south airfield departures is related to eliminating instances in which aircraft defer to the south airfield, not displacing operations, which under normal operating conditions, would typically depart from the south airfield. As such, balancing of the airfield would likely result in a decrease in taxiing emissions due to smaller taxi distances to the departure runway. These factors were considered in the air quality impact analysis presented in Section 4.2 of the SPAS Draft EIR.

SPAS-PC00130-512

Comment:

RSA's 2-7
Any runway movement north will distrub the Westchester business district. How does LAX plan on compensating the business community? How does the airport plan on compensating the community for the jobs and the ability to have another business community? Will LAX give away land and new buildings to those businesses that will be displaced? Will they pay for moving

Response:

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester Business District, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

Regarding disruption of the Westchester Business District, it is not proposed or certain that such business would be displaced due to changes in RPZs. As discussed in Section 4.7.2.6.1 of the SPAS Draft EIR, there are various potential options for dealing with incompatible structures or land uses within

an RPZ including: (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

CEQA does not require job losses and other purely social or economic impacts to be analyzed in an EIR (State CEQA Guidelines Sections 15064(e) and 15131(a)). Nevertheless, in the event it is determined in the future that relocation of an existing business is necessary, impacts associated with acquisition of the property and relocation of the business would be addressed in future project-specific CEQA documents, and by LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measure MM-RBR-1.

SPAS-PC00130-513

Comment:

Separation of Taxiway and runway 2-7
Why doesn't LAX extend the taxiway into park 1 so that the taxiway so it could handle the NLA's? Your document states an intent to fix the taxiway in all alternatives and therefore there is no need to move the runway. Why does LAX insist on both?

Response:

As described and depicted in Section 2.3.1 of the SPAS Draft EIR, Alternatives 1, 2, 5, 6, and 7 include extensions for Taxiways D and E to the east to accompany the extension to Runway 24L. Among other things, these taxiways provide sufficient areas at the ends of the runways for holding arriving flights and sequencing departing aircraft. Alternative 5 will be designed to full Aircraft Design Group VI standards to handle New Large Aircraft (NLA). It should be noted that Alternatives 1, 2, 5, 6, and 7 do include extending the airfield operations area eastward into the existing Park One parking lot, through the proposed development of Terminal/Concourse 0. The alignments of Taxiways D and E lie north of Park One; hence, the eastward extension of those taxiways would not include Park One. Moreover, the lengthening of those taxiways is not what is needed for accommodating NLA, but rather it is the lateral separation between those taxiways and Runway 6R/24L that is the primary consideration relative to NLA.

Page 2-2 of the SPAS Draft EIR provides that the outdated airfield design creates a situation where aircraft are at increased risk of hazards. Those hazards include potential collisions with other aircraft and insufficient side-by-side passing clearances between certain types of aircraft arriving/departing on runways. As evidenced by Alternative 2, which proposes taxiway improvements but not runway relocation, the future, unrestricted operation of ADG V and VI aircraft is dependent upon runway relocation. (See Section 2.3.1.2 of the SPAS Draft EIR.)

Since the existing separation between the two northern runways is only 700', either runway must be shifted at least 100' to provide sufficient space for the installation of a centerline taxiway. Separation beyond the 100' would provide further standardization of operations for certain aircraft. Please see Responses to Comments SPAS-PC00130-63, SPAS-PC00130-260, and SPAS-PC00135-2 regarding the safety and operational benefits of a centerfield taxiway.

SPAS-PC00130-514

Comment:

Terminal improvements 2-7

Moving terminal 3 would result in LAX dealing with the black mold issue, How does LAX plan on dealing with the mold? Wouldn't moving T-3 cause building over the passenger underpass between T-BIT and T3? What improvements would be made to ensure the safety of pedestrians?

Response:

LAWA is not aware of "black mold issue" at Terminal 3, and the comment does not provide any evidence to support the implication that such an issue exists. In the event that mold or other contaminants are encountered during demolition of Terminal 3, or any other facility at LAX, and are determined to pose a potential health risk to those nearby, including workers and the general public, appropriate protective and materials management measures would be implemented in accordance with applicable federal, state, and local health and safety requirements.

The commentor inquires about the passenger underpass between TBIT and Terminal 3 as it relates to "moving" Terminal 3 and the safety of pedestrians. Please refer to a discussion of the improvements to Terminal 3 concourse discussed under Alternative 1 in Section 2.3.1.1.2 on page 2-10 of the SPAS Draft EIR, and under the other SPAS alternatives in their respective sections under the section heading of "Terminal Facilities." The team of architects and engineers assigned to the Terminal 3 improvements would ensure that improvements to Terminal 3 would not challenge the structural integrity of the underpass between Terminal 3 and TBIT, or any facilities located in the proximity of Terminal 3, and therefore would not create a risk to pedestrians. Any SPAS-related construction project that affects the normal operation of ground transportation would be subject to LAX Master Plan Commitment ST-18, which requires preparation of a Construction Traffic Management Plan (CTMP). Under the CTMP, project construction may be limited to certain times; message signs, arrow boards, temporary striping and other pedestrian construction advisory signs would be deployed; and pedestrian activity could be rerouted. (See page 4-1165 of the SPAS Draft EIR.) During construction, all standards of safety to pedestrians using facilities around Terminal 3 would be upheld.

SPAS-PC00130-515

Comment:

Where does LAX plan on eliminating gates so that terminal O and the mid field terminal don't excede the gate limit?

Response:

Please refer to Response to Comment SPAS-PC00130-188 regarding a discussion of the assumed passenger gate position layouts and gate counts in 2025.

SPAS-PC00130-516

Comment:

We were told during Spas meetings that underground access to a mid field terminal would not be possible because of underground issues or above ground because of the inability to predict the size of future planes. How does LAX plan on accessing the mid field? Are they going to do buses? If so why not just keep the remote gates? How much would a mid field terminal cost? What changes to an airport road are you planning? What specific transportation facilities are you planning? What changes to parking locations?

Response:

The Midfield Satellite Concourse is not a component of SPAS; rather, this project was approved as part of the LAX Master Plan and is currently undergoing preliminary engineering design and analysis. The MSC, including the concourse and gates, associated taxiways, and passenger processing facilities, will be subject to a project-level EIR when the project is proposed for implementation. As part of the design process, the means of accessing the MSC from the CTA will be determined. In the LAX Master Plan, an underground APM was assumed. In characterizing the conveyance as part of the analysis of cumulative impacts for SPAS, it was assumed that passengers would access the MSC via buses.

Please see Response to Comment SPAS-PC00130-409 regarding removal of remote gates with implementation of the SPAS alternatives. Changes to on-airport roadways within the CTA associated with implementation of the MSC passenger processor are described in Section 4.12.1.6.2 of the SPAS Draft EIR. As indicated in that discussion, these improvements are independent of SPAS, but were assumed to be in place and operational relative to the EIR analyses of future conditions in 2025. The costs associated with the MSC will be determined in the detailed planning being undertaken for that project. The costs of this facility are not germane to the analysis of environmental impacts associated with SPAS. Transportation facilities, including any changes in parking and airport roads, planned under the SPAS alternatives are described in Chapter 2 of the SPAS Draft EIR.

SPAS-PC00130-517

Comment:

How much money does the airport have put aside for the CONRAC? Where is the escrow account? Who is in charge of it? Why are they waiting to build it?

Response:

Questions pertaining to financing associated with the CONRAC and the CFCs being collected for the CONRAC are beyond the scope of the SPAS Draft EIR. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic considerations in an EIR. Please see Response to Comment SPAS-PC00130-443 regarding the independent planning and consideration of a CONRAC at LAX by LAWA, and the relationship of that planning effort to SPAS.

SPAS-PC00130-518

Comment:

Overview 2-8
Alternatives 1-4 are "fully integrated" according to LAX plan, what does that mean? Does it mean we could build Alt 3 with Alt 4 and alt 9? Does that mean that all the studies done so far aren't completely accurate? Why would you build more than one alternative? What about 'non-Spas" projects? Doesn't building more than one project impact the environment impacts? How does it change air quality, solid waste, and traffic? Will you build an APM and a bus way?

Response:

Please see Response to Comment SPAS-PC00130-444 for an explanation of the term "fully integrated." As described on page 1-17 of the SPAS Draft EIR, Alternatives 3 and 4 are unique fully-integrated alternatives and are not considered to have elements that are "interchangeable" with the other SPAS alternatives. Therefore, Alternatives 3 and 4 would not be combined with Alternative 9. The fact that there is interchangeability between the components of Alternatives 1, 2, and 5 through 9 does not mean that the studies completed as part of the SPAS Draft EIR are not accurate. LAWA would not build more than one alternative although, as indicated on pages 1-17 and 1-18 of the SPAS Draft EIR, among Alternatives 1, 2, and 5 through 9, the airfield and terminal components of one alternative could be combined with the ground access components of another alternative. Therefore, LAWA would not build both a dedicated busway and a separate APM. The SPAS Draft EIR discloses the environmental impacts that would result from combining the airfield and terminal components of one alternative with the ground access components of another alternative. Non-SPAS projects are considered in the cumulative impacts analysis; see Section 5.3 of the SPAS Draft EIR.

SPAS-PC00130-519

Comment:

Alternative 1 2.3.1.1
What do you mean by fully integrated? All alternatives have airfield, terminal and ground access components. Are you adding more than one alternative at a time? There is no order in which improvements is listed why?

How long are you expecting the north airfield to be closed while these components are being built? Why aren't those disruptions included in the LAX costing?

Response:

Please see Response to Comment SPAS-PC00130-444 for an explanation of the term "fully integrated." As explained in that response, only Alternatives 1 through 4 have airfield, terminal, and ground access components. LAWA would implement only one set of improvements as part of SPAS. As indicated in Response to Comment SPAS-PC00130-444, there is interchangeability among Alternatives 1, 2, 5, 6, 7, 8, and 9, in which the airfield/terminal components from one alternative could be paired with the ground access components of another alternative. The improvements are generally listed in order of airfield components, terminal components, and ground access components. The SPAS Draft EIR is a programmatic document. Details regarding construction phasing would be determined during project-level planning for the north airfield.

SPAS-PC00130-520

Comment:

We've been told in many meetings that no land acquisitions will be necessary in order to build this alternative explain how this is possible? Why this plan hasn't included a consolidated car rental?

Response:

Please see Response to Comment SPAS-PC00130-287 regarding property acquisition associated with the SPAS alternatives and Response to Comment SPAS-AL00007-26 regarding the potential for acquisition of land uses within the RPZ. Alternative 1 does not include a CONRAC. A CONRAC is included in Alternatives 3, 4, 8, and 9.

As provided in Section 1.2.2 of the SPAS Draft EIR, ground access improvements consist of changes to on-airport and off-airport roads, the addition of specific transportation facilities, development of dedicated access, and changes in parking. While SPAS focused on alternatives to the Yellow Light Projects, the ground access improvements also considered non-Yellow Light Projects, such as the CONRAC. The SPAS alternatives propose ground access improvements that represent different combinations of options to the Yellow Light Projects. Because of the integral nature of these non-Yellow Light Projects, the SPAS alternatives include proposed modifications to, or proposed deletion of, these non-Yellow Light Projects. (See Section 1.2.2. of the SPAS Draft EIR.)

SPAS-PC00130-521

Comment:

How potential gates on the northside of tBIT won't interfer with the gates on the western side of terminal 3?

Response:

The commentor is inquiring about potential interferences between gates on the northside of Tom Bradley International Terminal (TBIT) and the western side of Terminal 3 Concourse. The comment was made following comments on Section 2.3.1.1 of the SPAS Draft EIR, which discusses Alternative 1.

Please see Figure B in Appendix F-1 of the Preliminary LAX SPAS Report which depicts the gate layout assumed under Alternative 1. Although the aircraft depicted in Figure B are shown for illustrative purposes only, these aircraft have been arranged with the appropriate safety areas around each of them and provide a good illustration of the area available within the alleys in between concourses. The depicted aircraft represent the largest aircraft that could be accommodated at each gate. Similarly to the alley between the Terminals 2 and 3 Concourses, operations in the alley between TBIT and Terminal 3 Concourse would be coordinated among LAWA and the operators, holding operations while aircraft taxi in or out of gates on the other side of the alley.

SPAS-PC00130-522

Comment:

Who will be responsible for the relocation of Lincoln blvd. What plans had the airport made for the utilities under Lincoln blvd? Why weren't those cost included in the project?

What portion of Lincoln Blvd would be below ground? Why hasn't there been any mention of sewers in that area?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-523

Comment:

What improvements to Taxilane D are being proposed? Why is that an improvement? How much will that cost?

Response:

The taxiway improvements generated for the SPAS alternatives provide a range of operational capability and impacts to the airfield. The specifics regarding the taxiway improvements included in each alternative are also included in Sections 2.3.1.1 through 2.3.1.7 of the SPAS Draft EIR. Each section contains a subtopic titled 'Taxiway Modifications' which describes the specific details of the taxiway improvements. Table 4.7.2-8 of the SPAS Draft EIR provides a comparison of the benefits of Taxiway E and Taxilane D improvements in tabular format.

Cost or other financial considerations are not topics requiring analysis in an EIR. (State CEQA Guidelines Section 15131.) Nevertheless, please see Chapter 8 of the Preliminary LAX SPAS Report regarding financial information related to the development of the SPAS alternatives.

SPAS-PC00130-524

Comment:

What improvements to Taxiway E are being proposed? Why is that an improvement? How much will that cost?

Response:

The content of the comment is similar to comment SPAS-PC00130-523; please refer to Response to Comment SPAS-PC00130-523.

SPAS-PC00130-525

Comment:

What is the difference between a Taxilane and a Taxiway? Where is the current service road? Why do you want to relocate it?

Response:

Per Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, a taxiway is 'a defined path for the taxiing of aircraft from one part of an airport to another.' A taxilane is 'designed for low speed and precise taxiing. Taxilanes are usually, but not always, located outside the

movement area, providing access from taxiways to aircraft parking positions and other terminal areas.' Taxiways and taxilanes have different dimensional criteria as well.

The service road for the existing airport is located between Taxiway E and Taxilane D. Relocation of the service road from its existing location would reduce the amount of vehicular traffic that is required to enter the movement area. It would also reduce the separation required between Taxiway E and Taxilane D, minimizing the impact to the gates/concourses at Terminals 1, 2, and 3.

SPAS-PC00130-526

Comment:

Why are you calling the proposed new terminal zero? It sounds as if you are anticipating failure.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

LAX terminals are named in numerical order around the Central Terminal Area (CTA) starting with Terminal 1 through Terminal 8. For planning purposes, and because Terminal 0 (zero) would be located east of the existing Terminal 1, the new terminal was named Terminal "Zero." No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-527

Comment:

What modifications of Sky Way are you proposing? Why have you connected Alt 8 & 9 with this proposal? If Manchester Square is future parking where are you planning on the CONRAC? Why would bus/shuttle require and ITF? Why not have stops at CONRAC, Crenshaw station, lot 3, and each of the terminals?

Response:

As indicated in Section 2.3 of the SPAS Draft EIR, Sky Way would be relocated easterly for all alternatives that propose the addition of Terminal 0. Specifically, Sky Way (upper and lower level roadways) would be shifted eastward between the future Terminal 0 and Sepulveda Boulevard to provide additional roadway and curbfront in the CTA, while allowing the development of Terminal 0. (See Section 2.3.1.1.3 of the SPAS Draft EIR.) Alternatives that propose the addition of Terminal 0 include Alternatives 1, 2, 5, 6, and 7. The relocation of Sky Way is included with Alternatives 8 and 9 because, as described on page 2-8 in Section 2.3, the ground transportation systems under Alternatives 8 and 9 would be paired with the airfield and terminal improvements of either Alternative 1, 2, 5, 6, or 7.

As indicated in Section 2.3 of the SPAS Draft EIR, a CONRAC is proposed at Lot C under Alternatives 3 and 4, and at Manchester Square under Alternatives 8 and 9. Alternative 1 does not include the construction of a CONRAC.

As indicated in Section 2.3 of the SPAS Draft EIR, the ITF proposed under Alternatives 1, 2, 8, and 9 would provide public parking and remote passenger pick up/drop off, and arriving passengers could travel to the ITF to board door-to-door shuttles or scheduled buses. The elevated busway proposed under Alternatives 1, 2, and 8 and the APM proposed under Alternative 9 would provide a dedicated access corridor connecting the ITF to the CTA. The elevated busway would include connections to the future Metro Crenshaw/LAX Transit Station and to the CONRAC proposed under Alternative 8, and that would also be the case for the APM proposed under Alternative 9. As provided above, Alternative 1 does not include a CONRAC. LAWA does not know what "lot 3" the commentor is referring to. The shuttle buses operating via the elevated busway between the CTA and the ITF under Alternatives 1, 2, and 8 would be able to make stops at each terminal once in mixed-flow traffic within the CTA. The APM

under Alternative 9 has been developed at a program level of planning for SPAS. The final APM system, including the number and placement of stations within the CTA, has not yet been defined. The SPAS Draft EIR is a programmatic document, and no design or engineering plans, or construction phasing plans or schedules, are available for any of the alternatives. However, there are no plans to include APM stations at every terminal.

SPAS-PC00130-528

Comment:

2.3.1.1.1 Airfield
This airfield design could put airplanes closer together by having a plane on the centerline taxiway, Why do you consider this safer than the current set up?

Response:

This comment raises questions similar to those brought up in comment SPAS-PC00130-402 and comment SPAS-PC00130-431; please see Response to Comment SPAS-PC00130-402 and Response to Comment SPAS-PC00130-431.

SPAS-PC00130-529

Comment:

Runway Modifications
What order would these modifications be done? How long would the north airfield be closed for the manchester tunnel? How long for the removal of the 100 year old hot oil pipe? How long will it take to remove the fuel station? Where will you park VIP (ie. the president) planes with the new set up?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding construction plans and phasing of project improvements. As noted in that response, construction plans have not yet been developed for the SPAS alternatives, therefore, information regarding necessary runway closures has not been determined. Please see Topical Response TR-SPAS-LR-1 regarding oil pipelines in the vicinity of LAX and Response to Comment SPAS-PC00130-551 regarding VIP planes.

SPAS-PC00130-530

Comment:

What is the difference between this alternative and the 300 alternative in the notice of preparation? by widening the runway to 200 feet you're moving 310' north? Or are you clipping off the extra 50' from the centerline taxiway? Will this impact the covered well?

Response:

The major difference between the 300-foot-north alternative included in the 2010 Notice of Preparation and SPAS Alternative 1 is a 40-foot reduction in the northerly relocation of Runway 6L/24R under Alternative 1 (i.e., Alternative 1 would shift the runway only 260 feet northward), along with different runway-taxiway separations between Runways 6L/24R, 6R/24L, and the centerfield taxiway. Section 5.7.2 of the Preliminary LAX SPAS Report notes that the 300-foot-north alternative included in the 2010 SPAS Notice of Preparation was refined to become the 260-foot-north alternative (i.e., SPAS Alternative 1) in the SPAS Draft EIR. For more information on SPAS Alternative 1, please see Section 2.3.1.1 of the SPAS Draft EIR.

Please refer to Response to Comment SPAS-PC00130-536 regarding the relocation of Runway 6L/24R and the fact that the SPAS Draft EIR calculates movement of runways in terms of the distance the centerline changes from its existing position. Although it is unclear what the commentor means by "clipping off the extra 50 feet from the centerline taxiway", the commentor may have been referring to the fact that, in addition to its northerly relocation, Runway 6L/24R would also be widened by 50 feet

under SPAS Alternative 1 (for a total width of 200 feet compared to its existing width of 150 feet). This would result in 25 feet of additional pavement to the north of the centerline and 25 feet of additional pavement to the south of the centerline. With this widening, under Alternative 1, the proposed centerline of Runway 6L/24R would be relocated 260 feet northward, with 100 feet of pavement of each side of the centerline, for a total width of 200 feet.

The commentor has not provided enough information for LAWA to adequately respond to the commentor's question regarding the "covered well."

SPAS-PC00130-531

Comment:

What is the source of water in the Manchester tunnel?

Response:

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester Tunnel).

SPAS-PC00130-532

Comment:

Runway 6R/24L
Your people keep saying that this alternative wouldn't require land purchase, however by extending eastward haven't you've placed some of the hotels into the RPZ? If so which ones? Do you own any of these adjacent Hotels already?

Response:

Section 4.7.2 of the SPAS Draft EIR addresses changes in the RPZ area associated with each SPAS alternative and includes for each alternative a figure showing the limits RPZ area. As indicated therein, the easterly extension of Runway 6R/24L by 1,250 feet under Alternatives 1, 2, 5, 6, and 7 would shift the existing RPZ eastward; however, the only parcels affected would be the northern edge or two (surface) parking lots located on the south side of West 96th Street east of Sepulveda Boulevard. Surface parking is generally considered to be a compatible uses within an RPZ. Under Alternative 3, Runway 6R/24L would be extended eastward by 1,280 feet and shifted southward by 340 feet. The relocated RPZ would extend over the aforementioned surface parking and would also extend over several single story structures that include a trade school and vehicle maintenance garages. As described in Section 4.7.2, should a SPAS alternative be selected for implementation, potential options for addressing any incompatible structures or uses within an RPZ would be assessed and determined in consultation with the FAA at more detailed levels of planning.

No hotels would be located within the RPZs for the north airfield under any alternative.

SPAS-PC00130-533

Comment:

What does RSA stand for? Explain what the difference is between runway length and displaced threshold?

Response:

As indicated throughout the SPAS Draft EIR, including Chapter 10, Acronyms, RSA stands for Runway Safety Area. As indicated on page 1-14 of the SPAS Draft EIR, a displaced threshold is a threshold that is located on a point on the runway other that the designated beginning of the runway to satisfy approach surface criteria and/or RSA length requirements. In other words, a displaced threshold shifts the beginning of that portion of the runway available for landing to a point on the runway beyond the beginning of the runway. "Threshold" always refers to landing, not the start of takeoff.

SPAS-PC00130-534

Comment:

What is grade compliance? Do you have topigrafical maps showing grades on the airport? Which way would excess flood water go?

Response:

FAA Advisory Circular (AC) 150/5300-13A, Airport Design, delineates longitudinal gradient standards for the centerline of runways, which must be met by airports to achieve grade compliance. These standards include the maximum longitudinal grade, vertical curve length, and minimum allowable distance between changes in grade. In conjunction with the easterly extension of Runway 6R/24L associated with Alternatives 1, 2, 5, and 6, the eastern 2,000 feet of the runway would require reconstruction in order to meet these standards. For further information on longitudinal grade limitations, as well as a graphical depiction, please refer to Figure 3-22 of AC 150/5300-13A.1 LAWA has topographical maps that depict gradients on the airport. Topographical gradients are depicted on the current Airport Layout Plan, which are available for review by contacting LAWA's Department of Community Relations. An illustration of regional drainage flows is provided in Figure 1 of Appendix H of the SPAS Draft EIR.

1. U.S. Department of Transportation, Federal Aviation Administration, Advisory Circular 150/5300-13A, Airport Design, September 29, 1989, as amended, September 28, 2012.

SPAS-PC00130-535

Comment:

Taxiway Modifications 2-9
Centerfield
These numbers are different than the ones in the previous explanation which numbers are correct?

Response:

The separations and width provided in Section 2.3.1.1.1 on page 2-9 in the SPAS Draft EIR are correct. The comment does not cite any specific previous descriptions alleged to be inconsistent. After careful review of the SPAS Draft EIR, no inconsistencies with previous descriptions of the Alternative 1 centerfield taxiway were found.

SPAS-PC00130-536

Comment:

According to these numbers you would be moving north 292' not 260' and that doesn't include the extra 50' width of the new runway. Explain why?

Response:

Section 2.3.1.1 of the SPAS Draft EIR discusses, in detail, the modifications and improvements proposed under Alternative 1, including the relocation and widening of Runway 6L/24R. The environmental impacts of these improvements are analyzed throughout the SPAS Draft EIR. All distances listed within the SPAS Draft EIR specifying the relocation of runways or taxiways refer to the distance between the centerlines. Taxiway or runway width does not have an effect on these measurements.

The commentor incorrectly asserts that Runway 6L/24R would be moved 292 feet northward. As discussed in the SPAS Draft EIR, Alternative 1 would entail a northbound shift of the centerline of Runway 6L/24R. (See page 1-89 of the SPAS Draft EIR.) FAA Advisory Circular 150/5300-13 and revised FAA Advisory Circular 150/5300-13A measures runway-to-runway and runway-to-taxiway

separation by centerline distance. The SPAS Draft EIR calculates movement of runways in terms of the distance the centerline changes from its existing position. Therefore, as described in Section 2.3.1.1 of the SPAS Draft EIR, the relocation of Runway 6L/24R under Alternative 1 would relocate the centerline of Runway 6L/24R 260 feet north.

SPAS-PC00130-537

Comment:

What do these inconsistent plans do to the studies for water, traffic, pollution etc? Does it completely nullify everything? How does this change noise contures? What does this do to the realignment of Lincoln Blvd? Does it increase the amount of sewer replacement? If so how much?

Response:

As stated in Responses to Comments SPAS-PC00130-535 and SPAS-PC00130-536, the description of Alternative 1 provided in the SPAS Draft EIR is correct and no inconsistencies with previous descriptions have been found. As a result, the environmental impact analyses provided in the SPAS Draft EIR, including studies related to water, traffic, and air quality, are accurate, as is the description of the Lincoln Boulevard realignment. Noise contours associated with Alternative 1 are provided in Figures 4.10.1-14 through 4.10.1-16 in Section 4.10.1 of the SPAS Draft EIR. Please see Topical Response TR-SPAS-LR-1 regarding the location of outfall sewers beneath the Lincoln Boulevard realignment area. As indicated in that discussion, no outfall sewers would be affected by the realignment.

SPAS-PC00130-538

Comment:

Taxiway E
Where is Taxiway E? How does extending this taxiway allow for planes to leave the terminals with greater speed? By holding more aircraft aren't you increasing the amount of pollution? More idling time?

Response:

As discussed on page 2-2 in Section 2.2 of the SPAS Draft EIR, the north airfield does not provide sufficient areas at the end of the runways to accommodate or move both aircraft that have just arrived and aircraft that are ready to depart. As such, there are times when aircraft queuing to depart Runway 24L on Taxiway E interfere with arriving aircraft taxiing to, as well as departing aircraft exiting from, parking positions at Terminals 1, 2, and 3. Extension of Taxiway E would relocate the departure queue for Runway 24L departures further to the east and allow arriving and departing aircraft easier access to the north terminals. Additionally, the extension of Taxiway E allows for better sequencing of departing flights, reducing the amount of holding time that some departures incur. This thereby would reduce idling time for some arriving and departing aircraft and consequently would result in a decrease in emissions for these aircraft. These factors were considered in the air quality impact analysis presented in Section 4.2 of the SPAS Draft EIR.

SPAS-PC00130-539

Comment:

Covering of the Argo flood Channel 2-10
What kind of covering are you planning on using to cover the flood channel? By covering the unlined flood channel to a concrete box culvert where will you be directing the flood water? What is the topigrapical layout of the north airfield? If water over runs the flood channel where would the excess go? Would it flood towards the other runway? Would it flood towards the business center? Would it flood the dunes? How is this process insured?

Response:

If Alternatives 1, 5, or 6 were selected, the existing, open Argo Drainage Channel would be replaced by a below grade, rectangular concrete box culvert with concrete floor, walls, and roof. This is a common flood control conveyance structure for large watersheds in urban areas. After construction of the box culvert, Argo Drainage Channel would continue to function as it does currently. Specifically, the culvert would connect to a similar existing box culvert near the west end of the airport property that is below Pershing Drive and discharges offshore into Santa Monica Bay through the Argo outfall. The drain would be designed to carry at least a 10-year storm event without overrunning the channel or causing flooding on the airport or offsite. Please see Response to Comment SPAS-PC00130-169 for additional detail regarding the design capacity of the Argo Drainage Channel with implementation of Alternatives 1, 5, and 6. If the capacity of the channel were exceeded, no impacts to the north terminals or to Westchester would result. Rather, the area upstream of the culvert inlet would be affected for a short time until water that had temporarily ponded upstream could be drained back into the channel once the peak of a large storm had passed.

Insurance associated with events at the airport is not germane to environmental issues and is beyond the scope of the SPAS Draft EIR. The comments are noted, are hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because these comments do not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-540

Comment:

Relocated Lincoln Blvd 2-10
Exactly how far north would lincoln Blvd be relocated? How far west would this run? What utilities, drainage pipes, electrical wires, and sewers are located currently beneath Lincoln Blvd? Where will they be relocated? How does LAWA planning on dealing with the capped wells in that area?

What agency will be responsible for the tunneling? What agency will be moving the sewer? How much time would moving of the sewer take? How long will Sepulveda and Lincoln be closed?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-541

Comment:

Does object free refer to the perimeter fence? If it doesn't how will LAWA secure the flight field?

Response:

As indicated in on page 4-491 in Section 4.7.2 of the Draft EIR, the Runway Object Free Area (OFA) is a two-dimensional ground clearance area surrounding the runway and extending beyond the runway end. Within the OFA, parked aircraft and natural or man-made objects are prohibited, except aviation/navigation objects that are fixed by their function. For airports serving the sizes and types of aircraft operating at LAX, the OFA extends 1,000 feet out from each end of the useable runway area and 400 feet out from the runway centerline (800 foot total width along the length of the runway).

Per Federal Aviation Administration (FAA) regulations, LAWA must provide safeguards to prevent inadvertent entry to the movement area by unauthorized persons or vehicles. This is accomplished through the use of a perimeter fence.

SPAS-PC00130-542

Comment:

Taxi Lane E and Taxi Lane D 2-10
By improving to full Taxi Lane size how much more operational efficiency are you expecting? How long will the runway 24L be out of commission during the building of the new taxilanes? Will both 24L & 24R both need to be closed? Are you looking at building the centerline at the same time?

Response:

The extension of Taxilanes D and E would provide additional holding area for departing aircraft. As discussed on page 4-513 of the SPAS Draft EIR, extension of the taxilanes under Alternative 1 in conjunction with the other north airfield improvements, including northward relocation of the runways and construction of a centerfield taxiway, would improve the ability of the north airfield to accommodate large aircraft and would meet FAA Airport Design Standards. (Also see page 4-521 of the SPAS Draft EIR.) Section 3 of Appendix F-2 of the Preliminary LAX SPAS Report provides a detailed discussion of the future operations of each alternative, including Alternative 1.

Due to the numerous SPAS alternatives, detailed construction phasing for Taxilane D, Taxiway E, Runway 24L extension, and the shift of Runway 24R has not been determined at this time. Once an alternative has been selected, detailed construction phasing for the selected alternative will be done in a way to minimize overall impacts to current airfield operations.

SPAS-PC00130-543

Comment:

Please explain ADG V standards and illustrate them.

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-490; please refer to Response to Comment SPAS-PC00130-490.

SPAS-PC00130-544

Comment:

What does APLL stand for? Why does the APLL need to move?

Response:

APLL stands for Aircraft Parking Limit Lines. Please refer to Section 1.2.2 of the SPAS Draft EIR for details on Aircraft Parking Limit Lines (APLL).

SPAS-PC00130-545

Comment:

2.3.1.1.2 Terminal Facilities 2-10
Please rename terminal 0 with the name terminal 1 annex or something updating the remaining part of terminal 1? If so what other modernizations of terminal 1 planned? Who pays for that?

Response:

Regarding the suggestion to rename Terminal 0, the comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Response to Comment SPAS-PC00130-526 regarding the Terminal 0 designation used for planning purposes.

Regarding Terminal 1 improvements assumed under the SPAS Draft EIR, please refer to Table 2-2 on page 2-45 in the SPAS Draft EIR for a comparison of the footprint of the Terminal 1 Concourse under each SPAS alternative. A discussion of improvements to the footprint of the Terminal 1 Concourse is provided for each alternative, starting with Alternative 1 in Section 2.3.1.1.2 on page 2-10 of the SPAS Draft EIR, and in the corresponding sections under the headings of "Terminal Facilities" for the remaining alternatives.

SPAS-PC00130-546

Comment:

Terminal 3 has a bad case of black mold. In demolishing of Terminal 3 how is LAWA planning on dealing with this issue? What can we expect for containment?

Response:

LAWA is not aware of "a bad case of black mold" at Terminal 3, and the comment does not present any facts or evidence that black mold exists at Terminal 3. In the event that mold or other contaminants are encountered during demolition of Terminal 3, or any other facility at LAX, and are determined to pose a potential health risk to those nearby, including workers and the general public appropriate protective and materials management measures would be implemented in accordance with applicable federal, state, and local health and safety requirements. See pages 4-596 and 4-597 of the SPAS Draft EIR.

SPAS-PC00130-547

Comment:

How is LAWA handling the issue of Terminal 3 being one of the major supports of the upper roadway? Will LAWA first do a complete rebuild of the upper roadway to make it a stand alone roadway? Is LAWA planning on leaving the roadway as a canalevered bridge? If so please explain why? Who will be paying for the tear down of terminal 3? What is the plan to accommodate the airlines currently using those gates? Will the demolishment of terminal 3 effect the new taxilane? Would the demolishment be done at the same time as the Tom Bradley north pavilion?

Response:

Please see Response to Comment SPAS-PC00130-411 regarding maintenance of the LAX second level roadway structures and bridges.

Contrary to the statement in the comment, the second level roadway is already a "stand-alone" roadway (to use the commentor's words) and Terminal 3 is not "one of the major supports of the upper roadway" and, in fact, does not structurally support the roadway at all. The second level roadway is not a cantilevered bridge, as stated by the commentor. It should be noted that the SPAS alternatives do not include a redesign of the second level roadway.

As discussed in Section 2.3.1 of the SPAS Draft EIR, under Alternatives 1, 2, 5, 6, and 7, the Terminal 3 concourse would be realigned to provide a wider alleyway between the concourses at Terminals 2 and 3 for aircraft taxiing. As a program-level document, the SPAS Draft EIR need not and does not include detailed information related to project-specific improvements, including engineering design and phasing plans. Such details would be evaluated in a project-level EIR for Terminal 3. A discussion of whether the demolition of Terminal 3 would affect the new taxiline or be done at the same time as the Tom Bradley North Pavilion is unwarranted at this time. An EIR's project description should not provide extensive detail beyond that needed for evaluation and review of a project's environmental impacts. (State CEQA Guidelines Section 15124.) Moreover, an EIR is required to provide only a "general description of the project's technical, economic, and environmental characteristics." (State CEQA Guidelines Section 15124.)

Please see Response to Comment SPAS-PC00096-2 regarding funding for improvements associated with the various alternatives.

SPAS-PC00130-548

Comment:

What are the exact FAA standards LAWA is trying to meet? How is LAWA dealing with the standards currently? Will the new area of the gates and/or taxilane be blind to the tower?

Response:

As discussed in Section 2.3.1.1.2 on page 2-10 of SPAS Draft EIR, Alternative 1 proposes to demolish and reconstruct the Terminal 3 concourse and associated gates while shifting the building centerline 40 feet to the west to increase the width of the alleyway between Terminals 2 and 3. This will bring the alleyway between Terminals 2 and 3 into compliance with FAA standards for taxilane to fixed or movable object (aircraft parking limit line) distances. LAX currently operates in this area with a distance less than specified by FAA standards.

Please see Response to Comment SPAS-PC00130-754 regarding tower line-of-sight.

SPAS-PC00130-549

Comment:

What does MSC stand for? What are the FAA ADG V standards? How is LAWA dealing with those standards currently? What commuter facility is currently in use east of Sepulveda Blvd?

Response:

As discussed on page 5-18 of the SPAS Draft EIR, MSC stands for Midfield Satellite Concourse. The MSC Program includes development, in separate and independent phases, of a new concourse west of the Bradley West Project, along with construction of a connection system for moving passengers, baggage, and materials between the Midfield Satellite Concourse (MSC), TBIT, and the Central Terminal Area (CTA). Completion of the MSC Program would also include development of a new passenger processor within the CTA, to include ticketing, baggage handling, security screening, etc., which would be constructed within the CTA east of Parking Structures 3 and 4. The existing two-directional arrival roadway of West Way is planned to be replaced with two southbound streets, one on each side of the processor, with one for public curbside use and the other for private vehicles (i.e., taxis, limousines, shuttles) only. The first phase of the MSC Program, the MSC North Concourse Facility, is estimated to be completed by 2019, and schedule for future phases, including new passenger processor, to be determined.

As discussed in Response to Comment SPAS-PC00130-490 above, the Federal Aviation Administration (FAA) created a classification of aircraft based on wingspan and tail height. Each aircraft is assigned a particular Aircraft Design Group (ADG). In addition, airfield standards such as separation between a runway and an adjacent taxiway, or between two taxiways, are also based on the types of aircraft that operate on an airfield and are therefore based on ADGs. The current airfield at LAX (runway and taxiway system) meets various ADG standards depending on various areas of the airfield. As discussed on page 2-2 in Chapter 2 of the SPAS Draft EIR, LAX does not have an airfield, in either the north complex or the south complex, that is fully designed for the largest aircraft types currently in service (ADG V and ADG VI). As such the current north airfield configuration requires non-standard operating procedures, which are not optimal for safety and increase traffic delay.

As described in Section 2.3.1.1.2 of the SPAS Draft EIR, the commuter facilities (both terminal and apron facilities) located east of Sepulveda Boulevard are currently maintained and operated by American Eagle (as of November 2012).

SPAS-PC00130-550

Comment:

Why isn't the commuter facility currently being maintained? What is it's use? Who uses it?

Response:

Section 2.3.1.1.2 of the SPAS Draft EIR refers to the commuter facilities (both terminal and apron facilities) located east of Sepulveda Boulevard that are currently maintained and operated by American Eagle (as of November 2012). Regional commuter flights operated by American Eagle, such as LAX to San Diego (SAN) or LAX to San Jose (SJC) are operated at these facilities. The SPAS Draft EIR assumes that these facilities would continue to be operated by commuter carriers in 2025.

SPAS-PC00130-551

Comment:

When the West remote gates are removed where will LAX park Vip planes? Where will LAX park the Air force 1? How will it be possible to maintain remote gates during construction of the new north airfield? Won't they be in the way?

Response:

Currently, VIP aircraft, such as Air Force One, are accommodated on remote parking aprons and are not serviced directly by the west remote gates.

As a program-level document, the SPAS Draft EIR does not specifically discuss VIP parking options. It is anticipated, however, that under all alternatives adequate space to accommodate future VIP aircraft would be available in the existing remote pad area and at other locations around the airport.

Please see Responses to Comments SPAS-PC00130-170 and SPAS-PC00130-409 regarding elimination of the west remote gates under the SPAS alternatives. As discussed therein, the west remote gates would be eliminated upon completion of the airfield and terminal improvements. The continued operation of the west remote gates during construction activities is therefore alternative dependent. Construction phasing will be developed after selection of an alternative by the Board of Airport Commissioners (BOAC).

SPAS-PC00130-552

Comment:

2.3.1.1.3 Ground Access Facilities 2-13
What CTA roadways would be improved in order to maintain private vehicle access to the CTA?

Response:

Please refer to Response to Comments SPAS-PC00130-492 for a description of the anticipated roadway improvements and mitigation measures that would be provided to maintain private vehicle access to the Central Terminal Area (CTA) such that traffic-related impacts on the CTA departures-level and arrivals-level curbsides would be less than significant following mitigation.

SPAS-PC00130-553

Comment:

Exactly where is LAWA planning on relocating Sky Way roadways? How much more curb space will exsist in front of terminal zero?

Response:

Figure 4.12.1-11 on page 4-1119 of the SPAS Draft EIR shows the proposed relocation of Sky Way (depicted as Link UW in the figure). The current location of Sky Way is depicted in Figure 4.12.1-6 on page 4-1069 of the SPAS Draft EIR. There will be approximately 500 feet of curb front along Terminal 0. However, Terminal 0 is functionally an extension of Terminal 1 that does not have external landside access to the CTA roadway system. As such, passenger ticketing and baggage claim functions for Terminal 0 passengers will be accommodated at the existing Terminal 1.

SPAS-PC00130-554

Comment:

Exactly where is the new commercial holding lot being relocated to? What is currently in that location?

Response:

As described on pages 2-55 and 4-1091 of the SPAS Draft EIR, and clarified in Chapter 5, Corrections and Additions Related to the SPAS Draft EIR, the existing taxi holding lot and the commercial vehicle holding lots for the shared-ride vans and charter buses/limousines would be relocated to the surface parking lot between Sepulveda Boulevard, relocated Sky Way, and Little Century Boulevard under Alternatives 1, 2, 8, and 9. This parking lot is currently within the eastern portion of the Park One public parking facility. Under Alternative 3, the commercial vehicle holding lot would be relocated to the Ground Transportation Center (GTC), while under Alternative 4, the taxi holding lot would likely move to Park One or Lot C and other commercial vehicle holding lots would remain in their current locations.

Please refer to Response to Comment SPAS-PC00130-802 for additional discussion related to the relocation of the taxi and commercial vehicle holding lots.

SPAS-PC00130-555

Comment:

What are the current FAA RSA and RPZ Standards? How is LAWA currently dealing with them?

Response:

Please see Paragraph 307 of Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, regarding FAA standards for the Runway Safety Area (RSA).

Please see Paragraph 310 of FAA AC 150/5300-13A, Airport Design, regarding FAA standards for the Runway Protection Zone (RPZ).

As discussed on Page 4-492 of Section 4.7.2 of the SPAS Draft EIR, a Runway Safety Area Study was completed for LAX by the FAA in 2006. RSA improvements for Runways 6L/24R and 6R/24L are being addressed as part of SPAS, as further discussed in Section 4.7.2 of the SPAS Draft EIR.. The improvements for Runway 7L/25R are scheduled to take place in 2013. Improvements for the north airfield runways were integrated into all of the SPAS build alternatives. The FAA has acknowledged that that implementation of solutions to RSA compliance may not be practicable by December 31, 2015 and is therefore coordinating with LAWA on the identification of potential interim solutions.

In regards to compliance with FAA standards related to the current RPZ, please see Page 4-497 and Figure 4.7.2-4 in Section 4.7.2 of the SPAS Draft EIR. That section of the SPAS Draft EIR also describes changes in the RPZ associated with each alternative.

SPAS-PC00130-556

Comment:

Please include a detailed map on the new ITF. Explain what is currently located in this area? How does LAWA expect this area to function? Why was this moved from Contintel City between 2 freeways and 2 trainlines to the community! [comentor's text cut off]

What roads would be involved?

Response:

The ITF proposed as a part of Alternatives 1, 2, 8, and 9 is depicted and described in Chapter 2 of the SPAS Draft EIR, and has been developed at a program level of planning and design. The design of the ITF will be determined and addressed at the project level, should one of those alternatives be approved, and will include detailed maps of the facility. The properties currently located in the area proposed for the ITF are illustrated in Figures 2-11 and 2-12 and listed in Table 2-4 (page 58) of the SPAS Draft EIR. The properties consist mostly of airport-related transportation uses, including parking and rental car facilities. A description of how the ITF would function is provided in Section 1.2 of Appendix E2-2 of the Preliminary LAX SPAS Report. The ITF was sited in the proposed location due to its proximity to the CTA and its location between the proposed ground access facilities in Manchester Square and the CTA. Land uses surrounding the proposed location of the ITF consist of commercial and industrial uses. There are no residences or community-serving uses located in proximity to the ITF.

It is unclear what commentor means by "what roads would be involved?" However, while there are no detailed plans for the ITF, Figures 2-1, 2-2, 2-8, and 2-9 provide a general description of the location of the proposed ITF. The specifics of the project would be determined if an alternative that includes the ITF is ultimately selected.

SPAS-PC00130-557

Comment:

Why is LAWA putting more parking in Manchester square? Won't building a consolidated Rent a car facility require most of the space?

Response:

As discussed in Section 2.3.1.1.3 of the SPAS Draft EIR, under Alternative 1, parking spaces would be added to Manchester Square. The additional parking spaces were proposed in conjunction with the dedicated busway between Manchester Square and the CTA, also proposed under Alternative 1. These improvements are designed to improve the ground access system at LAX. (See Section 2.2 of the SPAS Draft EIR.) Alternative 1 does not include a CONRAC.

In Alternatives 8 and 9, a CONRAC facility and a parking structure would be constructed at Manchester Square. (See Section 2.3.1.8 and 2.3.1.9 of the SPAS Draft EIR.) Alternative 8 also includes the development of a dedicated busway between Manchester Square and the CTA, while Alternative 9 proposes the construction of an automated people mover from Manchester Square to the CTA. Like the other alternatives, all the ground access improvements are designed to better accommodate airport-related traffic.

The SPAS Draft EIR is a programmatic document. There are currently no project-level design or engineering plans, nor are there plans for phasing construction. Thus, there are no plans delineating how much of the Manchester Square facility would be allocated for parking versus the CONRAC under Alternatives 8 or 9. If an alternative is selected, project-level environmental review would be conducted before implementation of any modifications and improvements.

SPAS-PC00130-558

Comment:

How many people are currently being serviced by the shuttle bus at the green line? Will LAWA pay transfer fees from green line to Crenshaw line? Why another bus? Why not have the train come all the way into the airport and skip bus way or apm?

Response:

In 2011, there was an average of approximately 3,900 riders per day on LAWA's shuttle from the Green Line station at Aviation Boulevard and Imperial Highway to the CTA.1 For purposes of the SPAS Draft EIR, the on-airport transportation analysis used a calibrated Trip Generation Model as discussed in Section 4.12.1.3.11 of the SPAS Draft EIR, to estimate the number of airport-related vehicles by classification based on airline passengers at the curbsides. The number of passengers assigned to any mode listed in Table 4.12.1-15 can be calculated by multiplying the passenger mode split percentage for either the departures or arrivals level curbside by the number of peak hour passengers at either the departures or arrivals level curbside provided in Table 4.12.1-14. Green Line shuttles are included within the LAX shuttle mode split percentage listed in Table 4.12.1-15. Based on the data from the 2006 LAX Air Passenger Survey, which was the most recent passenger survey available at the time of the analysis, passengers using the Green Line shuttle during the peak hours accounted for .07 percent of all peak hour passengers at the curbside. Therefore, it was estimated that approximately four (4,918 peak hour passengers x .0007) airline passengers departed the airport via the Green Line shuttle during the arrivals level peak hour, and during the departures level peak hour; approximately four (4,878 x .0007) airline passengers arrived at the airport via the Green Line shuttle. This does not include the transit passengers who use the transit station at Lot C along 98th Street, which are provided separately in Table 4.12.1-15. Additionally, the analysis recognizes that the majority of passengers using transit service to access the airport are airport employees. Since the peak passenger activity times do not typically coincide with employee shift changes, the numbers of employees using the Green Line shuttles during the departures or arrivals level peak hours were assumed to be minor.

The configuration of the future Green Line Aviation/Century station has not yet been defined. It is anticipated that passengers transferring between Metro's Green Line and LAX/Crenshaw lines to an airport conveyance system would be able to do so for free with a transfer. LAWA has no plans to pay for airport passengers to transfer from a LAWA bus (SPAS Alternatives 1, 2, 4, and 8) or Automated People Mover (SPAS Alternatives 3 and 9) to transfer to Metro service (bus or light rail).

As part of the SPAS process, and as described and depicted in Chapter 2 of the SPAS Draft EIR, LAWA is considering a variety of ground transportation alternatives to meet future ground transportation needs. These alternatives include bus options as well as APM options. Regarding the suggestion that the train should extend directly into the airport, please see Topical Response TR-SPAS-T-1 for a discussion of the Airport Metro Connector Project, which is examining ways to connect the regional rail system directly to LAX.

1. City of Los Angeles, Los Angeles World Airports, Daily Passenger Volumes from August 2009 Green Line - Aviation Station, August 27, 2011.

SPAS-PC00130-559

Comment:

Exactly where will the new metro station be built?

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including Metro's plans for a new transit station at Aviation and Century Boulevards.

SPAS-PC00130-560

Comment:

Parking 2-13
Explain how the exsisting structures in the CTA won't change? How is LAWA dealing with the water damage? Will LAWA be reconstructing the damaged passenger bridges?

Response:

Regarding the parking structures assumed in the SPAS Draft EIR, please refer to Response to Comment SPAS-PC00130-140.

The commentor inquires about "dealing with water damage" without providing specific details or evidence of the alleged existence or location of any water damage problem at LAX. In the event that water damage is encountered at LAX and is determined to pose a potential safety risk to those nearby, including workers and the general public, appropriate protective and construction management measures would be implemented in accordance with applicable federal, state, and local safety requirements.

The commentor also inquires about "reconstructing the damaged passenger bridges" without providing specific details or evidence of the existence or location of such damages. Please refer to Response to Comment SPAS-PC00130-411 regarding maintenance of the LAX roadway structures and bridges.

SPAS-PC00130-561

Comment:

What is meant by future pricing structures? How are you planning on which places would be long term or short term parking? Why isn't LAWA removing the employee parking in the CTA? Shouldn't parking be in the ITF?

Response:

"Future pricing structures" refers to the hourly and daily parking rates to be charged for the use of LAWA-owned public parking lots or structures. The rates typically vary by parking product and have a direct effect on where people chose to park.

Airline passengers will choose their parking location based on the price of the various options relative to their judgment of the value offered by that facility. For example, the Central Terminal Area (CTA) facilities are priced at a higher rate than the remote Economy Lot C. Most passengers staying for short-durations will park in the CTA. Passengers staying for longer durations and who are less concerned with cost (e.g., business travelers) may choose to park in the CTA, while others will park in the remote lots. For purposes of the SPAS Draft EIR, it is assumed that the distribution of short-duration and long-duration parking by location will continue to be similar to existing conditions (with the exception of SPAS Alternative 3). In general, short-term parking is expected to be provided in all the parking structures within the CTA and long-term parking is expected to be provided in the offsite facilities.

Table 2-2 on pages 2-45 through 2-48 of the SPAS Draft EIR includes a summary of the public and employee parking allocations under each SPAS alternative. As indicated in the table, 4,900 public parking spaces are planned within the ITF under Alternatives 1, 2, 8, and 9. Additional details regarding parking assumptions for each alternative are provided beginning on page 4-1091 in Section 4.12.1.6.1 of the SPAS Draft EIR.

SPAS-PC00130-562

Comment:

What does lawa mean by mixed-flow buses? How does that term differ from mixed-flow traffic?

Response:

The SPAS Draft EIR does not refer to "mixed-flow buses." Section 2.3.1.1.3 on page 2-13 of the SPAS Draft EIR describes a dedicated busway for exclusive use of the buses connecting the Central Terminal Area (CTA) to the offsite facilities. However, once these buses exit this dedicated busway and merge onto the CTA roadways or the off-airport city streets they will be "mixed" with other vehicles using the public roadways. The combination of the buses interacting with the traffic using the public roadway system is termed as "mixed-flow traffic."

SPAS-PC00130-563

Comment:

What are the future plans for parking lot E? Are traffic studies being done so accual counts of car trips are included? Where is parking lot D? Where is the Jenny lot?

Why aren't they included in the alternative map? How many trips will 3, 944 parking spots result in? Since the location is unknown what is LAWA planning on doing to help clear the air pollution associated with the parking? We recommend that the lot be ringed with smog helpful trees and at a minimum of 7,888 car trips we think at least 1,000 new trees.

Response:

Please see Response to Comment SPAS-PC00130-592 regarding LAWA's plans for their Lot E property. Parking Lot D is located north of LAX Lot C between Jenny Avenue to the east, Westchester Parkway to the south, and Will Rogers Street to the west. The Jenny Lot is located on the southwest corner of Jenny Avenue and Westchester Parkway. These lots are not included in the alternatives map because they are not new facilities proposed under SPAS. Commuter peak hour volumes accessing these lots under the various alternatives are shown in Table 4.12.2-10 on page 4-1212 of the SPAS Draft EIR.

Transportation-related mitigation measures that would apply to the SPAS alternatives are provided in LAX Master Plan Mitigation Measure MM-AQ-3 and listed in Table 4.2-9 of the SPAS Draft EIR. MM-AQ-3 focuses on expansion of the FlyAway system, and includes measures to encourage transit ridership and ridesharing, reduce traffic and parking congestion, and encourage the use of ultra low emission vehicles/super low emission vehicles/zero emission vehicles by passengers, commercial vehicles, car rental agencies, and shuttle operators.

The commentor's suggestion to plant 1,000 new trees around a specific parking lot is considered infeasible for legal, environmental, and policy reasons. LAWA has a number of mitigation measures, which involve planting of trees, including LAX Master Plan Mitigation Measure MM-BC-3 which provides for 2:1 tree replacement ratio for 300 mature trees. Similarly, trees would be planted in compliance with the LAX Street Frontage and Landscape Development Plan Update, which includes the planting of street trees in some locations (see pages 4-11 through 4-13 of the SPAS Draft EIR). However, it is not appropriate to mechanically assign a number of trees to a specific parking lot. Size limitations would preclude planting this number of trees at the subject location. The perimeter of the Parking Lot D and the Jenny Lot is approximately 5,800 linear feet. The planting of at least 1,000 trees to "ring" the site, as requested by the commentor, would place each tree less than six feet from each other, which would not be sufficient room for the root system and branches of most trees. Additionally, the continuous lining of the perimeter of the site with trees would pose the potential for damage to adjacent sidewalk, street, and infrastructure due to root growth. Also, the subject parking lot is located east of, and in proximity to, the north runways and the placement of over 1,000 trees directly beneath the runway flight path could pose an aircraft safety concern relative to being a bird attractant. (See page 4-176 of the SPAS Draft EIR and FAA Advisory Circular 150/5200-33B.)

SPAS-PC00130-564

Comment:

An extra 4,900 short term parking spaces and a drop off area would increase car trips by how much? Again to help pollution standards that another 1,000 smog helpful full canopy trees be added.

Response:

Table 4.12.2-10 on page 4-1212 of the SPAS Draft EIR shows the volume of peak hour private vehicles trips under various SPAS alternatives. The trips in the airport parking row of the table include the vehicle trips that are accessing the 4,900 public parking spaces at the ITF.

Please see Response to Comment SPAS-PC00130-563 regarding mitigation of air quality impacts associated with transportation.

SPAS-PC00130-565

Comment:

So Lawa is adding 16,000 parking spaces most of which will be impacting Westchester. So what plans does LAWA have to mitigate local traffic? What plans does LAWA have to mitigate air quality? Why are LAWA shuttles being discontinued?

Response:

As shown in Table 4.12.1-40 on page 4-1167 of the SPAS Draft EIR, LAWA's current parking supply is approximately 18,605 spaces. In the Future (2025) condition, Alternatives, 1, 2, 8, and 9 LAWA would have a parking supply of 23,441 spaces for a net increase in spaces of 4,836 spaces. The traffic analyses for the off-airport roadway system in the vicinity of Westchester was analyzed and documented in Section 4.12.2 of the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00201-1 regarding mitigation measures to address the air quality impacts associated with the SPAS alternatives.

Future SPAS facilities such as the Intermodal Transportation Facility (ITF), Ground Transportation Center (GTC) and Consolidated Rental Car Facility (CONRAC), provide alternative locations where passengers would be consolidated into groups and boarded onto high-capacity LAWA-operated buses that would be used to transport passengers into the CTA. This would allow for the reduction of shuttle buses and other LAWA parking lot shuttle vehicles that are currently used to transport passengers from off-site locations to the CTA. The consolidation of these busing operations would result in a net decrease in the number of commercial vehicles accessing the CTA.

Please refer to Response to Comments SPAS-PC00130-139 for additional information related to the consolidation of shuttle bus activity and the anticipated benefits related to traffic reduction and improved roadway operations.

It is unclear as to what the commentor is referring to in the question of "Why are LAWA shuttles being discontinued?" and the commentor provides no basis or supporting evidence for that claim. No shuttle services are being discontinued; shuttle services continue to be provided at all LAWA parking lots.

SPAS-PC00130-566

Comment:

How many parking spaces in park one being eliminated? What parking currently exists north of 111th street?

Response:

As indicated on page 2-47 of Table 2-2 of the SPAS Draft EIR, the exiting capacity of Park One is 2,728 spaces. All of these spaces will be eliminated in all of the SPAS alternatives except Alternative 4 as a result of the realignment of Sky Way.

The parking lot north of the 111th street is Lot E which is currently used for airport employee parking. This employee parking will be relocated to the Jenny Lot, located north of Westchester Parkway between Jenny Avenue and Airport Boulevard, once that lot has been constructed in early 2013. The Jenny Lot will provide 1,940 parking spaces for Alternatives 1 and 2, as noted on page 4-1092 of the SPAS Draft EIR. As noted on pages 2-38 and 2-41 of the SPAS Draft EIR, parking on the Jenny Lot under Alternatives 8 and 9 would be the same as Alternative 1. Under Alternatives 3 and 4, the Jenny lot would be part of the proposed Consolidated Rental Car Facility (CONRAC) and associated parking as noted on Page 1-94 of the SPAS Draft EIR.

SPAS-PC00130-567

Comment:

Where do you plan to put the conrac? It isn't shown in the alternative 1 plan?

Response:

Please see Response to Comment SPAS-PC00130-185 for how certain SPAS alternatives include the development of a CONRAC and the proposed location of the CONRAC under those alternatives.

SPAS-PC00130-568

Comment:

2.3.1.2 Alternative 2 2-14
What is meant by fully integrated? How much cheaper would alternative 2 be to institute? How much money would it cost to rebuild the Argo flood channel? How much would it cost to redesign the manchester tunnel? How much will it cost to relocate Lincoln Blvd? How much will it cost to move the 3 sewers? How much will it cost to move the hot oil pipes?

Response:

Please see Response to Comment SPAS-PC00130-444 for an explanation of the term "fully integrated." CEQA does not require an analysis of cost or project funding. (State CEQA Guidelines Section 15131; Pub. Resources Code Section 21068.) Nevertheless, LAWA provided a detailed account of the financial requirements of each of the alternatives in the Preliminary LAX SPAS Report. Table 8-1 in Chapter 8 of the Preliminary LAX SPAS Report provides a comparison of the preliminary rough-order-of-magnitude (ROM) costs associated with each alternative, and provides a comparison of the costs of Alternative 2 and the other alternatives. Details regarding the preliminary ROM cost estimates for the SPAS alternatives are provided in Appendix G of the Preliminary LAX SPAS Report. As indicated in Table AF-1 of Appendix G, the preliminary ROM cost of improvements to the Argo Drainage Channel would be $5,000,000 under Alternatives 2, 3, 4, and 7; $116,562,044 under Alternatives 1 and 5, and $66,839,416 under Alternative 6. The cost to fill the north airfield abandoned tunnel segment is estimated to be approximately $21,873,600. As indicated in Table AF-3 of Appendix G of the Preliminary LAX SPAS Report, the preliminary ROM cost estimate for the realignment of Lincoln Boulevard is $61,210,000 under Alternative 1, $89,960,000 under Alternative 5, and $45,290,000 under Alternative 6. Please see Topical Response TR-SPAS-LR-1 regarding the need to relocate utilities as part of the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6. As indicated in the topical response, realignment of Lincoln Boulevard is not anticipated to interfere with the major outfall sewers that run beneath LAX. Moreover, LAWA has not identified other major utilities, including oil pipelines, in the vicinity of Lincoln Boulevard. Nevertheless, the ROM cost estimates for the Lincoln Boulevard realignment include allowances related to utilities, including sewer lines and other utilities.

SPAS-PC00130-569

Comment:

2.3.1.2.1 Airfield Facilities 2-14
What are the current FAA standards for ADG V with a category 11/111 outbound runway? What are the current FAA standards for ADG V with a category 1 runway? What are the restrictions in place today to hold larger ADG V and ADG VI aircraft?

Response:

FAA Aircraft Design Group (ADG) V standards for runway-taxiway separation can be found in Tables 3-6 and 3-7 of FAA Advisory Circular 150/5300-13A Airport Design, which can be accessed at the following address: http://www.faa.gov/airports/resources/advisory_circulars/index.cfm/go/document.current/documentNumber/150_5300-13/.

As discussed in Section 1.2.1 of the SPAS Draft EIR, the current north airfield configuration at LAX requires non-standard operating procedures. Restrictions in place today generally do not allow ADG V or ADG VI aircraft to hold between Runways 6L/24R and 6R/24L. This reduces operational efficiency as Air Traffic Control must hold arrivals and departures until ADG V and ADG VI aircraft proceed safely across Runway 6R/24L.

SPAS-PC00130-570

Comment:

Runway Modifications 2-17
How much better will the north airfield operate by percentage with the improvements to the taxiways?

Response:

Appendix F-2, North Runway Alternatives Simulation Analysis, of the Preliminary LAX SPAS Report provides a detailed discussion of the future operations of the SPAS alternatives. Please refer to Response to Comment SPAS-PC00130-156 regarding the SPAS Draft EIR airspace simulation analysis.

SPAS-PC00130-571

Comment:

2.3.1.3 Alternative 3
Your first sentence (ie paragraph) says alt 3 is actually alt D and concurrently no action plan, please explain how this can be?

Response:

Please see Responses to Comments SPAS-AL00007-3, SPAS-AL00007-7, SPAS-PC00130-749, and SPAS-PC00130-873 regarding the CEQA "No Project" Alternative.

SPAS-PC00130-572

Comment:

Please explain the 17,000 previous eiR for alt D and how much completion of this project will cost?

Response:

The previous EIR to which commentor refers is the LAX Master Plan EIR. The LAX Master Plan EIR evaluated the potential environmental effects associated with the four LAX Master Plan alternatives. It is available at www.ourlax.org. Cost estimates to complete the remaining components of the LAX

Master Plan are provided in Chapter 8 of the Preliminary LAX SPAS Report, with details included in Appendix G.

SPAS-PC00130-573

Comment:

2.3.1.4 Alternative 4 2-22
Please explain what is meant by this first paragraph? What does MSC stand for? What is a related new passenger processor and connector? What terminal improvements are being considered? Does this alternative deal with the black mold currently in terminal 3?

Response:

The first paragraph of Section 2.3.1.4 on page 2-22 of the SPAS Draft EIR defines Alternative 4. Alternative 4 is defined in relationship with projects and improvements included in the LAX Master Plan.

Accordingly, Alternative 4 would:
- Include ongoing and reasonably foreseeable "non-Yellow Light improvements" identified in the LAX Master Plan which are: ongoing improvements to Tom Bradley International Terminal (Bradley West Project); the extension of Runway 6R/24L; the Midfield Satellite Concourse (MSC) and its associated connector and passenger processor; and various terminal improvements.
- Not include "Yellow Light Projects" identified in the LAX Master Plan. See Section 2.3.1.4.4. of the SPAS Draft EIR for a list of these projects that would not be included in Alternative 4.

A new passenger processor and connector are assumed under Alternative 4 associated with the construction of the planned Midfield Satellite Concourse (MSC). Please see Response to Comment SPAS-PC00130-549 above for further discussion of the MSC. A passenger processor is an airport facility in which departing passengers check in at the airline counters, drop their bags to be scanned by the Transportation Security Administration (TSA) and go through passenger security checkpoints. It also hosts arriving passenger functions such as baggage claim. The connector is a conveyance that will provide access to passengers from the passenger processor to the MSC.

Terminal improvements, aside from those listed above, are ongoing and reasonably foreseeable improvements that LAWA and airlines would make to terminal facilities, some of them unknown, but would be undertaken in the future.

LAWA is not aware of "a bad case of black mold" at Terminal 3, and the comment does not present any facts or evidence that black mold exists at Terminal 3. In the event that mold or other contaminants are encountered during demolition of Terminal 3, or any other facility at LAX, and are determined to pose a potential health risk to those nearby, including workers and the general public appropriate protective and materials management measures would be implemented in accordance with applicable federal, state, and local health and safety requirements. See pages 4-596 and 4-597 of the SPAS Draft EIR.

SPAS-PC00130-574

Comment:

As a Spas member we were told that the Conrac would need to be built underground in order to meet FAA safety standards. Is this still true? Does Lot C in its current condition meet current FAA Safety Standards?

Response:

Please see Response to Comment SPAS-PC00130-346 regarding FAA safety standards applicable to Lot C. Because Alternative 4 proposes the CONRAC at Parking Lot C, the CONRAC would be subject to the FAA Standards promulgated in AC 150/5300-13A. The SPAS Draft EIR is a programmatic document, and therefore it does not, and should not, evaluate the specific components of individual projects. (State CEQA Guidelines Section 15146; Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 369.) A project-specific document that analyzes

construction and design would be prepared for all projects, including the CONRAC, should an alternative that includes the CONRAC be approved.

SPAS-PC00130-575

Comment:

What portion of the Argo drainage channel would be covered? What are the RSA improvements? Why isn't the Argo flood channel included in the illustration?

Runway modifications 2-25.
If there is no change to runway Why is it necessary to change the Argo flood channel?

Response:

As described on page 4-492 of the SPAS Draft EIR, FAA prepared an RSA evaluation in 2006 and concluded that the existing RSA for Runway 6L/24R does not meet current airport design standards and improvements to the RSA were needed.1 Under Alternatives 2, 3, 4, and 7, the easternmost portion of the Argo Drainage Channel, which currently lies within the Runway 6L/24R RSA, would be covered to comply with RSA requirements. Please see Section 4.7.2.6.5 of the SPAS Draft EIR for a discussion of Alternative 4's RSAs. Moreover, as described in Section 4.7.2.6.4 of the SPAS Draft EIR, Alternative 4 would not result in any change to the existing runway safety areas that extend off-airport. The easternmost portion of the Argo Drainage Channel is required to be structurally covered to comply with the requirements governing RSAs. (Table 2-3 of the SPAS Draft EIR.) The proposed improvements to Argo Drainage Channel associated with the northerly relocation of Runway 6L/24R under Alternatives 1, 5, and 6 would also comply with RSA requirements.

The Argo Drainage Channel is not included in the illustration because the SPAS Draft EIR contains sufficient information about the effects of the alternatives on the Argo Drainage Channel to provide decision-makers with sufficient information to make an informed determination.

1. U.S. Department of Transportation, Federal Aviation Administration, Runway Safety Area Evaluation and Analysis for Los Angeles International Airport, June 14, 2006.

SPAS-PC00130-576

Comment:

Alternative 5 2-26
Overview
How much of Lincoln Blvd would need to be underground? Who would pay for this? Would it be like the Sepulveda tunnel and flood every time it rains? How would covering the argo flood channel interfer? What is the plan for moving the fuel station? What is the plan to relocate the 100 year old hot oil line from the Baldwin Hills oil field? Where are you planning on moving the sewers to? How much money would this alternative cost? Does the cost include redevelopment of the manchester tunnel? Has LAWA determined the sorce of water flowing into the tunnel?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6, including the presence of utilities such as oil pipelines within the relocation area. Please see Response to Comment SPAS-PC00130-539 regarding ability of the Argo Drainage Channel to convey stormwater if a box culvert is constructed. As indicated in that response, covering the Argo Drainage Channel would not have any adverse effects relative to stormwater conveyance, including stormwater associated with the Lincoln Boulevard realignment. It is unclear what fuel station the commentor is referring to. As indicated in Section 2.3.1.10 of the SPAS Draft EIR, an on-airfield fuel truck filling station would require reconfiguration and/or relocation under Alternatives 1, 2, 3, 5, 6, and 7. As indicated on page 2-56 of the SPAS Draft EIR, the fueling station would be relocated to another site within the AOA, if required. Please see Response to Comment

SPAS-PC00130-1012 regarding the north airfield tunnel segment (referred to in the comment as the Manchester Tunnel). Rough-order-of-magnitude cost estimates to remove and fill the north airfield tunnel segment are summarized in Table AF-1 and detailed in Table AF-8 of Appendix G of the Preliminary LAX SPAS Report.

SPAS-PC00130-577

Comment:

Does this alternative include a new tower that can see all of the airfield and taxiways? Where is LAWA planning on locating the new tower?

Response:

There is currently no reason to believe, nor does the commentor provide any supporting information to suggest, that relocation of the existing Air Traffic Control Tower (ATCT) or construction of a supplemental ATCT is warranted for any of the SPAS alternatives. The SPAS alternatives provide development concepts for consideration at the program level. Potential ATCT line-of-sight issues are determined in conjunction with detailed planning and design. The selection and approval of a particular alternative, if any, would be followed by the preparation of more detailed plans, which would address any potential tower line-of-sight issues in consultation with FAA and ATCT staff.

SPAS-PC00130-578

Comment:

2.3.1.6
Same comments on the covering and converting of the Argo flood channel. What other things on the northern airfield would need to be removed? Where would those things be moved to?

Response:

As described on page 2-33 of the SPAS Draft EIR, with the relocation of Runway 6L/24R 100 feet to the north under Alternative 6, 1,400 linear feet of the Argo Drainage Channel would fall within the RSA. As a result, this portion of the channel would need to be covered such that the weight of an aircraft could be supported within the RSA. This would be accomplished by converting the existing open unlined channel to an enclosed concrete box culvert. Other features that would be affected by the northerly relocation of Runway 6L/24R under Alternative 6 are illustrated in Figure 2-10 and described in Section 2.3.1.10. As described on page 2-52 of the SPAS Draft EIR, under Alternative 6, the maintenance road located at the northern edge of the north airfield would be moved north, outside of the RSA for the relocated runway, and operational restrictions would be imposed on the eastern end of the road, restricting its use during certain aircraft operations. Also under Alternative 6, the north airfield abandoned tunnel segment would be filled and navigational aids located at both ends of both of the north airfield runways would be relocated.

SPAS-PC00130-579

Comment:

This alternative also requires changes to the manchester tunnel why aren't those changes included?

How many sewers would LAWA need to move to implement this plan?

Response:

The need to remove and fill the North Airfield tunnel segment (referred to in this comment as the Manchester tunnel) is identified in Section 2.3.1.10 of the SPAS Draft EIR, including Table 2-3 and Figure 2-10. This component is also included in the ROM cost estimates prepared for Alternative 6 (see Table AF-1 of Appendix G of the Preliminary LAX SPAS Report). As the tunnel segment is not operational, it was not considered to be a facility that warranted mention in Section 2.3.1.6 of the SPAS

Draft EIR, which describes changes to airfield, terminal, and ground access facilities associated with implementation of Alternative 6.

Please see Response to Comment SPAS-PC00130-348 regarding outfall sewers that lie beneath LAX.

SPAS-PC00130-580

Comment:

Why isn't the widening of the runway included in the amount of feet the outer edge of the runway is moving?

Response:

The distance a runway is moved refers to the relative location of the new centerline to the location of the old centerline. Thus, if the runway is moved 260 feet north, the centerline of the runway is moved 260 north from the old centerline location.

The content of this comment is essentially the same as comment SPAS-PC00130-536; please refer to Response to Comment SPAS-PC00130-536.

SPAS-PC00130-581

Comment:

Why aren't ground Access things included with alternatives? Is the plan just to leave them off? How can full impacts be determined in pieces?

Response:

As indicated on page 1-17 of the SPAS Draft EIR, components of Alternatives 1, 2, 5, 6, 7, 8, and 9 are interchangeable such that airfield and terminal improvements from one alternative could be implemented in association with the ground access improvements proposed under another alternative. However, as stated on page 1-17, Alternatives 5 through 7 would only be approved in conjunction with the ground access improvements associated with Alternatives 1, 2, 8, or 9. Therefore, any SPAS alternative that is approved would include ground access components.

SPAS-PC00130-582

Comment:

2.3.1.7 Alternatives 7 2-34
How do these taxiway improvements compare to alternative 1? How much cheaper would this alternative be than alternative 1? How much cheaper would this alternative be than Alternative 4?

Response:

Please see Section 2.3.1 and Table 2.2 of the SPAS Draft EIR for a discussion of the various alternatives proposed under SPAS. Under Alternative 1, the separation distance between the centerline taxiway and Runway 6L/24R would be 500 feet and would meet FAA standards for ADG VI runway-to-taxiway separation for approach visibility at or above one-half mile (Category 1 approaches). The separation distance between the centerfield taxiway and Runway 6R/24L would be 460 feet, providing sufficient space for ADG V aircraft to hold prior to crossing the runway with a pilot line-of-sight to the end of Runway 24L. Under Alternative 7, the separation distance between the centerfield taxiway and both runways would be 400 feet, providing for ADG V separation distances. Under Alternative 1, Taxiway E and Taxilane D would meet ADG V standards. Under Alternative 7, Taxiway E would meet ADG VI standards and Taxilane D dimensions would meet ADG V standards.

Cost estimates for the SPAS alternatives are provided in Chapter 8 of the Preliminary LAX SPAS Report, with details included in Appendix G. The difference in costs associated with the alternatives would depend on which ground access alternatives are assumed. If the Alternative 1 ground access

components are assumed for both Alternative 1 and Alternative 7, the total cost of each alternative in escalated dollars is estimated to be $3,294,381,000 and $2,820,562,000, respectively. Alternative 4 would be the least costly of all the alternatives, with costs estimated to be $1,660,190,000.

SPAS-PC00130-583

Comment:

This alternative is showing improvements in all terminals on the northern airfield except terminal 2, Is that correct?

Response:

The commentor is correct in the sense that no modifications to the Terminal 2 building footprint (area) are planned under Alternative 7. However, as depicted in Figure 2-7 by the pink dashed line, Alternative 7 would relocate the Aircraft Parking Limit Line (APLL) south to meet ADG VI standards, and as a result, gates at the north end of Terminal 2 would be downsized (i.e., would accommodate smaller aircraft types). Given that the existing building footprint/area for Terminal 1 extends farther north than that of Terminal 2, the southward relocation of the APLL under Alternative 7 would affect both the northerly gates and the northern tip of the Terminal 1 building area (see red cross-hatch pattern in Figure 2-7). Regarding Terminal 3, the existing concourse is proposed to be relocated westward, which is why it is shown as a terminal improvement in Figure 2-7.

To provide clarification and to be consistent with similar statements made under the heading of Terminal Facilities for Alternatives 1, 5, and 6 in the SPAS Draft EIR regarding potential terminal facility improvements as a result of moving the APLL south, page 2-37 in Section 2.3.1.7.2 of the SPAS Draft EIR has been revised to note that as a result of moving the APLL south to meet ADG VI standards, several gates would be eliminated or the gates would be downsized (i.e., would accommodate smaller aircraft types).

Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-PC00130-584

Comment:

The illustration figure 2-7 shows a centerline taxiway, this change will require complete rebuilding of the manchester tunnel. How long would the north airfield need to be closed in order to do this?

Response:

Please see Response to Comment SPAS-PC00130-41 regarding construction plans and phasing of project improvements. As noted in that response, construction plans have not yet been developed for the SPAS alternatives, therefore, information regarding necessary runway closures has not been determined. Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to as the Manchester tunnel in this comment).

SPAS-PC00130-585

Comment:

2.3.1.7.2 Terminal Facilities
What commuter facility currently exsists east of Sepulveda Blvd.

Response:

This content of this comment is similar to comment SPAS-PC00130-550; please see Response to Comment SPAS-PC00130-550 regarding the commuter facilities located east of Sepulveda Boulevard.

SPAS-PC00130-586

Comment:

Alternative 8 2.3.1.8
What are the differences between the ground access improvements in Alt 8 compared with Alternatives 1-4? Why have Alt 5, Alt 6, and Alt 7 imcompatable with Alt 8?

Response:

The ground access components of Alternative 8 are similar to the components associated with Alternatives 1 and 2. All of these alternatives include private vehicle access to the CTA; a redesigned entry roadway with new curbside space at Terminal 0; an Intermodal Transportation Facility between 96th and 98th Streets west of Airport Boulevard; a dedicated busway with connectivity to public transit; and relocation of the commercial vehicle holding lot. However, Alternative 8 includes a CONRAC and parking in Manchester Square, whereas Alternatives 1 and 2 only provide parking in that location. Alternative 3 provides a ground access system that is very different from Alternative 8. Under Alternative 3, the CTA would be closed to private vehicles. The ground access system would consist of a Ground Transportation Center at Manchester Square; Intermodal Transit Center in Continental City; CONRAC in Parking Lot C; development of two Automated People Mover Systems to link the ITC, CONRAC, and CTA and link the GTA and CTA; construction of new on-airport roads east of and parallel to Aviation Boulevard; reconfiguration and expansion of Parking Lot E; and construction of a West Employee Parking facility. Similar to Alternative 8, Alternative 4 would maintain private vehicle access to the CTA. The only ground access improvements that would be constructed under Alternative 4 is a CONRAC in Parking Lot C and a parking structure in Continental City.

Please see Response to Comment SPAS-PC00130-581 concerning the interchangeability of the components of SPAS Alternatives 1, 2, 5, 6, 7, 8, and 9. As indicated on pages 2-37 and 2-38 in Section 2.3.1.8 of the SPAS Draft EIR, Alternative 8 is compatible with the airfield and terminal improvements associated with Alternatives 1, 2, 5, 6, and 7.

SPAS-PC00130-587

Comment:

In your illustration Fig 2-8 you show a consolidated car rental. Unfortunately your illustration shows no access to the public or exit by public, Why? There doesn't seem to be any new roads to access the freeway or Century Blvd, Why?

Response:

Figures 2-1 through 2-9 in the SPAS Draft EIR depict the development concepts proposed under each of the nine SPAS alternatives. They are intended to show the key elements of each alternative, as addressed at a programmatic level of planning and analysis within the SPAS Draft EIR. The delineation of specific vehicle access points and "curb cuts" at individual parcels, such as in Manchester Square where the CONRAC would be developed under Alternatives 8 and 9, would be determined at more detailed levels of planning and design, should one of those alternatives be selected for approval. As indicated in Section 3.1 in Appendix E2-2 of the Preliminary LAX SPAS Report, the overall concept for the CONRAC in Manchester Square would include access from multiple locations. To accommodate traffic between the southbound I-405 and the CONRAC, a westbound leg of the signalized intersection at La Cienega Boulevard and the I-405 southbound ramps north of Century Boulevard would be constructed. A new northbound leg of the signalized intersection at Century Boulevard and Concourse Way would also be constructed to accommodate CONRAC access. A third signalized entry/exit on Aviation Boulevard between Century Boulevard and Arbor Vitae Street is also likely, but its exact location would depend on the alignment of the CONRAC.

SPAS-PC00130-588

Comment:

The same observations with the parking currently located in the Hertz lot. How are the cars to access or exit and have street studies been done? If so where are they?

Response:

Hertz car rental company has an operations facility at the northeast corner of West Arbor Vitae Street and Airport Boulevard, and a vehicle storage lot at the southwest corner of West Arbor Vitae Street and Aviation Boulevard. Under Alternatives 3 and 4, the operations facility parcel would be replaced by a CONRAC, in which case the parking and access specific to Hertz would be replaced by that of the overall new facility. None of the other SPAS alternatives propose improvements to the existing Hertz operations facility site. None of the SPAS alternatives propose improvements at the existing Hertz vehicle storage lot; however, under Alternative 3, the subject property would be acquired under easement only, as indicated in Section 2.3.1.11 of the SPAS Draft EIR. Impacts to parking and access at the vehicle storage lot would be determined in conjunction with more detailed planning of Alternative 3, should that alternative be selected at the end of the SPAS process.

SPAS-PC00130-589

Comment:

Why is LAWA removing parking from continental City? What are LAWA's plans for this area?

Response:

Continental City is a vacant lot at the northeast corner of Imperial Highway and Aviation Boulevard; there is no parking there that would be removed. Regarding plans for this area, an Intermodal Transportation Center (ITC) would be developed at this location under Alternative 3 and a parking structure would be developed there under Alternative 4. There are no development plans proposed for this area under any of the other SPAS alternatives. Please also see Response to Comment SPAS-PC00130-177 which addresses the same question posed by the commentor in greater detail.

SPAS-PC00130-590

Comment:

2.3.1.9 Alternative 9 2-41
This document shows no illustration of the type of APM being considered?

The APM in Alt D EIR wasn't technically available yet is the APM in this DEIR techinally available? How does this APM differ from the APM in Alt D?

The best part of using an APM over an elevated Busway would be that it wouldn't be subject traffic vagrities in the CTA. How would an elevated Bus overcome the traffic in the CTA?

Response:

Please see Response to Comment SPAS-PC00130-502 regarding the APM systems associated with Alternatives 3 (which is the existing LAX Master Plan or Alternative D) and 9, and the differences between the two concepts. At the level of current planning, details regarding the type of APM trains that would be used have not yet been implemented. Please see Response to Comment SPAS-PC00130-816 regarding the level of analysis of the APM in the SPAS Draft EIR.

Section 4.12.1 of the SPAS Draft EIR evaluated the on-airport transportation impacts of Alternatives 1, 2, and 8, which all include a dedicated (elevated) busway. It should be noted that the busway would not be elevated within the CTA; rather, within the CTA, buses would travel in mixed-flow traffic. The analysis in the SPAS Draft EIR considered all traffic in the CTA, including traffic associated with buses.

As indicated in that analysis, on-airport traffic impacts related to curbsides and to departures and arrivals level roadways would be less than significant for Alternatives 1, 2, and 8. All of these alternatives would, however, result in a significant and unavoidable impact related to the volume to capacity level at one intersection within the CTA. Please see Response to Comment SPAS-PC00130-139 regarding consolidated busing and the proposed elevated busway.

SPAS-PC00130-591

Comment:

Your overview should be rewritten! The second to the last sentence could use some verbs. Why are only Alt 1 and Alt 2 comparable? All of the Alternatives have flight field improvements, Why does lawa consider that Alt 3, 4, 5, 6 and 7 don't contain flight field improvements?

Response:

The overview of Alternative 9 summarizes the fact that the subject alternative focuses on ground access improvements. Although Alternative 9 does not, in itself, propose any airfield or terminal improvements, it is compatible with, and could be paired with, the airfield and terminal improvements proposed in Alternatives 1, 2, 5, 6, and 7. The overview's reference to Alternatives 1 and 2 simply notes the fact that the ground access improvements proposed in Alternative 9, other than the APM and the CONRAC, are similar to those of Alternatives 1 and 2, those similarities being the development of an ITF, the connection to the future Metro station, and the redesigned entry roadways (i.e., Sky Way).

Please see the discussion of alternatives on page 2-8 of the SPAS Draft EIR for more information about the compatibility and interchangeability of SPAS alternatives. Alternatives 3 and 4 are considered unique "fully-integrated" alternatives, and are not considered to have elements that are interchangeable with other SPAS alternatives.

SPAS-PC00130-592

Comment:

Where are your arguments over the elimation parking Lot E? What are LAWA's future plans for this area and continental city site?

Response:

As noted in Section 2.3.1.1.3, page 2-13 of the SPAS Draft EIR "Parking Lot E would no longer be used for employee parking, although this property could be used for other airport purposes, in the future. Changes to the use of this parking lot would occur independently from SPAS." While LAWA is unsure of the future use for Lot E, the primary reason they will no longer operate the lot as an employee lot is to improve the efficiency of the operation of shuttling airport employees between parking lots and the Central Terminal Area.

Please see Response to Comment SPAS-PC00130-177 regarding LAWA's plans for the Continental City property.

SPAS-PC00130-593

Comment:

I haven't seen in any of your illustrations a cell phone lot, why? Who decided to remove the cell phone lot? Is the extra trips associated with no cell phone lot included in your traffic studies? If so where? How many extra trips have you determined no cell phone lot to cause?

Response:

The existing cell phone lot is located on the northwest corner of 96th Street and Vicksburg Avenue. In SPAS Alternatives 1, 2, 4, 8, and 9, the cell phone lot would remain in its existing location. In Alternative 3, private vehicle traffic would not be permitted within the CTA; therefore, the existing cell

phone lot could be closed and the site allocated to the proposed CONRAC. Instead of a cell phone lot, the Ground Transportation Center (GTC) could be designed with short-term parking.

Because the cell phone lot is located outside of the CTA, vehicles entering the CTA from the cell phone lot are treated like other private vehicles in the on-airport transportation section of the SPAS Draft EIR (Section 4.12.1). The growth in future cell phone lot trips is included in SPAS Draft EIR projections of future private vehicle trips entering the CTA (discussed on page 4-1062 in Section 4.12.1.3.11 of the SPAS Draft EIR). While a cell phone lot does not reduce the number of trips entering the CTA, vehicles dwelling in the cell phone lot are less likely to recirculate within the CTA since the driver knows when their party is waiting at the curb.

SPAS-PC00130-594

Comment:

Table 2-2 2-45
The distances referred to seem to be added incorrectly, Why? The width of the new centerline in Alt 1, plus the distances between the runways and the new width of the runway indicate Alt 1 is accually 340 north, Alt 5 would be 400' north, Alt 3 400' south. Why aren't LAWA's numbers correct? This is a huge concern that a different group do the lay out so that there isn't any confusion as to where things are supposed to be?

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-536; please refer to Response to Comment SPAS-PC00130-536.

SPAS-PC00130-595

Comment:

2.3.1.10 Exsisting Facilities 2-49
Table 2-3 Navigational Aids Talks about moving radar north of Westchester Parkway. Is this project in the northside EIR? How does LAWA propose to protect the radar from vandalism?

Response:

The California Environmental Quality Act (CEQA) Initial Study and Checklist for the LAX Northside Plan Update (available at http://www.lawa.org/GDZ/projectDocuments.aspx) designates areas for airport support uses, which could include radar surveillance facilities, among others.

Paragraph 606 of Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A states that "navigational and Air Traffic Control Facilities (ATC-F) located off an airport and in a location that is accessible to animals or the public will have a security perimeter fence installed at the time of construction." LAWA must comply with AC 150/5300-13A. Thus, any radar relocation would include a security perimeter fence.

SPAS-PC00130-596

Comment:

North Maintance Road Why aren't the specific lengths included? What operational restrictions would exsist on the eastern end? Why isn't this information included?

Response:

Specific lengths for the North Maintenance Road have not been included as the distance is variable depending on each SPAS alternative. Additionally, portions of this road are being relocated independent of SPAS as part of runway safety area (RSA) studies. (See page 2-52 of the SPAS Draft EIR.)

Depending on the SPAS alternative selected, future operational restrictions may prohibit vehicle operations on portions of the road which are within the RSAs of north airfield runways while the runways are in use.

SPAS-PC00130-597

Comment:

Argo drainage channel This channel isn't properly denoted. The name is Argo flood channel. How will water reach the flood channel if it is covered? Where does LAWA expect the water to go? Why doesn't LAWA cover the 50 year storm and the 100 year storm? How does LAWA intend to pay if covering the flood channel result in flooding? How long can LAWA run without the north airfield? Is Lawa planning on sending the water through Lincoln Blvd and Sepulveda interchange?

Response:

The comment pertaining to the name of the Argo Drainage Channel is noted. Water would reach the Argo Drainage Channel through upstream storm drains and inlets that are tributary to the eastern end of the culvert and through inlet drains along the length of the channel. Please see Responses to Comments SPAS-PC00130-169 and SPAS-PC00130-539 regarding the design of the Argo Drainage Channel improvements. Please see Responses to Comments SPAS-PC00130-85 and SPAS-PC00130-273 for a discussion of the flood standards applicable to the analysis of hydrology and water quality at LAX. Please see Response to Comment SPAS-PC00130-730 regarding the treatment of economic conditions in an EIR. CEQA does not require an EIR to determine and evaluate costs associated with recovery from natural and unavoidable catastrophes at the airport. Implementation of the Argo Drainage Channel improvements would not result in additional stormwater flows at the Lincoln Boulevard/Sepulveda Boulevard interchange.

The SPAS Draft EIR is a programmatic document. There are no existing designs or engineering plans, nor are there construction phasing plans or schedules for any of the alternatives. If an alternative is selected, project-level environmental review, including specific design and construction timelines, would be conducted.

SPAS-PC00130-598

Comment:

North Airfield Manchester Tunnel The tunnel will need attention in any alternative containing a centerline taxiway. Table 2-2 2-45. The tunnel is 740' not 720'. What would the tunnel be filled with? Have you found the sorce of water in the tunnel? Will you be using the well dug to keep the tunnel dry during it's construction? I don't see any referrance to the air shafts dug for tunnel use, How does lawa plan on dealing with them?

Response:

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as Manchester Tunnel).

SPAS-PC00130-599

Comment:

Airport Operation Area The table doesn't say where this area is, where is it located? What is it currently guarding?

Response:

The commentor's reference to "The table…" appears to be in regard to Table 2-3 on page 2-49 of the Draft EIR, which delineates the existing facilities affected by SPAS improvements including Aircraft Operations Area (AOA) Guard Post #3. Page 2-52 of the SPAS Draft EIR discusses the location of the AOA Access Guard Post #3. Guard Post #3 is located northwest of 96th Street/Sky Way, just east of

the eastern terminus of Taxiway E. Figure 2-10 also depicts the location of AOA Access Guard Post #3. The Guard Post provides an access point to the north airfield. The AOA includes the portion of the airport intended for the landing, takeoff, or surface maneuvering of aircraft. These areas include such paved or unpaved areas that are used or intended to be used for the unobstructed movement of aircraft in addition to its associated runway, taxiway, taxilane, or apron. Access to the AOA is restricted to authorized personnel only and there are several guard posts, including Guard Post #3, located around the perimeter of the AOA to control access to and from the AOA. If Runway 6R/24L is extended, the access point guarded by Guard Post #3 will be removed. There are no plans to establish a replacement access point in this area of the airport.

SPAS-PC00130-600

Comment:

Lincoln Blvd How long would it take to tunnel Lincoln Blvd 540'? How long would it take to tunnel Lincoln Blvd 765'? How long will it take to tunnel Lincoln Blvd 252'? Who would be responsible for the blvd? Who would be moving the utlieties beneath Lincoln? What does LAWA plan to do about sewers in the area? What about the hot oil pipe? Who will pay for these jobs?

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

SPAS-PC00130-601

Comment:

96th Street 2-50 removal of this roadway should be done! It is indanger of pulling the upper roadway in the CTA down and it obsures gates in terminal 1.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The commentor provides no evidence or substantiation of the claim that the 96th Street Bridge is in danger of "pulling down" the upper level roadway or that the upper roadway is at risk of collapsing. The bridge has no adverse effect on the structural integrity of the upper level roadway. Please see Response to Comment SPAS-PC00130-809 regarding the reconfiguration of Sky Way under the SPAS alternatives and the relationship of the reconfiguration to the 96th Street Bridge. The reconfiguration of the 96th Street Bridge under the Alternatives 1, 2, and 5 through 9 would be compatible with the airfield and terminal improvements associated with these alternatives. The commentor's reference that the bridge obscures gates in Terminal 1 is unclear. The bridge is currently located a sufficient distance from the Terminal 1 gates such that there is no obstruction to the movement or operation of aircraft these gates. Also, after reconfiguration of Sky Way in Alternatives 1, 2, and 5 through 9, the bridge would be located a sufficient distance from the terminal to allow for safe movement and operation of aircraft. (See Table 2-3 of the SPAS Draft EIR.)

SPAS-PC00130-602

Comment:

Taxi Holding lot we agree taxis should not be that close to the flight field.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-603

Comment:

Urgent Care This facility is the only medical care available to the traveling public in an emergency! If this facility is to be removed a newer version should be built before the old ones removal. Who owns this building? Is Lawa operating this building?

Response:

Please see Responses to Comments SPAS-PC00130-944 and SPAS-PC00130-623 regarding the relocation of the urgent care facility and the provision of emergency service. As stated on page 4-694 in Section 4.9.6.1 of the SPAS Draft EIR, the urgent care facility is leased from LAWA. The urgent care facility is operated by Reliant Urgent Care.

SPAS-PC00130-604

Comment:

LAWA Police Where is the new facility being planned? How big would the new facility be? Did you include an area for canines? Are you including a kennel area?

Response:

As discussed on page 2-55 in Chapter 2 of the SPAS Draft EIR, under all alternatives except Alternative 4, the existing LAWAPD station and associated facilities would be removed due to the realignment or, in the case of Alternative 3, removal of the 96th Street Bridge/Sky Way. As indicated in Section 4.11.2.6.10 of the SPAS Draft EIR, the existing LAWAPD station could be relocated to the future LAX Public Safety Complex, which is currently being planning independent of SPAS. A specific site and detailed building components such as space for a canine or kennel area has not yet been determined, and knowledge of its precise location and specific design components is not necessary to understand the environmental impacts of the alternatives. As explained on page 4-3 of the EIR, the SPAS Draft EIR is a programmatic document. Project-level impacts associated with implementation of individual components would be assessed in future CEQA documents. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

Furthermore, as discussed in Section 4.11.2.6.10, any impacts to law enforcement associated with ground improvements would be mitigated by implementation of Mitigation Measure MM-LE (SPAS)-1. LAX Master Plan Commitments PS-1 and PS-2 would also guide demolition of existing law enforcement structures and the construction of new facilities (see Section 4.11.2.5 of the SPAS Draft EIR).

As discussed in Section 4.11.2.6.1 of the SPAS Draft EIR, the LAX Public Safety Building and Supporting Facilities would consolidate existing facilities and personnel under one roof, creating a larger, more modern and efficient facility that would result in an improvement and expansion of law enforcement facilities. The Public Safety Building and Supporting Facilities project is independent of SPAS, and the site for the facility is currently unknown and under consideration.

SPAS-PC00130-605

Comment:

Park One Does the no relocation of parking not include the 16,000 new parking spots? How many parking spots are currently in park one?!

Response:

As provided in Table 4.12.1-1 on page 4-1054 of the SPAS Draft EIR, Park One currently has 2,728 public parking spaces.

The comment refers to the "no relocation of parking" relative to Park One which is consistent with SPAS Alternative 4 as described and depicted in Section 2.3.1.4 of the SPAS Draft EIR. As shown in Table 4.12.1-40 on page 4-1167 of the SPAS Draft EIR, Alternative 4 would have 18,896 total public parking spaces, only 291 more than the baseline supply. The existing CTA public parking structures 2B and 5, as well as Lot C public parking supply would be replaced by 9,127 spaces in the Intermodal Transportation Center (ITC). This would represent the only set of additional spaces in Alternative 4.

After reviewing Table 4.12.1-40 on page 4-1167 of the SPAS Draft EIR, this page has been revised due to a formatting error. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Accordingly, the numbers of parking spaces under Alternatives 8 and 9 under the "Airport Remote" section of Table 4.12.1-40 have been shifted down one row. Accordingly, the numbers of Airport Remote parking spaces assumed under Alternatives 8 and 9 are identical to those assumed under the column "Alts. 1-2." These minor revisions do not change the impact significance conclusions provided in the Draft EIR and are consistent with the data provided on page 2-47 in Table 2-2 of the SPAS Draft EIR.

SPAS-PC00130-606

Comment:

West remote gates If these gates are to be removed where is LAWA planning on parking VIP aircraft? (ie the president) Will celebrities have a special gate facility? What is the LAX gate build out plan? It is not described in the DEIR.

Response:

Regarding west remote gates, please see Responses to Comments SPAS-PC00130-170 and SPAS-PC00130-409. Refer to Figures B through D in Appendix F-1 of the Preliminary LAX SPAS Report for illustrations of the assumed gate layout plans under each alternative.

Regarding VIP aircraft parking, please see Response to Comment SPAS-PC00130-551.

SPAS-PC00130-607

Comment:

LAWA Construction & Maintanance Since construction and storage is to be shifted to continental city, will LAWA be putting in sound walls will landscaping in front of them to maintain the area? Will the toxic dirt removed from the airfield and placed next to the business center be moved there as well?

Response:

The use of the Continental City site by LAWA's Construction and Maintenance (C&M) Division is one of three possibilities for the relocation of the existing C&M facility, as would be necessary under Alternatives 1 through 3 and 5 through 7. As described on page 2-50 of the SPAS Draft EIR, relocation of existing C&M Division facilities affected under these alternatives may occur through on-site consolidation of facilities, relocation of affected facilities to another location with the Airfield Operations Area, or relocation to Continental City. As stated on page 2-49 of the SPAS Draft EIR, the planning and analysis for the SPAS alternatives are at a programmatic level, therefore specific improvements associated with the affected facilities, which would include those requiring relocation, have yet to be designed and would not be implemented until project-level review of specific improvements is complete. As such, both the likelihood of relocating C&M Division facilities to Continental City and the site design for the relocated facilities have not yet been determined. Additionally, the basic operational characteristics of the C&M Division facilities and the land use setting of Continental City suggest that significant noise impacts are very unlikely and, therefore, the use of sound walls to mitigate noise impacts is unwarranted. Specifically, as described on page 2-50 of the SPAS Draft EIR, the northern portion of the C&M Division facilities site potentially affected by the SPAS alternatives is used for materials recycling (i.e., sorting and bundling of recyclable materials), and equipment (storage) yard, and other materials storage. Such uses are not considered to be notable noise generators. The commentor is incorrect in suggesting that there are existing construction activities within C&M Division

facilities that would be shifted to Continental City, notwithstanding that it is currently unknown whether any of the existing facility would be relocated to Continental City. Even if one were to assume that construction activities, or other activities with noise levels comparable to those of construction, were to move to Continental City, Section 4.10.3 of the SPAS Draft EIR already addresses construction noise impacts at Continental City. As indicated therein, the only noise-sensitive use in the general vicinity of Continental City is residential development in Del Aire to the south. As indicated on page 4-951 of the SPAS Draft EIR, the northern edge of Del Air (i.e., point closest to Continental City) is approximately 800 feet south of Continental City and is lined by an existing 8-foot cinderblock wall, which already provides noise attenuation to the community. In summary, no significant noise impacts are anticipated from the potential relocation of C&M Division facilities to Continental City and the need for a sound wall at Continental City is unwarranted.

Please see Response to Comment SPAS-PC00130-265 regarding the handling of contaminated materials encountered during construction.

SPAS-PC00130-608

Comment:

Fedex 2-51
How would the facilities be reconfigured? How could they be consolidated? What does AOA mean?

Response:

In regards to the reconfiguration and/or consolidation of the FedEx Aircraft Maintenance Facility, please refer to Response to Comment SPAS-PC00130-627.

In regards to the Airport Operations Area (AOA), please refer to Response to Comment SPAS-PC00130-599.

SPAS-PC00130-609

Comment:

On Airfield Fuel Truck how would the fueling station be reconfigured?

Response:

As indicated on pages 2-51 and 2-56 of the SPAS Draft EIR, with the extension of Taxilane D under Alternatives 1, 2, and 6, the fueling station would need to be reconfigured or relocated within the airfield operations area (AOA), and under Alternatives 3, 5, and 7, the entire facility would be removed and relocated within the AOA. As stated on page 2-49, because the planning and analysis for the SPAS alternatives are at a programmatic level, specific improvements to the existing facilities potentially affected by SPAS improvements have yet to be designed and would not be implemented for several years.

SPAS-PC00130-610

Comment:

Southwest Airlines 2-51
Where would you move the facilities?

Response:

As stated on Page 2-56 in Section 2.3.1.10 of the SPAS Draft EIR, the Southwest Airlines Ground Support Equipment (GSE) facility would be removed and relocated elsewhere within, or adjacent to, the Airport Operations Area (AOA). A specific site has not yet been designated, and knowledge of its precise location is not necessary to understand the environmental impacts of the alternatives. As explained on page 4-3 of the EIR, the SPAS Draft EIR is a programmatic document. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the

programmatic review conducted for the SPAS project. Project-level impacts associated with implementation of individual components would be assessed in future CEQA documents.

SPAS-PC00130-611

Comment:

Airfield Bus Parking Area 2-51
Where on the AOA would you relocated the Bus parking area?

Response:

As stated in Section 2.3.1.10 on page 2-56 of the Draft SPAS EIR, the Airfield Bus Parking Area would be removed and relocated elsewhere within the Airport Operations Area (AOA) or in the area referred to as Continental City. A specific site has not yet been designated.

SPAS-PC00130-612

Comment:

LAX Fuel Why only on Alternatives 3,5, and 7 would the facilities be consolidated on the exsisting site? What will occur with the other Alternatives?

Response:

As described in Section 2.3 of the SPAS Draft EIR, the proposed airfield improvements proposed under Alternatives 3, 5, and 7 include the southward relocation of existing Taxiway E and Taxilane D. The combination of the two southward relocations would push the aircraft operations area farther south than exists today and would extend into the northern portion of the existing fuel farm area. As such, existing facilities in the northern portion of that site would need to be relocated and consolidated into the remaining undisturbed portion of the fuel farm area.

SPAS-PC00130-613

Comment:

US Airways Maintence Where would this facility be moved? How much square footage would the new building be?

Response:

As discussed on page 2-56 in Section 2.3.1.10 of the SPAS Draft EIR, the LAX Master Plan includes the construction of a new aircraft maintenance building on the west side of the airport (i.e., west of the former Continental Airlines (now United Airlines) maintenance hangar. Knowledge of its precise square footage is not necessary to understand the environmental impacts of the alternatives. As explained on page 4-3 of the EIR, the SPAS Draft EIR is a programmatic document. Please see Response to Comment SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project. Project-level impacts associated with implementation of individual components would be assessed in future CEQA documents.

SPAS-PC00130-614

Comment:

Avis Car Rental I thought Alternatives 8 & 9 were to be used in conjuction with another Alternative could these alternatives be used a stand alone measure? What property on 111th St does LAWA own? What other properties does LAWA own?

Response:

As indicated on page 2-8 in Section 2.3.1 of the SPAS Draft EIR, the ground access improvements associated with Alternatives 8 and 9 are compatible with, and could be paired with, the airfield and terminal improvements proposed under Alternatives 1, 2, 5, 6 and 7. Implementation of only the ground access improvements proposed under Alternatives 8 and 9 is not proposed and such a scenario would not respond most of the project objectives presented in Section 2.2. Specifically, such a scenario would not provide north airfield improvements that support the safe and efficient movement of aircraft at LAX, would not maintain LAX's position as the premier international gateway in supporting and advancing the economic growth and vitality of the Los Angeles region, would not plan improvements that do not result in more than 153 passenger gates at 78.9 MAP, and would not produce an improvement program that is efficient, sustainable, feasible, and fiscally responsible.

The airport boundary shown in Figures 2-12, 2-13, and 2-14 generally reflects the property owned by LAWA, and also shows properties proposed to be acquired by LAWA under the various SPAS alternatives.

SPAS-PC00130-615

Comment:

Travelodge & Dennys Restaurant2-52
What does LAWA plan to put in the Travelodge/Dennys location? Will LAWA give them other land that they own and pay to build a new facility? How many jobs would be effected?

Response:

The Travelodge Hotel is located in the southwest corner of Manchester Square. Under Alternatives 1, 2, 3, 8, and 9, this parcel would be used for ground access facilities. Because these facilities are located on LAWA property, they are not subject to the relocation provisions under the LAX Master Plan Draft Relocation Plan. (See page 4-668 of the SPAS Draft EIR.) No relocation of these facilities is planned by LAWA; rather, relocation would be a business decision. (See page 2-57 of the SPAS Draft EIR.) Whether or not jobs would be affected would depend on whether or not the businesses chose to relocate to another site in the area. Note that economic/social impacts, such as employment, are not required to be evaluated under CEQA. (State CEQA Guidelines Section 15064(e).)

SPAS-PC00130-616

Comment:

Navigational Aids What are you referring to as navigational aids? Is it just radar? Are you including runway status lights? What does ASR refer to?

Response:

Per Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, Navigational Aids (NAVAID) are 'electronic and visual air navigation aids, lights, signs and associated supporting equipment.' By definition, Runway Status Lights (RWSL) would be a NAVAID.

Per Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5300-13A, Airport Design, Airport Surveillance Radar (ASR) is "a radar facility used to detect and display azimuth, range, and elevation of aircraft operating within terminal airspace." For additional information, please refer to Paragraph 618 of AC 150/5300-13A.

SPAS-PC00130-617

Comment:

North Maintence Road Wouldn't movement 500' north place the maintence road on top of the Argo flood Channel? Is the plan to put the maintence road in the flood Channel?

Response:

As discussed on Page 2-52 in Section 2.3.1.10 of the SPAS Draft EIR, the north maintenance road would require relocation outside of the Runway Safety Area (RSA). The distance of the relocation is dependent on the runway shift occurring in each alternative. In instances where the Argo Drainage Channel and the service road fall within the RSA, the Argo Drainage Channel would be structurally covered to support the weight of a truck on the overhead service road once it is relocated outside of the RSA.

SPAS-PC00130-618

Comment:

Argo Drainage Channel This is improperly named it is called the Argo flood channel. If the channel is to be converted what plans has LAWA made to clean the water before returning it to the Santa Monica Bay? What kind of surface are you looking at to cover the channel? Where else do you know of has a covered flood channel with a perible surface that can support an aircraft? Have they had an difficulty with flooding, colasp, or contamination? If this situation does not exsist anywhere else where is the technology coming from and does it come with a garuntee?

Response:

Impacts from storm water pollutant loads are described generally on page 1-80 of the SPAS Draft EIR, and specifically in Section 4.8 of the SPAS Draft EIR. As described on page 4-637 of the SPAS Draft EIR, the annual stormwater pollutant loads would be either less than significant or less than significant with mitigation for all SPAS alternatives.

The comment pertaining to the name of the Argo Drainage Channel is noted. Conversion of the Argo Drainage Channel to a concrete box culvert would be subject to Standard Urban Stormwater Mitigation Plan (SUSMP) and Low Impact Development (LID) requirements pertaining to water quality. Under Alternatives 1, 5, and 6, the channel would be covered with concrete of sufficient strength to handle the weight of an aircraft. Use of permeable materials would not meet FAA RSA requirements and would therefore not be used to cover the Argo Drainage Channel. The technology exists to design a concrete box culvert to withstand the weight of an aircraft without resulting in flooding, collapse, or contamination. For example, at LAX, the Sepulveda Tunnel provides for the presence of Sepulveda Boulevard beneath the south runway complex.

SPAS-PC00130-619

Comment:

Manchester tunnel the tunnel is 740' long not 720'. The tunnel has never been open to public use but has been open in the past. Have you found the sorce of water in the tunnel? What do you plan to do about the airvents? Any use of a centerline taxiway would contribute to co lapse of the tunnel because it is only reinforced at the current north runway.

Response:

Please see Response to Comment SPAS-PC00130-1012 regarding the north airfield abandoned tunnel segment (referred to by the commentor as the Manchester Tunnel).

SPAS-PC00130-620

Comment:

figure 2-10
#4 is located incorrectly please get a survaior to find the actual location and length. Where are the current access vents?

Response:

The approximate location of the north airfield abandoned tunnel segment is accurately depicted in Figure 2-10 of the SPAS Draft EIR. There is no need for a surveyor to identify the precise location and length of the tunnel segment in order to evaluate the impacts of the SPAS alternatives on this facility, or to identify the current access points. As discussed in Table 2-3 of the SPAS Draft EIR, under Alternatives 1, 5, and 6, the tunnel would be filled.

If an alternative is selected, future project-level environmental review would be conducted. This level of review would analyze all impacts of the proposed project, including those to the abandoned north airfield tunnel.

SPAS-PC00130-621

Comment:

96th Street Bridge/Sky Way under all the alternatives (except 3) this bridge should be removed and reconfigured. This bridge blocks the interior gates to terminal one and is straining the connection to the upper roadway increasing the chance of collaspe of the upper roadway at the canalever junction of terminal one.

Response:

The content of this comment is similar to comment SPAS-PC00130-601; please refer to Response to Comment SPAS-PC00130-601.

SPAS-PC00130-622

Comment:

Commercial Holding Lots Has LAWA looked at putting the taxi holding lot in the parking lot within the central terminal? It would allow cabs and vans to pull to whatever side of horseshoe (CTA roadway) to get to waiting passengers more quickly. What other commercial Holding Lots does LAWA have? Where are they located?

Response:

As described below in further detail, relocating the taxi holding lot inside the CTA parking lot area is infeasible because there is insufficient space to construct a commercial vehicle holding lot within the CTA. Also, there is no evidence that relocating the commercial vehicle holding lot to the CTA would improve efficiency.

As can be seen SPAS Draft EIR Figures 1-5, 1-6, 1-12, and 1-13, which delineate the location and size of the commercial vehicle holding lot proposed under SPAS Alternatives 1, 2, 8, and 9, and also depict the CTA relative to building areas (gray shading) and open areas between buildings, there is insufficient space available within the CTA to efficiently accommodate the area needed for commercial vehicles such as taxis and shuttle vans. Moreover, there is no evidence that placing the commercial vehicle holding lot within the CTA would improve the efficiency by which taxis and shuttles could get to passengers awaiting pick up, given the one-way direction of most roads within the CTA. For example, if the holding lot were to be placed in the middle of the CTA, a taxi or shuttle dispatched to pick up passengers at Terminal 1 would be required to travel west on World Way North and/or south on West Way, then east on World Way South to the airport return road at the east end of the CTA, and then circle around to stop at Terminal 1. The dispatch of a taxi or shuttle to Terminal 1 from the currently proposed commercial vehicle holding lot would simply require the vehicle to travel south on Sky Way and stop at the first terminal. Although the physical straight-line distance between Terminal 1 and a holding lot within the CTA might be comparable or even less than the straight-line distance between Terminal 1 and the holding lot associated with the SPAS alternatives, the travel distance of the former would be substantially greater (i.e., approximately 2 to 5 times greater) than the latter, due to the one-way nature of roads within the CTA.

Regarding the location of existing commercial vehicle holding lots at LAX, as indicated on page 2-55 of the SPAS Draft EIR, the taxi holding lot is located northeast of the CTA, near 96th Street and Sepulveda Boulevard, as shown in Figure 2-10 of the SPAS Draft EIR. The existing shared ride van holding lot is located on Avion Drive south of Century Boulevard and the charter bus/limousine holding lot is located in the southwest corner of Jenny Street and Westchester Parkway.

SPAS-PC00130-623

Comment:

Urgent (Medical) Care Facility - Please have this facility relocated within the northside development. This facility is of major concern to the traveling public! It should be as close as possible to the airport yet not in the airport. Have you checked with Maxine Waters office about removing this facility? She negociated its' presence when Daniel Freeman Hospital was being sold. If there is an accident anywhere on airport grounds because of distance and traffic people could die.

Response:

As shown in Figure 2-10 and discussed on page 2-55 in Chapter 2 of the SPAS Draft EIR, the urgent care medical facility (i.e., Reliant Urgent Care) would be removed under all alternatives except Alternative 4. This facility could potentially be relocated elsewhere in the airport area, including LAX Northside, which allows for commercial and office uses such as an outpatient medical facility. Any decision to relocate within LAX Northside or the local area would be at the discretion of Reliant Urgent Care. It should be noted that, although located on LAWA property, the outpatient medical care facility has no relationship to LAX other than offering routine and urgent care medical services to residents and employees in the local area or others who may see it while driving along Sepulveda Boulevard. There are also other urgent care facilities in the area with convenient access from LAX, including Urgent Care at 8320 Lincoln Boulevard (approximately 0.75 mile north of LAX) and Los Angeles Airport Urgent Care at 1117 West Manchester Boulevard, Inglewood (approximately 1.25 miles northeast of LAX).

As described in Section 4.11.1 of the SPAS Draft EIR, medical emergencies are responded to by the City of Los Angeles Fire Department from their four fire stations located on airport property. Those patients in need of further attention are transported by ambulance to the nearest area hospitals with the necessary emergency medical treatment facilities. As shown in Figure 4.10.1-9 in Section 4.10.1 and listed in Table 1 of Appendix J1-2, the nearest hospitals within the SPAS land use study area are Centinela Hospital Medical Center (approximately 2 miles east of LAX) and Freeman Regional Medical Center (approximately 2.5 miles northeast of LAX). Furthermore, as described on pages 4-994 through 4-997 in Section 4.11.1 of the SPAS Draft EIR, LAX and surrounding communities are subject to various emergency response and disaster response plans and regulations in the event of a major emergency including the County of Los Angeles Mutual Aid Operations Plan, LAX Airport Emergency Plan, and LAX/Sea Disaster Preparedness Plan to ensure the safety of the public. Therefore, relocation of Reliant Urgent Care would have no effect on emergency response to accidents at LAX.

Comment:

Park One Parking and Billboards Always happy to hear of the removal of billboards.

West Remote Aircraft gates 2-55 What does MSC stand for?

Response:

The comment regarding the removal of billboards is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

MSC stands for Midfield Satellite Concourse. The MSC was a component of Alternative D and was addressed in the program-level LAX Master Plan; it is not a component of the SPAS alternatives but is considered in the analysis of cumulative impacts in the SPAS Draft EIR. The MSC is described on page 5-18 in Chapter 5 of the SPAS Draft EIR.

SPAS-PC00130-626

Comment:

LAWA Construction and Maintenance We recommend that these areas be consolidated and put in continential city

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As indicated on page 2-56 of the SPAS Draft EIR, LAWA is considering relocating these facilities to the area referred to as Continental City.

SPAS-PC00130-627

Comment:

Fed Ex Maintenance - Where else could these facilities be located? Employee parking could be consolidated with a parking structure.

Response:

As stated on page 2-56 in Section 2.3.1.10 of the SPAS Draft EIR, the FedEx Aircraft Maintenance Facility, including the various aspects of the facility that are within the existing leasehold, such as the maintenance hangars and apron areas, workshops and equipment storage buildings, employee parking, etc., would be consolidated and relocated on the existing site or relocated elsewhere on the Airport Operations Area (AOA). A specific site within the AOA has not yet been designated.

SPAS-PC00130-628

Comment:

On-Airfield Fuel Truck Filling station - Having this fueling station so close would seem somewhat dangerous where else could it be relocated?

Response:

As stated on page 2-49 of the SPAS Draft EIR, because the planning and analysis for the SPAS alternatives are at a programmatic level, specific improvements to the existing facilities potentially affected by SPAS improvements have yet to be designed and would not be implemented for several years. That includes the on-airfield fuel truck filling station.

If one of the alternatives that reconfigures or relocates the fuel truck filling station is approved, further project-level environmental review would be conducted. That review would assess, among other things, the safety of the location and configuration of the filling station.

SPAS-PC00130-629

Comment:

Southwest Airlines GSE Facility Exactly where are you considering relocating this facility?

Response:

The content of this comment is essentially the same as comment SPAS-PC00130-610; please refer to Response to Comment SPAS-PC00130-610.

Comment:

LAX Fuel Farm Same comments as Fuel Truck.

Response:

Please see Response to Comment SPAS-PC00130-628. The explanation provided therein is applicable to both the on-airfield fuel truck filling station and the LAX fuel farm. Also, please see Response to Comment SPAS-PC00130-612.

SPAS-PC00130-632

Comment:

US Airways Maintence Building This building could be retained if LAWA would shorten the length of the runways!

Response:

As stated on page 2-56 in Section 2.3.1.10 of the SPAS Draft EIR, the US Airways Maintenance Building would be removed under Alternatives 3, 5, and 7. Removal of this building would be required due to the lateral movement of Runway 6R/24L and/or the Taxilane D and Taxiway E improvements associated with those alternatives, and is not related to runway length. As can be seen by review of Figure 2-10 in the SPAS Draft EIR, to avoid removal of that structure (Facility #20 on the figure) by reducing the existing length of the runway and still accommodate the lateral runway move and taxilane/taxiway improvements associated with those alternatives, it would be necessary to reduce the length of the runway by about 50 percent. Such a reduction would be contrary to the basic design and function of the runway, and therefore would be infeasible.

SPAS-PC00130-633

Comment:

Avis Rental Car - Anything to finally get a Conrac

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-PC00130-634

Comment:

Burger King - How much does buying this business cost? Does LAWA currently own this property? What other property does LAWA currently own?

Response:

As noted on page 2-56 of the SPAS Draft EIR, LAWA owns the property currently occupied by a Burger King restaurant. LAWA does not own the restaurant; it operates under a lease. LAWA would not be required to purchase this business as the property is already owned by LAWA. Property owned by LAWA is illustrated by the property boundaries identified in Figure 1-2 of the SPAS Draft EIR.

SPAS-PC00130-635

Comment:

Travelodge Hotel 2-57 What airport facilities would replace the businesses? Would LAWA allow these businesses to open on the other property owned by LAWA?

Response:

The Travelodge Hotel is located in the southwest corner of Manchester Square. Under Alternatives 1, 2, 3, 8, and 9, this parcel would be used for ground access facilities. There are no plans to relocate the Travelodge to another airport-owned parcel. Please also see Response to Comment SPAS PC00130-615 for further discussion of the Travelodge Hotel.

SPAS-PC00130-636

Comment:

2.3.11 Acquistion 2-57
We have been told over and over again in public meetings that no Acquistions would be necessary. Who is responsible for saying this? What is LAWA's plan to accommodate the 493 employees who will have lost their jobs

Response:

Regarding analysis of property acquisition impacts on the Westchester community associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. No acquisition is proposed within the Westchester community, as shown in Figure 2-11 and listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR.

During the course of the public meetings held on August 25, 28, and 29, 2012, LAWA received several inquiries as to whether acquisition of homes and businesses in the Westchester community is proposed

under any of the SPAS alternatives. LAWA staff answered that question by correctly indicating that no acquisition is proposed within the Westchester community.

Section 2.3.1.11 of the SPAS Draft EIR delineates and describes the properties proposed to be acquired under each SPAS alternative, none of which include properties in Westchester. Section 4.7.2 of the SPAS Draft EIR addresses potential impacts associated with the relocation of runway safety zones (RPZs) and other safety areas under each alternative, and delineates the specific parcels that would fall within the RPZ under each alternative, including parcels within Westchester. The SPAS Draft EIR impacts analysis indicates that should incompatible structures or uses within the RPZ be determined to pose a safety risk, as assessed at more detailed levels of planning in consultation with the FAA, there are several options for addressing such risks, one of which is the removal of the structure or use. The acquisition of properties within RPZ areas is not proposed, nor is it a certainty, under any of the SPAS alternatives. The majority of the parcels, and uses therein, located within the RPZ areas under the SPAS alternatives have been within the existing runway RPZ area for decades. Information on specific options to address safety risks would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

In the event that it is determined in the future that relocation of an existing business is necessary, impacts associated with acquisition of the property and relocation of the business would be addressed in future project-specific CEQA documents, by LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measure MM-RBR-1.

Regarding the potential for job loss due to acquisition, CEQA does not require job losses and other purely social or economic impacts to be analyzed in an EIR (State CEQA Guidelines Section 15064(e). Nevertheless, as described in Section 4.9.6 of the SPAS Draft EIR, businesses proposed for acquisition under Alternatives 1, 2, 3, 4, 8, and 9, would be eligible for relocation assistance as described in LAX Master Plan Commitment RBR-1, and LAX Master Plan Mitigation Measures MM-RBR-1 and MM-RBR-2, thereby minimizing adverse economic impacts. The number of employees (493) referenced by the commentor was derived from the total number of employees listed in Table 2-4 in Section 2.3.1.11 of the SPAS Draft EIR; however, as shown in Table 2-5 in Section 2.3.1.11 of the SPAS Draft EIR, the acquisition of all of these areas would only occur under Alternative 3. Under Alternatives 1, 2, 4, 8, and 9, fewer parcels would be acquired and therefore fewer employees would be affected. Acquisition under any of the alternatives would be addressed by the LAX Master Plan commitment and mitigation measures noted above, which would provide both compensation and relocation assistance for business owners, and efforts may be taken to move businesses into airport-owned property or developments if feasible.

Comment:

Comments and Questions concerning Lincoln Boulevard Re-Alignment in Alternatives 1, 5, and 6.

In addition to these questions, there are further detail and more questions in the attached Letter from Bureau of Sanitation and the ARSAC White Paper: PROGRAM LEVEL VS PROJECT LEVEL EIR ANALYSIS RE: THE LINCOLN BLVD. TUNNEL PROJECT

1. Based upon the attached Bureau of Sanitation letter dated September 14, 2012, will LAWA be impacting any sewer lines? Which sewer lines will be impacted? How will LAWA mitigate these sewer lines? Considering that the three outfall lines running under LAX to the Hyperion Treatment Plant provide almost all of the sewage treatment capacity for the City of Los Angeles and some adjoining cities, is the risk of realigning Lincoln Blvd by LAWA too great as to prevent Angelenos from flushing their toilets?
2. Is the proposed Lincoln Blvd realignment in Alternatives 1, 5 and 6 a Program Level EIR or a Project Level EIR? Please see the White Paper for a detailed analysis. Please explain your answer with relevant citations from CEQA.

3. Which agencies has LAWA consulted with regarding the proposed Lincoln Blvd realignment?
a. Was CalTrans consulted? What was their response? Who at CalTrans was contacted and who from CalTrans replied?
b. Was the Los Angeles Department of Water & Power consulted? Who was contacted and who from LADWP replied?
c. Was the Bureau of Sanitation contacted? Who was contacted and who from LADWP replied?
d. Were oil pipeline operators contacted? Who was contacted and who from the oil pipelines replied?
e. Were fiber operators contacted? Who was contacted and who from the oil fiber operators replied?
f. Were other underground utilities or right of way users contacted? Who was contacted and who from the oil fiber operators replied?
4. Does LAWA face any challenges with regards to outfall sewers or abandoned sewer lines in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
5. Does LAWA face any challenges with regards to water lines in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
6. Does LAWA face any challenges with regards to storm drains in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
7. Does LAWA face any challenges with regards to electrical lines in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
8. Does LAWA face any challenges with regards to fiber lines in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
9. Does LAWA face any challenges with regards to other subsurface users of the road or right-of-way in relation to a proposed realignment of Lincoln Blvd? How will LAWA mitigate those challenges?
10. Is the proposed Lincoln Blvd realignment considered to be a minor street modification, an improvement or something else? Please explain your answer.
11. In the Light and Glare section, why does LAWA discount the significance of possible light and glare problems by proposing to move Lincoln Blvd 350 feet closer to homes, schools, churches and businesses.
12. In the Air Quality Section 4.2 (beginning page 4-88), why is the proposed Lincoln Blvd realignment not listed as a construction area?
13. In the Cultural Resources Section 4.5 (beginning page 4-337), the memorial marker for LAWA Police Office Tommy Scott on Lincoln Blvd is not listed. On April 29, 2005, Officer Scott was the first LAWA officer killed in the line of duty. Since LAWA has not listed the memorial marker on the maps, it is not clear if the proposed Lincoln Blvd realignment would affect access to this location. What mitigation measures does LAWA propose to preserve access to the Tommy Scott memorial marker?
14. In the Green House Gases Section 4.6, why did not LAWA study old petroleum lines? Why did not LAWA study old sewer lines that in some cases date back to the 1920's?
15. In the Hydrology Section 4.8, the intersection of Lincoln and Sepulveda was not studied as a hazard? Why in Section 2.3.1.1, Acquisition, did not LAWA list Lincoln and Sepulveda as a potential acquisition?
16. On page 4-988, why is there no impact measured for transit vibration? Lincoln Boulevard is a major highway and carries significant transit, public and private.
17. In the Utilities Section 4.13, why are the utilities underneath Lincoln and Sepulveda discussed and examined?
18. Creating a new tunnel brings all kinds of new and interesting problems, not just from construction, but also operation. This series of questions relates to the proposed tunneling of Lincoln Blvd.
a. Will the tunnel height restrict certain vehicles from entering?
b. If there are height restrictions where will trucks go to get around the tunnel? (Probably Sepulveda and Manchester)
c. Will there be hazardous materials restrictions for the tunnel?
d. How will the tunnel be ventilated? Who will operate and maintain the ventilation system?
e. Will there be emergency evacuation areas or exits? How many and where? Will there be call boxes?
f. Which agency or agencies will respond to accidents and emergencies in the tunnel?
g. Will there be traffic controls such as stoplights and electronic signage to warn drivers not to enter the tunnel? Will the electronic signage offer alternate routes? What will those alternate routes be?
h. Will LAWA consult with LAWA Police Department, LAPD, LAFD, CHP, the FAA, TSA and other relevant agencies for preventing the tunnel from becoming a terrorist target?
i. The Sepulveda Tunnel is dirty from automobile pollution and graffiti. What are the plans to clean the proposed Lincoln Boulevard tunnel on a regular basis?

ARSAC WHITE PAPER-
PROGRAM LEVEL VS PROJECT LEVEL EIR ANALYSIS
RE: THE LINCOLN BLVD. TUNNEL PROJECT

INTRODUCTION AND SUMMARY

The SPAS Report and DEIR recently released by LAWA purports to be a Program Level EIR, not a Project Level EIR, despite the fact that numerous specific projects are identified including an automated people mover, consolidated rental car facility, movement of taxiways and runways on the airfield and modernization of terminals.

This white paper is written to examine one of the projects specifically identified in the documents in the context of the Program versus Project Level EIR debate.

The specific project considered herein is the realignment of Lincoln Boulevard to accommodate the move northward of the outboard runway of LAX. This project will in effect swing Lincoln Boulevard, California State Route 1, on a wider arc around the airfield, bringing it much closer to homes, businesses, churches, schools and other sensitive uses in the Westchester community. It will also require that Lincoln be depressed below grade into a tunnel of a length that will depend on the extent of the runway move. A cost estimate in the SPAS Report puts the cost of this project in excess of $1billion with many elements admittedly not included. A cost figure three or four times larger would be more realistic.

This white paper does not undertake to study all aspects of the runway move. A similar white paper could be written about the implications of converting the Argo Trench to a box culvert or the elimination of the old tunnel that still exists under the north airfield.

Three of the alternatives proposed by LAWA would involve extending the perimeter fence of LAX hundreds of feet into the community and realigning and tunneling Lincoln Boulevard, California State Route 1. All would involve realigning and tunneling Lincoln Blvd.

Alternative 1 relocates runway 6L/24R, the outboard runway of the north airfield, 260 feet to the north; Alternative 5 relocates this runway 350 feet to the north; and Alternative 6 relocates this runway 100 feet to the north. Each of these alternatives requires that 6080 feet of Lincoln Blvd. be realigned and each would require that it be depressed into a tunnel. In the case Alternative 1, the tunnel would be 252 linear feet; Alternative 5 would require a 765-foot tunnel; and Alternative 6 would require a 540-foot tunnel.

In contrast to Alternatives 1, 5 and 6, Alternative 2 would not require moving the LAX perimeter fence or realigning and tunneling Lincoln Blvd.

The subject of Program Level versus Project Level EIR's is dealt with the California's CEQA Guidelines. Under the regulations stated therein, a Program Level EIR may be used to adopt a general plan for the conceptual planning of a district or area. It is designed to provide some level of analysis of "future and unspecified development" (CEQA Guideline 15146(b).

In summary, this white paper demonstrates that the realignment and tunneling of Lincoln Blvd. is a specific, tangible, identified project, not a "future and unspecified" project. A high level of technical analysis has been performed on the project, far more than the "conceptual planning" sanctioned by the Guidelines for a Program Level EIR.

The DEIR and SPAS Report analyze the Lincoln Blvd. project in significant detail including its alignment, length of tunneling and sloping, and cost. Doing so reveals that a "project", not a "program" is being proposed. Having opened the door of technical analysis, LAWA is obligated to perform the analysis completely and accurately. LAWA cannot escape the effects of faulty, incomplete, misleading and inaccurate analysis by claiming only a "program level" analysis is required.

The opinion expressed herein is that LAWA cannot have its cake and eat it too. It cannot disclose innocuous or general details and conceal specific details that reveal serious flaws. It cannot calculate

and state the costs of a project without including all of the costs. And it cannot identify some of the impacts of the project without revealing all of the impacts.

One does not need to be a civil engineer to discern that if LAWA is able to calculate the exact length of the tunnel required for the realigned Lincoln Blvd., then it must know Lincoln's proposed path including how much closer it will be to residences, businesses, schools, churches and other sensitive uses. It must also know how deep below surface level the tunnel must be placed including the extensive web of oil and gas pipelines, outfall sewers, water, electrical, fiber optic and other subsurface facilities which will have to be identified, located, and relocated as a result of the project. None of these factors are addressed in the DEIR or SPAS Report.

Having clearly revealed that it has taken the Lincoln Boulevard realignment project past conceptual planning and into preliminary engineering, LAWA must be forced by either community outcry or by court decree to treat the outward expansion of the LAX perimeter fence and the realignment and tunneling of Lincoln Boulevard as a project which can only be entitled by means of a project level EIR.

During the scoping phase of the SPAS process, numerous comments were offered asking that the subsurface structures below Lincoln and Sepulveda boulevards be studied. The failure to do so, or the failure to disclose the result of doing so, constitutes a fatal flaw in the DEIR.

A word about the real-world context of this program versus project level debate: Gina Marie Lindsey and other advocates for moving the north runway 24 Right to the north are openly and repeatedly refusing to defer the issue of the movement of the runway to a later time when more is known about LAX's passenger levels and the success or failure of the New Large Aircraft which the runway move is designed to accommodate. They are declaring that no other projects at LAX can be planned or implemented until the location of the runway is established. Clearly, this statement reveals that a program level EIR is simply not what LAWA needs at this time. At this time LAWA needs and should produce a Project Level EIR to move the runways. If LAWA has determined that the runway move and the attendant realignment and tunneling of Lincoln Blvd. is the lynchpin for all other LAWA projects, then it should withdraw the Program Level EIR, isolate the runway/Lincoln Blvd. project, study it thoroughly and circulate a project level DEIR which discloses and adequately studies all elements of the project.

WHITE PAPER METHODOLOGY

At page 4-3 of the DEIR LAWA quotes CEQA Guideline 15146(b) to the effect that a program level EIR should "provide an effective means of delineating and comparing and contrasting the overall characteristics, performance levels and environmental impacts of each alternative."

With respect to the runway relocation proposed for the LAX north airfield, this means that sufficient information must be given to compare and contrast Alternatives 1, 5 and 6 which would move the runway to Alternative 2 that would not.

This whitepaper will review both the SPAS Report and the DEIR on this issue. It will identify both what LAWA has disclosed and what it has not disclosed about the Lincoln Blvd. realignment and tunnel project.

The SPAS Report will be considered first. The SPAS Report states the study requirements agreed to by LAWA in the settlement agreement and gives background information and data which are a useful as a starting point for the consideration of the legally mandated and court enforced Environmental Impact Report.

The DEIR is organized, as required by the Guidelines, in terms of thirteen categories of environmental impact such as Aesthetics, Air Quality, etc. Within each such category the DEIR gives general background followed by a specific discussion of each of the nine alternatives. Within the discussion of each alternative there is a heading "Northern Boundary" within which the Lincoln Blvd. realignment is discussed. Within the "Northern Boundary" discussion is a section dealing with impact during operation and impact during construction. Hence each of the thirteen areas of environmental impact is outlined as follows:

- Environmental Impact category
  - General background
  - Specific alternative
    - Northern Boundary issues
      - Operational impacts
      - Construction impacts

The balance of this white paper will review and discuss LAWA's treatment of the Lincoln Blvd. realignment and tunnel project.

REVIEW OF THE "PRELIMINARY LAX SPECIFIC PLAN AMENDMENT STUDY REPORT"

At pages 1-4 through 1-16 SPAS Report basic descriptions of the nine alternatives are given together with diagrams of each. For Alternatives 1, 5 and 6, the "distinguishing airfield improvement feature" is said to be the northward movement of runway 6L/24R 260 feet, 350 feet and 100 feet respectively.

The narrative description of these three alternatives gives no indication that a necessary element of the runway move is the expansion of the airfield and the realignment and tunneling of Lincoln Blvd. Only in a small note on the diagrams is this revealed. A member of the public trying to understand LAWA's intentions would reasonably believe that the narrative would accurately describe the project and would not omit such a significant component as the complete realignment of Lincoln Boulevard, California State Highway 1.

After an extended review of the history of the LAX Master Plan and the SPAS process, Section 5.5 of the Report begins the discussion of the current, on-the-ground situation as LAX. This section, which begins at page 5-79, is entitled Refinement Of Second Iteration of SPAS Concepts.

At page 5-105 the following passage concerning Lincoln Boulevard appears:

Lincoln Boulevard
Similar to the Argo Drainage Channel, relocation of Runway 6L/24R to the north would place portions of Lincoln Boulevard within the RSA and/or OFA. Consequently, new alignments of Lincoln Boulevard were developed (including covered and below grade sections) in order to comply with FAA standards. Concepts with greater runway separation would require portions of the alignment to be covered and below grade.

The conceptual alignments are provided in Section 5.6 beginning at page 5-110. Major elements of each of the nine alternatives are placed into one of three categories: "airfield improvements," "terminal improvements" or "ground access improvements." The Lincoln Blvd. realignment is placed in the "airfield improvements" category and the issue is framed thus:

The extent to which the Lincoln Boulevard and the Argo Drainage Channel would have to be modified in order to accommodate a northerly shift in the alignment of Runway 6L/24R;

A strong argument can be made that it is highly misleading to characterize tunneling and realigning more than a mile of Lincoln Blvd. thereby taking it hundreds of feet closer to sensitive uses as a "modification."

Section 5.7 of the Report sets forth numerous alternatives that were "rejected" and not carried forward in SPAS. The fact that many of those alternatives had great potential for achieving the purposes of SPAS with less community impact than expanding the LAX fence line and realigning Lincoln is not the subject of this whitepaper, but should be noted.

Section 6, SPAS ALTERNATIVE PROJECTS, constitutes the real substance of the Report.

The three goals of SPAS are recited at page 6-1, one of which is to achieve 78.9 million annual passengers. At page 6-3 passenger counts for the years 2007 through 2011 are given.

Discussion of Alternative 1 begins at page 6-12. At page 6-13 the following appears:

Relocate Lincoln Boulevard northward between Sepulveda Boulevard and Westchester Parkway, and depress the eastern portion of the road segment to be compatible with the object free area requirements for the east end of Runway 6L/24R, which would require approximately 540 linear feet of the road segment to be tunneled.

Discussion of Alternative 5 begins at page 6-51, and the following appears at page 6-52:

Relocate Lincoln Boulevard northward between Sepulveda Boulevard and Westchester Parkway and depress the eastern and western portions of the road segment to be compatible with the object free area requirements for Runway 6L/24R, which would require approximately 765 linear feet of the eastern portion of the road segment to be tunneled.

The following appears at page 6-52:

With the combination of the runway improvements (including the easterly extension of Runway 6R/24L and improvements to 6L/24R), associated improvements to Lincoln Boulevard and the Argo Drainage Channel, and establishment of displaced thresholds, the Alternative 5 north airfield configuration would be fully compliant with FAA RSA standards for Runways 6L/24R and 6R/24L, addressing hazards relating to the potential for aircraft to overshoot, undershoot, or experience excursions from the runways.

Just as it is a misrepresentation for LAWA to characterize realigning Lincoln Blvd. for more than a mile and tunneling it for more than 750' as a "modification," so too is characterizing this very large project as a mere "improvement."

A serious question will be whether Caltrans will consider the conversion to a tunnel and the realignment of California State Route 1 by more than a mile to be a minor street "modification" or "improvement." Apparently LAWA considers the permitting of the "Lincoln Boulevard Realignment and Tunnel Project" to be a mere detail to be handled by staff at a later date.

Discussion of Alternative 6 begins at page 6-57, and the following appears at page 6-58:

Relocate Lincoln Boulevard northward between Sepulveda Boulevard and Westchester Parkway and depress the eastern and western portions of the road segment to be compatible with the object free area requirements for Runway 6L/24R, which would require approximately 252 linear feet of the eastern portion of the road segment to be tunneled

As was the case in its discussion of Alternative 1 and 5, the realignment and tunneling of Lincoln Blvd. is labeled "an improvement."

In stark and simple contrast to the expand-the-airfield, tunnel-and-realign-Lincoln approach of Alternatives 1, 5 and 6, the following is stated about Alternative 2 at page 6-34:

Improvements associated with Runway 6L/24R under this alternative, including connecting taxiways, are different than Alternative 1. Because there would be no northerly relocation of Runway 6L/24R under Alternative 2, it does not require the modifications to the Argo Drainage Channel (other than those required under existing conditions to meet federal RSA requirements) and Lincoln Boulevard described above for Alternative 1.

For purposes of this whitepaper this ends the relevant narrative discussion of the SPAS alternatives (although Report Chapter 8 on dollar costs awaits), and the question can be posed, has LAWA fairly described the alternatives and allowed a member of the public who simply wants to understand this important infrastructure project to compare and contrast the alternatives? Asked in another fashion, does characterizing the realignment of Lincoln Boulevard by hundreds of feet and its depression into a tunnel for as much as 765 linear feet as a "modification" or an "improvement" accurately portray what LAWA intends to do? The question answers itself.

The financial underpinnings of LAWA's much desired expansion is strategically placed where LAWA obviously wants it, at the very end before which most members of the public will long since have given up. In fact, Chapter 8, Financial Analysis, is exceptionally informative and, not surprisingly, misleading.

Sections 8.1 through 8.3 provide discussion of LAWA's governance structure, accounting and cost center structure, governing bond documents, and key business agreements. Section 8.4 sets forth key assumptions. All make for interesting reading.

However it is Section 8.5, Estimated Alternative Costs, Section 8.6, Approximation of Funding Sources", and their associated Table 8-1 that are of interest herein.

Section 8.5 incorporates an earlier discussion about the dollar cost of other, non-SPAS planned projects at LAX. A total of $6.5 billion is planned to be spent at LAX on non-SPAS projects. Of this amount $2.1 billion is currently in construction with $4.4 billion in the planning phase. Examples of projects in planning are the Midfield Satellite Concourse, renovations to existing terminals and the ongoing soundproofing program.

Now, on to the cost of SPAS and the Lincoln Blvd. Realignment and Tunnel Project:

To review the Report's analysis of the cost of SPAS one must turn his or her laptop a quarter turn clockwise and rest it on its right side because Table 8-1 is in landscape, not portrait, format and LAWA has made precious few hard copies available. For one reviewing the report on a desktop computer, you will need to rest your left ear on your desk and just do the best you can. The fact the font is nearly invisible and the size is in the 2 to 3 range does not help.

Table 8.1 is a summary of costs associated with each of the SPAS alternatives. Directing attention to the table for Alternative 5, one learns the following. The cost of the airfield component of Alternative 5, which is the component that includes expanding the airfield and realigning and tunneling Lincoln is said to be $808,660,000 in 2010 dollars or $1,099,792,000 in escalated dollars. Rounded that is $800 million if the projects had been built two years ago and $1.1 billion if the projects broke ground this year. Of course it is impossible to predict what it will cost if the work commences in 2025, the earliest year it is predicted LAX will actually reach 78.9 MAP, so we will work with $1.1 billion.

Table 8.1 states that the total escalated cost of Alternative 5 including terminal and ground access improvements to be $9,091,629,000 and the total identified funds available to be $3,601,629. The wisdom of undertaking a program that is underfunded by two-thirds is beyond the scope of this whitepaper, but is alarming.

In clear contrast to the cost estimates for Alternative 5, airfield improvements for Alternative 2 are estimated to be $205,200,000 in 2010 dollars and $279,760,000 in escalated dollars. Thus, the cost of Alternative 2 is approximately three percent (3%) of Alternative 5.

What follows in Chapter 8 is a number of charts and graphs that provide visual representations of the costs of various alternatives with and without various other alternatives concluded. Each is based on the specific dollar figures previously stated.

Where did these specific dollar figures come from? The answer to that question is buried even deeper in the Report in Appendix G, Preliminary Rough Order of Magnitude Cost Estimates. (On your way to Appendix G be sure and stop off at Appendix F that shows that LAWA achieves NO significant operational efficiencies by any of its proposed airfield modifications.)

Table AF-1 of Appendix G purports to summarize cost of the airfield improvements of the various alternatives. The cost of realigning and tunneling Lincoln is explicitly not included but the cost of removing the abandoned tunnel under the north runway and the cost of converting the unlined Argo Trench to a concrete box culvert are included. The cost of airfield improvements for Alternative 5 is placed at $716,700,000. The cost of airfield improvements for Alternative 2 is stated to be $205,200,000.

Parenthetically it can be noted that in addition to the cost of realigning and tunneling Lincoln, the following costs are identified in a footnote as not included in these estimates: site clearing, roadway work and facility demolition in support of Taxiway D and E work; security fence and guard post costs; right-of-way and land acquisition costs; costs of the Community Benefit Agreement or costs for the Mitigation Monitoring Plan; project phasing costs; tenant relocation costs; off-airport property acquisition and relocation costs; or mitigation costs of for the Lincoln (Park West) Apartments or 8939 S. Sepulveda office building. Cost of these items is left to the public's imagination.

Following summary Table AF-1 is seven pages of tightly constructed and very detailed estimates of the cost of moving runway 6L/24R. Examples of the level of detail achieved in the underlying cost estimate are "Removal of runway concrete pavement 19" thick", "Removal of shoulder asphalt 4" thick" and "Removal of Econocrete 12" thick."

Following the detailed seven page estimates to move the runway is our target prize: The estimated costs to realign and tunnel Lincoln Blvd.

Table AF-3 summarizes the cost to realign and tunnel Lincoln Blvd. as follows:
- Alternative 1 - $61,210,000
- Alternative 5 - $89,960,000
- Alternative 6 - $45,290,000

The cost to realign and tunnel Lincoln Blvd. for Alternative 2 is zero of course.

Following summary Table AF-3 are five pages of detailed estimates for the specific cost items of realigning Lincoln Blvd. including such items as "water for compaction" ($15,000), "base course 8" thick" ($208,000), and "subbase course 12" thick" ($216,000).

At this point the question posed at the very top of this whitepaper can be restated: Can it be fairly said that LAWA is only engaged in "conceptual planning" when it has obtained an estimate for 8" thick course base at $208,000 and for 12" thick subbase at $216,000. It is a remarkable "program level" EIR which includes an estimate for the precise amount of subbase required.

Table AF-4 is similarly illuminating of the level or project work completed by LAWA to date. This table states quite precisely the exact number of feet that will be flat, sloped, depressed and in a tunnel for all of the potential runway moves. For example, Table AF-4 indicates that if runway 6L/24R is moved 300 feet, then 6080 feet (more than a mile) of Lincoln Blvd. will be rerouted of which 350' will be in a tunnel, 600' will be "sloped" and 280' will be depressed and 4,850' will be flat. (It might be noted that the tunnel lengths listed in Exhibit G, Table AF-4 seems to be far off from the tunnel lengths listed in the body of the Report).

Is LAWA simply engaged in "conceptual planning?" Hardly.

Exhibit G in total is 56 pages of tightly constructed estimates for very specific projects pertaining to airfield modifications, terminal improvements, and ground access improvements including the Automated People Mover (APM) and the Consolidated Rental Car Facility (CONRAC).

"Conceptual planning" for a master plan involves favoring bike paths and housing near transit stations. It does not include a calculation the cost of concrete subbase 12" thick.

CONCLUSIONS TO BE DRAWN FROM CONSIDERATION OF THE PRELIMINARY LAX SPECIFIC PLAN AMENDMENT STUDY REPORT

Simply stated, LAWA has placed itself uncomfortably on the horns of a dilemma. Otherwise stated, it has hoisted itself on its own petard.

It has claimed that what it seeks is a "Program Level" EIR such as would occur in a community's broad general or zoning plan at the "conceptual planning" stage. And yet it is quite clear that it has gone far, far past "conceptual planning" and is deeply into preliminary engineering on a specific, project-by-project basis.

In recent conversations with Westchester and Playa del Rey community members, LAWA Executive Director Gina Marie Lindsey has been asked whether she would be willing to move forward with the terminal modernization projects and the ground access projects before LAWA proceeds with the airfield projects. Considering the limited acceptance and safety problems faced by the New Large Aircraft (NLA), the sluggish world economy and the "restrained" at best growth in traffic at LAX, such a question is justified.

Ms. Lindsey's response has been clear, unambiguous and simple: No, we can't move forward without knowing what is going to happen with the north airfield.

The community's response to Ms. Lindsey should be equally clear, unambiguous and simple. We believe it is the same answer she will receive in Court: If you want a specific project such as moving the runway and realigning and tunneling Lincoln Boulevard, then do a Project Level EIR. If the world of LAX revolves around one project, that being moving the runway, then all other projects should be put aside and the runway project should be resolved. Don't try to obtain a backdoor approval or confuse the public by throwing in community-serving projects which you have no intention of delivering. Withdraw the "program level" DEIR and prepare a "project level" EIR forthrightly stating that you seek to move the runway and realign and tunnel Lincoln.

Perhaps the expression that should be used in characterizing the Report should not refer to dilemmas or petards. What it is, is "neither fish nor fowl." It is far too detailed and advanced to be considered as a program level EIR and yet it falls far short of what would be necessary to be approved as a project level EIR.

POSTSCRIPT TO CONCLUSIONS TO BE DRAWN FROM CONSIDERATION OF THE PRELIMINARY LAX SPECIFIC PLAN AMENDMENT STUDY REPORT

Back to Exhibit G, Table AF-3, the cost breakdown to reroute Lincoln.

The Sepulveda Boulevard right of way is an old and historic one in Los Angeles. It was not always as urbanized as it is now. For many years it was the main route for subsurface pipelines to transport oil from the oilfields in the Baldwin Hills to the refineries in the South Bay including the Chevron refinery in El Segundo and the Mobil refinery in Torrance. It is still in use today for that purpose.

In more recent years one of the City of Los Angeles most important facilities was constructed and recently modernized, that being the Hyperion waste treatment plant in Playa del Rey immediately south and west of LAX. Fed by outfall sewers as much as 20' in diameter, Hyperion treats and disposes of tons of raw and treated sewage daily. The path of the outfall sewers: through Culver City and Westchester intersecting Sepulveda and Lincoln boulevards around LAX.

The major underground pipelines are all in addition to the innumerable public utility and private entity cables and pipes under the Sepulveda corridor at its intersection with Lincoln.

The spider web of pipes under Sepulveda Boulevard has been well known to the community for many years. Longtime Sepulveda property owner and civic activist Howard Drollinger knew it well and spoke of it often.

LAWA steps onto a very slippery slope when it undertakes to expand its campus and depress Lincoln Blvd. into a tunnel in this area, particularly considering that when it moved the southernmost runway it discovered a runway ON ITS OWN CAMPUS that it had no record of. This runway was a north-south runway that had existed behind the west side of the Tom Bradley International Terminal. Westchester Golf Course was the Runway Protection Zone (RPZ) for this former runway.

Not one word in the SPAS Report concerning the realignment and tunneling of Lincoln indicates that the underground situation around the Lincoln/Sepulveda intersection has been carefully studied. And the estimates to reroute Lincoln set forth in Exhibit G, Table AF-3 give no comfort, it appearing that the estimate contains no allowance for the discovery or relocation of such facilities. Third-party agreements

are a major cost item for such projects and yet Table AF-1 specifically indicates that costs for right of way and land acquisition are NOT included in the cost estimates.

The fundamental purpose of the Scoping process is to advise the project sponsor of items which must be carefully studied. If by some stretch of the imagination LAWA didn't know that it needed to study facilities under Lincoln and Sepulveda boulevards, it was certainly advised to do so in many comments and written correspondence during the Scoping process.

During the scoping phase of the CEQA effort numerous individuals and entities, including ARSAC requested that the subsurface conditions and structures in the Lincoln/Sepulveda intersection area should be carefully studied. The SPAS Report fails to show that this has been done. Nevertheless, Appendix G purports to give a cost estimate to realign and tunnel Lincoln Blvd. Having opened the door to a consideration of cost, LAWA cannot omit from consideration an element so important and costly and utility identification and relocation. To fail to study and/or disclose this cost item is to mislead and indeed deceive the public and public policy officials. While the question of whether this misrepresentation is intentional or inadvertent may be open to debate, the FACT that it IS a misrepresentation is not.

LAWA has either not studied a significant environmental issue or it has intentionally withheld the results of the study from the public. In either case, the DEIR should be withdrawn, re-scoped, properly prepared and re-circulated.

REVIEW OF THE DRAFT ENVIRONMENTAL IMPACT REPORT

The preceding sections of this white paper, with a few digressions, dealt with two questions:

First, can the mistakes and omissions in the two documents LAWA is currently circulating be overlooked because it is only a "program level" efforts. As demonstrated, LAWA is pursuing a very specific project, namely the movement of the northernmost runway 350' north and the realignment and tunneling of Lincoln Boulevard. For this project precise dimensions and costs have been calculated. A project level EIR should and must be done for this project.

Second, has LAWA met its obligations to study all relevant and significant issues raised in the Scoping sessions for the project? Using as a test case the issue of subsurface structures under Lincoln and Sepulveda boulevards where LAX would be tunneling, this obligation has not been met and LAWA's effort is flawed at least based on a review of the Preliminary LAX SPAS Report. Having failed to consider the cost of identifying and relocating major subsurface facilities and structures, LAWA's cost estimates, already gruesomely underfunded, become laughably worthless.

The question now presented is simple: Having failed in the Report to show that this significant topic was studied, does the DEIR go further or otherwise indicate that the issue has been considered by LAWA? The answer is no, and as a result the DEIR itself is fatally flawed.

WHITE PAPER METHODOLOGY RE DRAFT EIR

If the challenge in this section of the white paper is to determine whether LAWA has studied the subject of subsurface structures and facilities below Sepulveda and Lincoln boulevards, then perhaps the most direct approach would be to do a word search for such terms as "oil and gas," "petroleum pipelines," "outfall sewer," "Hyperion," "fiber optic cable," and "Dig Alert (811 service or Underground Service to locate underline pipelines and cables before digging into the ground)." This was not possible because LAWA did not enable the public to word searches on the online or disk versions of the Draft EIR and SPAS Report.

CEQA requires the EIR sponsor to specifically consider each of thirteen designated topics for each project alternative presented. Chapter 4 of the DEIR is LAWA's effort to meet this requirement. For each of the thirteen areas LAWA gives an Introduction, discussions of Methodology, Existing Conditions, Thresholds of Significance, and Master Plan Commitments and Mitigations followed by a review of each of the nine alternatives. The DEIR further divides each topic into a discussion of construction impacts and operational impacts once the project is completed.

If LAWA studied and reported on the impact of subsurface structures under the Lincoln/Sepulveda intersection then one would certainly think that it would be revealed in its comments about Alternative 5 which would relocate runway 6L/24R 350' north. Hence, the methodology used herein is to review LAWA's discussion of each of the thirteen study areas focusing on the Alternative 5 portion of the discussion. Particular attention is given to the Transportation (4.12) and Utilities (4.13) sections that would seem to be the logical locations for consideration rerouting and tunneling Lincoln Blvd.

REVIEW OF ALTERNATIVE 5 DISCUSSION IN DEIR

AESTHETICS, Section 4.1 of the DEIR

The discussion of the impact of the nine alternatives on area Aesthetics commences on page 4-6 and limits itself to consideration of "aesthetic qualities, views and lighting conditions at LAX and surrounding areas." Certainly one would assume that Caltrans would require Lincoln Blvd., California State Route 1, to have very bright overhead lighting at all times. Further, impacts of a major construction site including staging and laydown areas could be expected to be significant. Hence, one would assume moving Lincoln Blvd. 350' closer to the residential community would have significant implications for light and glare.

Discussion of the impacts of Alternative 5 begins at page 4-63 with the light and glare impacts beginning at page 4-65. At page 4-66 the following appears:

Therefore, these improvements would not result in a change in lighting or lighting intensity such that light would spill off and affect light-sensitive areas, and would not result in a substantial new source of glare which would adversely affect nighttime views in adjacent areas sensitive to glare, and thus associated light and glare impacts along the northern boundary would be less than significant.

Increases in light and glare from rerouting more than a mile of Lincoln Blvd. and constructing a tunnel are similarly brushed off with:

Construction Fencing, impacts associated with light and glare during construction would not result in a change in lighting or lighting intensity such that light would spill off and affect light-sensitive areas, and would not result in a substantial new source of glare which would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, construction light and glare impacts would be less than significant.

Thus, the Aesthetic impact, including light and glare impacts of rerouting more than a mile of Lincoln Blvd. including relocating oil and gas pipelines, utilities and a major sewer structure are viewed as less than significant.

AIR QUALITY, Section 4.2 of the DEIR.

The discussion of Air Quality impacts begins at page 4-83 of the DEIR. Two Air Quality impacts seem obvious for study, those being (1) the impact of routing Lincoln Blvd. 350' or more closer to homes, business, schools and churches, and (2) the impact of using very heavy construction equipment to unearth and expose oil and gas pipelines, utilities and sewer facilities.

The complete failure of the DEIR to study and report on the implications of realigning Lincoln for more than a mile and tunneling for 765' can be seen at page 4-88 where the following elements of the program are identified as studied:

Construction activities were assumed to be located on the north airfield and at the north terminals, in the Central Terminal Area (CTA), at Manchester Square, in the current Parking Lot C, at the proposed Intermodal Transportation Facility (ITF) site just south of Lot C, on the east side of Aviation Boulevard south of Century Boulevard, on the Automated People Mover (APM) routes along Century Boulevard and 98th Street, and on the west side where batch plant operations permitted by the SCAQMD and USEPA and project support activities could occur. The analysis was conducted using normalized emissions rates (1 gram per second) for each construction source area to determine the concentration-

to-emission ratio (X/Q) at each receptor for each source or source group. This X/Q ratio for a given source or source group were multiplied by the estimated emissions for a specific pollutant to obtain that pollutant's concentration at each receptor for the given source or group. The results for all sources in a given alternative were summed for each pollutant to obtain the project's construction activity contribution to ambient concentrations.

Quite apparently the large, high risk rerouting of Lincoln and extensive subsurface work in an area known to include high volume sewer lines and oil and gas transport lines in addition to large amount of standard subsurface utilities in a street in use for decades has not been studied in terms of Air Quality.

The discussions of Air Quality implications of Alternative 5, the most significant in terms of displacement of Lincoln and subsurface work appears at age 4-112 for post-construction air pollution and at page 4-118 for construction air pollution. In neither are the Air Quality implications of rerouting Lincoln for more than a mile even mentioned in passing.

BIOLOGICAL RESOURCES, Section 4.3 of the DEIR.

Discussion of the impact of the nine alternatives on Biological Resources begins on page 4-163, and the discussion of Alternative 5 on page 4-250.

While the DEIR discussion of the impacts of Alternative 5 at the west end of the airfield adjacent to Pershing Drive, no significant discussion appears about the impacts at the east end of the airfield near the Lincoln/Sepulveda intersection.

COASTAL RESOURCES, Section 4.4 of the DEIR.

Discussion of the impact of the nine alternatives on Coastal Resources begins at page 4-299, and the discussion of Alternative 5 on page 4-325.

While there could be storm water runoff impacts or other impacts on Coastal Resources from major construction at Lincoln and Sepulveda, other impacts are certainly far greater.

CULTURAL RESOURCES, Section 4.5 of the DEIR.

Discussion of the impact of the nine alternatives on Cultural Resources begins at page 4-337. Impacts of Alternative 5 with Historic implications appear on page 4-370. Impacts with Archeological implications appear on page 4-376.

As is the case in so many other sections of the DEIR, the Cultural Resource issue is dealt with as if the rerouting of Lincoln Blvd. swinging it further north towards many sensitive uses is ignored. It is as if LAWA failed to advise its CEQA consultants it was part of the project. Buildings older than 45 years must at minimum be inventoried. While the report makes mention of the Union Savings and Loan Building at 9800 Sepulveda, it makes no mention of numerous buildings along Sepulveda that are older than 45 years. If such nearby buildings are outside the technical boundaries of the study area such could be noted. Simply failing to even make mention of such buildings adds to the implication that LAWA is seeking to conceal the impacts of its massive, billion dollar-plus Lincoln/Sepulveda realignment and tunneling project.

GREENHOUSE GAS EMISSIONS, Section 4.6 of the DEIR.

Discussion of Greenhouse Gas impacts begins on page 4-385, and the discussion of impacts of Alternative 5 appears on page 4-407.

Because the methodology used to calculate Greenhouse Gas Emissions in the DEIR combines the impact of operations with the impact of construction and further combines airfield modifications with terminal and ground access impacts, isolating the effects of the Lincoln Blvd. realignment and tunneling project is virtually impossible.

Still, it would seem unearthing, opening and relocation of decades old petroleum lines would release significant greenhouse gas, both by the heavy equipment used in the process and by the pipeline and surrounding contaminated soil. Though not as old of construction, the same can be said for the major sewer lines in the area running to the Hyperion treatment plant.

This is a subject which LAWA should have studied, was asked to study, but apparently didn't study.

HAZARDS AND HAZARDOUS MATERIALS, section 4.7 of the DEIR.

Discussion of Hazards and Hazardous Materials begins on page 4-423, and the discussion of impacts of Alternative 5 appear on page 4-452.

The discussion in this section of the DEIR focuses primarily on the production of Toxic Air Contaminants (TAC) and the rate of cancer that results. This section of the DEIR uses two tricks used throughout to conceal and explain away the impact of locating, opening and relocating major petroleum, sewer and other underground facilities despite the apparent risk of release of toxic substances including explosive gases.

The first trick used is to hide behind the screen that "this is only a program level EIR."

Construction of any SPAS alternative is projected to take about 11 years. A detailed evaluation of TAC emissions during the construction phase cannot be accomplished until project-level information on construction staging is available. For purposes of the program-level evaluation in this EIR, possible construction emissions are estimated generically based on projected costs for the various alternatives. This approach provides sufficient information on the relative impact of construction emissions to analyze how important these emissions might be to incremental impacts of the SPAS alternatives. Detailed evaluation of construction impacts at the project level will be completed to help judge how construction impacts might vary from year-to-year as construction starts and moves through different phases across the airport.

If then LAWA is contending it can predict risk of exposure to cancer based on the "projected costs for the various alternatives", then those cost projections must be accurate. Refer to the sections of this white paper on the cost of the Lincoln Blvd. realignment and tunnel project in which numerous cost factors were declared to have been omitted intentionally and with other apparently simply "missed."

The second trick used is to combine cancel out the deleterious effects of air pollution caused by projects which LAWA intends to construct at any cost with the beneficial effects of ground transportation projects which LAWA has little if any intention or funds to construct.

In the discussion of health risks caused by Alternative 5, at page 4-452 it is claimed that the health risks constructing and operating State Route 1, Lincoln Blvd., 350 feet or more closer to residences, business, churches and schools is overcome by purported efficiencies in airfield operation, vehicle mix and transit facilities that are unfunded and probably will not be constructed.

And the public certainly should not ask for more information or detail. Recall, this is a program level, not a project level EIR.

Section 4.7.3 beginning at page 4-574 deals with Hazardous Materials, especially those that pose a risk to the personal safety of workers or the public or which risk groundwater contamination. At page 4-575 the following appears:

There are 32 sites at LAX where hazardous materials releases have resulted, or may have resulted, in groundwater and/or soil contamination. Of these 32 sites, seven have significant soil and/or groundwater contamination and are undergoing remediation activities under LAFD or RWQCB supervision.

This passage represents further proof, that while LAWA may have studied environmental issues on its own airfield in support of SPAS, it has not put forth a similar level of effort to study environmental issues, including hazardous materials, on the property that will be used for the realignment and

tunneling of Lincoln. For this DEIR to be credible LAWA must have as much knowledge about subsurface problems under Lincoln Blvd. and Sepulveda Blvd. as it knows about subsurface problems under the Central Terminal Area. LAWA has either not studied such subsurface conditions or it has studied them but is withholding the information. In either event, this DEIR is fatally flawed as a result.

Proof positive for this proposition appears at pages 4-592 and 4-593 where Hazardous Materials is discussed in the context of Alternative 5. While there is discussion of the construction in and around Terminals 1 and 2 and Taxilanes O and D, there is not one word about Lincoln and Sepulveda Blvds. and yet the construction in that area is the lynchpin of Alternative 5 and has a far higher cost factor than the taxilane work.

HYDROLOGY AND WATER, section 4.8 of the DEIR.

Discussion of Hydrology and Water begins on page 4-599. This introduction to the Hydrology section states its purpose as follows:

The hydrology analysis below addresses the potential for flooding to occur as a result of actions under any of the SPAS alternatives. The water quality analysis below addresses impacts to the quality of storm water runoff and dry weather flows as a result of actions under any of the SPAS alternatives.

Surely this is an excellent topic to study. What areas are then studied to learn this important information?

To compare baseline conditions with conditions under the SPAS alternatives, a single HWQSA was used. The HWQSA for this analysis includes the existing LAX property, the Manchester Square area, which is part of a voluntary property acquisition under LAWA's Aircraft Noise Mitigation Program, 413 and areas adjacent to LAX that would be acquired under certain of the SPAS alternatives (see Section 2.3.1.11 for description of acquisition areas).

By LAWA's own admission then the areas studied on the important subject of worker safety and groundwater contamination are the existing airport property, Manchester Square and properties identified in 2.3.1.11 which reads in full:

2.3.1.11 Acquisition
The alternatives would require the acquisition of properties located east of the airport. The parcels to be acquired vary with the different alternatives. Table 2-4 lists the properties that may be affected and provides information pertaining to each parcel. A composite map of all of the acquisition properties is provided in Figure 2-11. The parcels that would be acquired under each alternative are identified in Table 2-5 and illustrated in Figures 2-12 through 2-14. Following acquisition, the uses would be demolished and replaced with SPAS-related improvements.

The intersection of Lincoln and Sepulveda Blvds. is not in Figure 2-11 , is not to be acquired by LAWA, and hence was not studied on the subject of Hazards. In fact it was pushed under the rug and ignored in preparation of the DEIR.

LAND USE/ PLANNING, section 4.9 of the DEIR.

Discussion of Discussion of Land Use/Planning begins on page 4-641.

Discussion of Alternative 5 begins at page 4-738. An extended discussion of the numerous land use and planning maps in the LAX area is beyond the scope of this white paper. One sentence on page 4-739 is worth noting. It simply states:

Alternative 5 only includes airfield and terminal improvements.

A multi-billion dollar project to reroute and tunnel Lincoln Blvd. is dismissed as "only an airfield improvement."

NOISE, section 4.10 of the DEIR.

Discussion of the Noise component of CEQA begins at page 4-779.

Discussion of Road Traffic Noise impacts begins on page 4-935. Much technical data is presented. Alternative 5 is not even commented upon. Whatever technical processes and evaluations were performed, they apparently did not include the impact of having Lincoln Blvd. 350' or more closer to ones home, business, school or church.

Construction Noise is discussed beginning at page 4-945. The impact of construction noise under Alternative 5 is discussed at page 4-963. Here is it acknowledged that at various sound receptors in West Westchester, the impact of Alternative 5 would be significant including at St. Bernard's High School, along the 91st St. community border and at Park West Apartments.

It is telling that in the sole area where the impact of the Lincoln Blvd. project is considered, a finding of significant impact has been made. The question that needs to be asked and answered by LAWA is what other impacts would be revealed if the Lincoln Blvd. project had been thoroughly studied in all CEQA areas?

Truer to form, the DEIR did not measure the impact of Alternative 5 for Transit Vibration at page 4-988.

PUBLIC SERVICES, section 4.11 of the DEIR.

Discussion of the impact of the SPAS projects on Public Services begins on page 4-993. Impact on Fire Services and Law Enforcement Services.

As can be clearly seen throughout the SPAS Report and the DEIR, the magnitude of the billion dollar-plus Lincoln Blvd. project simply is not appreciated or understood by LAWA. It is California State Route 1 that is being moved. Massive disruption around one of the busiest intersections in Los Angeles will occur. The Lincoln/Sepulveda intersection is the pivot point between the South Bay and the Westside of Los Angeles. At page 4-1013 it is admitted that construction of the project has "the potential to hamper or delay emergency response". This delay in emergency response is shrugged off however by saying a "coordination office" will be established. This is a serious risk to the public and deserves more study than saying an office will be created in the future.

The impact of SPAS on Law Enforcement is discussed beginning at page 4-1019. At page 4-1035 the DEIR states:

As with Alternative 1, traffic congestion from construction activities would have the potential to hamper or delay response times and increase traffic patrol and other law enforcement activities.

This serious negative impact of Alternative 5 construction is similarly dismissed by the recitation of certain numbered "LAX Master Plan Commitments."

TRANSPORTATION, section 4.12 of the DEIR.

Perhaps nowhere in the DEIR is the failure to study the realignment of Lincoln Blvd. for more than a mile, more than 2000' feet of which would be depressed below surface grade and 765' of which would be in a tunnel more glaring than in the treatment of "Off Airport Transportation at page 4-1281 of the DEIR.

Treating it as if it were a curb and gutter project, the DEIR state shrugs of the realignment of California State Route 1 at page 4-1282 with the following:

In addition to potential disruption of local traffic conditions due to the addition of construction-related vehicle trips, there is the potential for additional disruption in the event a project-related improvement requires temporary closure of at least one lane adjacent to its site. Closures of key roadways and intersections could cause delays, except if done for short durations during periods of very low vehicular volumes.

One marvels at the naiveté of LAWA to think it can accomplish the realignment of Lincoln Blvd. by single-lane closures on off-peak hours.

The treatment of Off-Airport Transportation reveals LAWA's strategy for gaming the CEQA process and obtaining the backdoor approval of rerouting Lincoln. At page 4-1281 the DEIR states:

The nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. As such, it would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods.

As appears throughout the DEIR and SPAS Report, it is clear LAWA is currently hiding behind the skirts of the "Program Level DEIR" to prevent a full and complete disclosure to the public and to the elected officials who will be voting on the DEIR by saying that only "conceptual planning" need be done.

UTILITIES, section 4.13 of the DEIR.

Discussion of the impact on Utilities begins at page 4-1327. Despite what could be significant disruption from relocating utilities currently under Lincoln and Sepulveda Blvd. this section deals with energy use at the airport. The impact of the Lincoln Blvd. realignment and tunneling project is not discussed.

CONCLUSIONS TO BE DRAWN FROM CONSIDERATION OF THE DRAFT ENVIRONMENTAL IMPACT REPORT

Simply stated, the Lincoln Boulevard realignment and tunnel project is not adequately studied in the Draft Environmental Impact Report. In view of the fact that moving runway 6L/24R northward by up to 350' is LAWA's most important project and realigning Lincoln Blvd. is non-negotiable and critical to moving the runway, this failure must be viewed as fatal.

The DEIR must be withdrawn from circulation, the Lincoln Blvd. realignment project must be adequately studied and the DEIR circulated, preferably as a project level EIR that can receive full, detailed public scrutiny.

Response:

Please see Topical Response TR-SPAS-LR-1 for a discussion of the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6. While the topical response addresses a majority of the issues raised in this comment, other issues are addressed herein.

This comment discusses the organization of the SPAS Draft EIR. It should be noted that the State CEQA Guidelines do not mandate a specific organization for an EIR, nor do the Guidelines specify 13 categories of environmental impacts. Appendix G of the State CEQA Guidelines provides an Environmental Checklist Form that may be used in the preparation of an Initial Study for a proposed project which identifies 17 environmental factors that could potentially be affected by a project. The SPAS Draft EIR is organized into 13 environmental topics. The comment misstates the organization of the discussion within each environmental topic. Only the discussion of Aesthetics includes headings for geographic areas, such as "Northern Boundary."

Section 5.7 of the Preliminary LAX SPAS Report, the content of which is also provided in Section 2.3.2 of the SPAS Draft EIR, not only identifies alternatives considered but rejected during the concept development process, as noted by the commentor, the section also details reasons why the rejected alternatives were not considered to be feasible, would not meet the project objectives, and/or would not reduce the environmental impacts of the alternatives analyzed in the SPAS Draft EIR. Regarding enhancements to the safety and efficiency of the airfield under each alternative, please see Table 4.7.2-16 on pages 4-569 and 4-570 in Section 4.7.2 of the SPAS Draft EIR. As indicated in that table, the SPAS alternatives achieve substantial enhancements to safety and efficiency; the degree to which safety and efficiency is enhanced varies between the alternatives. Please see Response to Comment SPAS-PC00130-904 regarding the abandoned runway that was excavated during construction of the

South Airfield Improvement Project. Please see Response to Comment SPAS-PC00130-853 regarding the ability to perform word searches of the electronic versions of the SPAS Draft EIR.

A number of comments concern the financial analysis provided in Chapter 8 of the Preliminary LAX SPAS Report and the rough-order-of-magnitude (ROM) cost estimates provided in the accompanying Appendix G. There are a number of misstatements in this comment concerning the costs of various alternatives. It is important to correct these misstatements prior to addressing the underlying issues raised in this comment. The commentor states that the cost of the airfield component of Alternative 5 in 2010 dollars is $808,660,000. The actual cost estimate, as indicated in Table 8-1 of the Preliminary LAX SPAS Report is $806,660,000. The commentor states that the total escalated cost of Alternative 5 is $9,091,629,000. This number is incorrect in two regards. The number $9,091,629,000 is the number associated with Alternative 2, not Alternative 5. Moreover, this number represents the escalated costs of Alternative 2 as well as the costs of LAX Base Development Projects. As explained on pages 8-1 and 8-8 of the Preliminary LAX SPAS Report, LAX Base Development Projects are projects that are not associated with the SPAS alternatives. LAX Base Development Projects include projects currently underway and projects expected to be completed at LAX between fiscal year 2012 and fiscal year 2025. The correct escalated costs of Alternative 2, as indicated in Table 8-1, are $2,601,629,000. The escalated costs of Alternative 5 are estimated at $3,282,424,000. The commentor also states that total identified funds available for Alternative 5 are $3,601,629. This number does not represent the approximation of available funding for Alternative 5; rather, it appears to by a typographical error of the available funding for Alternative 2, which is $2,601,629 (with dollars represented in $1000s), or $2,601,629,000. It is misleading for the commentor to state the costs of the improvements as a whole number and the available funding as represented in $1000s. It should be noted that the approximation of available funding for Alternative 5 is $3,282,424,000. (More discussion of the relationship between estimated escalated costs and available funding is provided below.) The commentor correctly represents the estimated costs (in 2010 dollars) of airfield improvements for Alternative 2 (i.e., $205,200,000), but misstates the escalated costs of these improvements, which are estimated to be $279,768,000, not $279,760,000. The commentor states that the costs of airfield improvements for Alternative 5 are $716,700,000. This number actually represents the estimated costs (in 2010 dollars) of airfield improvements for Alternative 5 excluding costs associated with realignment of Lincoln Boulevard (Table AF-1 of Appendix G of the Preliminary LAX SPAS Report). The costs of the Lincoln Boulevard realignment are not intentionally missing from Table AF-1. Rather, ROM cost estimates for the Lincoln Boulevard realignment were calculated separately, and are presented in Tables AF-3 through AF-5. When the Lincoln Boulevard realignment costs are added (Table AF-3 of Appendix G of the Preliminary LAX SPAS Report), the total estimated costs (in 2010 dollars) of airfield improvements for Alternative 5 are $806,660,000, which is the cost shown in Table 8-1.

The commentor states that the cost of the airfield improvements for Alternative 5 would cost roughly $800 million (assuming the commentor is rounding down from $806,660,000) if the projects had been built two years ago, and $1.1 billion if the projects broke ground this year, and then says it is impossible to predict what it would cost if the work commences in 2025. The commentor is incorrect in stating that the cost of the airfield improvements for Alternative 5 would be $1.1 billion if the projects broke ground this year. As stated clearly on page 8-8 in Section 8.5 ("Estimated Alternative Costs"), "Estimated alternative costs are reflected both in 2010 dollars and based on escalation to the assumed mid-point of construction for alternative improvements (FY 2020)." The roughly $1.1 billion estimate of escalated costs for the airfield improvements for Alternative 5 is based on the assumption that the mid-point of construction is FY 2020.

Another issue raised in this comment relates to the approximation of available funding for the SPAS improvements. The commentor is incorrect in stating that the approximate available funding for SPAS Alternative 5 (or Alternative 2) improvements is less than escalated costs. The commentor incorrectly compares the total estimated costs of all planned and proposed capital improvements at LAX, including both SPAS improvements and the LAX Base Development Projects, to the estimated funding for the SPAS alternative improvements alone. A close review of Table 8-1 will show that the total escalated costs associated with each SPAS alternative match the approximate amount of funding from various sources that is anticipated to be available for the alternatives. For example, for Alternative 2 the amount of the "Total Estimated SPAS Alternative Funding Sources" in Table 8-1 is $2,601,629,000 which is equal to the amount of the escalated costs for Alternative 2 SPAS improvements (see row titled "Total SPAS Alternative Improvements"). For Alternative 5, the Total Estimated SPAS Alternative

Funding Sources is $3,282,424,000 which is equal to the amount of the escalated costs for Alternative 5 SPAS improvements. Funding sources associated with the LAX Base Development Projects are not reflected in Table 8-1, as the focus of this chapter is on comparing the order of magnitude costs and funding of the SPAS alternative improvements. Chapter 8 of the Preliminary LAX SPAS Report provides a discussion of each of the funding sources that is included in the approximations of estimated available funding.
