1. INTRODUCTION

In accordance with the California Environmental Quality Act (CEQA), the City of Los Angeles, as Lead Agency, completed a Draft Environmental Impact Report (Draft EIR) to address and disclose the potential environmental impacts associated with the proposed project, the Specific Plan Amendment Study (SPAS). The SPAS is required under Section 7.H of the LAX Specific Plan and Section V of the Stipulated Settlement, as discussed in more detail in Section 1.1.2 of the SPAS Draft EIR. Through the SPAS process, nine alternatives were formulated to provide a broad range of options for improvements to the north airfield, terminals, and the ground transportation system at LAX, all of which are addressed in the SPAS Draft EIR. As further described below in Chapter 2, a detailed description of the proposed project, including the proposed alternatives, is provided in Section 1.2 and Chapter 2 of the SPAS Draft EIR. The LAWA Staff-Recommended Alternative, which was derived from the range of alternatives discussed in Section 1.2 and Chapter 2 of the SPAS Draft EIR, is discussed below in Chapter 2.

The City of Los Angeles, Los Angeles World Airports (LAWA) has identified a range of potential improvements at Los Angeles International Airport (LAX) in conjunction with completion of the LAX SPAS. The SPAS process includes the identification and evaluation of potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that certain improvements within the Master Plan, referred to as "the Yellow Light Projects," were designed to address. The SPAS process also includes identification of potential amendments to the LAX Specific Plan that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA. Presented herein is the Final Environmental Impact Report for the SPAS project, as further described below.

On July 27, 2012, LAWA published the SPAS Draft EIR, which was circulated for public review for 75 days, providing an expanded opportunity for public review and input beyond the 45-day review period required by Section 15105 of the State CEQA Guidelines, with the SPAS Draft EIR review period closing on October 10, 2012. Additional means for public involvement during the SPAS Draft EIR review and comment period were provided through three public meetings, held during the comment period on August 25, 2012, August 28, 2012, and August 29, 2012, as well as through a "virtual meeting" available online between September 10, 2012 and October 10, 2012, and through a project website (laxspas.org). A total of 251 unique commentors submitted comments in conjunction with the SPAS Draft EIR public review period, through written correspondence and e-mails to LAWA, oral testimony and video-taped comments at the aforementioned public meetings, and comments on the virtual meeting and project website. A total of 2,063 individual comments were received by LAWA. For purposes of this Final EIR, written comments, video-taped comments, emailed comments, comments submitted via the virtual meeting and website, and oral testimony received during the public hearings are all referred to as "comment letters."

Pursuant to Section 15088 of the State CEQA Guidelines, LAWA evaluated comments received from persons who reviewed the SPAS Draft EIR and prepared written response to those comments. Those comments and written responses, along with other information, are included as part of the SPAS Final EIR. As required by Section 15088(c) of the State CEQA Guidelines, the focus of the responses to comments is on "the disposition of significant environmental issues raised."

Specifically, in accordance with Section 15132 of the State CEQA Guidelines, the SPAS Final EIR, consists of:

(a) The Draft EIR;

(b) Comments and recommendations received on the Draft EIR;

(c) A list of persons, organizations, and public agencies commenting on the Draft EIR;

(d) The responses of LAWA to significant environmental points raised in the review and consultation process; and,

(e) Other information added by LAWA.

The SPAS Final EIR is presented in two parts, as follows:

Part I: Draft EIR and Technical Appendices

Part 1 consists of the nine-volume SPAS Draft EIR, which was distributed for public review and comment from July 27, 2012 through October 10, 2012. The SPAS Draft EIR includes the Main Document (Chapters 1 through 10) in Volumes 1 through 4, and Appendices A through K2 in Volumes 5 through 9.

Part II: Responses to Comments and Other Final EIR Materials

The second part of the Final EIR includes a description of the LAWA Staff-Recommended Alternative (Chapter 2 of this document), which is a combination of two of the alternatives presented in the SPAS Draft EIR, and a discussion of the environmental impacts associated with this alternative; a description of potential amendments to the LAX Specific Plan and LAX Plan (Chapter 3 of this document); a compilation of the comments received on the SPAS Draft EIR and the written responses prepared by LAWA to those comments (Chapter 4 of this document); and corrections and additions to information presented in the SPAS Draft EIR (Chapter 5 of this document). Indices (i.e., lists) of agencies, organizations, and individuals that commented on the SPAS Draft EIR are provided in Chapter 4 to help locate specific comment letters, and copies of the comment letters in their original form (i.e., photocopies of comment letters) are included as Attachment 5 of this part of the Final EIR. (Videotaped comments were transcribed; this transcription is also provided in Attachment 5.) Supporting technical information is provided in Attachments 1 through 4.

All of the documents described above, comprising the Final EIR for the Specific Plan Amendment Study, are available for public review at:

Los Angeles World Airports
Capital Programming and Planning Division
One World Way
Los Angeles, CA 90045
Contact: Diego Alvarez
(424) 646-5179

The Final EIR is also available at www.lawa.org/laxspas/.

In addition to, and in conjunction with, completion of the SPAS process and the SPAS EIR, LAWA prepared a Preliminary LAX SPAS Report describing the history and development of the SPAS, including a description of the problems that the Yellow Light Projects were designed to address and the SPAS planning goals, the SPAS Community/Advisory Committee Input, the SPAS alternatives, potential LAX Specific Plan amendments, and a financial analysis of the SPAS alternatives. The six-volume Preliminary LAX SPAS Report was published in July 2012 concurrent with the SPAS Draft EIR and is also available at www.lawa.org/laxspas/. LAWA has also prepared the Final LAX SPAS Report, which describes the LAWA Staff-Recommended Alternative, identifies the proposed amendments to the LAX Specific Plan and LAX Plan, and provides minor corrections and additions to the July 2012 Preliminary LAX SPAS Report. The Final LAX SPAS Report is available for public review at:

Los Angeles World Airports
Capital Programming and Planning Division
One World Way
Los Angeles, CA 90045
Contact: Diego Alvarez
(424) 646-5179

The Final LAX SPAS Report is also available at www.lawa.org/laxspas/.

The Final EIR will be presented to the decision-makers for their use in considering the project. Any interested persons may comment on the Final EIR, including the responses to comments on the SPAS Draft EIR, in the course of the decision-making process related to SPAS. However, LAWA is not required to provide responses to such comments.

2. LAWA STAFF-RECOMMENDED ALTERNATIVE

2.1 Introduction

2.1.1 Identification of the LAWA Staff-Recommended Alternative

Nine alternatives offering various options to the Yellow Light Projects, including one alternative that provides for implementation of the Yellow Light Projects, were addressed in the SPAS Draft EIR. As described in Section 1.2.2 of the SPAS Draft EIR, the types of improvements used to define the key characteristics of each SPAS alternative can be grouped into the following three categories: airfield improvements, terminal improvements, and ground access improvements. Alternatives 1 through 4 are "fully-integrated" alternatives that include specific improvements in all three categories: airfield improvements, terminal improvements, and ground access improvements. Alternatives 5 through 7 focus on variations to the airfield improvements, which, in turn, affect the terminal improvements. Alternatives 8 and 9 focus on variations to the ground access improvements. Detailed descriptions of each of these alternatives are provided in Section 2.3 of the SPAS Draft EIR. The objectives associated with completion of the SPAS process are described in Section 2.2 of the SPAS Draft EIR. Table 1-2 of the SPAS Draft EIR provides an evaluation of how each alternative responds to these objectives.

As noted in Section 1.2.2 of the SPAS Draft EIR, there is a certain amount of interchangeability between the SPAS alternatives. Specifically, the airfield and terminal improvements in Alternatives 5 through 7 are equally compatible with the ground access improvements in Alternatives 1, 2, 8, and 9. Likewise, the ground access improvements in Alternatives 8 and 9 are equally compatible with the airfield and terminal improvements in Alternatives 1, 2, 5, 6, and 7. In other words, the proposed ground transportation system incorporated into Alternatives 1 and 2 could function in the same manner with Alternatives 5, 6, or 7. That would also be the case for the ground transportation systems under Alternatives 8 and 9, which could be developed under Alternatives 5, 6, or 7, and could also replace the ground transportation system associated with Alternatives 1 and 2.

Following completion of the SPAS Draft EIR, and receipt and review of public comments on the SPAS Draft EIR, LAWA staff identified a recommended alternative. LAWA staff recommends an alternative that combines the airfield and terminal components associated with Alternative 1 with the ground access components associated with Alternative 9. The key features of the LAWA Staff-Recommended Alternative include:

- Relocation of Runway 6L/24R 260 feet north
- Construction of a centerline taxiway
- Easterly extension of Runway 6R/24L
- Improvements to north airfield taxiways
- Development/redevelopment/extension of Terminal 0, Terminal 3, Tom Bradley International Terminal, and the future Midfield Satellite Concourse
- 153 passenger gates
- Development of an Intermodal Transportation Facility (ITF), Consolidated Rent-A-Car Facility (CONRAC), and parking outside the Central Terminal Area (CTA)
- Construction of an Automated People Mover (APM) to link new facilities to the CTA and provide connectivity with planned Metro facilities

The LAWA Staff-Recommended Alternative is illustrated in **Figure SRA-2.1-1**. A complete description of the alternative is provided in Section 2.2. All components of the LAWA Staff-Recommended Alternative were also described and analyzed in the SPAS Draft EIR. The approach to the analysis of alternatives in the SPAS Draft EIR (i.e., grouping components of the alternatives together into “fully-integrated”

alternatives or alternatives that focus on one particular category of improvements), and the subsequent identification of an alternative that combines the airfield and terminal improvements of Alternative 1 with the ground access improvements of Alternative 9 is consistent with CEQA.[1]

2.1.2 Rationale for the LAWA Staff-Recommended Alternative

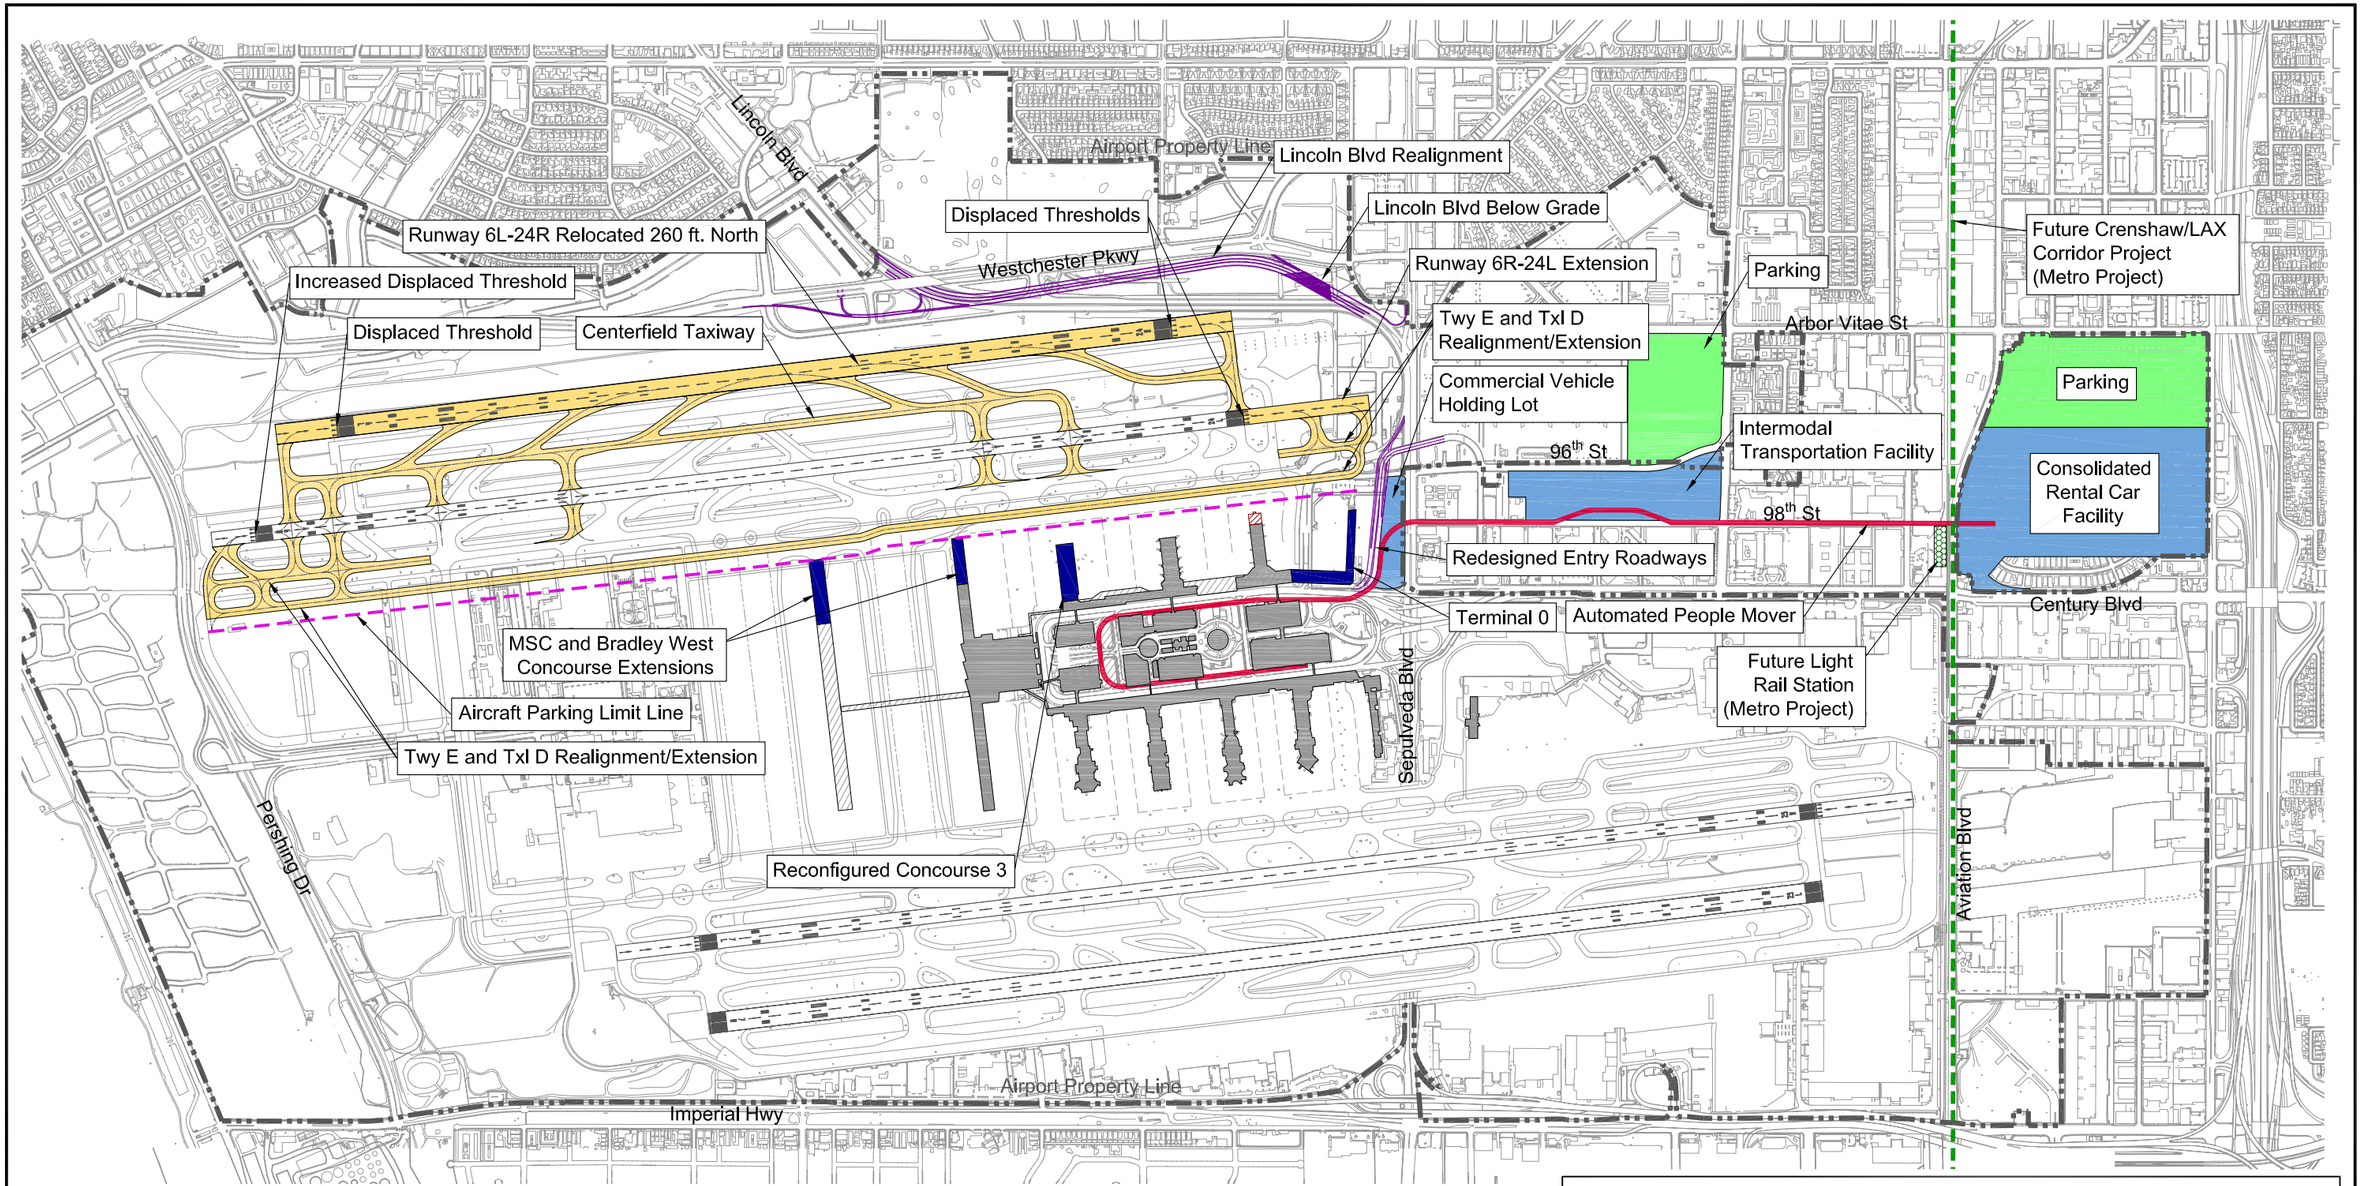
The LAWA Staff-Recommended Alternative seeks to achieve a balance between SPAS airfield-related objectives and the SPAS objective of minimizing impacts on surrounding communities. The airfield improvements associated with the LAWA Staff-Recommended Alternative, which are those associated with Alternative 1 in the SPAS Draft EIR, support standard operations on the north airfield, with the exception of Aircraft Design Group (ADG) VI aircraft when visibility is less than ½ mile, a condition that occurs infrequently at LAX. This alternative provides pilot line-of-sight to the end of Runway 6R/24L (the departures runway) for ADG V operations and includes needed taxiway/taxilane improvements. The LAWA Staff-Recommended Alternative addresses existing Runway Safety Area (RSA) deficiencies, and relocates the Runway 6L/24R Runway Protection Zone (RPZ) such that residences would no longer be located within the RPZ. Addition of a centerline taxiway would enhance the safe and efficient movement of aircraft at LAX and, by providing an airfield that can accommodate Group VI aircraft in most weather conditions, the LAWA Staff-Recommended Alternative would support LAX's role as an international gateway.

The ground access improvements associated with the LAWA Staff-Recommended Alternative, which are those associated with Alternative 9 in the SPAS Draft EIR, would better accommodate airport traffic, reduce congestion in the CTA, enhance security, and provide connectivity with existing and planned Metro bus and transit systems.

Following is a summary of the relationship between the project objectives identified in the SPAS Draft EIR and the LAWA Staff-Recommended Alternative.

1. **Provide North Airfield Improvements that Support Safe and Efficient Movement of Aircraft at LAX:** The LAWA Staff-Recommended Alternative would provide for standardization of nearly all airfield operations, substantially improve pilot situational awareness, address all airfield hazards, and include efficiency features. Specifically, the configuration of the airfield would meet FAA design standards for ADG V aircraft (i.e., Boeing 747) and would accommodate ADG VI aircraft (i.e., Airbus A380) in good visibility conditions, although it would not permit standardized operation of ADG VI aircraft on the centerfield taxiway in all visibility conditions (i.e., poor visibility). Improvements to Taxilane D and Taxiway E would improve the ability of large aircraft to taxi to/from runways and implementation of a centerfield taxiway would provide substantial safety benefits. The extension of Runway 6R/24L would enhance departure capability on the north airfield complex and the westward shift in the landing threshold on Runway 6L/24R would remove residential areas from RPZ.
2. **Improve the Ground Access System at LAX to Better Accommodate Airport-Related Traffic, Especially as Related to the Central Terminal Area:** The LAWA Staff-Recommended Alternative would redesign the CTA roadway segments/curbsides prone to traffic bottlenecks; reduce traffic volumes within the CTA by providing transportation facilities outside of CTA; provide grade-separated/dedicated access route into the CTA; and integrate CTA with regional transit facilities. Development of an Intermodal Transportation Facility (ITF) on 98th Street, provision of surface parking at Manchester Square, and the connection of those facilities, as well as the future Metro transit station nearby, to the CTA via an APM would reduce traffic in and around the CTA.

[1] A "component approach" to project description and a "mix and match" approach to alternatives was specifically upheld in *California Oak Foundation v. Regents of the University of California (*2010) 188 Cal.App.4th 227, 275-277.



Note: Improvements depicted are conceptual only and do not represent engineered design.

LAX Specific Plan Amendment Study Final EIR

LAWA Staff - Recommended Alternative

Figure
SRA - 2.1-1

This page intentionally left blank.

3. **Maintain LAX's Position as the Premier International Gateway in Supporting and Advancing the Economic Growth and Vitality of the Los Angeles Region:** The LAWA Staff-Recommended Alternative would fulfill this objective by substantially meeting objectives 1 and 2 above, while at the same time providing opportunity to modernize terminals and concourses for international passengers. Airfield improvements at LAX that support the safe and efficient operation of large aircraft, which are the predominant aircraft type used for international travel, would help maintain LAX's position as the international gateway to Southern California. Ground access improvements are also considered to be supportive of this objective.
4. **Plan Improvements That Do Not Result in More Than 153 Passenger Gates at 78.9 MAP:** The LAWA Staff-Recommended Alternative would provide for no more than 153 passenger gates.
5. **Enhance Safety and Security at LAX:** The LAWA Staff-Recommended Alternative would enhance safety at LAX by substantially fulfilling Objective 1 above. With appropriate security operations and protocols, the LAWA Staff-Recommended Alternative would meet existing and anticipated future federal security standards.
6. **Minimize Environmental Impacts on Surrounding Communities:** Implementation of applicable LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS-specific mitigation measures would minimize impacts on surrounding communities.
7. **Produce an Improvement Program that is Efficient, Sustainable, Feasible, and Fiscally Responsible:** The LAWA Staff-Recommended Alternative would have a low to moderate impact to LAWA finances upon implementation, relative to other alternatives.

2.1.3 Relationship of the LAWA Staff-Recommended Alternative to the SPAS Draft EIR

As noted above, the LAWA Staff-Recommended Alternative represents the combination of the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. The environmental impacts of both the Alternative 1 airfield and terminal improvements and the Alternative 9 ground access components were comprehensively identified and analyzed in the SPAS Draft EIR. The environmental impacts specific to the LAWA staff-recommended combination of Alternatives 1 and 9 are presented in Section 2.3 of Part II of this Final EIR. This summary of impacts is a restatement of information previously included in the SPAS Draft EIR and does not provide any significant new information. The features and components of the LAWA Staff-Recommended Alternative are components of either Alternative 1 or Alternative 9, and there have been no changes to any of these individual project components or features. All of the data presented in Section 2.3 are a recombination or restatement of previously-existing data. For the air quality analysis in Section 2.3, construction and operations emissions associated with Alternatives 1 and 9 were combined to present the emissions associated with the LAWA Staff-Recommended Alternative. These combined emissions were then modeled to present construction and operations concentrations. Toxic air contaminant emissions were similarly combined to model human health risks. Greenhouse gas (GHG) emissions were also combined to present GHG emissions associated with the LAWA Staff-Recommended Alternative. Although the criteria pollutant concentrations, GHG emissions, and human health risks are unique to the LAWA Staff-Recommended Alternative, the results fall within the low and high ends of the ranges of impacts presented in the SPAS Draft EIR. Therefore, the results do not constitute significant new data or information.

Given that the SPAS Draft EIR clearly explains the potential for interchangeability between the SPAS alternatives, and explains that the ground access improvements in Alternative 9 are compatible with the airfield and terminal improvements in Alternative 1, the LAWA Staff-Recommended Alternative is within the range of alternatives that the public could reasonably have anticipated LAWA's decision-makers to consider. As stated above, the environmental effects of the LAWA Staff-Recommended Alternative are the same as Alternative 1, Alternative 9, or a combination of the impacts of these alternatives, or the impact of the LAWA Staff-Recommended Alternative falls within the low and high ends of the ranges of

impacts presented in the Draft EIR. Similarly, all LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS-specific mitigation measures that pertain to the LAWA Staff-Recommended Alternative were previously identified in the SPAS Draft EIR, except for those that were modified as a result of responses to comments, and added to the SPAS Draft EIR through corrections and additions to that document, as identified in Chapter 5 of Part II of this Final EIR. The LAWA Staff-Recommended Alternative would not result in a new significant environmental impact beyond those described in the SPAS Draft EIR or a substantial increase in the severity of an environmental impact described in the SPAS Draft EIR, and does not represent an alternative or mitigation measure that is different from others analyzed in the SPAS Draft EIR, as amended by corrections and additions as noted above. Therefore, the following description of the LAWA Staff-Recommended Alternative and the summary of its impacts is not significant new information. In light of this, and after consideration of the comments received on the SPAS Draft EIR, all of the comments received on the SPAS Draft EIR, and the responses to those comments provided in Chapter 4 of Part II of this Final EIR, apply to the LAWA Staff-Recommended Alternative.

2.2 LAWA Staff-Recommended Alternative Description

2.2.1 Features of the LAWA Staff-Recommended Alternative

Overview

The LAWA Staff-Recommended Alternative is a fully-integrated alternative, consisting of airfield, terminal, and ground access components. The distinguishing airfield improvement feature of this alternative is the movement of Runway 6L/24R 260 feet north, along with the addition of a centerfield taxiway, the extension of Runway 6R/24L, improvements to Taxilane D and Taxiway E, and relocation of the service road. Terminal Improvements include addition of new Terminal 0, loss or modifications to concourse areas and/or gates at Terminals 1, 2, and 3, and the modification and potential northward extension of concourse area and gates at TBIT and the future MSC. Ground access improvements include modification of Sky Way; development of an Intermodal Transportation Facility (ITF) at 98th Street west of Airport Boulevard; development of a CONRAC and parking at Manchester Square; development of an Automated People Mover (APM) along 98th Street; and the relocation of Lincoln Boulevard, a portion of which would be below grade and/or tunneled. The APM would be located within an elevated/dedicated corridor along 98th Street, with a bridge over Sepulveda Boulevard and stops at Manchester Square, the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards, the ITF, and the CTA. Within the CTA, the APM would be located on a new elevated guideway. This alternative is illustrated in **Figure SRA-2.1-1**.

2.2.1.1 Airfield Facilities

The LAWA Staff-Recommended Alternative meets FAA airport (runway) design standards for ADG V with a Category II/III outboard runway (Runway 6L/24R) and Category I inboard runway (Runway 6R/24L), and provides sufficient space between Runway 6R/24L and the centerfield taxiway for ADG V aircraft to hold prior to crossing the runway with a pilot line-of-sight of the end of Runway 24L. This alternative provides the FAA standard ADG VI runway-to-taxiway separation between Runway 6L/24R and the centerfield taxiway for approach visibility at or above one-half mile (Category I approaches). Taxiway E and Taxilane D dimensions would meet ADG V standards.

Runway Modifications

Runway 6L/24R

- Relocate 260 feet north of current location to accommodate a new centerfield parallel taxiway (see below) and to provide for ADG V separation distances
- Extend 604 feet west so that the RPZ no longer extends over residential areas

- Establish dual displaced thresholds to remove existing residences from the RPZ (east end displaced threshold) and maintain existing westerly aircraft landing heights (west end displaced threshold)
- Widen to 200 feet to meet FAA standards

Runway 6R/24L

- Remains in its current location
- Extend 1,250 feet east to meet RSA requirements and maximize aircraft takeoff length
- Shift 6R landing threshold 104 feet east to meet RSA requirements
- Reconstruct east 2,000 feet for grade compliance

Taxiway Modifications

Centerfield Taxiway

- Construct an 82-foot-wide centerfield taxiway between Runways 6L/24R and 6R/24L, with a centerline separation distance of 500 feet to Runway 6L/24R and 460 feet to Runway 6R/24L, to enhance safety and reduce incursions and other airfield hazards, while providing for ADG V separation distances; also provide exit taxiways from Runway 6L/24R to the centerfield taxiway, taxiways from the centerfield taxiway to and across Runway 6R/24L, and other related airfield taxiway improvements

Taxiway E

- Rebuild western 2,190 feet to straighten alignment (0 to 64 feet southerly relocation)
- Extend 950 feet east to support easterly extension of Runway 6R/24L and to provide additional hold area for departing aircraft

Taxilane D

- Relocate varying distances (ranging from 15 to 19 feet) north to provide ADG V separation distances between the taxiway and APLL
- Extend 745 feet east to support easterly extension of Runway 6R/24L and 5,145 feet west to provide for dual full-length taxiways in the north airfield

Other Airfield-Related Features

- Cover the entire length of the Argo Drainage Channel (9,857 linear feet) such that the weight of an aircraft could be supported within the RSA by converting the existing open unlined channel to a concrete box culvert
- Relocate Lincoln Boulevard northward between Sepulveda Boulevard and Westchester Parkway, and depress the eastern portion of the road segment to be compatible with the object free area requirements for the east end of Runway 6L/24R, which would require approximately 540 linear feet of the road segment to be tunneled
- Relocate the service road that currently lies between Taxiway E and Taxilane D to a location 142 feet south of Taxilane D centerline to increase the separation between the two taxiways to allow for simultaneous operations with larger aircraft than currently accommodated, improve safety and efficiency, and meet FAA standards
- Taxiway E and Taxilane D dimensions, based on proposed improvements, would meet ADG V standards

- In the eastern portion of the airfield, the APLL would move south to a location 852 feet south of the existing Runway 6R/24L centerline. Beginning just west of Taxiway S, the APLL would move south an additional 50 feet (902 feet south of the Runway 6R/24L centerline).
- Relocate and/or remove existing facilities as specifically described in Section 2.2.2 and as listed in **Table SRA-2.2-2** below and as shown in Figure 2-10 of the SPAS Draft EIR

2.2.1.2 Terminal Facilities

Proposed modifications to terminal facilities, including aircraft gates, under the LAWA Staff-Recommended Alternative would include the following:

- Construct a new Terminal 0 with seven gates in the western portion of the area now occupied by Park One to replace gates lost or downsized at Terminals 1 through 3
- Demolish approximately 177 feet of the Terminal 1 concourse to accommodate the southerly movement of the APLL
- Demolish and reconstruct the Terminal 3 concourse and associated gates, with the building centerline shifted 40 feet to the west to increase the width of the alleyway between Terminals 2 and 3 to allow for dual-directional aircraft movement and comply with FAA standards
- Demolish and replace the northerly end of the TBIT concourse and associated gates (with new concourse and gates in line with the new Bradley West concourse) to the LAWA Staff-Recommended Alternative APLL
- Provide the opportunity to extend the northerly end of the future MSC to the LAWA Staff-Recommended Alternative APLL
- As a result of moving the APLL south to meet ADG V standards, several gates would be eliminated or downsized (i.e., would accommodate smaller aircraft types)
- The commuter facility currently in use east of Sepulveda Boulevard would be maintained
- Use of west remote gates would be eliminated upon completion of the airfield and terminals improvements
- The total number of gates used at LAX for scheduled passenger service would be 153

2.2.1.3 Ground Access Facilities

Ground Access

Under the LAWA Staff-Recommended Alterative, the characteristics of the airport ground access system would be as follows:

- Maintain private vehicle access to the CTA
- Relocate Sky Way (upper and lower level roadways) eastward between the future Terminal 0 and Sepulveda Boulevard to provide additional roadway and curbfront in the CTA, while allowing the development of Terminal 0
- Add new curbside space at Terminal 0
- Relocate the commercial vehicle holding lot south of 96th Street, between Sepulveda Boulevard and the relocated Sky Way to meet RSA and RPZ requirements
- Construct a new ITF on 14 acres between 96th and 98th streets and between Vicksburg Avenue and Airport Boulevard. Key features of the ITF include public parking and remote passenger pick up/drop off. In addition, arriving passengers could travel to the ITF to board door-to-door shuttles or scheduled buses
- Construct a CONRAC in a portion of Manchester Square, including a customer service area and a structured parking facility to accommodate approximately 1,000 stalls for quick turn-around and 5,800 stalls for ready return. Additional surface parking would be constructed to accommodate a portion of the total demand for staging and storage of rental vehicles by the various operators.

- Construct an elevated APM between Manchester Square and the CTA, primarily using the 98th Street corridor, including a bridge over Sepulveda Boulevard and stops at the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards and the new ITF. Within the CTA, the APM would be located on an elevated guideway. The number of stations in the CTA has yet to be determined but could range from 3 to 5.
- Provide connectivity to public transit via the APM, with a stop/connection at the new Metro transit station at Aviation/Century. LAX shuttle bus from the Metro Green Line Aviation Station would be discontinued.
- An APM maintenance facility would be constructed, likely in Manchester Square
- Relocate Lincoln Boulevard to the north, outside of the Runway 6L/24R RSA, with a portion below grade and/or tunneled

Parking

Under the LAWA Staff-Recommended Alternative, the characteristics of airport parking within the control of LAWA would be as follows:

- Generally, no changes to existing CTA parking conditions would occur as a result of SPAS, although future pricing structures may change long-term/short-term composition
- Parking Lot E, would no longer be used for employee parking, although this property could be used for other airport purposes in the future. Changes to the use of this parking area would occur independently from SPAS.
- No changes are proposed to Public Parking Lot C
- Parking Lot D would provide approximately 1,944 employee parking spaces. The Jenny Lot east of Parking Lot D would provide approximately 2,000 employee parking spaces. These parking areas were not in use in the 2010 baseline year; however, their use for parking is occurring independently from SPAS.
- Development of the ITF would include approximately 4,900 short-term public parking spaces to facilitate passenger drop off and pick up outside of CTA
- Construct approximately 2,750 employee parking spaces in the existing Avis rental car lot
- Construct approximately 4,200 public parking spaces in a portion of Manchester Square
- No public or employee parking is proposed for the area referred to as Continental City
- The existing Park One parking would be eliminated to allow development of Terminal 0 and the relocated entry roadway
- The West Employee Parking facility would not be constructed

2.2.1.4 Elimination of LAX Master Plan Components

Under the LAWA Staff-Recommended Alternative, the following non-Yellow Light projects approved as part of the LAX Master Plan would be fully or partially eliminated:

- Demolition of all CTA parking structures and replacement with passenger terminals (partially eliminated)
- West Employee Parking facility
- CONRAC in Parking Lot C (would be developed in Manchester Square instead)
- Reconfiguration and expansion of Parking Lot E north of 111th Street
- ITC in the area referred to as Continental City
- APM between ITC, CONRAC, and CTA (APM 1)

A summary of the key characteristics of the LAWA Staff-Recommended Alternative is presented in **Table SRA-2.2-1**.

Table SRA-2.2-1

Summary of the LAWA Staff-Recommended Alternative

	Baseline Conditions	SRA
Airfield Elements - Key Components		
Runways		
Relocate Runway 6L/24R to north		260'
Extend Runway 6L/24R to west		604'
Extend Runway 6R/24L to east		1,250'

Total	**25,695**	**32,155**

[1] Some of the public parking in the CTA is currently used by government employees.
[2] Assumes that the MSC Passenger Processor building (not a SPAS-related project) would require the removal of parking structures 2B and 5 (1,536 total spaces). Any parking spaces that may be included as a component of the Passenger Processor project is not included in these parking totals.
[3] An area of Parking Lot C comprising approximately 850 spaces is currently being used as a limousine and charter bus holding lot. The 7,300 spaces represents the number of potential spaces if this commercial holding lot were relocated.
[4] Parking Lot D opened to employee parking in November 2011 with 1,944 parking spaces. However, there was no parking in this lot in 2010 (baseline year).
[5] This parking structure is currently used primarily by airport tenants; however, LAWA does sell some monthly parking passes to the public who likely work in nearby offices. For purposes of this summary, this structure is considered as employee parking.

2.2.2 Existing Facilities Affected by SPAS Improvements

Implementation of the LAWA Staff-Recommended Alternative would require the relocation and/or removal of several existing facilities both within LAX property, and outside of LAX property. **Table SRA-2.2-2** below provides an overview of the existing facilities that would be affected by the LAWA Staff-Recommended Alternative, including the name, size, current use, and disposition of each facility. Additional discussion of the facilities is provided in Section 2.3.1.10 of the SPAS Draft EIR. Figure 2-10 of the SPAS Draft EIR delineates the existing and proposed locations of the affected facilities. Because the planning and analysis for the LAWA Staff-Recommended Alternative are at a programmatic level, specific improvements to these facilities have yet to be designed and would not be implemented for several years. The disposition of each facility described below is based on 4th quarter 2011 conditions and currently available information, and is subject to change as local conditions change and more detailed plans are formulated.

Table SRA-2.2-2

Summary of Existing Facilities Affected by the LAWA Staff-Recommended Alternative

Facility	Approximate Size	Current Use	Disposition of Facility/Use
Navigational Aids		Navigational aids	The navigational aids located at the ends of the north airfield runways would be relocated. FAA's existing Airport Surveillance Radar (ASR) would be relocated north of Westchester Parkway.
North Maintenance Road	Various lengths	Road	The eastern portion of the road would be relocated independent of the LAX Master Plan or SPAS. The LAWA Staff-Recommended Alternative would require relocation of the entire road to the north with operational restrictions on the eastern end.
Argo Drainage Channel	9,857 feet long	Drainage channel	Independent of SPAS, the easternmost portion of the channel is required to be structurally covered to comply with requirements governing RSAs. Under the LAWA Staff-Recommended Alternative, the entire length of the channel would be structurally covered (i.e., converted to a concrete box culvert).
North Airfield (Abandoned) Tunnel Segment	720 feet long	Unused	The tunnel would be filled.
Airport Operations Area (AOA) Access Guard Post #3	155 square feet	Guard post	Building and appurtenant structures would be demolished. There are no plans to replace the guard post in this area.
Lincoln Boulevard and Adjoining Streets		Road	Lincoln Boulevard and adjoining streets would be realigned. Approximately 540 linear feet of Lincoln Boulevard would require the tunneling.
96th Street Bridge/Sky Way		Bridge	The bridge and roadway would be reconfigured, allowing the eastern extension of Runway 6R/24L and Taxiway E, additional CTA curbside, and the accommodation of Terminal 0.
Taxi Holding Lot	100 vehicles (2.5 acres)	Vehicle parking/staging area	Independent of the LAX Master Plan or SPAS, the taxi holding lot must be relocated. Under the LAWA Staff-Recommended Alternative, the lot would move to the eastern portion of the Park One facility.
Urgent (Medical) Care Facility	Approx. 21,500 square feet	Medical office building	The building would be demolished due to the realignment of 96th Street Bridge/Sky Way. This building could potentially be relocated elsewhere in the vicinity.
LAWA Police Station/Facilities	33,300 square feet	Police station and related facilities	Facilities would be removed and relocated. The facilities could be relocated to the future LAX Public Safety Building and Supporting Facilities currently being planned by LAWA, separate from SPAS.

Table SRA-2.2-2

Summary of Existing Facilities Affected by the LAWA Staff-Recommended Alternative

Facility	Approximate Size	Current Use	Disposition of Facility/Use
Park One Parking Facility and Billboards	2,728 spaces and 8 billboards	Privately-operated airport parking lot and outdoor advertising	Parking lot use would be eliminated, along with eight billboards. No relocation of the parking is anticipated.
West Remote Aircraft Gates/Parking Positions	18 gates to facilitate scheduled passenger service	Aircraft gates and parking spaces	With the extension of Taxilane D, various west remote gate structures and parking positions would be removed. These gates and parking positions would be replaced in the buildout gating plan. (It should be noted that all West Remote gates/parking positions are to be removed under LAX Master Plan buildout.)
LAWA Construction and Maintenance (C&M) Division Facilities	135,000 square feet	C&M facilities	With the extension and/or relocation of Taxilane D, the C&M recycling yard and equipment yard (northern portion of the facility), as well as separately located structures used for storage, would be removed and consolidated/reconfigured at the current site or moved elsewhere on the AOA or to the area referred to as Continental City.
FedEx Aircraft Maintenance Facility	164,000 square feet	Maintenance facilities	The extension and/or relocation of Taxilane D would require the removal of the FedEx Maintenance employee parking area, an apron and run-up area, and miscellaneous storage areas within the northern portion of the facility. The facilities on the leasehold would be reconfigured and consolidated on the existing site or relocated elsewhere on the AOA.
On-Airfield Fuel Truck Filling Station		Fueling facility	With the extension of Taxilane D, the fueling station would need to be reconfigured or relocated within the AOA.
Southwest Airlines Ground Support Equipment(GSE) Facility	7,972 square feet	GSE and vehicle maintenance facility	With the extension and/or relocation of Taxilane D, the Southwest Airlines GSE facility would be removed and relocated elsewhere on, or adjacent to, the AOA.
Airfield Bus Parking Area and Operations Building	44 parking spaces, 3,876-square-foot-building	Bus parking	With the extension of Taxilane D, 44 bus parking spaces and an airfield bus operations building would be removed. These uses would be relocated within the AOA or the area referred to as Continental City.
Avis Rental Car Facility	24 acres	Rental car operation	This facility would be replaced with parking. The primary rental car function would be relocated to the CONRAC in Manchester Square. Heavy maintenance and supporting functions would require relocation elsewhere, but could potentially occur on LAWA property on 111th Street west of La Cienega Boulevard.

Table SRA-2.2-2

Summary of Existing Facilities Affected by the LAWA Staff-Recommended Alternative

Facility	Approximate Size	Current Use	Disposition of Facility/Use
Burger King Restaurant	3,551 square feet	Restaurant	An existing Burger King restaurant located on the northwest corner of Airport Boulevard and 96th Place would be eliminated. Relocation would be a business decision. This business could potentially relocate to elsewhere in the vicinity.
Travelodge Hotel and Denny's Restaurant	154 rooms (Travelodge) 7,347 square feet (Denny's)	Hotel and restaurant	An existing Travelodge hotel and Denny's restaurant located in the southwestern portion of Manchester Square would be eliminated. Relocation would be a business decision. These businesses could potentially relocate to elsewhere in the vicinity.

Source: LAWA and CDM Smith, 2011.

2.2.3 Acquisition

The LAWA Staff-Recommended Alternative would require the acquisition of properties located east of the airport. Table 2-4 of the SPAS Draft EIR lists the properties that may be affected and provides information pertaining to each parcel. A composite map of all of the acquisition properties is provided in Figure 2-11 of the SPAS Draft EIR. The parcels that would be acquired under the LAWA Staff-Recommended Alternative are identified in Table 2-5 of the SPAS Draft EIR (under the heading "Alts. 1, 2, 8, and 9") and illustrated in Figure 2-12 of the SPAS Draft EIR. Following acquisition, the uses would be demolished and replaced with SPAS-related improvements.[2]

2.2.4 Construction Staging Areas

Figure 2-15 of the SPAS Draft EIR depicts the locations of potential construction staging areas that could be utilized in some combination during development of the LAWA Staff-Recommended Alternative. As indicated in Section 2.2.1, the LAWA Staff-Recommended Alternative was formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for this alternative.

Construction Staging Areas A though D are located within the LAX Northside planning area, which is planned for future development independent from SPAS. Depending on the nature and timing of such future development, use of Construction Staging Areas A through D for SPAS-related construction staging may be limited.

In addition to the potential construction staging areas described above, there are numerous existing surface parking lots in the vicinity of Arbor Vitae Street, and Airport and Aviation Boulevards that could serve as potential short-term and temporary construction staging areas.

[2] The LAWA Staff-Recommended Alternative would require the same acquisition as Alternatives 1, 2, 8, and 9.

2.3 Environmental Impact Analysis of the LAWA Staff-Recommended Alternative

Introduction

This section presents the environmental impacts of the LAWA Staff-Recommended Alternative described in Section 2.2, *LAWA Staff-Recommended Alternative Description*, as derived from the analysis presented in the SPAS Draft EIR as amended by corrections and additions to that document identified in Chapter 5 of Part II of this Final EIR. A description of the physical environment at and within the vicinity of LAX that may be affected by the LAWA Staff-Recommended Alternative is provided in Chapters 3 and 4 of the SPAS Draft EIR.

Based on information in the SPAS Draft EIR, this section provides a discussion of the potential impacts to that physical environment that are specifically associated with the LAWA Staff-Recommended Alternative and the measures proposed to mitigate those impacts, as required.

As described in Section 2.1 of this chapter, the LAWA Staff-Recommended Alternative couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Thus, the impacts analysis in this section for the LAWA Staff-Recommended Alternative is representative of the impacts analysis of Alternatives 1 and 9 in Chapter 4 of the SPAS Draft EIR. For some topics, such as aircraft noise, impacts from the LAWA Staff-Recommended Alternative would only result from airfield improvements; the impacts for these topics are equivalent to the impacts associated with Alternative 1 as presented in the SPAS Draft EIR. For other sections, such as on- and off-airport transportation, impacts from the LAWA Staff-Recommended Alternative would only result from the ground access improvements; the impacts for these sections are identical to the impacts associated with Alternative 9 in the SPAS Draft EIR. For some topics, such as aesthetics, impacts from the LAWA Staff-Recommended Alternative would result from both the airfield/terminal and the ground access improvements; in these cases, the impacts associated with the LAWA Staff-Recommended Alternative represent a combination of the impacts associated with Alternative 1 and Alternative 9 of the SPAS Draft EIR.

The following provides a list of topics addressed in this section, along with an indication of the analogous impacts assessment in the SPAS Draft EIR:

- Aesthetics (Alternatives 1 and 9)
- Air Quality (Alternatives 1 and 9, with the combined emissions modeled to identify air pollutant concentrations)
- Biological Resources (Alternatives 1 and 9)
- Coastal Resources (Alternative 1)
- Cultural Resources (Alternatives 1 and 9)
- Greenhouse Gases (Alternatives 1 and 9)
- Hazards/Hazardous Materials
  - Human Health Risk Assessment (Alternatives 1 and 9, with new risk calculations for the combined toxic air contaminant emissions)
  - Safety (Alternative 1)
  - Hazardous Materials (Alternatives 1 and 9)
- Hydrology/Water Quality (Alternatives 1 and 9)
- Land Use and Planning (Alternatives 1 and 9)
- Noise
  - Aircraft Noise (Alternative 1)

  - Road Traffic Noise (Alternative 9)
  - Construction Traffic and Equipment Noise (Alternatives 1 and 9)
  - Transit Noise and Vibration (Alternative 9)
- Public Services
  - Fire Protection (Alternatives 1 and 9)
  - Law Enforcement (Alternatives 1 and 9)
- Transportation
  - On-Airport Transportation (Alternative 9)
  - Off-Airport Transportation (Alternative 9)
- Utilities
  - Energy (Alternatives 1 and 9)
  - Solid Waste (Alternatives 1 and 9)
  - Wastewater Generation (Alternatives 1 and 9)
  - Water Supply (Alternatives 1 and 9)

As discussed in Section 2.1.3 of this chapter, the analysis of impacts associated with the LAWA Staff-Recommended Alternative is not new information. Rather, the analysis presented herein is a restatement of the analyses provided in the SPAS Draft EIR under the headings of "Alternative 1" and "Alternative 9." As noted above, additional modeling was performed to provide an estimate of the air pollutant concentrations associated with the combination of emissions from the Alternative 1 airfield and terminal improvements and the Alternative 9 ground access components. Such calculations are provided in Attachment 1 of Part II of this Final EIR. Similarly, new risk calculations were performed on the combined toxic air contaminant emissions. These calculations are also provided in Attachment 1 of Part II of this Final EIR. The results of the calculations fall within the range of air pollutant concentration impacts and human health risk impacts identified in Sections 4.2, *Air Quality*, and 4.7.1, *Human Health Risk Assessment*, of the SPAS Draft EIR and do not constitute new significant environmental impacts.

Each of the 13 main environmental disciplines addressed in this section is discussed in a separate section using a common organization. Sections are numbered 2.3.1 through 2.3.13. Several sections are divided into subsections to simplify and clarify the discussion. The impacts analyses in this section is based upon the same methodology and thresholds of significance described in Chapter 4 of the SPAS Draft EIR. Unless otherwise noted, the impacts analysis for the LAWA Staff-Recommended Alternative also assumes that the applicable LAX Master Plan commitments and mitigation measures identified in Section 2.5, *Summary of Impacts and Mitigation Measures Related to the LAWA Staff-Recommended Alternative*, of this chapter and described in detail in Chapter 4 of the SPAS Draft EIR would be implemented concurrently with and as part of the LAWA Staff-Recommended Alternative.

Within each environmental topic section, discussion of the following is provided:

- The **Impacts Analysis** section presents the analysis of impacts for the LAWA Staff-Recommended Alternative for the buildout horizon year 2025. Impacts were compared to the thresholds of significance identified in Chapter 4 of the SPAS Draft EIR to determine whether they would be, under CEQA, significant or less than significant. For purposes of determining significance, potential impacts were compared to the environmental baseline conditions, as further described in the *Analytical Framework* in the Introduction to Chapter 4 of the SPAS Draft EIR.
- **Mitigation Measures** are specified procedures, plans, policies, or activities proposed for adoption by the lead agency to reduce or avoid the significant impacts identified in the analysis of environmental impacts. This section identifies SPAS-specific mitigation measures proposed to address significant impacts that would occur with implementation of the LAWA Staff-Recommended Alternative. In accordance with the requirements of CEQA, a Mitigation Monitoring and Reporting Program would be

adopted as part of the SPAS project approvals, to ensure that implementation of mitigation measures is properly monitored and documented.

- **Level of Significance After Mitigation** is a CEQA determination of the significance of a particular impact after implementation of the proposed mitigation measures. This section identifies any significant impacts that cannot be mitigated to a level that is less than significant. These "significant unavoidable impacts" are also listed in Section 2.5, *Summary of Impacts and Mitigation Measures Related to the LAWA Staff-Recommended Alternative*, of this chapter. The level of significance after mitigation is not included for those environmental topics where no significant impacts would occur and, as a result, where no mitigation measures specific to SPAS are required.

2.3.1 Aesthetics

2.3.1.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to aesthetics are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.1.6 of the SPAS Draft EIR.

In addition to the LAX Master Plan commitments and mitigation measure, and as previously discussed under Section 4.1.3.1 of the SPAS Draft EIR, new development at LAX is subject to compliance with a number of design- and lighting-related regulations and guidelines. Compliance with applicable regulations and guidelines is supported through LAWA's design review process where plans are reviewed by the Facilities Planning Division, other airport divisions, and by the City of Los Angeles Building and Safety Department as part of the permitting process. The Building and Safety Department distributes the plans as appropriate to other City departments including Planning, Public Works, and Cultural Affairs with final design approval required by the Cultural Affairs Commission. As architectural plans are not available for the improvements proposed under the LAWA Staff-Recommended Alternative, the following analysis assumes that new development at LAX would be carried out in compliance with relevant LAX Master Plan commitments and mitigation measure, and with relevant LAX and City of Los Angeles design and lighting regulations and guidelines.

The LAWA Staff-Recommended Alternative (described in Section 2.2, *LAWA Staff-Recommended Alternative Description*, of this chapter) includes various features that are particularly relevant to the analysis of impacts to aesthetics, views, and light and glare. These features include airfield facility and terminal improvements; ground access improvements, such as the Intermodal Transportation Facility (ITF), new parking and a CONRAC in the Manchester Square area, and the relocation of Lincoln Boulevard; and the relocation of navigational aids.

2.3.1.1.1 Aesthetics

Century Corridor/Eastern Boundary

The LAWA Staff-Recommended Alternative would involve construction of a new ITF on 14 acres between 96th and 98th Streets and between Vicksburg Avenue and Airport Boulevard. Key features of the ITF include public parking and remote passenger pick up/drop off areas. In addition, arriving passengers would travel to the ITF to board door-to-door shuttles or scheduled buses. As part of the LAWA Staff-Recommended Alternative, the Manchester Square area would be developed with a parking facility and a CONRAC. An APM between Manchester Square and the CTA would be constructed within an elevated/dedicated structure primarily using the 98th Street corridor, including a bridge over Sepulveda Boulevard and stops at the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards and the new ITF.

The construction of a new ITF would involve the acquisition and demolition of existing parking structures, and commercial and industrial properties, some of which are currently vacant and fenced off from the street. The structures that would be removed do not contribute to a valued aesthetic character or image of the area. As described in Section 4.1 of the SPAS Draft EIR, the existing visual quality of this area is

poor and limited landscaping is located within this area. Construction of the ITF would create a new use that would be compatible with surrounding commercial, industrial, and parking uses. Design plans for the ITF have not been developed. However, the LAX Street Frontage and Landscape Development Plan Update requires passenger facilities, such as the ITF, as a highly utilized public facility, to include intensive landscaping amenities and visual treatments. Such visual treatments would include edge treatments, pedestrian amenities, and other decorative elements. In addition, the LAX Specific Plan requires the development of conceptual design guidelines for new projects, including new central terminals and passenger facilities such as the ITC.

LAX Master Plan Commitments DA-1, Provide and Maintain Airport Buffer Areas, LU-4, Neighborhood Compatibility Program, and LU-2, Establishment of a Landscape Maintenance Program for Parcels Acquired Due to Airport Expansion, would further reduce the potential for the ITF to have adverse effects on aesthetic and visual resources. In particular, LU-4, Neighborhood Compatibility Program, outlines interface treatments along the airport perimeter for the purpose of "ensuring that the airport complements surrounding properties and neighborhoods." As stated in LAX Master Plan Commitment LU-4, the purpose of the NCP is to encourage ongoing coordination and planning by LAWA to ensure that the airport complements surrounding properties and neighborhoods. Efforts to promote the visual compatibility of the ITF with surrounding uses would be undertaken during LAWA's architectural design and development process and would support the LAX Specific Plan, LAX Street Frontage and Landscape Development Plan Update, and future conceptual design guideline objectives. In light of these applicable design guidelines, plan provisions, and LAX Master Plan commitments, and given that the site and surrounding areas are not of high aesthetic quality, and the ITF would not remove features that would change the aesthetic character of the area, impacts to aesthetic and visual resources from the ITF would be less than significant.

The ITF would be developed in an area with poor visual quality that does not include notable views. The ITF would not be located within the viewshed of a designated scenic highway, corridor, or parkway. As development of the ITF would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views, impacts on views would be less than significant.

Since the Manchester Square area has been largely cleared and consists of vacant grass lots surrounded by fencing, the existing visual quality of the area is low, and areas surrounding the site do not provide valued scenic views or include sensitive visual receptors. Development of the proposed parking facility and CONRAC would involve removal of the limited remaining structures in Manchester Square and existing LAWA- maintained landscaping. The new parking facility and CONRAC would be in character with surrounding surface parking facilities, commercial, and industrial development. Furthermore, edge and landscape treatments would be incorporated into the design of the parking facility and CONRAC in compliance with the LAX Street Frontage and Landscape Development Plan Update and efforts to promote the visual compatibility of the new parking facility and CONRAC would be undertaken as part of LAX Master Plan Commitments DA-1, Provide and Maintain Airport Buffer Areas, and LU-4, Neighborhood Compatibility Program. As discussed above, the Manchester Square area does not provide valued focal or panoramic views, nor is the area within the viewshed of a designated scenic highway, corridor, or parkway. In light of applicable design guidelines and LAX Master Plan commitments for screening, buffers, setbacks, and maintenance of neighborhood compatibility, and given that the site and surrounding areas are not of high aesthetic quality, impacts to aesthetic and visual resources due to the proposed parking facility and CONRAC would be less than significant. As development of the new parking facility and CONRAC would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views, impacts on views would also be less than significant.

Development of the APM and support pilings ranging in height from ground level up to 20 feet above grade would be developed between Manchester Square and the CTA primarily along the 98th Street corridor, including a bridge over Sepulveda Boulevard and stops at the future Metro LAX/Crenshaw Light Rail Transit Station near Century and Aviation Boulevards and the new ITF. Views in this area are limited and consist of parking facilities, hotel, commercial, and industrial uses which do not contribute to a valued aesthetic image. Furthermore, efforts to promote the visual compatibility of the elevated APM with

surrounding uses would also be undertaken during LAWA's architectural design and development process and through conformance with LAX Master Plan Commitment LU-4, Neighborhood Compatibility Program. Therefore, in light of applicable design guidance and LAX Master Plan commitments, and because the elevated APM would not degrade an area valued for its aesthetic character or involve the removal of features that contribute to the aesthetic image of the area, impacts to aesthetic and visual resources would be less than significant.

The elevated APM would be most visible from lower floors of hotels and office buildings along 98th Street and adjacent roadways. The elevated APM would also be visible from adjacent roadways and properties along 96th Street, Sepulveda Boulevard south of 96th Street, and portions of Aviation Boulevard adjacent to the cross-over at 98th Street. While development of the elevated APM would introduce a new and unique feature in the project area, due to the height of the structure and support pilings, views most likely to be affected would be from the lower levels of hotel and office uses along 98th Street and Sepulveda Boulevard, which are not scenic. As such, development of the elevated APM would not impact valued focal or panoramic views from upper stories of hotel and office uses. Furthermore, the elevated APM is not within the viewshed of a designated scenic highway, corridor, or parkway. Accordingly, the elevated APM would have a less than significant impact in regard to obstruction or diminishment of views.

Central Terminal Area

Terminal improvements under the LAWA Staff-Recommended Alternative include the addition of new Terminal 0, loss or modifications to concourse areas and/or gates at Terminals 1, 2, and 3, and the modification and northern extension of concourse area and gates at TBIT and the future Midfield Satellite Concourse (MSC). Ground access improvements within the CTA include modification of Sky Way (the primary access road connecting CTA to southbound Sepulveda Boulevard and 96th Street Bridge). No modifications to the Theme Building or Airport Traffic Control Tower would occur. An APM would be located within the CTA under this alternative. The APM would be situated on an guideway located between the parking garages and the terminal buildings. The existing parking garages and terminal buildings are aging, functional in nature, and generally lack architectural interest or extensive landscaping, and do not contribute meaningfully to the aesthetic quality of the CTA. As such, the addition of the APM adjacent to these structures, while it would be visually noticeable, would introduce a new, modern feature within the CTA that would be consistent with the airport's image as a Gateway to the City of Los Angeles.

The APM would be developed within the CTA, but its precise alignment has yet to be designed. Depending on the height of the APM tracks and various support structures, the APM could potentially diminish valued focal views of the Theme Building from a variety of vantage points in the CTA, particularly views from terminal front areas and sidewalks to the north and south. Views of the Theme Building are valued focal views within the CTA. Although plans for the APM within the CTA are conceptual, impacts to valued focal views of the Theme Building from different vantage points within the CTA under the LAWA Staff-Recommended Alternative would be significant. With incorporation of Mitigation Measure MM-HA Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, described in Section 2.3.1.2 below, views of the north and south elevations of the Theme Building would not be impaired by the APM, reducing this impact to a level that is less than significant.

The new Terminal 0, and reconstruction and modifications of the Terminal 3 concourse and gates would, pursuant to the LAX Plan and LAX Street Frontage and Landscape Development Plan Update, incorporate external and more modern design elements and greater architectural articulation than current conditions. In addition, the LAX Specific Plan requires the development of conceptual design guidelines for new central terminals. Thus, the new Terminal 0 and modified facilities are expected to represent an aesthetic improvement within the CTA that would promote the airport's image as a Gateway to the City of Los Angeles. Therefore, impacts to aesthetic and visual resources would be less than significant.

Terminal and airfield improvements within/near the CTA under the LAWA Staff-Recommended Alternative would take place on the airfield and north of Sky Way. These improvements would not obstruct or degrade views of the Theme Building within the CTA.

Additional CTA improvements proposed as part of the LAWA Staff-Recommended Alternative include the relocation of Sky Way eastward between the future Terminal 0 and Sepulveda Boulevard. These modifications involve the relocation of an existing roadway, which would not detract from or constitute the loss of a valued visual resource. Existing views of Sky Way are not notable, and notable views within the CTA would not be altered with the relocation of Sky Way.

Since development of terminal improvements under the LAWA Staff-Recommended Alternative would not degrade features that contribute to the valued aesthetic character of the area, impacts to aesthetic and visual resources would be less than significant. As development of the terminal improvements under the LAWA Staff-Recommended Alternative would not affect views from a designated scenic highway, corridor, or parkway or obstruct valued focal or panoramic views, impacts to views would also be less than significant.

Southern Boundary

Limited improvements would occur near the southern portion of the airport under the LAWA Staff-Recommended Alternative, representing little change from existing conditions. Airfield and terminal modifications would be visible in the distance from upper stories of hotels and office buildings located along the south side of Imperial Highway to Sepulveda Boulevard and motorists along Imperial Highway. Farther west along Imperial Avenue from California Street to Pershing Drive, there are views of the airfield and the CTA and more distant views of the Santa Monica Mountains from viewers on the bluff-top greenbelt and a limited number of taller commercial buildings and elevated residential properties.

Various terminal and airfield modifications under the LAWA Staff-Recommended Alternative would not introduce a new land use that would materially alter the overall visual character of the airfield, CTA, or aircraft operations. Since improvements under the LAWA Staff-Recommended Alternative within the southern boundary would not degrade or remove features that contribute to the valued aesthetic character of the area, impacts on aesthetic and visual resources would be less than significant.

Views of the existing airfield, while of public interest, and more distant views to the CTA, are not scenic. Changes to the north airfield and terminal improvements in the northern portion of the CTA would not alter existing long-range views of the Santa Monica Mountains due to the distance of the proposed improvements and the substantially higher vantage points to the south. Modifications would not affect views from a designated scenic highway, corridor, or parkway. Improvements under the LAWA Staff-Recommended Alternative would not alter valued views in El Segundo of airfield operations, such as arriving and departing aircraft. Accordingly, improvements that would occur near the southern boundary of the airport under the LAWA Staff-Recommended Alternative would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views; therefore, impacts on views would be less than significant.

Western Boundary

Development in the western boundary area would also be limited under the LAWA Staff-Recommended Alternative. Runway 6L/24R would be extended to the west, and taxiways would be improved and extended near the western end of the site. In order to accommodate the relocation of Runway 6L/24R, and the adjustment to the Runway 6R landing threshold, existing navigational aids within the Dunes and Habitat Restoration Area would be removed and new facilities would be installed and modified to align with proposed runway configurations.

Improvements to the airfield, CTA, and navigational aids would represent a continuation of existing uses and would not introduce a new land use that would materially alter the overall visual character of the airfield, CTA, or aircraft operations. Similar to existing conditions, new and modified navigational aids would be low in profile or would be narrow thin poles that would not materially change the aesthetic character of the Dunes or Habitat Restoration Area. Since improvements under the LAWA Staff-Recommended Alternative within the western boundary would not degrade or remove features that contribute to the valued aesthetic character of the area, impacts on aesthetic and visual resources would be less than significant.

Existing views of the airfield and more distant views to the CTA from public vantage points along Pershing Drive and residential areas north and south of the airport, while of public interest, are not scenic. As stated in Section 4.1 of the SPAS Draft EIR, scenic views of the ocean to the west are obscured by the Dunes. West of Pershing Drive, large areas of the Dunes are undeveloped and somewhat natural in appearance and, accordingly, provide a scenic appearance to pedestrians and motorists along Pershing Drive and to residential areas and public streets north and south of the Dunes. Other areas of the Dunes include remnant residential streets, radar, navigational aids, related safety facilities, and other ancillary facilities, which are not visually prominent from public vantage points along Pershing Drive. Vista del Mar, a City of Los Angeles-designated Scenic Highway, bounds the far westerly edge of the airport property, adjacent to the Dunes. Views of airport facilities are not possible from Vista del Mar due to the intervening Dunes.

The runway improvements under the LAWA Staff-Recommended Alternative would generally occur at grade level and would not block any valued focal or panoramic view of the Dunes. Additionally, with the exception of changes to existing navigational aids, no development would take place in the Habitat Restoration Area, and views of the Dunes and views along Vista del Mar, a City of Los Angeles-designated Scenic Highway, would not materially change.

As discussed previously, in order to accommodate the relocation of Runway 6L/24R, and the adjustment to the Runway 6R landing threshold, existing navigational aids would be removed and new facilities would be installed and modified to align with proposed runway configurations. However, similar to existing conditions, new and modified navigational aids would be low in profile or would be narrow thin poles that would not comprise a noticeable portion of the overall viewshed. Furthermore, the intervening topography of the Dunes makes the navigational aids difficult to see from adjacent roadways. Existing vegetation is low in profile and minimal vegetation would be removed to accommodate new and modified navigational aids.

Since airfield and terminal improvements and the relocation and modification of navigational aids under the LAWA Staff-Recommended Alternative within the western boundary would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views, impacts on views would be less than significant.

Northern Boundary

Implementation of the LAWA Staff-Recommended Alternative would involve changes to the north airfield, which would include movement of Runway 6L/24R to the north and extension of Runway 6R/24L to the east. Modifications to the north airfield and CTA would be visible from the Westchester Golf Course, residential areas to the north of Lincoln Boulevard, homes located along West 91st Street north of Saint Bernard High School and west of Falmouth Avenue, and homes west of Pershing Drive due to the higher elevation of these areas. However, views of the north airfield and CTA from residential areas north of Lincoln Boulevard and east of the Westchester Golf Course are limited. As described in Section 4.1 of the SPAS Draft EIR, the northern boundary of the LAX Northside project site, along West 88th Place between Sepulveda West Way and the Westchester Golf Course, and then north to Manchester Avenue, is largely screened with 20-foot-high buffers.

Improvements to the north airfield and CTA under the LAWA Staff-Recommended Alternative would represent a continuation of existing airfield uses and would not meaningfully change the aesthetic and visual characteristics of the airfield or CTA. Under the LAWA Staff-Recommended Alternative, Lincoln Boulevard would be realigned to the north, with approximately 540 linear feet below grade and/or covered. The realignment and depression of Lincoln Boulevard would not introduce a new land use that differs substantially from existing conditions.

As discussed in Section 4.1 of the SPAS Draft EIR, future development within LAX Northside would be subject to height restrictions, setback requirements, and landscape guidelines set forth in Appendix A of the LAX Specific Plan, as well as the 1989 LAX Northside Design Plan and Guidelines. Implementation of these conditions would promote a visually open landscaped northern boundary, and setbacks and height limits would reduce aesthetic impacts associated with the airfield modifications.

In addition, LAX Master Plan Commitments DA-1, Provide and Maintain Airport Buffer Areas, and LU-4, Neighborhood Compatibility Program, would further reduce impacts to aesthetic and visual resources along the northern boundary. In particular, LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas, requires the provision and maintenance of landscaped buffer areas that will include setbacks, landscaping, screening, or other appropriate view-sensitive improvements with the goals of avoiding land use conflicts, shielding lighting, enhancing privacy, and screening view of airport facilities from adjacent residential areas. LAX Master Plan Commitment LU-4, Neighborhood Compatibility Program, addresses all issues relating to compatible land use, including landscape buffer issues as well as noise, light spill-over, odor, and vibration.

In light of these applicable LAX Master Plan commitments and plan provisions, and given that improvements to the north airfield under the LAWA Staff-Recommended Alternative would not degrade or remove features that contribute to the valued aesthetic character of the area, impacts on aesthetic and visual resources would be less than significant.

Views of the north airfield operations are not scenic although more distant views of the historic Theme Building are visible. Airfield improvements would generally occur at grade level and improvements to the CTA would be comparable in scale, proportion, and massing to existing uses and would not block distant views of valued visual resources, such as the iconic Theme Building. Modifications under the LAWA Staff-Recommended Alternative would not affect views from a designated scenic highway, corridor, or parkway. Furthermore, as discussed previously, future development within LAX Northside would be subject to height restrictions, setback requirements, and landscape guidelines set forth in Appendix A of the LAX Specific Plan, as well as the 1989 LAX Northside Design Plan and Guidelines. Implementation of these conditions would promote a visually open landscaped northern boundary, and setbacks and height limits would reduce visual intrusion or obscuring of distant views.

As improvements occurring under the LAWA Staff-Recommended Alternative within the northern boundary would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views, impacts on views would be less than significant.

Construction

Construction of airfield, terminal, ground access, and parking improvements under the LAWA Staff-Recommended Alternative would occur during different time periods, and construction of many improvements, such as runway improvements and navigational aids, would not be visually intrusive from surrounding vantage points. However, construction activities would cause some areas of the airport environs to have an incomplete, disrupted, and unattractive quality.

Areas where the construction activities would be most visible include commercial and hotel uses along 98th and 96th Streets; commercial areas north and south of Manchester Square; residential areas and viewers near the relocated portion of Lincoln Boulevard; residential areas northwest of Pershing Drive; and viewers along Imperial Highway, Sepulveda Boulevard south of 96th Street, Pershing Drive, I-405 north of Century Boulevard, I-105, Imperial Highway, and Aviation, Lincoln, Airport, and Century Boulevards.

Under the LAWA Staff-Recommended Alternative, Construction Staging Areas A, B, C, and D would be located along the northern boundary of the airport (see Figure 2-15 in Chapter 2, *Project Description*, of the SPAS Draft EIR). These construction staging areas would be visible from residential areas north of Westchester Parkway, and from the Westchester Golf Course and elevated residential areas northwest and northeast of Pershing Drive. A number of sound walls of varying heights separate some of the residential uses from these construction areas, particularly along West 88th Street. However, the noise walls may not be of sufficient height to block all views of the construction activities, and not all residential areas have such walls. Although Construction Staging Areas A, B, C, and D would be visible to some degree from off-site vantage points, the areas are largely vacant and do not include valued aesthetic resources or notable views. Construction staging equipment and activities would not contrast or be out of character with airfield runways and axillary structures located to the south.

Construction Staging Areas E and F in the mostly vacated Belford and Manchester Square areas would be visible from surrounding commercial, industrial, and surface parking uses. Views of the Manchester Square area would also be visible from the limited number of multi-family homes to the north, some which would have elevated views of the site from upper stories. Construction Staging Areas E and F would also be visible from surrounding roadways. While Construction Staging Areas E and F would be visible to surrounding uses and vantage points, these areas are largely vacant, the existing visual quality in these areas is low, and the areas do not support notable views.

The vacant Continental City site would potentially serve as Construction Staging Area G which would be visible along on Aviation Boulevard, 111th Street, and I-105. Residential areas south of I-105 have limited views of the Continental City site due to the presence of I-105 support pilings, a sound wall, and right-of-way fronting Imperial Highway. Currently, the Continental City site is vacant and does not contain valued aesthetic resources or notable views.

Since these construction staging areas do not contain notable views or valued aesthetic resources, temporary aesthetic and visual impacts related to construction staging areas would be less than significant. Furthermore, impacts related to temporary construction activities would be reduced by LAX Master Plan Mitigation Measure MM-DA-1, Construction Fencing. Specifically, MM-DA-1 would ensure construction fencing and pedestrian canopies would be installed by LAWA to the degree feasible to ensure maximum screening of areas under construction along major public approach and perimeter roadways. Along Century Boulevard, Sepulveda Boulevard, and in other areas where the quality of public views are a high priority, treatment of the fencing would further reduce temporary visual impacts.

Therefore, short-term impacts related to temporary construction activities would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views; therefore, impacts on views would be less than significant. Similarly, short-term aesthetic and visual impacts related to temporary construction activities would be less than significant.

2.3.1.1.2 Light and Glare

Century Corridor/Eastern Boundary

Under the LAWA Staff-Recommended Alternative, the Manchester Square area would be developed with a lighted parking facility and CONRAC. Development of the parking facility and CONRAC would replace an isolated, predominantly vacant area containing a few remaining residences with some street lights with more and higher intensity light sources. This increase in lighting would be consistent in character with surrounding commercial and industrial development, but would also occur in proximity to two light-sensitive uses including a multi-story apartment complex approximately one-half block to the north, and the Westin Los Angeles Airport Hotel across Century Boulevard to the south.[3]

Although development in the Manchester Square area would result in a change in lighting or lighting intensity, light spill would be minimized. Similar to other development on LAX property, parking facility lighting would be shielded and directed downward to minimize light spillover consistent with LAMC Section 93.0117. Furthermore, the parking facility would be screened and buffered from surrounding land uses by decorative walls, berms, trees, and landscaping, and/or other appropriate mechanisms in accordance with the LAX Street Frontage and Landscape Development Plan Update and LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas. Also, the future parking facility

[3] The parking facility would also be constructed adjacent to the Animo Leadership Charter High School. At the publication time of the Notice of Preparation for the SPAS Draft EIR, October 2010 (i.e., the baseline year for the EIR impacts analysis), the Animo Leadership Charter High School was located at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. This school, however, has subsequently moved to a new location in Lennox, approximately 2.5 miles from the current site (see http://www.dailybreeze.com/news/ci_21358340/animo-leadership-has-new-lennox-campus-and-new, accessed on December 10, 2012). In order to provide a consistent basis of comparison, the impacts discussion for the LAWA Staff-Recommended Alternative contained herein assumes the location of the Animo Leadership Charter High School to be at its former location at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. However, even at its former location, because schools are not in normal use during nighttime hours, schools are not considered light-sensitive uses for purposes of this analysis.

lighting would first undergo LAWA review to ensure that it is placed in such a manner that it does not adversely affect adjacent sensitive receptors consistent with the NCP and LAX Master Plan Commitment LI-3, Lighting Controls. Also, while there would be several new light sources visible from the aforementioned light-sensitive uses under this alternative, the general character of the existing ambient light environment at these receptors would not change appreciably. Compliance with the applicable LAX Master Plan commitments and plans described above would ensure that light spillover onto these uses from LAX parking lot lighting would be minimized such that sensitive uses would not be affected. Impacts related to light spill would thus be less than significant.

As discussed above, the LAWA Staff-Recommended Alternative could result in a new source of glare in the Manchester Square area. However, the parking facility would be subject to the anti-glare requirements of LAX Master Plan Commitment LI-2, Use of Non-Glare Generating Building Materials, which would avoid the generation of substantial glare. Glare from unshielded bright lighting would be avoided through conformance with LAX Master Plan Commitment LI-3, Lighting Controls, which requires that lighting be shielded and focused to avoid glare. Therefore, glare impacts in this area would not adversely affect nighttime views in adjacent areas sensitive to glare, and impacts would be less than significant.

Under the LAWA Staff-Recommended Alternative, between 96th and 98th Streets, the ITF would include public parking, remote passenger and pick up/drop off areas, and indoor waiting areas for passengers and meter/greeters within a multi-story parking structure. This would replace approximately 14 acres of existing commercial, industrial, and surface parking lot uses at the site. Lighting from the ITF would be typical of parking structures and terminal-like facilities, with light emanating from the interior and the rooftop deck equipped with parking lot lighting on light standards. While there are several existing light-sensitive uses (e.g., hotels) along 98th Street that would have views of the ITF, lighting from the ITF would not spillover onto these hotels for the same reasons discussed above with respect to the proposed Manchester Square parking facility. Thus, the impacts of the ITF on light-sensitive uses within this area would be less than significant.

As discussed above, the LAWA Staff-Recommended Alternative could result in new sources of glare in the vicinity of the ITF. However, the ITF would not generate substantial glare as it would be subject to the glare controls of LAX Master Plan Commitment LI-2, Use of Non-Glare Generating Building Materials, LAX Master Plan Commitment LI-3, Lighting Controls, which requires that lighting be shielded and focused downward, the buffering requirements of the LAX Street Frontage and Landscape Development Plan Update, and LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas. In addition, the ITF would replace existing uses at the site which already generate glare and, while the ITF would operate during nighttime hours, the parking lot already operates during nighttime hours and security lighting already exists around the commercial and industrial uses and generates glare. Therefore, the glare impacts in this area would not adversely affect nighttime views in areas sensitive to glare, and the impacts would be less than significant.

Throughout the Century Corridor and eastern boundary area, a proposed APM on pilings up to 20 feet above grade would be visible. The route of the APM would extend along 98th and 96th Streets from the proposed Manchester Square parking facility westward to the ITF and CTA. Light sources associated with the APM would include street lighting and lighting from the headlights and interiors of the APM trains. Such light sources would not be expected to generate unusually bright emissions, and, although some APM track lighting could spill off the elevated APM track and onto the uses below, this APM track lighting would be shielded and focused downward consistent with LAMC Section 93.0117 to minimize such spillover. Buffering and landscape treatments would be provided, where possible, in accordance with the LAX Street Frontage and Landscape Development Plan Update; LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas; and the NCP. Also, most of the land uses along the proposed APM route are commercial and industrial uses, which are not light-sensitive. The only exceptions are the hotels along the north side of Century Boulevard, including those with rooms oriented towards 98th Street. However, the area around the hotels is presently developed and brightly lit; thus lighting associated with the APM would not be expected to meaningfully increase ambient lighting levels. Furthermore, the 98th Street right-of-way, which includes existing street lights on both sides of 98th

Street, would separate potentially affected hotel uses from the APM alignment, and lighting from APM trains would be focused on 98th Street rather than the hotel uses. Also, while there would be several new light sources visible from the hotels under this alternative, the general character and intensity of the existing ambient light environment at these hotels would not change appreciably and window shades would continue to be employed by guests for privacy and to control outdoor lighting. Therefore, the proposed elevated APM would not result in a change in lighting or lighting intensity such that light would spill off and affect light-sensitive areas, and impacts would be less than significant.

The elevated APM could introduce new sources of glare. However, light from the headlights of APM trains would be similar to or less than existing automotive lighting on the City streets and would occur within a well-lit urban environment. Furthermore, the APM would also not be oriented toward hotel buildings. Also, the APM would not include large expanses of glass or other reflective surfaces, and thus would not generate substantial reflective glare. Therefore, the glare impacts in this area would not adversely affect nighttime views in adjacent areas sensitive to glare, and impacts would be less than significant.

Southern Boundary

The airport improvements proposed under the LAWA Staff-Recommended Alternative closest to the existing light-sensitive uses to the south would include the relocated/new navigational aids proposed in the Habitat Restoration Area west of Pershing Drive, CTA improvements proposed to the northern ends of the TBIT and MSC terminal concourses, and the north airfield runway and taxiway improvements. New sources of light associated with these improvements would include navigational aids, entrance lighting, light emanating from structure interiors, roof perimeter and parapet lights, and security lighting.

As discussed in Section 4.1.3.2.2, of the SPAS Draft EIR, there are a number of intervening features between the light-sensitive uses to the south and the airport property, including Imperial Highway, Imperial Avenue, I-105, the Imperial Strip, and partially opaque airport perimeter fencing or earthen berm. Some of the residences south of Imperial Highway could see the proposed relocated/new navigational aids through the trees of the Imperial Strip, and the navigational aids could be visible from the upper stories of the apartments and hotels south of Imperial Highway. However, navigational aids already exist in both the Habitat Restoration Area and the north airfield, and there would be no net increase in navigational aids. The navigational aids only operate periodically (e.g., when Santa Ana winds require eastward takeoffs and landings) and they are too far from the light-sensitive uses in the southern boundary area to result in light spillover onto these uses. Similarly, some of the residences south of Imperial Highway could see lighting associated with the balance of the proposed improvements through the trees of the Imperial Strip, while the upper floors of the multi-story apartment buildings and hotels could have views of these improvements. However, the closest of these improvements would be the TBIT and MSC concourse extensions, which would be located several thousand feet from these light-sensitive uses. The substantial distance would attenuate the light intensity from these improvements and the balance of the proposed improvements, and light from these improvements would not spill over onto the light-sensitive uses and affect light-sensitive areas. Furthermore, LAX Plan Policy P7 requires the provision of landscaped buffer areas along the southern boundary of Airport Airside to include screening or other mechanisms to shield airport lighting from adjacent residential areas. Therefore, light spillover impacts in this area would be less than significant.

Furthermore, any glare from these proposed improvements would be subject to the anti-glare requirements of LAX Master Plan Commitments LI-2, Use of Non-Glare Generating Building Materials, and LI-3, Light Controls, as well as the buffering requirements of LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas, and light shielding and directional requirements of LAMC Section 93.0117. Therefore, the glare impacts in this area would not adversely affect nighttime views in adjacent areas sensitive to glare, and impacts would be less than significant.

Western Boundary

Development within the western boundary area would be limited under the LAWA Staff-Recommended Alternative to the relocation of Runway 6L/24R to the north and extension to the west, construction of a

centerfield taxiway, extension of Taxiway D to the west, and relocated navigational aids within the Dunes and Habitat Restoration Area. Development in this area would not be appreciably intensified, nor would the improvements represent a substantial change or contrast with existing facilities. Nighttime lighting associated with the runway, taxiway and navigational aids modifications would include aviation lighting which is highly visible to aircraft but not to ground-level views.

Light from the aforementioned new and relocated runways and taxiways on the airport property would not result in light spillover into the Dunes or Habitat Restoration Area because of the distance (135 or more feet) between the airport property and the Dunes and Habitat Restoration Area, and the fact that runway and taxiway lights would be at ground level rather than on light standards. Similarly, the runway and taxiways and associated light fixtures would not be constructed of large expanses of reflective materials that could generate substantial reflective glare that would adversely affect nighttime views within this area. Therefore, light and glare impacts within the Dunes and Habitat Restoration Area from proposed runway and taxiway improvements under the LAWA Staff-Recommended Alternative would be less than significant.

Similarly, the relocated navigational aids in the Dunes and Habitat Restoration Area under this alternative would not result in an increase in light spillover into, or generate substantial glare which would adversely affect nighttime views within, these areas. This is because: (1) there would be no net increase in navigational aids; (2) while upgrades would occur to the relocated navigational aids, there would be no increase in light intensity of individual bulbs, no change in the frequency of blinking, and no change in the color spectra; (3) the navigational aids would be directed upward rather than downward; (4) the navigational aids would only operate occasionally, when Santa Ana winds require eastward takeoffs and landings; (5) the navigational aids would not be reconstructed with large expanses of reflective materials; and (6) light and glare from the existing navigational aids and street lights along both Pershing Drive and Vista del Mar already generate light and glare within the Dunes and Habitat Restoration Area such that ambient light and glare conditions in the Dunes and Habitat Restoration Area would not change appreciably under this alternative. Based on relevant data contained in a quantitative lighting study conducted for the LAX Master Plan, it is anticipated that increases in lighting in the vicinity of the Dunes and Habitat Restoration Area under the LAWA Staff-Recommended Alternative would be less than 0.34 footcandles and far below the LAMC 2.0 footcandle threshold.[4,5] Therefore, light and glare impacts in the Dunes and Habitat Restoration Area under the LAWA Staff-Recommended Alternative would be less than significant.

Northern Boundary

Under the LAWA Staff-Recommended Alternative, airport improvements in the northern portion of the airport property would include relocation of Runway 6L/24R 260 feet to the north, and extension of the runway westward; extension of Runway 6R/24L eastward; development of the centerfield taxiway; modifications to Taxiway E and Taxilane D, including the westerly extension of Taxilane D; extension of the TBIT and MSC concourses north; replacement of the Terminal of 3 concourse; development of Terminal 0; and realignment of Lincoln Boulevard to the north, with approximately 540 linear feet below grade and/or covered.

The residential uses north of the airport that have both southern exposures and are elevated on the bluffs would likely have views of some of these improvements. However, the light and glare effects of these improvements would be attenuated by several factors. The distance between the proposed facilities and the closest receptors would range from several hundred to several thousand feet, distances that would

4 City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, Section 4.18, April 2004.

5 The LAX Master Plan EIR evaluated four development alternatives, including LAX Master Plan Alternative D, Because the runway, taxiway, and navigational aid improvements within the western boundary area under the LAWA Staff-Recommended Alternative would be less than those under LAX Master Plan Alternative D (e.g., no West Employee Parking Structure and no net increase in navigational aids in the Dunes), it is anticipated that light levels in the Dunes under the LAWA Staff-Recommended Alternative would increase by even less than the 0.34 footcandles projected for under Alternative D. Light impacts in the Dunes under Alternative D were determined to be less than significant in the LAX Master Plan EIR.

substantially attenuate light intensities and any glare from the project. Moreover, an earthen berm and opaque perimeter fence intervene between most of the LAX Northside area and the airport property, thus blocking direct views of the proposed improvements from Manchester Parkway. Farther east, the Westchester Golf Course and a 12-foot-high noise wall atop an 8-foot-high berm buffer the airport from view by residential uses north and immediately east of the golf course. Many of the north airfield improvements would involve the replacement of existing uses, rather than the development of new uses, and thus would not represent new light and glare sources. Lighting from the runways and taxiways, including from the new centerfield taxiway, would be at ground level and directed at oncoming aircraft, and would not result in light and glare impacts off-site. Lighting associated with Terminal 0 would be sufficiently distant as to not result in light impacts off-site. The potential for light and glare impacts would be further reduced by existing requirements to assure that airport development does not result in light spillover onto adjacent properties or the generation of substantial glare, including: the NCP; LAX Master Plan Commitment DA-1, Provide and Maintain Airport Buffer Areas, which requires screening and buffering of airport uses; LAX Master Plan Commitments LI-3, Light Controls, which put controls on lighting to avoid substantial light and glare impacts; and LAMC Section 93.0117 which prohibits light spillover and requires that light sources be shielded and directed downward.[6] Furthermore, with respect to the Lincoln Boulevard realignment under this alternative, associated lighting would also be subject to the light and glare standards of the LAX Northside Plan and Development Guidelines, and to the light standards and objectives of the Los Angeles Transportation Element. Finally, while the concourse improvements under this alternative would be up to several stories in height, the lengthy distance between the concourses and the residences north of the airport, combined with LAX Master Plan Commitment LI-2, Use of Non-Glare Generating Building Materials, would ensure that concourse building facades would not generate substantial glare which could adversely affect nighttime views in adjacent areas sensitive to glare.

Given all of the above factors, while there would be several new light sources visible from the aforementioned light-sensitive uses under this alternative, the general character of the existing ambient light and glare environment at these receptors would not change appreciably. As a result, the LAWA Staff-Recommended Alternative would not result in light spillover onto, and would not generate substantial new sources of glare which would adversely affect nighttime views in, adjacent areas sensitive to glare along the northern boundary area. Therefore light and glare impacts in this area would be less than significant.

Construction

Construction activities associated with improvements under the LAWA Staff-Recommended Alternative would involve nighttime activities that would require lighting of work areas at the construction sites themselves and within the proposed construction staging areas. A number of sound walls of varying heights separate some of the residential uses from these construction areas, particularly along West 88th Street. However, the noise walls may not be of sufficient height to block all light and glare associated with construction activities, and not all residential areas have such walls. Whether or not such noise walls are already present, construction fencing would be installed in accordance with LAX Master Plan Mitigation Measure MM-DA-1, Construction Fencing, to block and/or buffers views of the construction sites and construction staging areas. Also, some of the construction staging areas are already the sites of construction staging activities and, thus, are already a source of construction light and glare. Finally the construction sites and proposed construction staging areas are already located in a well-lit, urban environment. Therefore, although there would be greater levels of ambient lighting during construction in these areas, this light and any associated glare would not result in a change in lighting or lighting intensity such that light would spill off and affect light-sensitive areas, and would not result in substantial new

[6] The LAX Northside Design Plan and Development Guidelines are not included because, while they include substantial controls on future development within the LAX Northside area, they are not applicable to uses in other parts of the airport. Similarly, the LAX Street Frontage and Landscape Development Plan Update is not included because none of the proposed northerly facilities occur along public street frontages and, thus, this plan is not applicable.

sources of glare which would adversely affect nighttime views of adjacent areas sensitive to glare. Therefore, construction light and glare impacts would be less than significant.

2.3.1.2 Mitigation Measures

2.3.1.2.1 Aesthetics

Implementation of LAX Master Plan Commitments DA-1, DA-2, LU-2, and LU-4, and Mitigation Measure MM-DA-1 would ensure that impacts to aesthetic and visual resources and views would remain less than significant for the LAWA Staff-Recommended Alternative in most instances described above. However, even with implementation of these LAX Master Plan commitments and mitigation measures, there would be significant impacts to views of the Theme Building as a result of the implementation of the APM under the LAWA Staff-Recommended Alternative. The following mitigation measure specific to SPAS was developed as part of the historical resources analysis (see Section 2.3.5, *Cultural Resources*, of this chapter) to address impacts to the Theme Building and Setting, and would reduce impacts to views of the Theme Building associated with the LAWA Staff-Recommended Alternative:

- **MM-HA (SPAS)-2. Preservation of Historic Resources: Theme Building and Setting.**

  Consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties, this measure will ensure that the historic character of the Theme Building and Setting will be retained and preserved. The Theme Building's integrity will be preserved and removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the Theme Building and contribute to its eligibility will be avoided (Standards for Preservation 1-7). The contributing Setting of the Theme Building shall be protected and maintained (Standards for Rehabilitation and Guidelines for Rehabilitation) and changes to the features and spatial relationships of the CTA shall be undertaken in a manner consistent with the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitation, and shall be compatible with the historic materials, features, size, scale and proportion, and massing of the Theme Building to protect the integrity of the historic resource and its environment (Standards for Rehabilitation 9 and 10).

  The historic features of the Theme Building include the extant original exterior and interior features of the structure such as the base, elevator core, original features of the restaurant space, public viewing platform, structural arches and footings and associated original hardscape/landscape features and circulation elements immediately surrounding the structure (concrete wall/grille around base, pedestrian entrance, patios, planters/planting beds, and pedestrian and vehicular circulation). The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the Theme Building and contribute to its eligibility shall be avoided (Standards for Preservation 1-7). Necessary alterations to the Theme Building shall conform to the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards for Rehabilitation 9 and 10).

  Changes to the features and spatial relationships of the CTA that may remove or alter features, spaces, and spatial relationships that characterize the Setting of the Theme Building and contribute to the Theme Building's eligibility shall also be avoided (Standards for Rehabilitation 1-7). Necessary alterations to the Theme Building Setting shall conform to the Secretary of the Interior's Standards for Rehabilitation 9 and 10. Contributing features and views of the Theme Building's Setting include:

  - the two Central Service Facility Buildings and a segment of original axial road alignment and associated concrete sidewalks and hardscape;
  - the architectural form of the 1961 Airport Traffic Control Tower and its distinctive control booth;
  - the general character of the airport setting, including the centrally located and visually predominant Theme Building within the U-shaped concourse area, and the horizontal forms, rectangular massing and generally consistent scale and height of the concourse buildings and their Modern architectural character and materials (Jet Age/International Style, rectangular volumes, horizontality, metal and concrete, smooth surfaces, large expanses of glass, and ribbon windows);

- the Primary Axial View between the Theme Building and the 1961 Airport Traffic Control Tower, including the axial road alignment and unobstructed view corridor between the 1961 Airport Traffic Control Tower and the Theme Building, the view to the 1961 Airport Traffic Control Tower from the Theme Building restaurant and public roof-top viewing platform, the view from the 1961 Airport Traffic Control Tower to the Theme Building, and the view from vehicular and pedestrian circulation paths within the immediate vicinity of the Primary Axial view corridor;
- the mid- and long-range outward looking views from the Theme Building's 80-foot level restaurant and the 360-degree views from the roof-top viewing platform, including mid-range views of the concourses and terminals, long-range views of the airfields, and distant views to the surrounding neighborhoods, mountains, and Pacific Ocean;
- direct views of the Theme Building from the U-shaped vehicular and pedestrian circulation paths within the concourse complex where, at a minimum, the upper portions of the Theme Building would be visible; and
- direct views of the Theme Building from the edges of the horizontal concourse levels, including views through the continuous horizontal strip windows directly facing the Theme Building from the south terminals where, at a minimum, the upper portions of the Theme Building would be visible.

Changes to non-contributing features and spatial relationships of the CTA that may indirectly impact the Theme Building and Setting shall be undertaken in a manner consistent with the Secretary of the Interior's Standards for Rehabilitation 9 and 10, and shall be compatible with the historic materials, features, size, scale and proportion, and massing of the Theme Building to protect the integrity of the historic resource and its environment. The design of the APM shall ensure that important contributing views of the north and south elevations of the Theme Building are not materially impaired.

Prior to the final design of the APM, a qualified historic preservation consultant shall be engaged by LAWA to review the compatibility of new design and construction components adjacent to the Theme Building for conformance with Secretary of the Interior's Standards that provide guidelines for sensitively and respectfully managing changes to the defining characteristics of a historic property's site and environment. With regard to adjacent new construction, Standard for Rehabilitation 9 recommends that destruction of historic materials that characterize the property be avoided where feasible, and that adjacent new work shall be compatible with the massing, size, scale, and architectural features of the historical resource to protect the historic integrity of the property and its environment. Standard for Rehabilitation 10 requires that new construction be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired. This mitigation measure and the required Standards conformance review by a qualified historic preservation consultant shall achieve and document compliance with the applicable Standards through the requisite plan reviews and sign-off of plans. In addition, a letter report will be provided to the City of Los Angeles Office of Historic Resources documenting the results.

2.3.1.2.2 Light and Glare

Implementation of LAX Master Plan Commitments LI-2 and LI-3 would ensure that impacts with respect to light and glare associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to SPAS are required.

2.3.1.3 Level of Significance After Mitigation

Implementation of SPAS Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, would reduce impacts to views associated with the LAWA Staff-Recommended Alternative within the CTA to a level that is less than significant.

2.3.2 Air Quality

2.3.2.1 Impacts Analysis

As noted in Section 2.3, air quality emissions (of both criteria pollutants and toxic air contaminants) associated with the airfield/terminal components of Alternative 1 were combined with the emissions associated with the ground access components of Alternative 9 to present air quality emissions associated with the LAWA Staff-Recommended Alternative. These combined emissions were then modeled to identify air pollutant concentrations.

2.3.2.1.1 Construction Emissions

Peak daily construction emissions for the LAWA Staff-Recommended Alternative are presented in **Table SRA-2.3.2-1**. As indicated in **Table SRA-2.3.2-1**, the vast majority (80 percent or more) of the construction emissions for the LAWA Staff-Recommended Alternative would be associated with the airfield and terminal improvements. Such improvements include moving Runway 6L/24R 260 feet north and completing related improvements such as covering the Argo Drainage Channel and realigning Lincoln Boulevard, lengthening Runways 6L/24R and 6R/24L, various taxiway and taxilane improvements, and terminal improvements.

Sources: Environmental Compliance Solutions, 2012; CDM Smith, 2012.

Under the LAWA Staff-Recommended Alternative, peak daily emissions of SO_2 would not exceed the SCAQMD construction emission thresholds; however, peak daily emissions of CO, VOC, NO_x, PM10, and PM2.5 would exceed the SCAQMD construction emissions thresholds. Therefore, the LAWA Staff-Recommended Alternative construction emissions of CO, VOC, NO_x, PM10, and PM2.5 would be significant.

2.3.2.1.2 Construction Concentrations

Calculations supporting the results presented in the following sections are provided in Attachment 1 of Part II of this Final EIR.

Ambient concentrations resulting from construction-related activities for the LAWA Staff-Recommended Alternative are presented in **Tables SRA-2.3.2-2** and **SRA-2.3.2-3**. **Table SRA-2.3.2-2** addresses CO, NO_2, and SO_2, for which the applicable thresholds of significance require the inclusion of background concentrations (see Table 4.2-6 of the SPAS Draft EIR), and **Table SRA-2.3.2-3** addresses PM10 and PM2.5, which include only the project-related concentrations, without background concentrations, pursuant to the applicable thresholds of significance (see Table 4.2-6 of the SPAS Draft EIR).

As shown in **Table SRA-2.3.2-2**, construction concentrations for the LAWA Staff-Recommended Alternative would exceed the 1-hour NO_2 CAAQS and NAAQS. In addition, PM10 concentrations would exceed the 24-hour and annual CEQA thresholds set by SCAQMD, as shown in **Table SRA-2.3.2-3**. Therefore, the LAWA Staff-Recommended Alternative construction concentrations would be significant for NO_2 and PM10. The LAWA Staff-Recommended Alternative construction concentrations would be less than significant for CO, SO_2, and PM2.5.

Table SRA-2.3.2-2

Peak Construction Concentrations for CO, NO_2, and SO_2

Pollutant/ Source[1]	Averaging Period	LAWA Staff-Recommended Alternative ($\mu g/m^3$)

Total	24-Hour	16
Threshold[9]	24-Hour	105
Significant?	24-Hour	**No**

[1] The significance thresholds for CO, NO_2, and SO_2 are based on California and/or National Ambient Air Quality Standards (CAAQS and/or NAAQS) which are absolute thresholds. Therefore, future construction concentrations are determined by adding existing background concentrations to the calculated future airport-related concentrations under a given alternative for comparison to the thresholds.

[2] The 1-Hour CO threshold is the 1-Hour CO CAAQS since this standard is more stringent than the 1-Hour CO NAAQS.

[3] The 8-Hour CO threshold is equivalent to both the 8-Hour CO CAAQS and 8-Hour CO NAAQS.

[4] The 1-Hour NO_2 CAAQS is not to be exceeded.

Table SRA-2.3.2-2

Peak Construction Concentrations for CO, NO_2, and SO_2

Pollutant/ Source[1]	Averaging Period	LAWA Staff-Recommended Alternative ($\mu g/m^3$)

[5] The 1-Hour NO_2 NAAQS is based on the 3-year average of the 98th percentile of daily maximum 1-hour concentrations.
[6] The annual NO_2 threshold is the annual NO_2 CAAQS since this standard is more stringent than the annual NO_2 NAAQS.
[7] The 1-Hour SO_2 CAAQS is not to be exceeded.
[8] The 1-Hour SO_2 NAAQS is based on the 3-year average of the 99th percentile of daily maximum 1-hour concentrations.
[9] The 24-Hour SO_2 CAAQS is not to be exceeded.

PM2.5		
Alternative	24-Hour	6
Threshold	24-Hour	10.4
Significant?	24-Hour	**No**

[1] The significance thresholds for PM10 and PM2.5 are based on project incremental thresholds developed by SCAQMD. Therefore, future construction concentrations are the values under a given alternative to be compared to the thresholds.

Source: CDM Smith, 2012.

Off-airport peak NO_2 construction-related concentrations are estimated to occur at the western property line of the airport north of the Hyperion Treatment Plant, based on the assumption that much of the construction support equipment/operations would occur in the western portion of the airport south of World Way West, as has been the case for several major construction projects at LAX, such as the South Airfield Improvement Project, the Crossfield Taxiway Project, and the Bradley West Project. Key construction support equipment/operations are assumed to include a concrete/asphalt batch plant(s) and rock crusher, and associated equipment such as loaders and concrete/materials transfer trucks, and construction delivery/haul staging. These facilities and activities would contribute the majority of the NO_2 emissions that drive the peak emissions, while the NO_2 emissions associated with overall construction activities in the north airfield (i.e., runway and taxiway improvements) would be a secondary contributor to the peak NO_2 concentrations.

The peak 24-hour and annual PM10 concentrations are estimated to occur just east of the CTA, near the intersection of Century Boulevard and Sepulveda Boulevard. The sources contributing to this peak concentration would include the construction of the proposed APM, north airfield improvements and north concourse improvements along with the bridge and roadway modifications at the entrance to the CTA.

2.3.2.1.3 Operational Emissions

Operational emissions for the LAWA Staff-Recommended Alternatives are presented in **Tables SRA-2.3.2-4** and **SRA-2.3.2-5**. **Table SRA-2.3.2-4** indicates the change from baseline (2009) conditions relative to each emissions source (i.e., aircraft, APU, GSE, on- and off-airport roadways, parking facilities, and on-airport stationary sources) that would occur. For **Table SRA-2.3.2-4**, the incremental project operational emissions were determined by calculating total airport emissions in 2025 after implementation of the alternative, then subtracting the baseline (2009) emissions. The incremental project emissions for the LAWA Staff-Recommended Alternative were then compared to the significance thresholds for operations that are presented in Table 4.2-5 of the SPAS Draft EIR.

[1] Project operational emissions are determined by subtracting existing airport emissions (see Table 4.2-4 of the SPAS Draft EIR) from future airport emissions for each alternative. Totals may not add exactly due to rounding.

Table SRA-2.3.2-4

Incremental Project Operational Emissions Compared to Baseline (2009) Conditions

Pollutant/Source[1]	LAWA Staff-Recommended Alternative lbs/day

[2] Ranges in aircraft and APU emissions were developed from various weather conditions that impact airfield activity. The low end of the range typically represents good visibility with less spacing required between aircraft, and the high end of the emission range typically represents poor weather conditions with greater spacing between aircraft and more ground delay time.

[3] GSE operations and activity levels are assumed to be directly related to aircraft activity levels; therefore, GSE emissions are the same for all future alternatives since aircraft activity is the same for all alternatives in 2025.

[4] On-airport stationary sources are natural gas combustion units for space heating and water heating.

[5] Off-airport stationary sources are natural gas combustion electric power generators supplying electricity to project facilities. It is estimated that 22 percent of LADWP power is produced in the South Coast Air Basin (Los Angeles Department of Water and Power, 2011 Power Integrated Resource Plan, December 22, 2011).

Table SRA-2.3.2-5

Peak Daily Project Operational Emissions Compared to Alternative 4 (2025)

Pollutant/Source[1]	LAWA Staff-Recommended Alternative lbs/day

[1] The operational emissions presented in this table represent the incremental differences of the LAWA Staff-Recommended Alternative's emissions compared to those of Alternative 4. Emissions are based on 2025 activity levels, with Alternative 4 representing the future scenario with the fewest airport improvements compared to the LAWA Staff-Recommended Alternative. Totals may not add exactly due to rounding.

[2] Ranges in aircraft and APU emissions were developed from various weather conditions that impact airfield activity. The low end of the range typically represents good visibility with less spacing required between aircraft, and the high end of the emission range typically represents poor weather conditions with greater spacing between aircraft and more ground delay time.

[3] GSE operations and activity levels are assumed to be directly related to aircraft activity levels; therefore, GSE emissions are the same for all future alternatives since aircraft activity is the same for all alternatives in 2025.

[4] On-airport stationary sources are natural gas combustion units for space heating and water heating.

[5] Off-airport stationary sources are natural gas combustion electric power generators supplying electricity to project facilities. It is estimated that 22 percent of LADWP power is produced in the South Coast Air Basin (Los Angeles Department of Water and Power, 2011 Power Integrated Resource Plan, December 22, 2011).

Source: CDM Smith, 2012.

For **Table SRA-4.1.2-5**, the incremental project operational emissions were determined by calculating total airport emissions in 2025 after implementation of the alternative, then subtracting the Alternative 4 (2025) emissions. The incremental project emissions were then compared to the significance thresholds for operations that are presented in Table 4.2-5 of the SPAS Draft EIR. The results of that comparison, relative to Alternative 4 conditions, are delineated in **Table SRA-2.3.2-5**. Alternative 4 represents the future scenario with the least amount of airfield improvements, and thus provides a basis for comparing alternatives with the same level of aircraft activity.

In each of these emissions tables, a range of aircraft emissions is presented which represents the range of daily emissions that might occur due to different weather conditions. The high end of the emission ranges for aircraft typically represents poor weather conditions that result in greater engine-on ground delays. The grand total maximum values for the LAWA Staff-Recommended Alternative are compared to the significance thresholds.

As shown in **Table SRA-2.3.2-4**, many of the pollutant emissions associated with the LAWA Staff-Recommended Alternative are shown as negative values, indicating that the emissions associated with each alternative in 2025 would be lower than the existing emissions in the baseline (2009) conditions. In most cases, these negative values are due primarily to reductions in emissions from on-road motor vehicles (cars and trucks carrying passengers and cargo to and from the airport). As emission standards for motor vehicles continue to become more stringent over time, and the motor vehicle fleet is replaced with newer, less-polluting cars and trucks, the daily emissions from these sources decrease substantially when compared to baseline (2009) conditions. The reduction in motor vehicle emissions occurs even though the total VMT for airport-related trips increases between the baseline (2009) period and 2025. As reflected in **Table SRA-2.3.2-4**, this emissions reduction more than compensates for the growth in emissions from aircraft and APUs for all gaseous pollutants except SO_2. Fuel sulfur content for motor vehicle fuels, as well as for aircraft fuel, does not change between the baseline (2009) condition and 2025; therefore, SO_2 emissions would increase relative to the baseline (2009) condition as noted above. In addition, fugitive road dust emission factors are assumed to remain constant between 2009 and 2025; thus, PM10 and PM2.5 emissions would increase relative to the growth in vehicle trips between 2009 and 2025.

Table SRA-2.3.2-5 was developed to provide a more direct comparison between alternatives, delineating changes in emissions that are primarily attributable to the specific characteristics of each alternative, while controlling for effects of emissions standards common to all alternatives. Of the fully developed alternatives analyzed in the SPAS Draft EIR, Alternative 4 has the least amount of improvements and most closely represents a future (2025) "no Yellow Light Projects" scenario, from which to measure the differences in emissions that would occur with implementation of the improvements associated with each other alternative. It should be noted that Alternative 4 does not represent a future scenario with no airport improvements related to air quality impacts, as inclusion of a CONRAC (and associated consolidation/reduction of rental car company shuttle travel) in Alternative 4 provides some air quality benefits not achieved in the other alternatives, as further described below. The modeling assumptions associated with Alternative 4 do, however, account for the continued implementation of more stringent motor vehicle emissions standards and cleaner vehicle fleets in the future that would also occur with all the other alternatives, including the LAWA Staff-Recommended Alternative. In so doing, the differences between vehicular source emissions shown in **Table SRA-2.3.2-5** are more illustrative of the differences in ground access improvements between the alternatives.

Using Alternative 4 as a basis of comparison also better represents the differences in aircraft emissions that are directly attributable to the different airfield configurations currently being considered. Under Alternative 4, the only airfield improvement would be the eastward extension of Runway 6R/24L, which would be solely to provide for additional runway safety area in accordance with FAA requirements and would not alter existing airfield operations. Within **Table SRA-2.3.2-4**, the incremental aircraft emissions associated with the LAWA Staff-Recommended Alternative in 2025 (i.e., buildout year) are measured against the existing aircraft emissions in the baseline (2009) condition. As such, the incremental aircraft emissions of the LAWA Staff-Recommended Alternative include both the growth in aircraft activity anticipated to occur between 2009 and 2025, which is common to all alternatives, and the changes in aircraft operations that are attributable to the proposed airfield configuration specific to the LAWA Staff-Recommended Alternative. The vast majority of the aircraft emissions increases shown in **Table SRA-2.3.2-4** are due to the anticipated growth in aircraft activity. **Table SRA-2.3.2-5** presents the incremental aircraft emissions associated with the LAWA Staff-Recommended Alternative in 2025 as measured against the 2025 emissions of Alternative 4. The same aircraft activity level and fleet mix are assumed for all alternatives, including the LAWA Staff-Recommended Alternative, in 2025. As such, the incremental aircraft emissions shown in **Table SRA-2.3.2-5** are only influenced by the differences in the airfield configuration specific to the LAWA Staff-Recommended Alternative. It should be noted that conclusions regarding whether the incremental emissions would result in a significant impact are based on the comparisons in **Table SRA-2.3.2-4**. The comparisons in **Table SRA-2.3.2-5**, which include a delineation of the SCAQMD threshold for each criteria pollutant, are provided for informational purposes only.

Comparison to Baseline (2009) Conditions

Project operational emissions of SO_2, PM10, and PM2.5 would exceed the daily operational thresholds. Therefore, the LAWA Staff-Recommended Alternative operational emissions of SO_2, PM10, and PM2.5 would be significant relative to baseline (2009) conditions. Aircraft and APUs are the sources of increased SO_2 emissions. Fugitive road dust is the primary source of increased PM10 and PM2.5 emissions.

Daily operational thresholds would not be exceeded for total emissions of CO, VOC, and NO_x. These pollutant emissions would not exceed their respective thresholds mainly because of ongoing implementation of more stringent motor vehicle emissions standards and cleaner future fleet mixes in the future, as described above in the introduction to the operational emissions impacts analysis. These anticipated reductions in future motor vehicle emissions would more than offset the estimated increases in other types of emissions, such as from aircraft, APU, and GSE.

The majority of emissions that would increase in the future under the LAWA Staff-Recommended Alternative would be from aircraft. If one were to consider airfield emissions (aircraft, APU, and GSE) alone under the LAWA Staff-Recommended Alternative, the thresholds of significance would be

exceeded for all criteria pollutants, except PM10; however, based on total emissions compared to baseline (2009) conditions, only the emissions of SO_2, PM10, and PM2.5 would be a significant impact.

Comparison to 2025 Conditions Using Alternative 4 as Basis of Comparison

As shown in **Table SRA-2.3.2-5**, the airside-related (aircraft, APU, and GSE) criteria pollutant peak daily emissions associated with the LAWA Staff-Recommended Alternative would range from approximately 2 to 4,040 lbs/day less than would otherwise occur under Alternative 4, depending upon the pollutant and weather condition. This comparative decrease in airside-related emissions is due primarily to reduced aircraft taxi/idle time associated with aircraft moving more efficiently on the ground with the proposed airfield improvements. Roadway- and parking-related emissions associated with the LAWA Staff-Recommended Alternative would also be less than those of Alternative 4, with the primary distinguishing factor being that the LAWA Staff-Recommended Alternative has an APM (reducing the number of shuttle bus trips to and from the airport).

2.3.2.1.4 Operational Concentrations

Ambient concentrations resulting from operations, including background concentrations, for CO, NO_2, and SO_2 under the LAWA Staff-Recommended Alternative are presented in **Table SRA-2.3.2-6** and compared to the appropriate NAAQS and CAAQS. Since the project is located in a nonattainment area for PM10 and PM2.5, the project concentrations are compared against the SCAQMD significance thresholds for short term and annual PM10 and PM2.5, instead of the NAAQS or CAAQS. The PM10 and PM2.5 project concentrations are shown in **Table SRA-2.3.2-7**.

Table SRA-2.3.2-6

Threshold[11]	Annual	80
Significant?	Annual	**No**

1 The significance thresholds for CO, NO_2, and SO_2 are based on California and/or National Ambient Air Quality Standards (CAAQS and/or NAAQS) which are absolute thresholds. Therefore, future operational concentrations are determined by adding existing background concentrations to the calculated future airport-related concentrations under a given alternative for comparison to the thresholds. Totals may not add exactly due to rounding.

2 The 1-Hour CO threshold is the 1-Hour CO CAAQS since this standard is more stringent than the 1-Hour CO NAAQS.

3 Although the CAAQS and NAAQS background design value are different, because the standards are the same and CAAQS background is higher, this represents a more conservative value.

4 The 8-Hour CO threshold is equivalent to both the 8-Hour CO CAAQS and 8-Hour CO NAAQS. Although the CAAQS and NAAQS background design value are different, because the standards are the same and CAAQS background is higher, this represents a more conservative value.

5 The 1-Hour NO_2 CAAQS is not to be exceeded.

6 The 1-Hour NO_2 NAAQS is based on the 3-year average of the 98th percentile of daily maximum 1-hour concentrations.

7 The annual NO_2 threshold is the annual NO_2 CAAQS since this standard is more stringent than the annual NO_2 NAAQS.

8 The 1-Hour SO_2 CAAQS is not to be exceeded.

9 The 1-Hour SO_2 NAAQS is based on the 3-year average of the 99th percentile of daily maximum 1-hour concentrations.

10 The 3-Hour SO_2 NAAQS is not to be exceeded more than once per year.

11 The 24-Hour SO_2 NAAQS and CAAQS, and annual SO_2 NAAQS, are not to be exceeded.

Table SRA-2.3.2-7

Peak Incremental Operational Concentrations for PM10 and PM2.5

Pollutant/Source[1]	Averaging Period	LAWA Staff-Recommended Alternative (µg/m^3)
PM10		
Alternative	24-Hour	2.3 to 2.4
Threshold	24-Hour	2.5
Significant?	24-Hour	**Yes**[2]
Alternative	Annual	1.2
Threshold	Annual	1.0
Significant?	Annual	**Yes**
PM2.5		
Alternative	24-Hour	0.8 to 2.1
Threshold	24-Hour	2.5
Significant?	24-Hour	**No**

1 The significance thresholds for PM10 and PM2.5 are based on project incremental thresholds developed by SCAQMD. Therefore, future operational concentrations are the values under a given alternative to be compared to the thresholds.

2 The project increment for the LAWA Staff-Recommended Alternative is just under the significance threshold. Given that the peak daily concentrations for all other alternatives are higher than the threshold, and that there is a very small margin between the peak daily concentration for the LAWA Staff-Recommended Alternative and the threshold, the lead agency is identifying the PM2.5 project concentration as significant.

Source: CDM Smith, 2012.

Operational impacts of the LAWA Staff-Recommended Alternative in 2025 were analyzed using the methods described in Section 4.2.2.2 of the SPAS Draft EIR. The estimated operational concentrations shown in **Table SRA-2.3.2-6** indicate that, with the exception of the 1-hour NO_2 CAAQS and NAAQS, all other NAAQS or CAAQS for CO, NO_2, and SO_2 would not be exceeded. As shown in **Table SRA-2.3.2-7**, the project incremental concentrations of PM10 would exceed the SCAQMD significance thresholds, and incremental concentrations of PM2.5 would not exceed the thresholds.

Implementation of the LAWA Staff-Recommended Alternative would exceed the 1-hour NAAQS for NO_2, the 1-hour CAAQS for NO_2, and the SCAQMD significance thresholds for PM10; therefore, the LAWA Staff-Recommended Alternative operational concentrations would be significant for NO_2 and PM10. Aircraft in the takeoff mode would contribute over 95 percent to the peak 1-hour NO_2 concentrations, and the peak 1-hour NO_2 impact locations would be on the LAX property line east of Runway 25R. Emissions from the parking lot and CONRAC located at Manchester Square contribute to the peak daily and annual PM10 concentrations. The peak impact location for PM10 is the northeast corner of Manchester Square. Peak impact locations for each pollutant and averaging period for the LAWA Staff-Recommended Alternative are shown in **Figure SRA-2.3.2-1**. The extent to which these standards would be exceeded under the LAWA Staff-Recommended Alternative would be less than the exceedance that would otherwise occur under Alternative 4 (i.e., future NO_2 NAAQS and PM10 concentrations would be higher if the LAWA Staff-Recommended Alternative improvements were not made to the airfield).

2.3.2.2 Mitigation Measures

With respect to all construction-related impacts from air emissions associated with the SPAS project, including the LAWA Staff-Recommended Alternative, LAWA is committed to mitigating temporary construction-related emissions to the maximum extent feasible and has established some of the most aggressive construction emissions reduction measures in Southern California, particularly with regard to requiring construction equipment to be equipped with emissions control devices. The framework

identified in the MPAQ for reducing air emissions associated with construction of the Master Plan and the specific means for implementing the mitigation measures described in Section 4.2.5 of the SPAS Draft EIR, as well as all of the measures identified in Table 4.2-8 of the SPAS Draft EIR, would be used to reduce air emissions associated with implementation of the SPAS project. In addition, LAWA has identified a SPAS-specific mitigation measure, MM-AQ (SPAS)-1, that would further address construction-related emissions associated with the SPAS alternatives, including the LAWA Staff-Recommended Alternative. These mitigation measures establish a commitment and process for incorporating all technically feasible air quality mitigation measures into each component of the SPAS project as each element of that project is constructed. At a programmatic level, this provides the most comprehensive means of ensuring air emissions will be reduced to the maximum extent feasible. In addition, the *LAWA Sustainable Airport Planning, Design and Construction Guidelines* encourage contractors to implement a number of voluntary measures that would reduce criteria pollutant and greenhouse gas emissions. Through the sustainability program, contractors are encouraged to implement such measures as: further reduce vehicle and equipment idling times; comply with Tier 4 emission standards for non-road diesel equipment; retrofit existing diesel equipment with particulate filters and oxidation catalysts; replace aging equipment with new low-emission models; and consider the use of alternative fuels for construction equipment. There are no additional feasible measures that could be adopted at this time to reduce air emissions further.

It is estimated that the LAWA Staff-Recommended Alternative would have significant impacts relative to operational emissions of SO_2, operational concentrations of NO_2, and operational concentrations of SO_2. As indicated in the impacts discussion above, the vast majority (over 95 percent) of the emissions contributing to those significant impacts (i.e., causing exceedances of the applicable 1-hour CAAQS and NAAQS) would occur from aircraft during takeoff. Other than potential future improvements in aircraft engine technology and associated reductions in air pollutant emissions, there are no feasible means to mitigate emissions during aircraft takeoff because the only measures are related to aircraft operational options, such as reduced thrust take-off, which are at the sole discretion of the pilot. However, as noted above, LAWA is committed to mitigating operational air quality impacts to the maximum extent feasible. The specific measures (i.e., MM-AQ-3, Transportation-Related Mitigation Measures, and MM-AQ-4, Operations-Related Mitigation Measures) described in Section 4.2.5 of the SPAS Draft EIR would also be applied to the SPAS project. In addition, LAWA has identified two SPAS-specific mitigation measures, MM-AQ (SPAS)-1 and MM-AQ (SPAS)-2, that would further address transportation- and operations-related impacts associated with the SPAS alternatives, including the LAWA Staff-Recommended Alternative. Although these measures would not mitigate operational impacts to a level that is less than significant, they would reduce impacts associated with the LAWA Staff-Recommended Alternative to the maximum extent feasible. When the specific elements of the SPAS project are implemented, additional project-specific mitigation measures may be identified to further reduce air quality impacts.

2.3.2.3 Level of Significance After Mitigation

Even with implementation of feasible construction-related mitigation measures, the maximum daily construction-related emissions associated with the LAWA Staff-Recommended Alternative would be significant for CO, VOC, NO_x, PM10, and PM2.5. Construction-related concentrations of NO_2 and PM10 would also be significant for the LAWA Staff-Recommended Alternative.

Even with implementation of feasible operations-related mitigation measures, the maximum daily operational emissions associated with the LAWA Staff-Recommended Alternative would be significant for SO_2, PM10, and PM2.5. Operational concentrations of NO_2 and PM10 would be significant for the LAWA Staff-Recommended Alternative.

2.3.3 Biological Resources

2.3.3.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on biological resources are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.3.6 of the SPAS Draft EIR, Habitats/Vegetation Associations.

The analysis of impacts to habitats and vegetation associations is presented in two parts. The first part addresses impacts associated with development of the north airfield--including the relocation of Runway 6L/24R and associated high-speed taxiway exits, the construction of a centerfield taxiway, the reconstruction of the western portion of Taxiway E and the westerly extension of Taxilane D, and the structural covering of the Argo Drainage Channel--as well as the use of construction staging areas around the perimeter of the airport. Also considered in the analysis are the roadway modifications, terminal/concourse modifications, Intermodal Transportation Facility (ITF), Consolidated Rental Car Facility (CONRAC), Automated People Mover (APM), and parking area on the eastern side of the airport; however, as these facilities would occur in areas that are currently either developed or highly disturbed on the east side of the airport and well-removed from sensitive biological resources, these improvements are not discussed further in this section, with the exception of vegetation in developed areas that may support nesting birds. The second part addresses impacts specifically associated with the relocation of navigational aids. The analysis of navigational aids considers impacts associated with new light standards and foundations. At this level of planning, the location of construction staging areas and temporary access roads associated with the relocation of the navigational aids, and potential permanent service roads for navigational aids, have not yet been determined. However, as discussed in Section 4.3.2 of the SPAS Draft EIR, the extent of the new permanent service roads has been estimated based on plans generated for the LAX Master Plan EIR (Alternative D), and impacts based on these estimates are considered herein.

North Airfield and Construction Staging Areas

Figure SRA-2.3.3-1 depicts impacts to vegetation associations under the LAWA Staff-Recommended Alternative associated with development of the north airfield and use of construction staging areas. (For ease of viewing the vegetation associations, not all proposed project improvements are labeled in **Figure SRA-2.3.3-1**. Refer to Figure SRA-2.1-1 of this chapter for a complete depiction of all improvements associated with the LAWA Staff-Recommended Alternative, and Figure 2-15 of the SPAS Draft EIR for proposed construction staging areas.) The acreage of each vegetation association affected by the LAWA Staff-Recommended Alternative, and the acreage that would remain following implementation of this alternative, are included in **Table SRA-2.3.3-1**.

There are approximately 637.47 acres of undeveloped area located east of Pershing Drive, including areas within the airfield and Construction Staging Areas A, B, C, D, and G. Vegetation associations within the undeveloped portions of this area include: Disturbed Southern Dune Scrub; Encelia Scrub; California Bulrush Marsh; Sandbar Willow Thicket; ruderal (Argo Drainage Channel); and ruderal vegetation. Implementation of the improvements under the LAWA Staff-Recommended Alternative would reduce the total undeveloped area from the baseline conditions of 637.47 acres within this area by 128.37 acres to 509.10 acres (refer to **Table SRA-2.3.3-1**). Impacts to 128.37 acres of undeveloped area includes 121.71 acres of ruderal vegetation associated with the north airfield and with proposed Construction Staging Areas A, B, C, D, and G, and 2.69 acres of Disturbed Southern Dune Scrub within Construction Staging Area A. Additional impacts associated with structurally covering the Argo Drainage Channel include 1.31 acres of California Bulrush Marsh, 0.21 acre of Sandbar Willow Thicket, and 2.45 acres of ruderal (Argo Drainage Channel).

With respect to ruderal vegetation, areas classified as ruderal are not locally- or state-designated sensitive habitat; ruderal vegetation areas are also subject to regular operations and maintenance, including mowing. For these reasons, impacts to ruderal vegetation are not significant.

LAX Specific Plan Amendment Study Final EIR	**Vegetation/Land Uses: LAWA Staff - Recommended Alternative**	Figure **SRA - 2.3.3-1**

This page intentionally left blank.

Construction of the north airfield improvements under the LAWA Staff-Recommended Alternative would result in the permanent loss of 2.69 acres of Disturbed Southern Dune Scrub (refer to **Table SRA-2.3.3-1**). Southern Dune Scrub is a state-designated sensitive habitat with a global ranking of G1 and a state ranking of S1.1, indicating that there are less than 2,000 acres throughout both its global and state range, and that it is very threatened. However, the Disturbed Southern Dune Scrub associated with the north airfield occurs in a long, narrow strip covering approximately 2.69 acres along Westchester Parkway, is surrounded by developed and ruderal areas, and is highly disturbed, having been previously developed for residential use. Because this area is highly disturbed, isolated, colonized by invasive, non-native species, and provides greatly diminished habitat value relative to the Disturbed Southern Dune Scrub in the Dunes, it is not consistent with the definition of the state-designated sensitive habitat (i.e., Southern Dune Scrub), despite the presence of indicator species. Nevertheless, this impact is considered significant. To address this impact, Mitigation Measure MM-BIO (SPAS)-14, Replacement of Habitat Units, described in Section 2.3.3.2 below, is proposed. This measure would provide compensatory mitigation for this loss of habitat. With implementation of Mitigation Measure MM-BIO (SPAS)-14, impacts to Disturbed Southern Dune Scrub habitat in this area would be less than significant. See Other Impacts, below, for additional discussion of this mitigation.

Construction of the north airfield improvements under the LAWA Staff-Recommended Alternative would result in the permanent loss of all vegetation associated with the Argo Drainage Channel, including 0.21 acre of Sandbar Willow Thicket, 1.31 acres of California Bulrush Marsh, and 2.45 acres of ruderal vegetation within the channel (refer to **Table SRA-2.3.3-1**). None of these vegetation associations are state-designated sensitive habitats or otherwise considered sensitive, and impacts would be less than significant. Impacts to Sandbar Willow Thicket, California Bulrush Marsh, and ruderal (Argo Drainage Channel) within potential USACOE and CDFG jurisdiction are further addressed under the heading Jurisdictional Aquatic Features.

Under the LAWA Staff-Recommended Alternative, operation of the proposed improvements would not have an impact on sensitive habitats and vegetation associations, as operation would not result in any additional disturbance leading to a substantial reduction in any federally-designated critical habitat, locally-designated natural communities including state-designated sensitive habitats, ESHAs, and habitat preservation areas designated pursuant to local ordinances. Operation of the proposed improvements would also not conflict with any local policies or ordinances protecting biological resources. Under both construction and operation of the improvements associated with the LAWA Staff-Recommended Alternative, there would be no conflict with the provisions of an adopted HCP, Natural Communities Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plans, as there are no adopted HCP or NCCP plans covering any portion of the biological resources study area. Under both construction and operation of the improvements associated with the LAWA Staff-Recommended Alternative, there would be no substantial reduction in a locally-designated natural habitat or plant community, as no such habitats or plant communities are associated with the biological resources study area.

Navigational Aids

Under the LAWA Staff-Recommended Alternative, relocation of navigational aids would result in permanent impacts to 0.31 acre of undeveloped area within the north airfield east of Pershing Drive, including impacts to 0.03 acre of Encelia Scrub and 0.28 acre of ruderal vegetation (refer to **Table SRA-2.3.3-2** and **Figure SRA-2.3.3-2**). Additional temporary impacts to ruderal vegetation and Encelia Scrub may occur during construction associated with temporary access roads. Since ruderal is not a sensitive vegetation association for the reasons discussed above, impacts to ruderal habitat would be less than significant.

Under the LAWA Staff-Recommended Alternative, 0.03 acre of Encelia Scrub would be impacted for construction on the western end of the north airfield. The Encelia Scrub vegetation association has a Global/State Ranking G4 S3, meaning that it is apparently secure in its global range, but there are approximately 10,000 to 50,000 acres of this association in its state range. However, the Encelia Scrub occurrence associated with the north airfield consists of a long, narrow habitat fragment covering

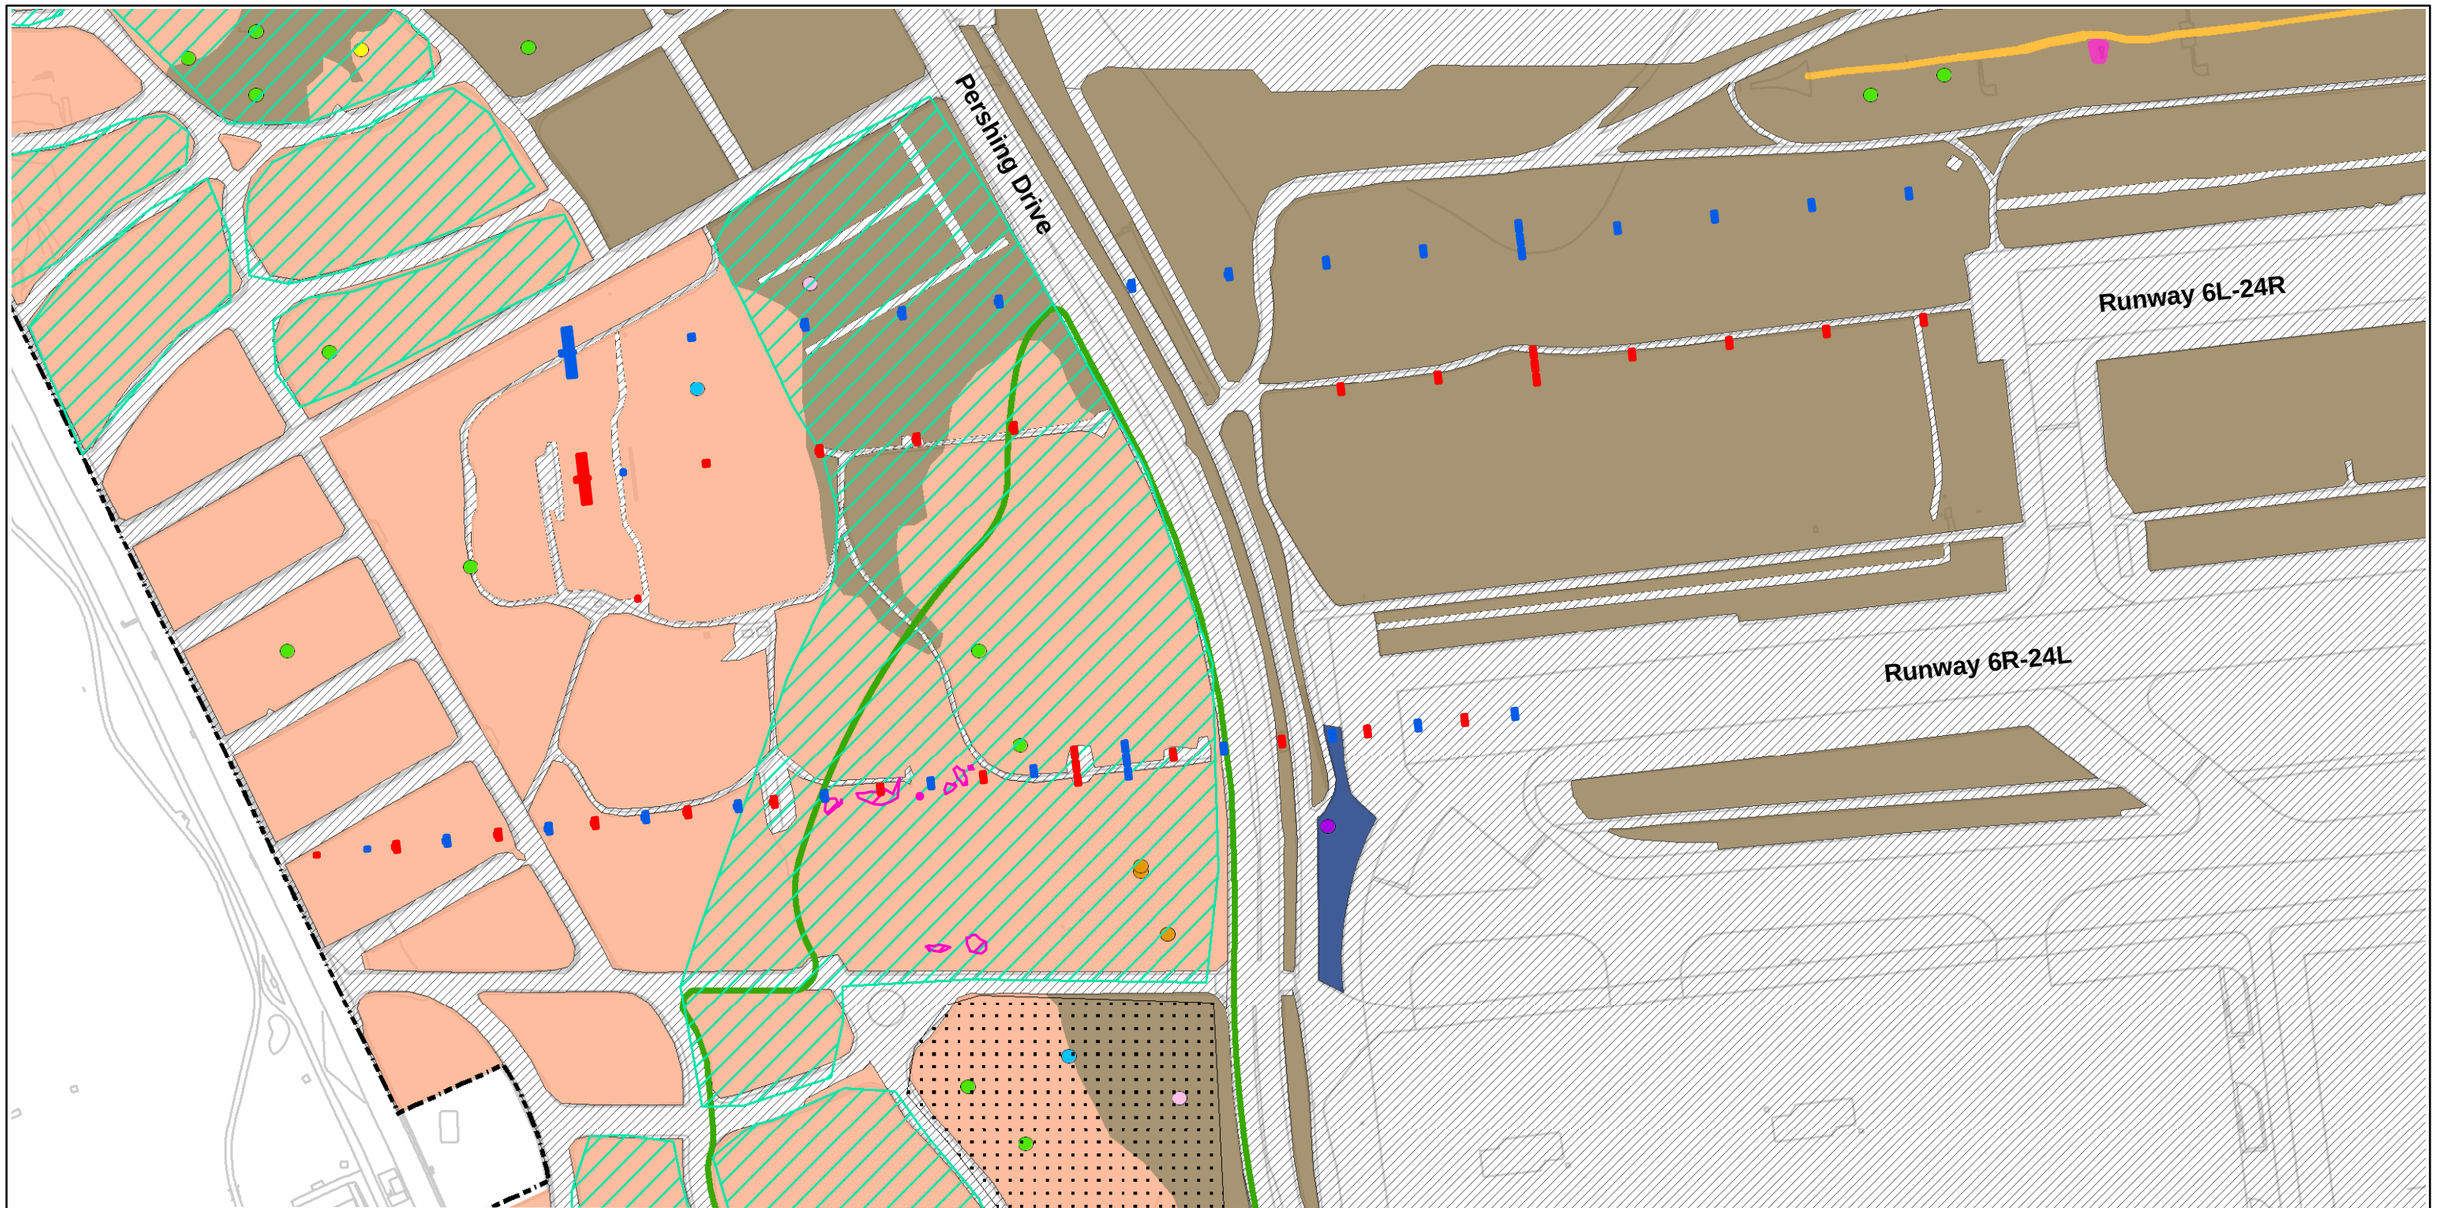
approximately 0.72 acre at the western boundary of the airfield at the end of Runway 6R/24L and adjacent to Pershing Drive, and is surrounded by developed and ruderal areas. Because this strip of Encelia Scrub is isolated, shows evidence of human disturbance, provides greatly diminished habitat value relative to larger contiguous habitat areas in the region, and includes non-native, invasive species, it is not consistent with the definition of the state-designated sensitive habitat. As such, impacts to Encelia Scrub would be less than significant.

Under the LAWA Staff-Recommended Alternative, relocation of navigational aids and construction of new service roads would result in permanent impacts to 0.89 acre of undeveloped area within the Los Angeles/El Segundo Dunes, including impacts to 0.54 acre of Disturbed Southern Foredune, and 0.35 acre of ruderal (refer to **Table SRA-2.3.3-2** and **Figure SRA-2.3.3-2**). Southern Foredune is a state-designated sensitive habitat with a global ranking of G2 and a state ranking of S2.1, indicating that there are 2,000-10,000 acres throughout both its global and state range, and that it is very threatened. Permanent loss of 0.54 acre of Disturbed Southern Foredune would occur in two locations: within the Habitat Restoration Area (0.19 acre) and north of the Habitat Restoration Area (0.35 acre). Given the relative rarity of Southern Foredune, and because these areas are contiguous with other habitat, thus providing better habitat quality and connectivity than isolated patches, the permanent loss of 0.54 acre of Disturbed Southern Foredune constitutes a substantial reduction in state-designated sensitive habitat, and would be a significant impact. Moreover, temporary impacts associated with minor grading and construction-related access roads would occur within Disturbed Southern Foredune and would be significant. The permanent loss of 0.35 acre of ruderal vegetation for new navigational aids and associated service roads, as well as additional temporary construction impacts, would not be significant, as ruderal vegetation is not a state- or locally-designated sensitive habitat. To address impacts to state-designated habitats associated with the relocation of navigational aids within the Dunes, Mitigation Measure MM-BIO (SPAS)-1, Replacement of State Designated Habitats, described in Section 2.3.3.2 below, is proposed. This measure would provide for restoration of habitat within the Dunes. With implementation of Mitigation Measure MM-BIO (SPAS)-1, impacts to sensitive habitats would be less than significant.

Under the LAWA Staff-Recommended Alternative, impacts to sensitive habitats associated with operation of the navigational aids would be less than significant, as maintenance and other operational activities would be limited to existing roads and graded pads or those constructed under the LAWA Staff-Recommended Alternative, and therefore would not result in any additional disturbance of or reduction in any federally-designated critical habitat, locally-designated natural communities including state-designated sensitive habitats, ESHAs, and habitat preservation areas designated pursuant to local ordinances. Operation of the proposed improvements would also not conflict with any local policies or ordinances protecting biological resources. Under both construction and operation of the improvements associated with the LAWA Staff-Recommended Alternative, there would be no conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plans, as no such plan covers any portion of the biological resources study area. Under both construction and operation of the improvements associated with the LAWA Staff-Recommended Alternative, there would be no substantial reduction in a locally-designated natural habitat or plant community, as no such habitats or plant communities are associated with the biological resources study area.

Other Impacts

As noted above, construction activities associated with the LAWA Staff-Recommended Alternative would occur in the Dunes, both within and adjacent to the El Segundo Blue Butterfly Habitat Restoration Area. Implementation of LAX Master Plan Mitigation Measure MM-BC-1, Conservation of State-Designated Sensitive Habitat Within and Adjacent to the El Segundo Blue Butterfly Habitat Restoration Area, would ensure the protection of this habitat.



Note: Lewis' Evening Primrose identified at western end of north airfield in 1998 are not depicted on this figure, as a map of the population is not available.

LAX Specific Plan Amendment Study Final EIR

Vegetation/Land Uses and Sensitive Species: LAWA Staff - Recommended Alternative

Figure
SRA - 2.3.3-2

This page intentionally left blank.

The LAWA Staff-Recommended Alternative would result in the loss of 21.06 habitat units (see **Table SRA-2.3.3-3**). In accordance with the LAX Master Plan mitigation program for biological resources, specifically, LAX Master Plan Mitigation Measure MM-BC-8, Replacement of Habitat Units, the loss of habitat units would be mitigated through a habitat replacement program. Mitigation Measure MM-BIO (SPAS)-14, Replacement of Habitat Units, described in Section 2.3.3.2 below, outlines the habitat replacement program as it would apply to the LAWA Staff-Recommended Alternative. Pursuant to this program, a habitat value of 0.8 would apply to the replacement acreage. Therefore, 26.33 acres would be required to mitigate the loss of habitat units.

The relocation of Lincoln Boulevard would result in the removal of mature trees. In addition, mature trees may be removed in conjunction with the use of Construction Staging Areas B, C, and D. Implementation of LAX Master Plan Mitigation Measure MM-BC-3, Conservation of Floral Resources: Mature Tree Replacement, would ensure that associated impacts would be less than significant.

Sensitive Plants

As discussed in Section 4.3, *Biological Resources*, of the SPAS Draft EIR, six sensitive plant species are either known to occur or have potential to occur in the biological resources study area, within the navigational aids relocation area and/or construction staging areas under the LAWA Staff-Recommended Alternative. Two species, Lewis' evening primrose and California spineflower, were identified in the Los Angeles/El Segundo Dunes during past surveys conducted for the LAX Master Plan EIR. As discussed in Section 4.3, *Biological Resources*, of the SPAS Draft EIR, Lewis' evening primrose was also detected on the westerly end of the north airfield, and is assumed to be present at locations affected by the relocation of navigational aids. One species, south coast branching phacelia, was detected in 2011 in the vicinity of the navigational aids relocation area. Two other recently recognized sensitive species, a subspecies of mesa horkelia and a variety of Orcutt's pincushion, have potential to occur within the Los Angeles/El Segundo Dunes, but surveys were conducted after the time of year when these species can be detected, so, although it cannot be confirmed that they occur within areas that would be affected by navigational aids relocation under this alternative, for purposes of this analysis, these taxa are assumed to occur. One species, southern tarplant, was previously detected in Construction Staging Area G and in two other locations not within the SPAS impact area, and was subsequently impacted as part of the Bradley West and Crossfield Taxiway projects. Southern tarplant was planted in the southwestern portion of the airport as mitigation for those impacts. During the course of work associated with the Bradley West and Crossfield Taxiway projects, Construction Staging Area G was modified such that it would no longer

support southern tarplant, and no impacts are proposed in the vicinity of the Southern Tarplant Mitigation Area, or the other two locations were southern tarplant was previously detected. Southern tarplant was not detected during 2011 focused surveys; however, given the history of occurrence on-site, for purposes of this analysis it is assumed that southern tarplant may occur within the biological resources study area, and specifically the north airfield and Construction Staging Areas B, C, and D.

The relocation of navigational aids under the LAWA Staff-Recommended Alternative, the construction of improvements in the north airfield, and the disturbance associated with the Construction Staging Areas B, C, and D would result in habitat alteration or removal and may result in a significant impact to these species, depending on the total population size present on-site and the percentage of the population that would be affected. As the number and distribution of the species varies from year to year and these fluctuations can be extreme, and the presence or absence of some species was not able to be determined during preparation of this EIR, it is assumed that significant impacts to sensitive plant species would occur as a result of construction of the LAWA Staff-Recommended Alternative. To address impacts to sensitive plant species, a series of mitigation measures is proposed, as described in Section 2.3.3.2 below, including MM-BIO (SPAS)-2, Conservation of Floral Resources: South Coast Branching Phacelia, MM-BIO (SPAS)-3, Conservation of Floral Resources: Lewis' Evening Primrose, MM-BIO (SPAS)-4, Conservation of Floral Resources: California Spineflower, MM-BIO (SPAS)-5, Conservation of Floral Resources: Mesa Horkelia, MM-BIO (SPAS)-6, Conservation of Floral Resources: Orcutt's Pincushion, and MM-BIO (SPAS)-7, Conservation of Floral Resources: Southern Tarplant. With implementation of these mitigation measures, impacts to sensitive plants would be less than significant.

Upon completion of construction, operation of facilities associated with the LAWA Staff-Recommended Alternative would not result in impacts to sensitive plant species, as operation would not involve additional disturbance of habitat, including maintenance access, as routine access would be limited to existing roads and roads constructed as part of the LAWA Staff-Recommended Alternative. Under the LAWA Staff-Recommended Alternative, there would be no substantial loss of individuals or the substantial reduction of existing habitat of a locally-designated species, as no such plant species are known to occur within the biological resources study area.

Sensitive Wildlife

Six sensitive wildlife species have been detected in and around the biological resources study area during surveys conducted for the LAX Master Plan EIR: Riverside fairy shrimp, El Segundo blue butterfly, western spadefoot toad, loggerhead shrike, western burrowing owl, and San Diego black-tailed jackrabbit. As previously discussed, Riverside fairy shrimp and western spadefoot toad are believed extirpated from the biological resources study area, and are not discussed further in this section.

As noted above, relocation of navigational aids in the Los Angeles/El Segundo Dunes associated with implementation of the LAWA Staff-Recommended Alternative would result in permanent impacts to at least 0.89 acre of undeveloped area in the Los Angeles/El Segundo Dunes, of which approximately 0.54 acre consists of state-designated sensitive habitat (Disturbed Southern Dune Scrub), and additional temporary impacts associated with project construction. The undeveloped areas in the Los Angeles/El Segundo Dunes support several species of sensitive arthropods and gastropods, silvery legless lizard, and coast horned lizard. As the permanent loss of 0.89 acre would not result in a substantial adverse effect, through the reduction of existing habitat, impacts to these species through habitat loss would be less than significant. However, construction activities could result in the loss of individuals through direct take of sensitive arthropod and gastropod species, the silvery legless lizard, and the coast horned lizard, which is considered to be a significant impact. Various detection methods are available to locate individuals and would be used to find and relocate them, in order to reduce the level of take. With implementation of Mitigation Measure MM-BIO (SPAS)-8, Conservation of Faunal Resources: Sensitive Reptiles, Arthropods, and Gastropods, described in Section 2.3.3.2 below, impacts to these sensitive wildlife species would be less than significant.

Loggerhead shrike may occasionally visit or forage in the AOA, but is not expected to nest within the AOA. Loggerhead shrike was reported to occur at the westerly end of the airfield in 1998, but has not

been detected in subsequent formal biological surveys within the biological resources study area for projects associated with the LAX Master Plan. However, LAWA's USDA Wildlife Hazard Biologist reports occasional sightings since 2005 in the parking lot adjacent to the Proud Bird restaurant in the southeast corner of LAX. The vast majority of the loggerhead shrike occurrences mapped in 1998 were in the Los Angeles/El Segundo Dunes and, since occurrences in the airfield are rare, it is assumed that the Los Angeles/El Segundo Dunes provide far greater habitat value for the shrike than the airfield. The areas of ruderal vegetation that would to be affected by runway relocation are directly adjacent to the current runways, and do not provide habitat value to loggerhead shrike under baseline conditions because of the proximity to these active runways. The sightings of shrikes in the urbanized area in the southwest corner of the airport indicate that the population on the airport utilizes both undeveloped areas as well as the edges of developed areas for foraging. The loss of ruderal habitat that is rarely used by the species does not constitute a substantial adverse effect through reduction of existing habitat, especially given that shrikes are known to use the edges of developed areas associated with LAX, and are not restricted to or rely heavily upon the ruderal habitat in the airfield. Therefore, impacts to loggerhead shrike through habitat loss within the AOA would be less than significant under the LAWA Staff-Recommended Alternative.

There is no potential for construction of the LAWA Staff-Recommended Alternative to result in loss of adult individuals, as loggerhead shrikes can avoid construction areas. Loggerhead shrikes are not known to nest in the airfield or the proposed staging areas, but if loggerhead shrikes were to nest within a construction or staging area, implementation could have a significant impact on this species through interference with nesting activity. With implementation of Mitigation Measure MM-BIO (SPAS)-9, Conservation of Faunal Resources: Loggerhead Shrike, described in Section 2.3.3.2 below, impacts to this sensitive wildlife species associated with use of construction or staging areas would be less than significant.

Loggerhead shrike is a resident species that has been documented to nest within the Los Angeles/El Segundo Dunes. In addition to observations made in 1998 surveys for the LAX Master Plan EIR, LAWA's USDA Wildlife Hazard Biologist has reported occasional sightings in the Los Angeles/El Segundo Dunes during the summer months, including sightings of fledglings. Relocation of navigational aids and construction of related service roads would result in the permanent loss of approximately 0.89 acre of open space area suitable for loggerhead shrike, as well as temporary impacts associated with construction, including temporary access roads. Since only a small proportion of habitat within the 302-acre dunes complex would be permanently affected, this does not constitute a substantial adverse effect, through the reduction of existing habitat, and thus impacts to loggerhead shrike through habitat loss in the Dunes would be less than significant. As discussed in Section 4.3, *Biological Resources*, of the SPAS Draft EIR, it is assumed that this species persists as a resident breeding species in the Los Angeles/El Segundo Dunes. Removal and replacement of navigational aids and service roads is therefore considered to result in a significant impact on this species through interference with nesting activity. With implementation of Mitigation Measure MM-BIO (SPAS)-9, Conservation of Faunal Resources: Loggerhead Shrike, described in Section 2.3.3.2 below, impacts to this sensitive wildlife species associated with the relocation of navigational aids would be less than significant.

Burrowing owl may occasionally occur on the edges of the AOA as wintering individuals. As previously discussed, a wintering burrowing owl was detected by Glenn Lukos Associates biologists and by LAWA personnel along the Argo Drainage Channel in December 2011 and at the western end of Runway 6R/24L by LAWA personnel in February 2012. For wintering burrowing owls that occasionally use the AOA, improvements associated with the north airfield and use of the construction staging areas would result in the loss of 121.71 acres of ruderal vegetation in the airfield and 2.45 acres of ruderal vegetation in the Argo Drainage Channel that could provide foraging area. However, 508.38 acres of ruderal vegetation would remain within the airfield, with additional foraging area available in the 302-acre Dunes, where burrowing owls were documented by the LAX Master Plan EIR to occur as wintering individuals. Burrowing owl home ranges have been calculated to comprise between 280 acres in irrigated farmland to

600 acres in pastureland.[7] Given that upwards of 770 acres of undeveloped open space would remain in the AOA and Dunes under the LAWA Staff-Recommended Alternative, there would be no substantial adverse effect through the reduction of habitat on burrowing owl, and impacts would be less than significant. For burrowing owl within the Los Angeles/El Segundo Dunes, relocation of navigational aids and related service roads would result in permanent impacts to 0.89 acre of open space ruderal vegetation and Disturbed Southern Foredune habitat, as well as limited temporary impacts associated with construction. Since impacts to this small amount of acreage do not constitute a substantial adverse effect, through the reduction of existing habitat, impacts to burrowing owl through habitat loss would be less than significant.

If burrowing owl is present in areas associated with construction, including the construction staging areas, Argo Drainage Channel, the AOA east of Pershing Drive, or the navigational aids relocation area in the Los Angeles/El Segundo Dunes, project implementation would have a significant impact on this species. With implementation of Mitigation Measure MM-BIO (SPAS)-10, Conservation of Faunal Resources: Burrowing Owl, described in Section 2.3.3.2 below, impacts to this sensitive wildlife species would be less than significant.

One individual San Diego black-tailed jackrabbit was found to use the southwestern airfield in 1997. Due to changes in site management since then, along with installation of airfield perimeter security fencing with a solid block base and tightly-spaced grids that greatly restrict or preclude wildlife movement, the species is likely extirpated from the biological resources study area. There is a very low chance that this species may persist within the AOA despite lack of recent detection. Since San Diego black-tailed jackrabbit represents a potential safety hazard to aviation (i.e., is an attractant to raptors, which can lead to a birdstrike hazard for aircraft), it is anticipated that the presence of an individual jackrabbit, albeit unlikely, would be addressed by LAWA's USDA Wildlife Hazard Biologist pursuant to FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan." San Diego black-tailed jackrabbit is not known to occur within the Los Angeles/El Segundo Dunes. Since this species is likely extirpated from the biological resources study area and, even if one or more individuals persist, impacts to this species through either habitat modification or loss of individuals would be less than significant.

Implementation of the LAWA Staff-Recommended Alternative would result in the permanent conversion of occupied habitat of the El Segundo blue butterfly within the Habitat Restoration Area associated with relocation of navigational aids, because the navigational aids relocation activities would occur in an area that is occupied by this species, albeit at very low densities due to the small quantity of host plants with low flowerhead density. In accordance with LAX Master Plan Mitigation Measures MM-ET-3, El Segundo Blue Butterfly Conservation: Dust Control, and MM-ET-4, El Segundo Blue Butterfly Conservation: Habitat Restoration, and the Biological Opinion for the project that was issued by the USFWS, impacts to the El Segundo blue butterfly and habitat occupied by the El Segundo blue butterfly would be addressed through dust control during construction, habitat replacement, and avoidance of the flight season. With implementation of these measures, impacts to El Segundo blue butterfly would be less than significant.

Use of proposed Construction Staging Areas B, C, D, and F under the LAWA Staff-Recommended Alternative would have the potential to result in the removal of mature trees used for nesting by raptors or birds. Such removal would have the potential to result in impacts to nesting birds or raptors protected under the MBTA and/or California Fish and Game Code Sections 3503, 3503.5, 3511, and 3513. The LAX Master Plan Final EIR concluded that removal of any mature ornamental trees would be a significant impact requiring replacement with native trees at a 2:1 ratio because the trees may provide nesting sites for raptors; however, raptor nesting in ornamental trees within the biological resources study area was not documented by the LAX Master Plan EIR.[8] Additionally, evidence of raptor nesting in ornamental trees

California Bird Species of Special Concern: A ranked assessment of species, subspecies, and distinct populations of birds of immediate conservation concern in California, Studies of Western Birds 1, Western Field Ornithologists, Camarillo, California, and California Department of Fish and Game, Sacramento, California, USA.

8 Sapphos Environmental, Inc., LAX Master Plan EIS/EIR, Technical Report 7, Biological Resources, Memoranda for the

within Construction Staging Area A was not found during field surveys conducted for the Bradley West Project in 2010, nor within the biological resources study area during field surveys conducted by Glenn Lukos Associates in 2011. Although the 2011 surveys were conducted on July 7, November 18, and December 1, 2011 at the end of, and outside of, the raptor breeding season (January 1 - September 15), past evidence of raptor nesting, such as nesting materials and whitewash, would likely have been detectable. Additionally, the majority of the ornamental trees in the biological resources study are not the types typically preferred by common raptor species in Southern California, with the exception of eucalyptus trees, which may be used by red-tailed and red-shouldered hawks, and palm trees, which may be used by American kestrels. Since the ornamental trees on-site are not subject to a tree-replacement ordinance, and are not known to provide nesting sites for sensitive raptors, removal of mature trees is not a significant impact unless such trees are documented to support nesting.

Under the LAWA Staff-Recommended Alternative, construction activities may result in substantial interference with nesting during the breeding season (March 15 to August 15) through either close proximity of construction activity or removal of vegetation that supports avian species afforded protection under the MBTA or Fish and Game Code 3503 or 3503.5. Such impacts would be significant. With implementation of Mitigation Measures MM-BIO (SPAS)-11, Conservation of Faunal Resources: Mature Tree Replacement - Nesting Raptors, and MM-BIO (SPAS)-12, Conservation of Faunal Resources: Nesting Birds/Raptors, described in Section 2.3.3.2 below, impacts to nesting birds and raptors would be less than significant.

Upon completion of construction, operation of the facilities associated with the LAWA Staff-Recommended Alternative would not result in significant impacts to sensitive wildlife species. In the Los Angeles/El Segundo Dunes, operation of the relocated navigational aids would be largely automated and/or controlled remotely. Vehicular access for maintenance would be limited to existing roads and cleared areas, and offroad activity would be limited to technicians on foot. Therefore, no sensitive species would be impacted either through habitat loss or direct take. Operations and maintenance of the airport improvements would be conducted following the same procedures currently in use, with continued maintenance mowing in the airfield. However, no sensitive species would be impacted through either habitat loss or direct take, except when required for hazardous wildlife management pursuant to FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan."

Under the LAWA Staff-Recommended Alternative, there would be no substantial loss of individuals or the substantial reduction of existing habitat of a locally-designated species, as no locally-designated wildlife species are known to occur within the biological resources study area. There are no wildlife movement/migration corridors associated with any portion of the biological resources study area, including the Argo Drainage Channel. Therefore, the LAWA Staff-Recommended Alternative would not result in interference with wildlife movement/migration corridors.

Jurisdictional Aquatic Features

The LAWA Staff-Recommended Alternative would have an impact on all USACOE and CDFG jurisdictional areas associated with the Argo Drainage Channel by structurally covering the Channel in order to relocate Runway 6L/24R 260 feet north of its current location. Impacts to USACOE jurisdictional areas would include 3.78 acres, of which 1.33 acres consists of wetlands vegetated with California Bulrush Marsh (1.31 acres) and Sandbar Willow Thicket (0.02 acre), and 2.45 acres consists of non-wetland waters of the U.S. vegetated with the ruderal (Argo Drainage Channel) association. Impacts to CDFG jurisdictional areas would include 3.97 acres, of which 2.45 acres consist of streambed and banks vegetated with the ruderal (Argo Drainage Channel) association, and 1.52 acres consist of vegetated riparian habitat (0.21 acre of Sandbar Willow Thicket and 1.31 acres of California Bulrush Marsh). These impacts would constitute a substantial alteration of the flow, bed, channel, or bank of rivers, streams, or

Record on Floral and Faunal Surveys, January 2001.

lakes as defined in Section 1600 of the State Fish and Game Code and a substantial adverse effect on federally-protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruptions, or other means, and would be significant. With implementation of Mitigation Measure MM-BIO (SPAS)-13, Replacement of Jurisdictional Aquatic Features, described in Section 2.3.3.2 below, impacts relating to USACOE and CDFG jurisdictional areas would be less than significant.

Indirect Impacts

Under the LAWA Staff-Recommended Alternative, increased concentrations of air pollutants would result from construction activities and from operations at build out in 2025 (see Section 2.3.2, *Air Quality*, of this chapter). Due to prevailing wind conditions, operational concentrations would be highest within the eastern portion of the airport, away from the locations of sensitive species. However, construction activities would result in increased concentrations of nitrogen dioxide (NO_2) at construction sites, which would occur in various locations, including those on the west end of the airport. Sensitive species within the Dunes are currently exposed to air pollutant concentrations from existing airport operations and other sources in the airport environs. As discussed in Section 4.3.3.3 of the SPAS Draft EIR, *Existing Effects from Light, Air Quality, and Noise*, the success of vegetation restoration efforts and increases in populations of the El Segundo blue butterfly indicate that flora and fauna at LAX are not adversely affected by existing air quality. Moreover, El Segundo blue butterfly populations do not correspond to annual aircraft populations. Similarly, it is not anticipated that implementation of the LAWA Staff-Recommended Alternative would result in significant indirect impacts to biological resources, including sensitive floral and faunal species.

Construction of the LAWA Staff-Recommended Alternative, particularly construction of airfield improvements at the west end of the north airfield in close proximity to the Los Angeles/El Segundo Dunes and the El Segundo Blue Butterfly Habitat Restoration Area, would have the potential to deposit fugitive dust within state-designated sensitive habitats that support a listed species, the El Segundo blue butterfly. With implementation of LAX Master Plan Mitigation Measures MM-BC-1, Conservation of State-Designated Sensitive Habitat within and Adjacent to the El Segundo Blue Butterfly Habitat Restoration Area, and MM-ET-3, El Segundo Blue Butterfly Conservation: Dust Control, impacts associated with fugitive construction dust would be less than significant.

The analysis of light emissions conducted for the LAX Master Plan EIR found that increased light would have no effect on the El Segundo blue butterfly, as it is a diurnal species, does not exhibit flight-to-light behavior, and remains perched around the coast buckwheat foodplant at night. With respect to other sensitive species, the analysis found that, although light emissions would be slightly increased within the Los Angeles/El Segundo Dunes, impacts to sensitive biological resources would be less than significant. An updated light analysis for the SPAS EIR, provided in Section 4.1, *Aesthetics*, of the SPAS Draft EIR, and further addressed by Section 2.3.1, *Aesthetics*, of this chapter, similarly shows that increased light emissions associated with the LAWA Staff-Recommended Alternative would not result in spillover into the Los Angeles/El Segundo Dunes or Habitat Restoration Area, due to their distance (135 or more feet), and the low profile of airfield-related lights. Light emissions associated with the relocated navigational aids within the Los Angeles/El Segundo Dunes would be similar to existing light emissions from this light source, as the number, color, intensity, and usage of the lighting would remain the same. As a result, impacts from light emissions on biological resources under the LAWA Staff-Recommended Alternative would be less than significant.

The analysis of potential noise impacts conducted for the LAX Master Plan found that maximum noise levels would not increase with implementation of the Master Plan, and impacts to sensitive biological resources from noise would be less than significant. The analysis of potential noise impacts for the SPAS EIR (see Section 2.3.10.1, *Aircraft Noise*, of this chapter) found that maximum noise levels within the Los Angeles/El Segundo Dunes and Habitat Restoration Area would decrease at two grid points and slightly increase at a third under the LAWA Staff-Recommended Alternative. Under baseline conditions, the maximum noise level at grid points 27, 28, and 37 in the Dunes is 101, 105.2, and 111.9 decibels, respectively. Under the LAWA Staff-Recommended Alternative at project buildout in 2025, the project

maximum noise level at the same grid points would be 92.5, 106.5, and 103.2 decibels, indicating a decrease for grid points 27 and 37, and a slight increase of 1.3 decibels for grid point 28, corresponding with the northerly move of Runway 6L/24R. Given that noise levels are already above the maximum threshold for those sensitive species with known thresholds, the effect of a rise of 1.3 decibels for grid point 28 would be speculative. Furthermore, multiple occurrences of sensitive species, including loggerhead shrike, burrowing owl, San Diego horned lizard, and silvery legless lizard, have been observed at grid points 27, 28, and 37 under baseline conditions, and it is assumed that the sensitive species that utilize the Dunes have habituated to the baseline noise level. As maximum noise levels would decrease over much of the Dunes under the LAWA Staff-Recommended Alternative, and the increase at grid point 28 would be minimal, the impacts to sensitive species from aircraft noise would be less than significant.

Construction noise originating in the airfield would have little effect on sensitive biological resources. Noise levels from the noisiest outdoor construction activities, independent of background ambient noise levels, are typically 86 dBA L_{eq}[9] at 50 feet from the noise source. These activities include excavation and grading. This type of sound typically dissipates at a rate of 4.5 dBA to 6.0 dBA for each doubling of distance. Based on a sound dissipation rate of 4.5 dBA per doubling of distance, a sound level of 86 dBA at 50 feet from the noise source would be approximately 81.5 dBA at a distance of 100 feet, 77 dBA at a distance of 200 feet, and so on. That sound drop off rate does not take into account any intervening shielding or barriers, such as structures or hills between the noise source and noise receptor. Under the LAWA Staff-Recommended Alternative, the nearest construction to the Los Angeles/El Segundo Dunes and associated sensitive biological resources where substantial excavation and grading would occur would be for the relocation of Runway 6L/24R and associated high-speed taxiway exits at the western end of the north airfield, which is roughly 275 feet from the Habitat Restoration Area. At that distance, construction noise levels would be expected to be less than 75 dBA at any given time. As discussed in the LAX Master Plan EIR, the level at which a noise event becomes a disturbance to the sensitive species in the Dunes is generally at L_{max}[10] of 95 dBA. Therefore, the impact of construction noise originating in the airfield on sensitive biological resources in the Dunes would be less than significant. As indicated in Section 2.3.10.3, *Construction Traffic and Equipment Noise*, of this chapter, the relocation of navigational aids would require little, if any, use of heavy-duty construction equipment, and therefore impacts would be less than significant.

Construction noise originating in the airfield may also affect sensitive biological resources in the airfield, such as burrowing owl and loggerhead shrike. Under the LAWA Staff-Recommended Alternative, construction noise associated with structurally covering the Argo Drainage Channel and the use of Construction Staging Area A would be the closest sources of noise to mapped locations of loggerhead shrike and burrowing owl. As Construction Staging Area A has been previously developed and in continuous use for the Bradley West and Crossfield Taxiway projects, the use of the area under the LAWA Staff-Recommended Alternative would not constitute a significant change from baseline noise levels and, as such, impacts would be less than significant. Regarding construction noise from covering the Argo Drainage Channel, as burrowing owls and loggerhead shrikes could avoid the area, impacts would be less than significant.

2.3.3.2 Mitigation Measures

Implementation of LAX Master Plan Mitigation Measures MM-BC-1, MM-ET-3, and MM-ET-4 would ensure that impacts to the El Segundo blue butterfly and the Habitat Restoration Area associated with the LAWA Staff-Recommended Alternative would be less than significant. Implementation of LAX Master Plan Mitigation Measure MM-BC-3 would ensure that impacts related to the removal of mature trees associated with the LAWA Staff-Recommended Alternative would be less than significant.

---

9 L_{eq} = equivalent noise level.

10 L_{max} is the maximum or peak sound level during a noise event. The metric only accounts for the instantaneous peak intensity of the sound, and not for the duration of the event. As an aircraft passes by an observer, the sound level increases to a maximum level and then decreases.

To address the potential significant impacts to state-designated sensitive habitats; sensitive plants; sensitive wildlife, including nesting birds/raptors, and mature trees utilized by nesting raptors; and jurisdictional aquatic features associated with the LAWA Staff-Recommended Alternative, the following mitigation measures specific to SPAS are proposed:

- **MM-BIO (SPAS)-1. Replacement of State-Designated Sensitive Habitats.**[11]

  LAWA or its designee shall undertake mitigation for the loss of state-designated sensitive habitat within the Los Angeles/El Segundo Dunes, including the Habitat Restoration Area, by restoring areas of temporary disturbance and by restoring additional areas of sensitive habitat to compensate for temporary and permanent impacts. Installation of navigational aids and associated temporary construction impacts may result in impacts to state-designated sensitive habitat within the Los Angeles/El Segundo Dunes within habitat occupied by the El Segundo blue butterfly. Impacts to state-designated sensitive habitat within the Los Angeles/El Segundo Dunes shall be replaced at a ratio of 2:1 within the Los Angeles/El Segundo Dunes as described in the "Los Angeles/El Segundo Dunes Habitat Restoration Plan." The replacement of state-designated sensitive habitat shall be undertaken through restoration procedures as described in the "Los Angeles/El Segundo Dunes Habitat Restoration Plan." The restoration and enhancement of sensitive habitat as related to the establishment or enhancement of wildlife habitat shall consider and comply with the provisions of FAA Advisory Circular 150/5200-33B regarding hazardous wildlife attractants on or near airports. Additionally, restoration and enhancement shall take into account, as appropriate, the Memorandum of Agreement between the FAA and other federal agencies, including USFWS, pertaining to environmental conditions that could contribute to aircraft-wildlife strikes.

  Valley Needlegrass Grassland restoration efforts consist of site preparation, propagation and planting of Valley Needlegrass Grassland species, and maintenance and monitoring of the restoration site as described in the "Los Angeles/El Segundo Dunes Habitat Restoration Plan."

  Southern Foredune restoration efforts consist of site preparation, propagation, and planting of the species characteristic of the Southern Foredune community at the Los Angeles/El Segundo Dunes, and maintenance and monitoring of the restoration site as described in the "Los Angeles/El Segundo Dunes Habitat Restoration Plan."

- **MM-BIO (SPAS)-2. Conservation of Floral Resources: South Coast Branching Phacelia.**

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, including construction staging areas, pre-construction focused surveys shall be conducted during the period of March through August by a qualified botanist to determine the presence or absence of south coast branching phacelia. Known populations of this species shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If this species is not observed, no further mitigation shall be required; however, if it is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive south coast branching phacelia. LAWA or its designee shall collect seed from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as

[11] For purposes of the identified SPAS alternatives, this measure satisfies the intent of LAX Master Plan Mitigation Measure MM-BC-13.

needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of south coast branching phacelia for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-3. Conservation of Floral Resources: Lewis' Evening Primrose.**[12]

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, including construction staging areas, pre-construction focused surveys shall be conducted during the period of March through June by a qualified botanist to determine the presence or absence of Lewis' evening primrose. Known populations of this species shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If this species is not observed, no further mitigation shall be required; however, if it is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive Lewis' evening primrose. LAWA or its designee shall collect seed from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of Lewis' evening primrose for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-4. Conservation of Floral Resources: California Spineflower.**

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, including construction staging areas, pre-construction focused surveys shall be conducted during the period of March through August by a qualified botanist to determine the presence or absence of California spineflower. Known populations of this species shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If this species is not observed, no further mitigation shall be required; however, if it is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive California spineflower. LAWA or its designee shall collect seed from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in

[12] For purposes of the identified SPAS alternatives, this measure satisfies the intent of LAX Master Plan Mitigation Measure MM-BC-2.

consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of California spineflower for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-5. Conservation of Floral Resources: Mesa Horkelia.**

  Prior to any work activities(i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, pre-construction focused surveys shall be conducted during the period of February through September by a qualified botanist to determine the presence or absence of mesa horkelia subspecies puberula. Known populations of this taxon shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If the common *Horkelia cuneata* is identified by a qualified botanist, then no further mitigation is required. If the sensitive *Horkelia cuneata* ssp. *pupurbula* is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive mesa horkelia subspecies puberula. LAWA or its designee shall collect seed from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of mesa horkelia for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-6. Conservation of Floral Resources: Orcutt's Pincushion.**

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, pre-construction focused surveys shall be conducted during the period of January through August by a qualified botanist to determine the presence or absence of Orcutt's pincushion (*Chaenactis glabriuscula* var. *orcuttiana*). Known populations of this taxon shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If the common *Chaenactis glabriuscula* is identified by a qualified botanist, then no further mitigation is required. If the sensitive *Chaenactis glabriuscula* var. *orcuttiana* is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive Orcutt's pincushion. LAWA or its designee shall collect seed

from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of Orcutt's pincushion for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-7. Conservation of Floral Resources: Southern Tarplant.**

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal) within suitable habitat on the project site, including construction staging areas, pre-construction focused surveys shall be conducted during the period of May through November by a qualified botanist to determine the presence or absence of southern tarplant. Known populations of this species shall be monitored to determine the best time to conduct pre-construction surveys. The surveys shall follow guidelines developed by the CNPS and the CDFG. If this species is not observed, no further mitigation shall be required; however, if it is identified within work areas, then further mitigation as described below is required.

  If this species is observed, LAWA or its designee shall prepare and implement a plan to compensate for the loss of individuals of the sensitive southern tarplant. LAWA or its designee shall collect seed from those plants to be removed, and properly clean and store the collected seed until used. A mitigation site of suitable habitat equal to the area of impact shall be delineated within the boundaries of LAX or at a suitable off-site location. If a site at LAX is selected, site selection will occur in consultation with a qualified restoration biologist, as well as LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. Ninety-percent of the collected seed shall be broadcast (distributed) after the first wetting rain with 10 percent maintained as a contingency and used as needed to meet performance criteria. LAWA or its designee shall implement a monitoring plan to monitor the establishment of individuals of southern tarplant for a period of not more than five years. Performance criteria shall include the establishment of an equal number of plants as that impacted in the first year following the distribution of seed within the mitigation site. Performance criteria shall also include confirmation of recruitment for two years following the first year flowering is observed and establishment of individuals throughout the mitigation area within three years following the first year flowering is observed.

- **MM-BIO (SPAS)-8. Conservation of Faunal Resources: Sensitive Reptiles, Arthropods, and Gastropods.**[13]

  LAWA or its designee shall have a qualified restoration biologist conduct pre-construction surveys to determine the presence of individuals of sensitive arthropod and gastropod species, the silvery legless lizard, and the San Diego horned lizard within the proposed area of impact within the Los Angeles/El Segundo Dunes. Surveys will be conducted at the optimum time to observe these species using the methodology as described in Section 6.1 of the "Los Angeles/El Segundo Dunes

[13] For purposes of the identified SPAS alternatives, this measure satisfies the intent of relevant portions of LAX Master Plan Mitigation Measure MM-BC-9.

Habitat Restoration Plan," including pitfall traps and active opportunistic searching, as well as any additional appropriate methodology as determined by the qualified wildlife biologist. Immediately prior to grubbing of clearing of vegetation, all herbaceous and non-herbaceous plants will be individually shaken to flush out insects. Should an individual be observed, they will be relocated by a qualified wildlife biologist to suitable habitat for that species within the Habitat Restoration Area. Prior to construction, LAWA or its designee shall have a qualified wildlife biologist develop and implement a relocation plan to avoid the potential loss of individuals from the installation of navigational aids and associated temporary impact areas. Relocation efforts shall be undertaken by a qualified biologist.

- **MM-BIO (SPAS)-9. Conservation of Faunal Resources: Loggerhead Shrike.**[14]

  Vegetation removal for the proposed project shall be conducted outside the nesting season for the loggerhead shrike (March 15 to August 15), if feasible. If this is not feasible, a qualified wildlife biologist shall inspect the shrubs/trees at least 14 days prior to construction activities to ensure that no nesting shrikes are present. If a nest is present, construction avoidance measures implemented by the qualified wildlife biologist shall include flagging of all active nests and a 300-foot wide buffer area around the active nests. These construction avoidance measures will be coordinated with LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft. In addition, a Biological Monitor shall be present to ensure the buffer area is not infringed upon and vegetation clearing within the designated 300-foot buffer only takes place from August 16 to March 14.

- **MM-BIO (SPAS)-10. Conservation of Faunal Resources: Burrowing Owl.**[15]

  Prior to any work activities (i.e., vegetation clearing, invasive species removal and/or spraying, and sediment removal), a survey for burrows by a qualified wildlife biologist will be conducted by walking through the suitable habitat within the site (generally the Argo Drainage Channel and Los Angeles/El Segundo Dunes, as well as any other area deemed suitable by the qualified biologist) in accordance with CDFG-accepted protocols. If a work site contains burrows that could be used by burrowing owls, four additional surveys will be conducted during the burrowing owl breeding season (April 15 through July 15). If an active burrow is observed during the nesting season, the burrow will be protected until nesting activity has ended. Nesting activity for burrowing owl normally occurs from February 1 through August 31. To protect any active burrow, the following restrictions are required between February 1 and August 31 (or until burrows are no longer active as determined by a qualified wildlife biologist): (1) clearing limits will be established a minimum of 300 feet in any direction from any occupied nest and (2) access and surveying will be restricted within 200 feet of any occupied nest. Any encroachment into the 300/200 foot buffer area around the known nest will only be allowed if it is determined by a qualified wildlife biologist that the proposed activity will not disturb the nest occupants. These avoidance measures will be coordinated with LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan."

  If nesting individuals are observed, LAWA or its designee shall have a qualified wildlife biologist develop and implement a habitat replacement plan to compensate for the loss of habitat associated with the project. The habitat replacement plan shall replace lost habitat value with equal or greater habitat value, and shall follow the methodology outlined in the CDFG *Staff Report on Burrowing Owl Mitigation*.[16] The habitat replacement will occur in the Los Angeles/El Segundo Dunes in a location approved by LAWA's USDA Wildlife Hazard Biologist that will be consistent with FAA Advisory

---

[14] For purposes of the identified SPAS alternatives, this measure satisfies the intent of relevant portions of LAX Master Plan Mitigation Measure MM-BC-9.

[15] For purposes of the identified SPAS alternatives, this measure satisfies the intent of relevant portions of LAX Master Plan Mitigation Measure MM-BC-9.

[16] State of California, Natural Resources Agency, Department of Fish and Game, Staff Report on Burrowing Owl Mitigation, March 7, 2012.

Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan", or at an off-site location to avoid potential conflicts with aircraft activities at LAX.

Whether or not any nesting burrowing owls are identified on-site, after the end of the nesting period (August 31), LAWA or its designee will remove all burrows from the immediate area in and around the construction and construction staging areas on a monthly basis between September and January. Removal may include physically collapsing the burrows or installing one-way exit doors in burrow entrances. Such maintenance will continue annually until such time as construction areas are fully in use and/or developed and no longer contain suitable habitat for burrowing owls.

- **MM-BIO (SPAS)-11. Conservation of Floral Resources: Mature Tree Replacement - Nesting Raptors.**

  For those areas of the project site that have a potential for nesting raptors, prior to the initiation of construction activities during the nesting season (February 1 to June 30), all mature trees will be inspected for current or past raptor nesting activity. Inspections shall be conducted by a qualified biologist, and may be conducted outside of nesting season. The wildlife biologist shall identify active nests and/or evidence of past raptor nesting in mature trees to be removed from the construction area.

  LAWA or its designee shall compensate at a ratio of 2:1 for the loss of mature trees with either active nests or evidence of past raptor nesting, which would occur as a result of implementation of any of the project components. The species of newly planted replacement trees shall be local native tree species to the extent feasible. Each mitigation tree shall be at least a 15-gallon or larger specimen. The replacement will be implemented within the boundaries of LAX or at a suitable off-site location. It mitigation occurs within LAX boundaries, the replacement site and tree species will be determined in consultation with LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft.

- **MM-BIO (SPAS)-12. Conservation of Faunal Resources: Nesting Birds/Raptors.**

  For those areas of the project site that have a potential for nesting birds/raptors, if construction is scheduled to occur during the nesting season for birds/raptors (generally February 1 to June 30 for raptors and March 15 to August 15 for nesting birds), vegetation clearing for the proposed project shall be conducted outside the nesting season if feasible. If this is not feasible, then a qualified wildlife biologist shall inspect the shrubs/trees prior to project activities to ensure that no nesting birds/raptors are present. If the biologist finds an active nest within the construction area and determines that the nest may be impacted, the wildlife biologist will delineate an appropriate buffer zone; the size of the buffer zone will depend on the species and the type of construction activity. Only construction activities (if any) that have been approved by a Biological Monitor will take place within the buffer zone until the nest is vacated. The wildlife biologist shall serve as a construction monitor during those periods when construction activities shall occur near active nest areas to ensure that no inadvertent impacts on these nests shall occur. Netting or other bird exclusion methods shall be used to discourage birds from nesting in construction equipment and facilities, if determined by the wildlife biologist to be necessary. These construction avoidance measures will be coordinated with LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft.

- **MM-BIO (SPAS)-13. Replacement of Jurisdictional Aquatic Features.**

  LAWA will consult with USACOE to obtain a determination of the jurisdictional area associated with the Argo Drainage Channel, if any, within its jurisdiction pursuant to Section 404 of the Clean Water Act. Mitigation for impacts to the Argo Drainage Channel shall be determined in consultation with USACOE, and at a minimum will ensure that no net loss of wetlands occurs. For previous maintenance impacts to the Argo Drainage Channel, LAWA has restored/enhanced 2.44 acres of

wetlands at Ken Malloy Regional Park, which may be counted towards future impacts to the Argo Drainage Channel.

LAWA will consult with CDFG to obtain a determination of the jurisdictional area associated with the Argo Drainage Channel, if any, within its jurisdiction pursuant to Section 1600 of the Fish and Game Code. Mitigation for impacts to the Argo Drainage Channel shall be determined in consultation with CDFG, and at a minimum will ensure that no net loss of wetlands occurs. For previous maintenance impacts to the Argo Drainage Channel, LAWA has restored/enhanced 2.44 acres of wetlands at Ken Malloy Regional Park, which may be counted towards future impacts to the Argo Drainage Channel.[17]

If the Argo Drainage Channel is not found to be jurisdictional by USACOE, LAWA will consult with the Los Angeles Regional Water Quality Control Board (LARWQCB) to obtain a determination of the area associated with the Argo Drainage Channel that would be subject to Waste Discharge Requirements pursuant to the Porter Cologne Act, if any. If applicable, mitigation for impacts to the Argo Drainage Channel shall be determined in consultation with LARWQCB, with the 2.44 acres of wetlands noted above applied to final mitigation totals.

If a mitigation site at LAX is selected, site selection will occur in consultation with LAWA's USDA Wildlife Hazard Biologist and will be consistent with FAA Advisory Circular No. 150/5200-33B "Hazardous Wildlife Attractants on or Near Airports" and LAWA's "LAX Wildlife Hazard Management Plan" to avoid increasing wildlife hazards to aircraft.

- **MM-BIO (SPAS)-14. Replacement of Habitat Units.**[18]

LAWA or its designee shall undertake mitigation for the loss of habitat units resulting from implementation of the selected SPAS alternative. The habitat units shall be replaced at a 1:1 ratio within the Los Angeles/El Segundo Dunes, or at a suitable off-site location. Opportunities for compensation for the loss of habitat units include, but are not limited to, restoration of ruderal habitat to Valley Needlegrass Grassland, and/or Southern Foredune, removal and restoration of existing roadways to Southern Foredune; and restoration of Disturbed Dune Scrub/Disturbed Southern Foredune to Southern Foredune. A habitat value of 0.8 is considered to the maximum feasible target value for restoration and enhancement. The restoration and enhancement of habitat as related to the establishment or enhancement of wildlife habitat shall consider and comply with the provisions of FAA Advisory Circular 150/5200-33 regarding hazardous wildlife attractants on or near airports. Additionally, restoration and enhancement shall take into account, as appropriate, the Memorandum of Agreement between the FAA and other federal agencies, including USFWS, pertaining to environmental conditions that could contribute to aircraft-wildlife strikes.

Valley Needlegrass Grassland restoration efforts consist of site preparation, propagation and planting of species characteristic of the Valley Needlegrass Grassland community at the Los Angeles/El Segundo Dunes, and maintenance and monitoring of the restoration site. The species to be planted include native perennials as described in the Long-Term Habitat Management Plan for Los Angeles Airport/El Segundo Dunes. The characteristic species include nodding needlegrass (*Stipa cernua*): 1,500 plants/habitat unit; white everlasting (*Pseudognaphalium microcephalum*): 40 plants/habitat unit; doveweed (*Croton setigerus*): 40 plants/habitat unit; California croton (*Croton californicus*): 45 plants/habitat unit; and dune primrose (*Camissonia chieranthifolia*): 70 plants/habitat unit. Site preparation includes physical demarcation of the site, mapping of the restoration site onto a high resolution aerial photograph, and removal of all non-native species (weed abatement). Removal of

---

17 The 2.44 acres of mitigation was required by USACOE and CDFG to compensate for the loss of wetland/riparian habitat from maintenance of the channel, including removal of all vegetation and remedial grading to allow unimpeded flows within the channel. Although the vegetation has been allowed to regrow, the loss of the resource has already been mitigated elsewhere, and the 2.44 acres should be counted towards the mitigation obligations that would be incurred with structural covering of the Argo Drainage Channel associated with Alternatives 1, 5, and 6. Any additional mitigation requirements established by USACOE or LARWQCB and CDFG beyond the 2.44 acres would require establishment of additional off-site mitigation.

18 For purposes of the identified SPAS alternatives, this measure satisfies the intent of LAX Master Plan Mitigation Measure MM-BC-8.

non-native herbaceous species shall take place by mowing prior to seed set, raking to remove cut material, and hand-pulling the remainder. Removal of non-native shrubs shall be undertaken by cutting and daubing with herbicide. Propagation and planting of nodding needlegrass shall be accomplished by propagation from seed collected on-site during late spring/early summer. Seed shall be properly cleaned, dried, and stored until used. In late summer, nodding needlegrass seed shall be propagated at an on-site nursery in two-inch thimble pots and properly maintained. Nodding needlegrass shall be planted at a rate of 1,500 plants per habitat unit within areas of ruderal vegetation, within the Los Angeles/El Segundo Dunes, which has undergone site preparation as described above. Planting shall take place in the fall or after the first wetting rain. Maintenance of restoration plantings shall consist of adequate irrigation and weed abatement. Given the irregularity of rainfall in Southern California, supplemental irrigation shall be provided for two years to ensure the successful establishment of mitigation plantings. Irrigation of the site shall be adjusted to adequately provide for the establishment of the out-plantings. Weed abatement shall take place on a quarterly basis for a period of five years. Monitoring shall be undertaken on a quarterly basis for the first three years following planting, and twice a year thereafter. Monitoring shall consist of qualitative and quantitative monitoring; quantitative monitoring shall take place once a year. Performance criteria to be met include the attainment of at least a 10 percent cover of native cover in the first year and 20, 30, 40 and 45 percent cover of native species over a five-year period as determined by the point-intercept transect method (the CDFG has adopted a 10 percent threshold of native cover as its criteria for significance of native grasslands). This plan assumes the performance criteria outlined herein shall be met. If monitoring discerns any failure in performance goals, remedial plantings shall be undertaken. Habitat restoration shall be conducted by a qualified habitat restoration specialist.

Southern Foredune restoration efforts consist of site preparation, propagation, and planting of the species characteristic of the Southern Foredune community at the Los Angeles/El Segundo Dunes, and maintenance and monitoring of the restoration site. The species to be planted include primary and secondary perennial plants as described in the Long-Term Habitat Management Plan for Los Angeles Airport/El Segundo Dunes. Site preparation, propagation, and planting, and maintenance and monitoring shall take place as described above. Performance criteria to be met include the attainment of 10, 20, 30, 40, and 45 percent cover of native species over a five-year period as determined by the point intercept method. The Long-Term Habitat Management Plan for Los Angeles Airport/El Segundo Dunes assumes the performance criteria stated above shall be met. If monitoring discerns any failure in performance goals, remedial plantings shall be undertaken. Habitat restoration shall be conducted by a qualified habitat restoration specialist.

Any combination of habitat replacement completed by LAWA or its designee drawn from the opportunities listed above that equals at least the number of habitat units that would be lost shall be considered sufficient replacement for loss of habitat units resulting from implementation of the selected SPAS alternative.

2.3.3.3 Level of Significance After Mitigation

Implementation of SPAS Mitigation Measures MM-BIO (SPAS)-1 through MM-BIO (SPAS)-14 would reduce all significant impacts to biological resources associated with the LAWA Staff-Recommended Alternative to a level that is less than significant.

2.3.4 Coastal Resources

2.3.4.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on coastal resources are only associated with the airfield components of Alternative 1, as evaluated in Section 4.4.6 of the SPAS Draft EIR, because the ground access improvements are not located within the coastal zone.

The LAWA Staff-Recommended Alternative would require changes to navigational aids currently located within the Dunes, including instrument landing light systems and other navigational aids, which must be in alignment with their respective runways. Under the LAWA Staff-Recommended Alternative, Runway

6L/24R would be relocated 260 feet north. The runway would also be extended 604 feet to the west; however, the existing Runway 6L landing threshold would remain in its current location. The landing threshold for Runway 6R would be relocated 104 feet to the east.

In order to accommodate the relocation of Runway 6L/24R, and the adjustment to the Runway 6R landing threshold, the instrument landing light systems, as well as other navigational aids associated with these runways, would be modified. Existing navigational aids would be replaced with new facilities, which would be installed to align with proposed runway configurations. Specifically, new Runway 6L/24R navigational aids would be located 260 feet north of the existing landing lights. A new localizer antenna, MTI radar reflector, and middle marker would also be located to the north of their current locations. Because the landing threshold for Runway 6L would be in the same longitudinal location, the navigational aids would not move east or west. A new service road would be developed to access the navigational aids associated with Runway 6L/24R. The new service road would be similar to existing service roads (i.e., existing paved roads would be used where feasible and new road surface would be graded and graveled to minimize erosion).

New navigational aids associated with Runway 6R/24L would be located 104 feet to the east to accommodate the easterly shift in the Runway 6R landing threshold. The middle marker would also be shifted 104 feet east. The localizer antennae would not need to be replaced. As navigational aids associated with Runway 6R/24L would be situated laterally, new navigational aids could be accessed by the existing service road.

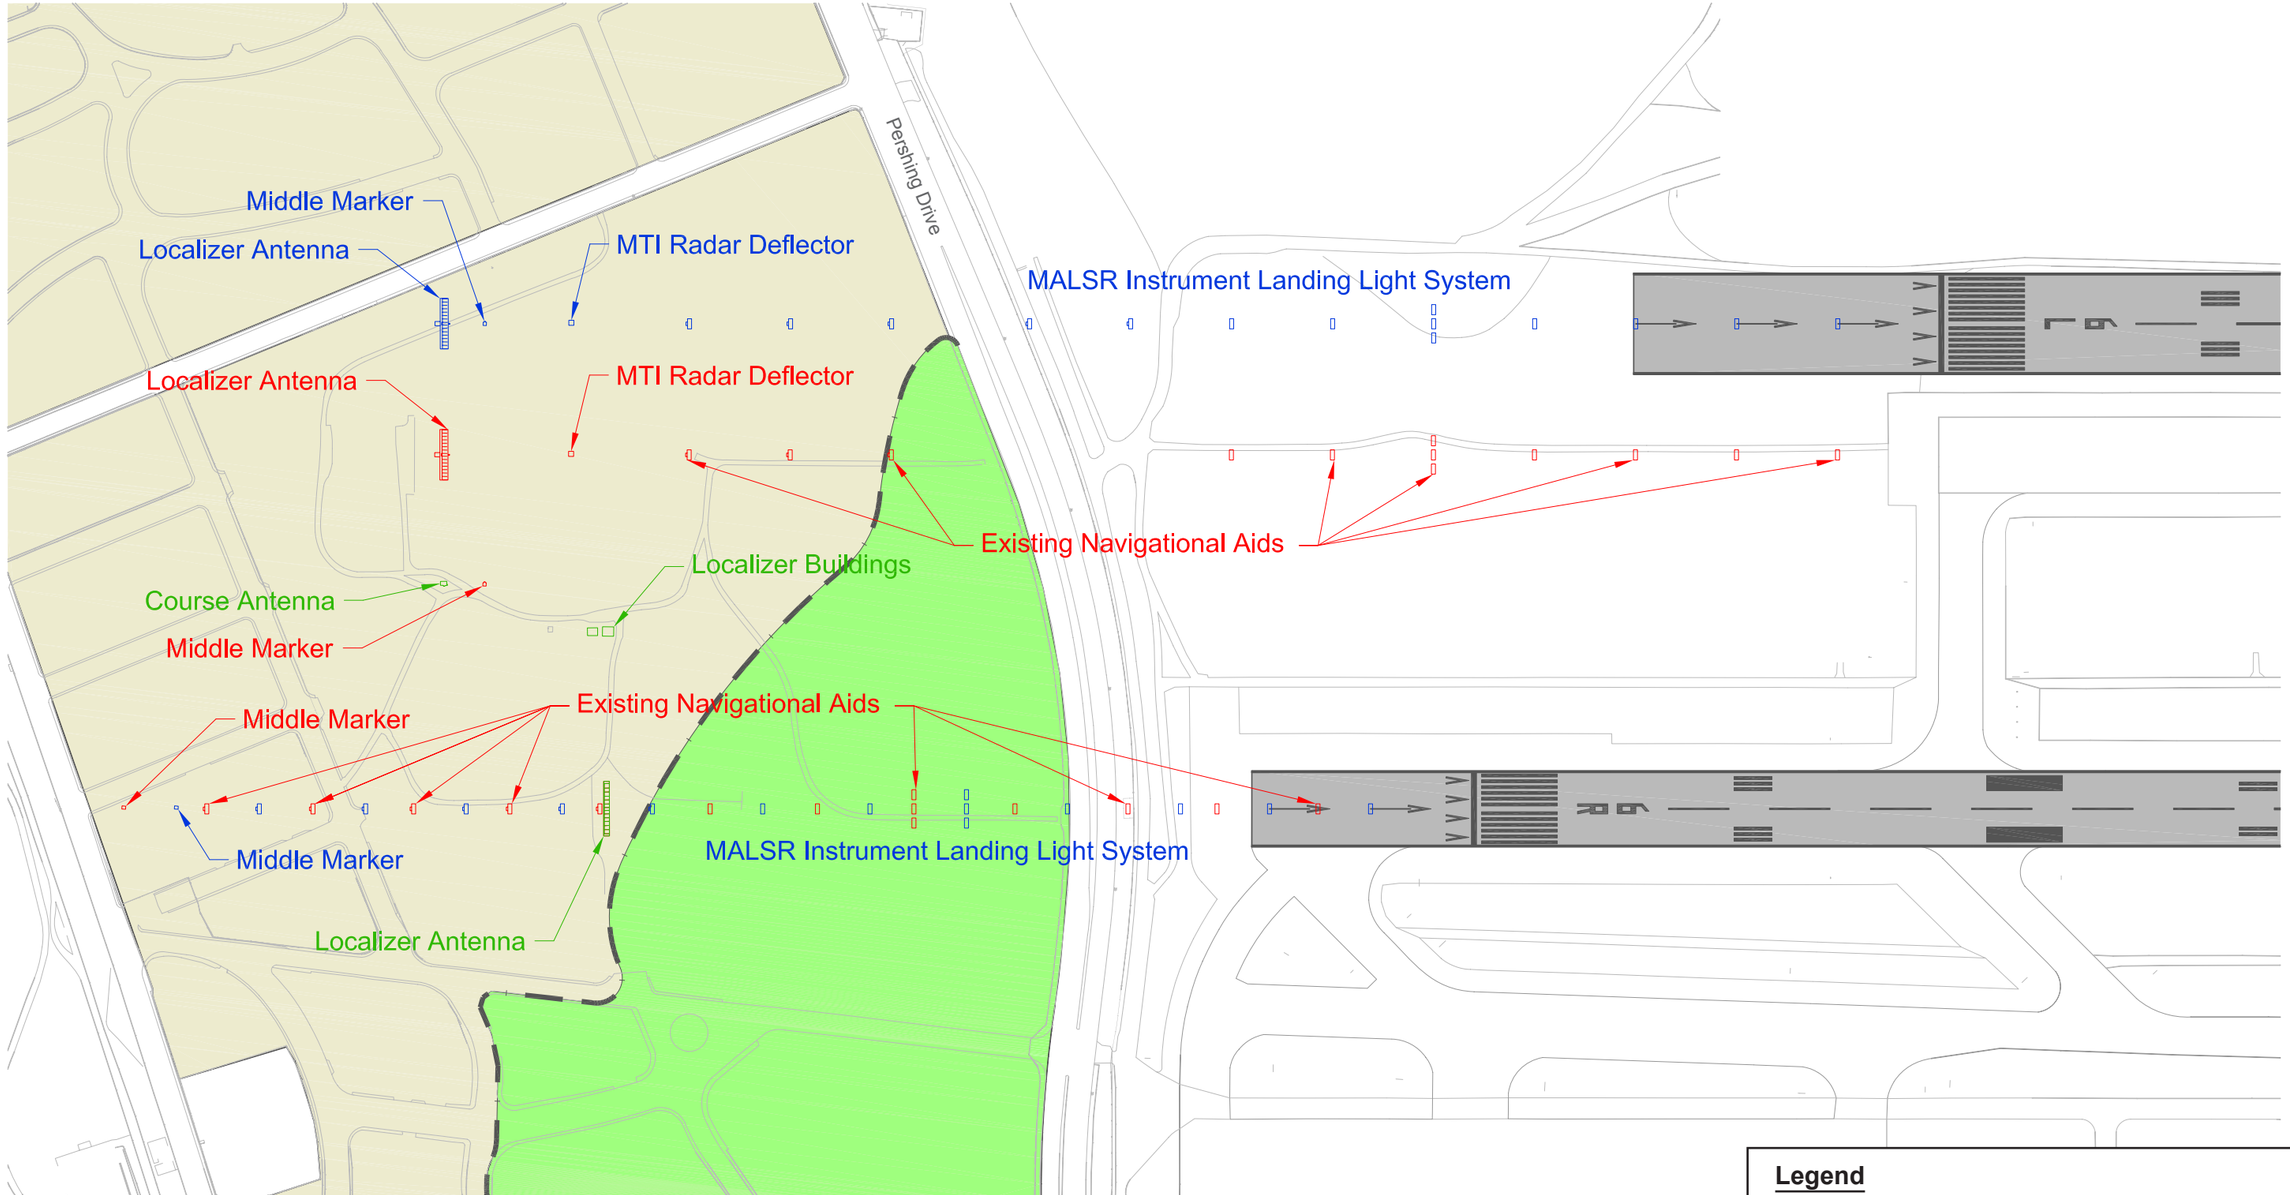
The planned facilities would be similar to existing facilities, which include navigational aids in the Dunes and on the north airfield. The proposed locations of the navigational aids for the LAWA Staff-Recommended Alternative are shown in **Figure SRA-2.3.4-1**.

As indicated previously, the Dunes are considered an ESHA. CCA coastal resource planning and management policies state that ESHAs shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within these areas. Navigational aids are not a use that is dependent on the Dunes resources. In connection with approval of the LAX Master Plan, the FAA previously determined that the installation of new navigational aids and associated service roads at LAX associated with implementation of the LAX Master Plan was consistent, to the maximum extent practicable, with the California Coastal Management Program, pursuant to the requirements of the CZMA and the CCA, as discussed above. An additional consistency determination or certification from CCC may be required to permit implementation of the LAWA Staff-Recommended Alternative. In addition, the new navigational aids would require a Coastal Development Permit.

Navigational aid placements depend on the location of the runways. Under the LAWA Staff-Recommended Alternative, navigational aids must be placed in the proposed locations within the Dunes to comply with FAA requirements and ensure aircraft safety. The only new facilities that would be located in the Dunes are those that must be placed there due to FAA requirements, as specified in the Series 150 Advisory Circulars and as necessary for approval of the Airport Layout Plan.

The placement of navigational aids and an associated service road within the Dunes would not damage the overall quality of the coastal zone environment or its natural or artificial resources. The impacts on biological resources as a result of the installation of navigational aids and an associated service road within the Dunes are addressed in Section 2.3.3, *Biological Resources*, of this chapter which concludes that such impacts would be less than significant with implementation of existing LAX Master Plan and proposed SPAS mitigation measures, and that the Dunes would be protected from any significant disruption of habitat values. These impacts, and related mitigation measures, are discussed further below. The navigational aids would be the same in size, design, and lighting as the existing facilities that have existed in the Dunes for decades, and would continue to exist irrespective of the LAWA Staff-Recommended Alternative. Similar to the existing navigational aids, the new navigational aids would not be readily apparent from either Pershing Drive or Vista del Mar.

The LAWA Staff-Recommended Alternative would not inhibit the orderly, balanced utilization and conservation of coastal zone resources. All conservation plans and protections for the Dunes, discussed



Source: HNTB Corporation, Los Angeles International Airport Layout Plan, August 2010; Ricondo & Associates, Inc., 2011.

LAX Specific Plan Amendment Study Final EIR	**Location of Proposed Navigational Aids - LAWA Staff - Recommended Alternative**	Figure **SRA - 2.3.4-1**

This page intentionally left blank.

above, would remain in effect, and the utilization of the coastal zone resources would be almost identical to the existing utilization. Therefore, the relocation of navigational aids and construction of an associated access road would not interfere with the goals of the CCA.

Sensitive Resources within the Coastal Zone

Under the LAWA Staff-Recommended Alternative, installation of navigational aids and an associated service road would directly affect state-designated sensitive habitat within the Dunes, including occupied habitat of the El Segundo blue butterfly, although this species is present within the navigational aids relocation area in very low densities due to the small quantity of host plants with low flowerhead density. Direct impacts to sensitive habitat, and to the El Segundo blue butterfly, would be less than significant with implementation of existing LAX Master Plan and proposed SPAS mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter (i.e., LAX Master Plan Mitigation Measures MM-BC-1, Conservation of State-Designated Sensitive Habitat Within and Adjacent to the El Segundo Blue Butterfly Habitat Restoration Area, and MM-ET-4, El Segundo Blue Butterfly Conservation: Habitat Restoration, and proposed SPAS Mitigation Measure MM-BIO (SPAS)-1, Replacement of State-Designated Habitats).

The replacement of navigational aids under the LAWA Staff-Recommended Alternative may result in significant impacts to five sensitive plant species--including Lewis' evening primrose, California spineflower, south coast branching phacelia, mesa horkelia, and Orcutt's pincushion--depending on the total population size present on-site and the percentage of the population that would be affected. Impacts to these sensitive plant species would be less than significant with implementation of proposed SPAS mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter (i.e., MM-BIO (SPAS)-2, Conservation of Floral Resources: South Coast Branching Phacelia, MM-BIO (SPAS)-3, Conservation of Floral Resources: Lewis' Evening Primrose, MM-BIO (SPAS)-4, Conservation of Floral Resources: California Spineflower, MM-BIO (SPAS)-5, Conservation of Floral Resources: Mesa Horkelia, and MM-BIO (SPAS)-6, Conservation of Floral Resources: Orcutt's Pincushion).

The replacement of navigational aids may also have significant impacts to sensitive wildlife species, including sensitive arthropods, silvery legless lizard, coast horned lizard, loggerhead shrike, and burrowing owl. Impacts to these sensitive wildlife species would be less than significant with implementation of proposed SPAS mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter (i.e., MM-BIO (SPAS)-8, Conservation of Faunal Resources: Sensitive Reptiles and Arthropods, MM-BIO (SPAS)-9, Conservation of Faunal Resources: Loggerhead Shrike, and MM-BIO (SPAS)-10, Conservation of Faunal Resources: Burrowing Owl).

As indicated in Section 2.3.3, *Biological Resources*, of this chapter, impacts to sensitive resources within the Dunes associated with operation of the navigational aids would be less than significant. Similarly, as discussed in Section 2.3.3, *Biological Resources*, of this chapter, indirect effects from jet exhaust emissions, light emissions, and noise would not significantly affect the El Segundo blue butterfly or other sensitive floral and faunal species within the Dunes. However, construction activities under the LAWA Staff-Recommended Alternative have the potential to result in deposition of fugitive dust within state-designated sensitive habitat, including habitat within the El Segundo Blue Butterfly Habitat Restoration Area. With implementation of the existing LAX Master Plan mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter (i.e., MM-ET-3, El Segundo Blue Butterfly Conservation: Dust Control), the potential indirect impacts to state-designated sensitive habitat due to construction activities would be less than significant.

2.3.4.2 Mitigation Measures

Implementation of mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter, including LAX Master Plan Mitigation Measures MM-BC-1, MM-ET-3, and MM-ET-4, and SPAS Mitigation Measures MM-BIO (SPAS)-1, MM-BIO (SPAS)-2, MM-BIO (SPAS)-3, MM-BIO (SPAS)-4, MM-BIO (SPAS)-5, MM-BIO (SPAS)-6, MM-BIO (SPAS)-8, MM-BIO (SPAS)-9, and MM-BIO (SPAS)-10, would ensure that impacts to sensitive resources within the coastal zone associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no additional mitigation measures specific to SPAS are required.

2.3.5 Cultural Resources

2.3.5.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on cultural resources are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.5.6 of the SPAS Draft EIR.

In addition to the LAX Master Plan commitment and mitigation measures identified in Section 4.5.5 of the SPAS Draft EIR, and as discussed in Section 4.5.3.1 of the SPAS Draft EIR, new development at LAX is subject to compliance with a number of design and lighting related regulations and guidelines. Compliance with applicable regulations and guidelines is supported through LAWA's design review process where plans are reviewed by the Facilities Planning Division, other airport divisions, and by the City of Los Angeles Building and Safety Department as part of the permitting process. The Building and Safety Department distributes the plans as appropriate to other City departments including Planning, Public Works, and Cultural Affairs with final design approval required by the Cultural Affairs Commission. The following analysis assumes that new development at LAX would be carried out in compliance with pertinent LAX Master Plan commitments and mitigation measures, and with relevant LAX and City of Los Angeles design regulations and guidelines.

2.3.5.1.1 Historical Resources

Two eligible historical resources potentially affected by the LAWA Staff-Recommended Alternative are analyzed below: the Theme Building and Setting and the Union Savings and Loan Building.

The World War II Munitions Storage Bunker (eligible), Hangar One (listed), and the Intermediate Terminal Complex are located within the cultural resources study area but would not be directly or indirectly affected because of their distance from the LAWA Staff-Recommended Alternative improvements, as shown in Figure 4.5-1 in Section 4.5, *Cultural Resources*, of the SPAS Draft EIR. Hangar One (building number 4 in Figure 4.5-1) is situated within the far southeastern portion of the cultural resources study area. The site survey and review of the LAWA Staff-Recommended Alternative found that Hangar One would not be directly or indirectly affected by the LAWA Staff-Recommended Alternative, and no further investigation with regard to this resource was warranted. The World War II Munitions Storage Bunker (building 1 in Figure 4.5-1) is situated within the far western portion of the cultural resources study area. Review of the LAWA Staff-Recommended Alternative found that the World War II Munitions Storage Bunker would not be directly or indirectly affected by the LAWA Staff-Recommended Alternative and no further investigation with regard to this resource was warranted. The Intermediate Terminal Complex (building 3 in Figure 4.5-1) is situated in the far eastern portion of the cultural resources study area and would not be affected directly or indirectly by the LAWA Staff-Recommended Alternative. (This property was included in the 2011-2012 survey prior to this determination.) Therefore, no further analysis of this resource is provided in this section.

Other than the World War II Munitions Storage Bunker, Hangar One, the Theme Building and Setting, the Intermediate Terminal Complex, and the Union Savings and Loan Building, the remainder of surveyed properties did not meet the definition of a historical resource under State CEQA Guidelines Section 15064.5(a) and therefore the LAWA Staff-Recommended Alternative would have no impact to historical resources in relation to these properties.

Contributing features of the original Theme Building structure (extant original exterior and interior features) include, but are not necessarily limited to, the base, elevator core, extant original features of the restaurant space (excluding later alterations), public viewing platform, structural arches and footings, surrounding concrete wall/grille around base, pedestrian entrance, associated original hardscape features such as pedestrian patios and planters/planting beds, and surrounding pedestrian and vehicular circulation.

Contributing features of the Theme Building Setting include:

- The Central Service Facility Buildings (two similar one-story utility/office buildings with concrete arched roofs, remaining segment of original axial road alignment, associated concrete sidewalks and hardscape);
- The Primary Axial View between the Theme Building and the 1961 Airport Traffic Control Tower, including the axial road alignment and unobstructed view corridor between the 1961 Airport Traffic Control Tower and the Theme Building, from the Theme Building restaurant and public roof-top viewing platform, from the 1961 Airport Traffic Control Tower, and from vehicular and pedestrian circulation paths within the immediate vicinity of the view corridor;
- Although not eligible individually due to substantial later alterations, the 1961 Airport Traffic Control Tower remains recognizable; it retains its architectural form and distinctive control booth;
- Although substantially altered with numerous additions and upgrades necessitated by the large expansion in service since the 1960s, the general character of the airport setting from the 1960s and 1970s remains residually recognizable, including the site plan, horizontal forms and rectangular massing of the concourse buildings, their generally consistent scale and height, the figure-ground relationships of masses and voids, the relationships of spaces and use, general architectural character and materials (Jet Age/International Style, rectangular volumes, horizontality, metal and concrete, smooth surfaces, large expanses of glass, ribbon windows) the centrally located Theme Building which remains predominant within the U-shaped concourse and circulation complex, and the exterior terminals and associated airfields located to the north and south of the concourse area;
- Mid- and long-range outward looking views from the Theme Building's 80-foot level restaurant and 360-degree views from the roof-top viewing platform including mid-range views of the concourses and terminals, long-range views of the airfields, and distant views to the surrounding neighborhoods, mountains, and Pacific Ocean, which can still be experienced as originally conceived;
- Direct views of the Theme Building from the U-shaped vehicular and pedestrian circulation paths within the concourse complex; and
- Direct views of the Theme Building from the edges of the horizontal concourse levels, including views through the continuous horizontal strip windows directly facing the Theme Building from the south terminals.

The airfield and terminal improvements under the LAWA Staff-Recommended Alternative would have no direct impacts and no adverse indirect impacts on historical resources because of their design, distance, and intervening development. There would be no direct physical impacts to the Theme Building and Setting, and no interruption of related views that characterize the Theme Building and Setting would occur under the LAWA Staff-Recommended Alternative. The physical characteristics of the Theme Building and Setting would remain unaffected and no change in the significance of a historical resource would occur, pursuant to CEQA 15064.5(b)(1)(2).

With the exception of vantage points within the taller Theme Building, within the CTA, public views of the airfield and areas adjacent to the airport are blocked by the terminal buildings. Construction of airfield improvements, including the movement of Runway 6L/24R 260 feet north, the addition of a centerfield taxiway, the extension of Runway 6R/24L, improvements to Taxilane D and Taxiway E, and relocation of the service road, would have no adverse impact to the Theme Building and Setting since the general character of the airfield would remain and no intervening improvements would be constructed that would substantially obscure existing views of the airfield from the Theme Building.

The proposed terminal improvements, including the addition of a new Terminal 0, loss/modifications to concourse areas and/or gates at Terminals 1, 2, and 3, and the modification and northern extension of concourse area and gates at the Tom Bradley International Terminal (TBIT) and the future Midfield Satellite Concourse (MSC), would be compatible in design, scale, proportion and massing and would not have a direct impact or significant adverse indirect impact on the Theme Building and Setting. The proposed terminal improvements are located at the northern perimeter of the CTA and would be largely blocked from view from the Theme Building by the existing concourses. Furthermore, because of the

height limitations of the proposed terminal improvements and the incorporation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources, which supports the preservation of significant historic/architectural resources through careful review of design and development adjacent to such resources to ensure modifications are carried out consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties, the impacts on the Theme Building and Setting from terminal improvements under the LAWA Staff-Recommended Alternative would be less than significant.

The ground access improvements under the LAWA Staff-Recommended would have significant impacts on the National Register-eligible Theme Building and Setting but no impact on the ineligible 1961 Airport Traffic Control Tower. With incorporation of Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, described in Section 2.3.5.2.1 below, potentially significant impacts to the Theme Building and Setting would be avoided because views of the north and south elevations of the Theme Building would not be impaired by the APM. Potential indirect impacts to the Union Savings and Loan Building from the proposed ground access improvements, specifically, an elevated APM structure along 98th Street and extending over Sepulveda Boulevard, would be less than significant due to their proposed location within or north of the 98th Street right-of-way, their distance from the eligible Union Savings and Loan Building, and the incorporation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources.

The ITF, proposed to be located between 96th Street and 98th Street west of Airport Boulevard, and the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards, would not have any direct physical impacts or indirect impacts on identified eligible or listed historical resources in the cultural resources study area due to their distance from these resources. Likewise, the relocation of Lincoln Boulevard would have no impact on identified eligible and listed historical resources.

The proposed parking improvements under the LAWA Staff-Recommended Alternative would not be visible from the Theme Building or the Union Savings and Loan Building. The proposed parking in Manchester Square, located east of Aviation Boulevard and north of Century Boulevard, would have no impact on identified eligible or listed historical resources in the area due to its distance of approximately one mile or more to the east from these resources.

2.3.5.1.2 Archaeological Resources

The following addresses the potential for improvements associated with the LAWA Staff-Recommended Alternative to have an impact on known archaeological resource sites. Only those resource sites located in general proximity to the improvements are addressed. One potentially eligible site under CEQA (CA-LAN-2345) would not be affected by the LAWA Staff-Recommended Alternative because it is located far enough away from the alternatives to not be impacted.

All potentially significant impacts on archaeological resources associated with the LAWA Staff-Recommended Alternative would be less than significant with implementation of mitigation measures, as discussed later in this section.

Airfield improvements associated with Runway 6L/24R and construction of a centerfield taxiway would not have an impact on CA-LAN-2385H and P-19-100115 because these resources are not historical resources or unique archaeological resources under State CEQA Guidelines Section 15064.5 and Section 21083.2 of the Public Resources Code, respectively. Specifically, CA-LAN-2385H was likely identified out of context and no association determination can be made, which diminishes the potential to determine whether the site meets any of the eligibility criteria, and the lack of solid provenance data for P-19-100115 diminishes its potential to yield important information to the study of prehistory. In addition, isolate resources are unlikely to retain additional buried components that would yield important information to the study of prehistory. Therefore, impacts to CA-LAN-2385H and P-19-100115 would be less than significant.

Use of Construction Staging Area A would have an impact on CA-LAN-1118. This resource is not a historical resource or a unique archaeological resource under State CEQA Guidelines Section 15064.5 and Section 21083.2 of the Public Resources Code, respectively. This is a result of current and former

construction activities that have likely displaced components of the site from their original location and have consequently reduced the integrity of the site and diminished the potential to determine whether CA-LAN-1118 meets any of the eligibility criteria. Because this site has been determined ineligible for listing at the federal, state, and local level, impacts to CA-LAN-1118 would be less than significant.

No other previously recorded archaeological resources have been identified in the improvement areas associated with the LAWA Staff-Recommended Alternative. Despite the lack of recorded archaeological resources within the area affected by the LAWA Staff-Recommended Alternative, this alternative has the potential to disturb or destroy significant, undiscovered archaeological resources during construction excavations. However, with the exception of the north airfield and the navigational aids in the Los Angeles/El Segundo Dunes, the improvements associated with the LAWA Staff-Recommended Alternative are located in disturbed areas. The north airfield improvements and navigational aids would not require deep excavations, and the area subject to excavation for the navigational aids would be small. The lack of deep excavations reduces the potential to encounter undiscovered archaeological resources because deep excavations may encounter previously undisturbed soils conducive to retaining undiscovered archaeological resources. Shallow excavations are likely to be conducted in previously disturbed soils that are likely not conducive to retaining undiscovered archaeological resources because resources in these soils may have been destroyed or displaced from prior disturbances (e.g., rough grading or trenching, road/airstrip construction). Since improvements associated with the north airfield and navigational aids would include shallow excavations in disturbed soils, the likelihood of encountering undiscovered significant archaeological resources during construction is limited. Nevertheless, the potential for construction to affect previously unidentified archaeological resources is a significant impact. Mitigation Measure MM-HA (SPAS)-4, Conformance with LAX Master Plan Archaeological Treatment Plan (described in Section 2.3.5.2.2 below), is proposed to address significant impacts to previously unidentified archaeological resources by requiring construction activities to be undertaken in conformance with the ATP. In the event subsurface deposits are encountered, the ATP provides for evaluation and treatment of archaeological resources consistent with the Secretary of the Interior's Standards and Guidelines for Archaeological Documentation and other applicable guidance. Requirements outlined in the ATP include specific procedures for archaeological monitoring, identifying and assessing the significance of resources, and for the recovery and curation of resources when warranted. For example, an archaeological excavation program to remove the resources may be implemented, if deemed necessary. In addition, the ATP includes guidance on retaining a Native American monitor if Native American cultural resources are encountered. If human remains are found, LAWA will need to comply with the State Health and Safety Code regarding the appropriate treatment of those remains as outlined in the ATP. Finally, the ATP details the reporting requirements to document the archaeological monitoring effort and provides guidance as to the proper curation and archiving of artifacts in accordance with industry and federal standards. The procedures outlined in the ATP would reduce potentially significant impacts to previously unidentified archaeological resources associated with this alternative to a less than significant level.

2.3.5.2 Mitigation Measures

2.3.5.2.1 Historical Resources

Implementation of LAX Master Plan Commitment HR-1 would ensure that impacts to the Union Savings and Loan Building associated with the LAWA Staff-Recommended Alternative, would be less than significant. Therefore, no mitigation specific to SPAS is required for the LAWA Staff-Recommended Alternative relative to the Union Savings and Loan Building. However, even with implementation LAX Master Plan Commitment, HR-1 there would be a significant impact to the Theme Building and Setting as a result of the implementation of the APM under the LAWA Staff-Recommended Alternative. To address this impact, the mitigation measure specific to SPAS listed is proposed. The focus of Mitigation Measure MM-HA (SPAS)-2 is to provide specific guidance to ensure that alteration of the surrounding setting of the Theme Building in connection with the LAWA Staff-Recommended Alternative is undertaken in accordance with the Secretary of the Interior's Standards.

- **MM-HA (SPAS)-2. Preservation of Historic Resources: Theme Building and Setting.**

  Consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties, this measure will ensure that the historic character of the Theme Building and Setting will be retained and preserved. The Theme Building's integrity will be preserved and removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the Theme Building and contribute to its eligibility will be avoided (Standards for Preservation 1-7). The contributing Setting of the Theme Building shall be protected and maintained (Standards for Rehabilitation and Guidelines for Rehabilitation) and changes to the features and spatial relationships of the CTA shall be undertaken in a manner consistent with the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitation, and shall be compatible with the historic materials, features, size, scale and proportion, and massing of the Theme Building to protect the integrity of the historic resource and its environment (Standards for Rehabilitation 9 and 10).

  The historic features of the Theme Building include the extant original exterior and interior features of the structure such as the base, elevator core, original features of the restaurant space, public viewing platform, structural arches and footings and associated original hardscape/landscape features and circulation elements immediately surrounding the structure (concrete wall/grille around base, pedestrian entrance, patios, planters/planting beds, and pedestrian and vehicular circulation). The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize the Theme Building and contribute to its eligibility shall be avoided (Standards for Preservation 1-7). Necessary alterations to the Theme Building shall conform to the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards for Rehabilitation 9 and 10).

  Changes to the features and spatial relationships of the CTA that may remove or alter features, spaces, and spatial relationships that characterize the Setting of the Theme Building and contribute to the Theme Building's eligibility shall also be avoided (Standards for Rehabilitation 1-7). Necessary alterations to the Theme Building Setting shall conform to the Secretary of the Interior's Standards for Rehabilitation 9 and 10. Contributing features and views of the Theme Building's Setting include:

  - the two Central Service Facility Buildings and a segment of original axial road alignment and associated concrete sidewalks and hardscape;
  - the architectural form of the 1961 Airport Traffic Control Tower and its distinctive control booth;
  - the general character of the airport setting, including the centrally located and visually predominant Theme Building within the U-shaped concourse area, and the horizontal forms, rectangular massing and generally consistent scale and height of the concourse buildings and their Modern architectural character and materials (Jet Age/International Style, rectangular volumes, horizontality, metal and concrete, smooth surfaces, large expanses of glass, and ribbon windows);
  - the Primary Axial View between the Theme Building and the 1961 Airport Traffic Control Tower, including the axial road alignment and unobstructed view corridor between the 1961 Airport Traffic Control Tower and the Theme Building, the view to the 1961 Airport Traffic Control Tower from the Theme Building restaurant and public roof-top viewing platform, the view from the 1961 Airport Traffic Control Tower to the Theme Building, and the view from vehicular and pedestrian circulation paths within the immediate vicinity of the Primary Axial view corridor;
  - the mid- and long-range outward looking views from the Theme Building's 80-foot level restaurant and the 360-degree views from the roof-top viewing platform, including mid-range views of the concourses and terminals, long-range views of the airfields, and distant views to the surrounding neighborhoods, mountains, and Pacific Ocean;
  - direct views of the Theme Building from the U-shaped vehicular and pedestrian circulation paths within the concourse complex where, at a minimum, the upper portions of the Theme Building would be visible; and

- direct views of the Theme Building from the edges of the horizontal concourse levels, including views through the continuous horizontal strip windows directly facing the Theme Building from the south terminals where, at a minimum, the upper portions of the Theme Building would be visible.

Changes to non-contributing features and spatial relationships of the CTA that may indirectly impact the Theme Building and Setting shall be undertaken in a manner consistent with the Secretary of the Interior's Standards for Rehabilitation 9 and 10, and shall be compatible with the historic materials, features, size, scale and proportion, and massing of the Theme Building to protect the integrity of the historic resource and its environment. The design of the APM shall ensure that important contributing views of the north and south elevations of the Theme Building are not materially impaired.

Prior to the final design of the APM, a qualified historic preservation consultant shall be engaged by LAWA to review the compatibility of new design and construction components adjacent to the Theme Building for conformance with Secretary of the Interior's Standards that provide guidelines for sensitively and respectfully managing changes to the defining characteristics of a historic property's site and environment. With regard to adjacent new construction, Standard for Rehabilitation 9 recommends that destruction of historic materials that characterize the property be avoided where feasible, and that adjacent new work shall be compatible with the massing, size, scale, and architectural features of the historical resource to protect the historic integrity of the property and its environment. Standard for Rehabilitation 10 requires that new construction be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired. This mitigation measure and the required Standards conformance review by a qualified historic preservation consultant shall achieve and document compliance with the applicable Standards through the requisite plan reviews and sign-off of plans. In addition, a letter report will be provided to the City of Los Angeles Office of Historic Resources documenting the results.

2.3.5.2.2 Archaeological Resources

The following mitigation measure specific to SPAS has been developed to ensure compliance with the ATP, which incorporates the requirements of LAX Master Plan Mitigation Measures MM-HA-4 through MM-HA-10:

- **MM-HA (SPAS)-4. Conformance with LAX Master Plan Archaeological Treatment Plan.**

  Prior to initiation of grading and construction activities, LAWA will retain an on-site Cultural Resource Monitor (CRM), as defined in the LAX Master Plan MMRP Archaeological Treatment Plan (ATP), who will determine if the proposed project area is subject to archaeological monitoring. As defined in the ATP, areas are not subject to archaeological monitoring if they contain redeposited fill or have previously been disturbed. LAWA shall retain an archaeologist to monitor excavation activities in native or virgin soils in accordance with the detailed monitoring procedures and other procedures outlined in the ATP regarding treatment for archaeological resources that are accidentally encountered during construction. In accordance with the methods and guidelines provided in the ATP, the CRM will compare the known depth of redeposited fill or disturbance to the depth of planned grading activities, based on a review of construction plans. If the CRM determines that the proposed project area is subject to archaeological monitoring, a qualified archaeologist (an archaeologist who satisfies the Secretary of the Interior's Professional Qualifications Standards [36 CFR 61]) shall be retained by LAWA to inspect excavation and grading activities that occur within native material. The extent and frequency of inspection shall be defined based on consultation with the archaeologist. Following initial inspection of excavation materials, the archaeologist may adjust inspection protocols as work proceeds. Identification, evaluation, and recovery of cultural resources shall be conducted in accordance with the methods, guidelines, and measures established in the ATP. If Native American cultural resources are encountered, LAWA shall comply with guidance established in the ATP for retaining a Native American monitor. If human remains are found, LAWA shall comply with the State Health and Safety Code regarding the appropriate treatment of those remains as outlined in the ATP. Reporting shall be completed in conformance with the requirements established in the ATP to

document the archaeological monitoring effort and guidance as to the proper curation and archiving of artifacts in accordance with industry and federal standards.

2.3.5.3 Level of Significance After Mitigation

2.3.5.3.1 Historical Resources

With implementation of SPAS Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, significant indirect impacts associated with changes to the setting and primary views of the Theme Building under the LAWA Staff-Recommended Alternative would be reduced to a level that is less than significant.

2.3.5.3.2 Archaeological Resources

Compliance with the ATP, as ensured by SPAS Mitigation Measure MM-HA (SPAS)-4, Conformance with LAX Master Plan Archaeological Treatment Plan, would reduce impacts to previously unidentified archaeological resources that may be discovered during construction of the LAWA Staff-Recommended Alternative to a level that is less than significant.

2.3.6 Greenhouse Gases

2.3.6.1 Impacts Analysis

As noted in Section 2.3, GHG emissions associated with the airfield/terminal components of Alternative 1 were combined with the GHG emissions associated with the ground access components of Alternative 9 to present GHG emissions associated with the LAWA Staff-Recommended Alternative. These emissions are within the range of emissions identified in Section 4.6.6 of the SPAS Draft EIR.

2.3.6.1.1 Construction Emissions

Annual construction GHG emissions for the LAWA Staff-Recommended Alternative before mitigation are presented in **Table SRA-2.3.6-1**. SCAQMD recommends that amortized GHG construction emissions (i.e., total construction emissions divided by the lifetime of the project, assumed to be 30 years) be added to operational emissions to evaluate significance.[19] As a result, construction-related significance is not determined on an individual basis for GHG emissions; rather, Section 2.3.6.1.2 below evaluates the significance of the combined construction-related and operations-related GHG emissions for the LAWA Staff-Recommended Alternative.

2.3.6.1.2 Operational Emissions

Operational GHG emissions, plus amortized construction GHG emissions, for the LAWA Staff-Recommended Alternative at buildout of the alternative in 2025 are presented in **Table SRA-2.3.6-2**. Also shown in **Table SRA-2.3.6-2** are the baseline operational GHG emissions in 2009-2010, as well as operational GHG emissions for Alternative 4 for comparative purposes (discussed below). The per capita (per passenger) emissions for baseline conditions and for the LAWA Staff-Recommended Alternative are identified at the bottom of each emissions column in the table, along with an indication of how much less, percentage-wise, the per capita emissions of the LAWA Staff-Recommended Alternative are compared to per capita emissions for baseline conditions. The determination of per capita emissions is based on 56.5 MAP for baseline (2009) conditions and 78.9 MAP for future (2025) baseline conditions. Where the per capita GHG emissions are not at least 16 percent less than those of baseline conditions, a significant impact is identified.

Incremental changes in GHG emissions associated with the LAWA Staff-Recommended Alternative, compared to baseline conditions, are summarized in **Table SRA-2.3.6-2**. As indicated in **Table SRA-**

[19] South Coast Air Quality Management District, Draft Guidance Document - Interim CEQA Greenhouse Gas (GHG) Significance Threshold, October 2008.

2.3.6-2, the majority of increases in GHG emissions compared to baseline conditions would be from aircraft operations, which is entirely attributable to the anticipated growth in airport activity levels that is common to 2025 buildout of any and all of the alternatives, including the LAWA Staff-Recommended Alternative. Although there would be a notable increase in aircraft emissions compared to baseline conditions, the airfield improvements under the LAWA Staff-Recommended Alternative would actually reduce GHG emissions for future conditions if no airfield improvements were implemented. This can be seen in comparing the aircraft emissions between the LAWA Staff-Recommended Alternative and Alternative 4, the latter of which includes no airfield improvements other than safety-related improvements. Under the LAWA Staff-Recommended Alternative, aircraft emissions in 2025 would be approximately one percent less than would otherwise occur if no airfield improvements were implemented. Under federal law, LAWA has no direct control over aircraft operations relative to GHG emissions; however, the airfield improvements proposed by LAWA and the ability of those improvements to enable aircraft to operate more efficiently (i.e., reduce the amount of time that aircraft are operating in the taxi/idle mode) would serve to reduce GHG emissions.

With regards to other increases in GHG emissions under the LAWA Staff-Recommended Alternative compared to baseline conditions, there would be an approximately 30 percent increase in GSE emissions and 36 percent increase in APU emissions, again being attributable to the projected growth in airport activity by 2025 independent of the alternatives. Vehicle-related GHG emissions at buildout of the LAWA Staff-Recommended Alternative would be slightly more than those of baseline conditions. Although the volume of airport-related traffic would increase substantially by 2025, compared to baseline conditions, due the aforementioned projected growth in airport activity, the ongoing implementation of motor vehicle emission control and fuel mileage standards in new vehicles along with the gradual transition to newer, cleaner, and more fuel efficient vehicles over time would result in reduced GHG emissions per vehicle by 2025.[20] The amount of per vehicle GHG emission reductions would largely offset the increase in the volume of vehicles projected to occur between the baseline year and 2025. In comparing the 2025 GHG emissions for the LAWA Staff-Recommended Alternative to those of Alternative 4 (i.e., the alternative with minimal improvements), the vehicle-related emissions of the LAWA Staff-Recommended Alternative would be less. This is primarily due to the improved parking infrastructure that would reduce the number of off-airport roadway trips. Stationary source GHG emissions for the LAWA Staff-Recommended Alternative, as well as all other alternatives, are anticipated to be greater than baseline conditions because of the additional airfield/terminal and ground access components.

On a per capita (per passenger) basis, the GHG emissions associated with implementation of the LAWA Staff-Recommended Alternative would be approximately 14.68 percent less than the per capita (per passenger) GHG emissions for baseline conditions. Notwithstanding that reduction in per capita GHG emissions would be a substantial improvement over baseline conditions, the reduction is less than the 16 percent targeted reduction reflected in the AB 32 Scoping Plan, which is the basis for the threshold of significance in this analysis; hence, the GHG emissions associated with the LAWA Staff-Recommended Alternative would be significant.

[20] The EMFAC2011 emission factors used to estimate GHG emissions for each alternative, including the LAWA Staff-Recommended Alternative, in 2025 do not include the GHG reductions anticipated to occur from implementation of several measures specifically included in the AB 32 Scoping Plan for future reductions. Such measures that were not included in the GHG emissions estimates for future conditions include those associated with continued implementation of the Pavley greenhouse gas vehicle standards (i.e., Pavley II) and Advanced Clean Cars improvements. As such, the on-road vehicle GHG emissions estimates for each alternative, including the LAWA Staff-Recommended Alternative, are conservative and would actually be lower than estimated with future implementation of these, and other, measures.

Table SRA-2.3.6-1

Total GHG Construction Emissions - LAWA Staff-Recommended Alternative

	$MTCO_2e$[1]/year	
Source	**Alt. 4**	**SRA**
Airfield/Terminal Construction	13,836	315,985
Ground Access Construction	32,196	66,130
Total	46,031	382,115
Amortized Total[2]	1,534	12,737

Notes:

Totals may not add due to rounding.

[1] $MTCO_2e$ = metric tons carbon dioxide equivalent

[2] Amortized total equals the grand total (airside plus ground access construction) divided by the lifetime of the project, assumed to be 30 years.

Table SRA-2.3.6-2

Incremental Changes in GHG Emissions Compared to Baseline Conditions - LAWA Staff-Recommended Alternative

Source	Baseline[1] $MTCO_2e$/year[2]	Incremental Increase or Decrease Compared to Baseline: Alt. 4 $MTCO_2e$/year[4]	Incremental Increase or Decrease Compared to Baseline: SRA[2] $MTCO_2e$/year[4]
Aircraft	634,424	332,648	322,013
Ground Support Equipment[2]	60,551	18,287	18,287
Auxiliary Power Units	44,380	16,160	16,160
Parking Facilities	108,784	-3,268	-9,985
On-Airport Roadways	48,865	-4,353	-5,582
On-Airport Stationary	66	8	77
On-Airport Subtotal	897,070	359,482	340,970
Building Electricity	7,763	956	9,107
Solid Waste Disposal	345	43	405
Indoor/Outdoor Water Usage	646	80	758
Off-Airport Roadways	1,404,778	100,450	78,560
Off-Airport Subtotal	1,413,532	101,528	88,830
Amortized Construction		1,534	12,737
Total Incremental Emissions		462,544	442,537
Total Emissions (Baseline + Increment)	**2,310,602**	**2,773,146**	**2,753,139**
Per Capita Emissions ($MTCO_2e$/year)	0.04090	0.03515	0.03489
Percent Reduction Compared to Baseline Conditions	**NA**	**14.06%**	**14.68%**
Significance Threshold		>16%	>16%
Significant Impact?		**Yes**	**Yes**

Notes:

1 Emissions totals may not add due to rounding.
2 $MTCO_2e$/year = metric tons carbon dioxide equivalent per year
3 GSE operations and activity levels are assumed to be directly related to aircraft activity levels; therefore, GSE emissions are the same for all future alternatives since aircraft activity is the same for all alternatives in 2025.

Source: CDM Smith, 2012.

2.3.6.2 Mitigation Measures

The LAWA Staff-Recommended Alternative includes mitigation measures to reduce construction equipment operations/duration, as described above. Additionally, GHG emissions associated with the LAWA Staff-Recommended Alternative would be reduced directly or indirectly through compliance with LAWA's Sustainable Airport Planning, Design and Construction Guidelines and/or the requirements of the City of Los Angeles Green Building Ordinance. There are no other feasible mitigation measures to reduce construction-related GHG emissions other than those already identified above in Section 4.6.5 and in Section 4.2, *Air Quality*, of the SPAS Draft EIR, as amended by corrections and additions to the SPAS Draft EIR identified in Chapter 5 of Part II of this Final EIR.

For operational impacts, the LAWA Staff-Recommended Alternative would comply with the requirements of the City of Los Angeles Green Building Ordinance and with LAWA policies and programs related to sustainability and reducing GHG emissions that are implemented on project-specific and on an airport-wide basis. As noted in OPR's Technical Advisory on CEQA and Climate Change, LAWA's programmatic

efforts to address GHG emissions agency-wide can be a more effective approach than mitigating GHG emissions at a project level.[21] **Tables SRA-2.3.6-3** and **SRA-2.3.6-4** present a comprehensive list of suggested mitigation measures for new development projects throughout the state of California. The list presented in **Table SRA-2.3.6-3** is prepared by the California Office of the Attorney General relative to addressing GHG emissions and climate change impacts within an EIR.[22] The list presented in **Table SRA-2.3.6-4** is prepared by OPR and presents examples of measures that have been used by some public agencies to reduce GHG emissions.[23] **Tables SRA-2.3.6-3** and **SRA-2.3.6-4** and text below indicate how the SPAS alternatives, including the LAWA Staff-Recommended Alternative, as well as LAWA's overall sustainability actions and objectives, relates to each of the applicable mitigation measures.

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
Energy Efficiency	
Incorporate green building practices and design elements.	New development occurring under any of the SPAS alternatives would be subject to the LAWA's sustainability guidelines (i.e., LAWA *Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Projects* [LSAG] and/or the City of Los Angeles Green Building Ordinance). Those guidelines and Ordinance requirements address green building practices and design elements. LAWA requires new terminal facilities to achieve LEED® Silver certification.[1]
Meet recognized green building and energy efficiency benchmarks.	As noted above, all of the SPAS alternatives would be subject to LSAG and/or the Green Building Ordinance, which include provisions for energy efficiency and conservation. For example, the Green Building Ordinance requires that a project exceed CEC 2008 Energy Efficiency Standards by 15 percent.
Install energy efficient lighting (e.g., light emitting diodes [LEDs]), heating and cooling systems, appliances, equipment, and control systems.	The use of energy efficient lighting, systems, and equipment in new facilities and in the renovation/modification of existing facilities is standard practice by LAWA and is generally reflected in the requirements of the Green Building Ordinance.
Use passive solar design, e.g., orient buildings and incorporate landscaping to maximize passive solar heating during cool seasons, minimize solar heat gain during hot seasons, and enhance natural ventilation. Design buildings to take advantage of sunlight.	Utilization of passive solar design features in new development is an option available through LSAG and would be considered under any of the SPAS alternatives.
Install light colored "cool" roofs and cool pavements.	LSAG includes provisions for "heat island" reduction including the use of cool roofs as an option available under all of the SPAS alternatives.

23 State of California, Governor's Office of Planning and Research, Technical Advisory - CEQA and Climate Change Addressing Climate Change Through California Environmental Quality Act (CEQA) Review, Attachment 3, June 19, 2008.

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
Install efficient lighting, (including LEDs) for traffic, street, and other outdoor lighting.	As indicated above, the use of energy efficient lighting is standard practice by LAWA and would also occur in meeting the energy conservation requirements of the Green Building Ordinance, which would be applicable to all of the SPAS alternatives. With regard to traffic lights, LAWA and LADOT install LEDs for any major upgrades to existing signals or addition of new signals, which would also be the case with all of the SPAS alternatives.
Reduce unnecessary outdoor lighting.	Development of improvements involving outdoor lighting under any of the SPAS alternatives is anticipated to avoid any unnecessary lighting, as a means to help achieve the energy conservation requirements of the Green Building Ordinance.
Provide education on energy efficiency to residents, customers, and/or tenants.	Provisions for education of LAWA contractors, suppliers, tenants, and the community relative to the benefits of sustainability measures are included in the LSAG, which would apply to all of the SPAS alternatives.
Renewable Energy and Energy Storage	
Meet "reach" goals for building energy efficiency and renewable energy use.	While the ability to achieve "zero net energy" buildings in conjunction with any of the SPAS alternatives is uncertain, the energy efficiency and conservation provisions of Green Building Ordinance would support progress towards such a goal.
Install solar, wind, and geothermal power systems and solar hot water heaters.	Based on land constraints and airfield safety considerations, it is generally infeasible to install alternative energy systems at the airport. LAWA is, however, committed to, and a participant in, LADWP's "Green Power for LA" program, which promotes the use of green power provided through LADWP.
Install solar panels on unused roof and ground space and over carports and parking areas.	As noted above, land constraints and airfield safety considerations limit the opportunities for solar panels at the airport.
Where solar systems cannot feasibly be incorporated into the project at the outset, build "solar ready" structures.	Please see above.
Incorporate wind and solar energy systems into agricultural projects where appropriate.	Not applicable
Include energy storage where appropriate to optimize renewable energy generation systems and avoid peak energy use.	Although separate from SPAS, the LAX Central Utility Plant (CUP) Replacement Project, currently under construction, includes a thermal energy storage system (i.e., large tank below grade to store cooled water, which can reduce needs during peak energy use periods). The new CUP will help provide for the heating and cooling needs of the terminal improvements associated with all of the SPAS alternatives, except Alternative 4, which does not include terminal improvements.
Use on-site generated biogas, including CH_4, in appropriate applications.	Not applicable.

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
Use combined heat and power (CHP) in appropriate applications.	The CUP Replacement Project, described above, also includes cogeneration for the production of electricity from heat generated during the production of steam.
Water Conservation and Efficiency	
Incorporate water-reducing features into building and landscape design.	Provisions for incorporating water-reducing features into building and landscape design are included in the Green Building Ordinance, which would be applicable to all of the SPAS alternatives.
Create water-efficient landscapes.	Please see above.
Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and use water-efficient irrigation methods.	Please see above.
Make effective use of graywater. (Graywater is untreated household wastewater from bathtubs, showers, bathroom wash basins, and water from clothes washing machines. Graywater to be used for landscape irrigation.)	Not applicable; generation of such graywater from the types of uses associated with the SPAS alternatives would be negligible.
Implement low-impact development practices that maintain the existing hydrology of the site to manage storm water and protect the environment.	All of the SPAS alternatives would comply with the City's Low Impact Development (LID) Ordinance requirements, as applicable.
Devise a comprehensive water conservation strategy appropriate for the project and location.	As indicated above, the Green Building Ordinance includes provisions for water conservation, which would be applicable to all of the SPAS alternatives.
Design buildings to be water-efficient. Install water-efficient fixtures and appliances.	Please see above.
Offset water demand from new projects so that there is no net increase in water use.	Please see above.
Provide education about water conservation and available programs and incentives.	Provisions for education of LAWA contractors, suppliers, tenants, and the community relative to the benefits of sustainability measures, which water conservation is an element, are included in the LSAG.
Solid Waste Measures	
Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).	The Green Building Ordinance includes provisions for waste reduction and management, including, but not limited to, reuse and recycling of construction and demolition waste, which would be applicable to all of the SPAS alternatives.
Integrate reuse and recycling into residential, industrial, institutional, and commercial projects.	In addition to the requirements of the Green Building Ordinance, LAWA has a comprehensive facility-wide solid waste diversion/recycling program at LAX. That program is described in Section 4.13.2, *Solid Waste*, of this EIR and would be applicable to all of the SPAS alternatives.
Provide easy and convenient recycling opportunities for residents, the public, and tenant businesses.	Please see above.

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
Provide education and publicity about reducing waste and available recycling services.	Please see above.
Land Use Measures	
Ensure consistency with "smart growth" principles - mixed-use, infill, and higher-density projects that provide alternatives to individual vehicle travel and promote the efficient delivery of services and goods.	Not applicable.
Meet recognized "smart growth" benchmarks.	Not applicable.
Educate the public about the many benefits of well-designed, higher density development.	Not applicable.
Incorporate public transit into the project's design.	Transit bus stops/connections for several municipalities are currently provided at LAX, in addition to the LAWA shuttle system between the CTA and the existing Metro Green Line Station. With the exception of Alternative 4, all of the SPAS alternatives include facilities that can improve and encourage transit use at the airport, such as the Intermodal Transportation Facility (ITF) (Alternatives 1, 2, 8, and 9), the Ground Transportation Center (GTC) and Intermodal Transportation Center (ITC) (Alternative 3), and the elevated/dedicated busway or Automated People Mover (APM) that would connect the CTA to the ITF and the future LAX/Crenshaw Metro Light Rail Station (Alternatives 1, 2, 8, and 9).
Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.	Not applicable.
Develop "brownfields" and other underused or defunct properties near existing public transportation and jobs.	Not applicable.
Include pedestrian and bicycle facilities within projects and ensure that existing non-motorized routes are maintained and enhanced.	The improvements proposed under all of the SPAS alternatives would include provisions for pedestrian and bicycle facilities, as appropriate.
Transportation and Motor Vehicles	
Meet an identified transportation-related benchmark.	As noted above, all of the SPAS alternatives, except for Alternative 4, include improvements that can improve and encourage transit use at the airport. The success of these and other such measures can help reduce vehicle miles traveled (VMT). Reduction of VMT is a GHG reduction strategy recognized in the California Energy Commission's 2007 Staff Report *The Role of Land Use in Meeting California's Energy and Climate Change Goals*.
Adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation.	While LAWA could develop and implement a parking policy that discourages private vehicles use, such ability would be limited to only those facilities controlled by LAWA. It is likely that the effect of such restrictions would be substantially diminished by the availability of many other privately-owned/operated parking facilities near the airport.
Build or fund a major transit stop within or near the development.	Please see the transit discussion in Land Use Measures above.

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
Provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers.	LAWA has a comprehensive rideshare and vanpool program available to all employees. LAWA's Rideshare Program offers financial incentives and discounts to participating employees. This program would continue agency-wide and is not particular to any specific SPAS alternative.
Promote "least polluting" ways to connect people and goods to their destinations.	Please see measures above regarding transit.
Incorporate bicycle lanes, routes, and facilities into street systems, new subdivisions, and large developments.	The improvements proposed under all of the SPAS alternatives would include provisions for bicycle facilities, as appropriate.
Require amenities for non-motorized transportation, such as secure and convenient bicycle parking.	Please see above.
Ensure that the project enhances, and does not disrupt or create barriers to, non-motorized transportation.	Please see measures above regarding facilities that would improve and enhance transit access.
Connect parks and open space through shared pedestrian/bike paths and trails to encourage walking and bicycling. Create bicycle lanes and walking paths directed to the location of schools, parks, and other destination points.	Not applicable.
Work with the school districts to improve pedestrian and bicycle access to schools and to restore or expand school bus service using lower-emitting vehicles.	Not applicable.
Institute teleconferencing, telecommute, and/or flexible work hour programs to reduce unnecessary employee transportation.	LAWA offers flexible work hour programs to employees, which would continue agency-wide and is not particular to any specific SPAS alternative.
Provide information on alternative transportation options for consumers, residents, tenants, and employees to reduce transportation-related emissions.	It is anticipated that the facilities described above relative to improving transit access at LAX would be reflected in the routes, schedules, and other information available from the affected transit agencies.
Educate consumers, residents, tenants, and the public about options for reducing motor vehicle-related GHG emissions. Include information on trip reduction; trip linking; vehicle performance and efficiency (e.g., keeping tires inflated); and low or zero-emission vehicles.	Beyond scope of project.
Purchase, or create incentives for purchasing, low or zero-emission vehicles.	The majority of LAWA's vehicle fleet is comprised of low-emission vehicles, and LAWA continues to increase that percentage. LAWA would continue that program agency-wide, which is not particular to any specific SPAS alternative.
Create a ridesharing program. Promote existing ridesharing programs e.g., by designating a certain percentage of parking spaces for ridesharing vehicles, designating adequate passenger loading and unloading for ridesharing vehicles, and providing a website or message board for coordinating rides.	Please see above regarding LAWA's existing ridesharing program.
Create or accommodate car sharing programs, e.g., provide parking spaces for car share vehicles at convenient locations accessible by public transportation.	LAWA would consider, and incorporate if feasible, this measure in the design of the transportation facilities associated with Alternatives 1, 2, 3, 8, and 9 (i.e., ITF,

Table SRA-2.3.6-3

Evaluation of Potential GHG Mitigation Measures from the California Office of the Attorney General

Measure	Discussion
	GTC, and ITC).
Provide a vanpool for employees.	Please see above regarding LAWA's existing vanpool program.
Create local "light vehicle" networks, such as neighborhood electric vehicle systems.	Not applicable.
Enforce and follow idling time limits for commercial vehicles, including delivery and construction vehicles.	The LAX Master Plan MMRP and state law include provisions to limit construction vehicle idling, which would apply to all of the SPAS alternatives.
Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles.	Electric vehicle charging stations are available to the public near Parking Structure 1 within the CTA. Such facilities would continue to be available and possibly expanded, if/as feasible, in conjunction with all of the SPAS alternatives. Additionally, aircraft gate improvements associated with concourse modifications or additions under any of the SPAS alternatives, except for Alternative 4 which does not include such improvements, would accommodate electric ground support equipment (eGSE) charging stations.
Require best management practices in agriculture and animal operations to reduce emissions, conserve energy and water, and utilize alternative energy sources, including biogas, wind, and solar.	Not applicable.
Preserve forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas, and other open space that provide carbon sequestration benefits.	Not applicable.
Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance.	The incorporation of trees and other landscaping into development plans for all of the SPAS alternatives will be considered, giving due consideration to federal requirements and guidelines related to airport safety (i.e., avoid/discourage bird attractants which may increase risk of birdstrike incidents).

Table SRA-2.3.6-4

Evaluation of Potential GHG Reduction Measures from the Governor's Office of Planning and Research

Measure	Discussion
Land Use and Transportation	
Implement land use strategies to encourage jobs/housing proximity, promote transit-oriented development, and encourage high-density development along transit corridors. Encourage compact, mixed-use projects, forming urban villages designed to maximize affordable housing and encourage walking, bicycling, and use of public transit systems.	Not applicable.
Encourage infill, redevelopment, and higher-density development, whether in incorporated or unincorporated settings.	Not applicable.
Encourage new developments to integrate housing, civic, and retail amenities (jobs, schools, parks, and shopping opportunities) to help reduce VMT resulting from discretionary automobile trips.	Not applicable.
Apply advanced technology systems and management strategies to improve operational efficiency of transportation systems and movement of people, goods, and services.	All of the SPAS alternatives include ground transportation improvements designed to improve operational efficiency of transportation systems and movement of people.
Incorporate features into project design that would accommodate the supply of frequent, reliable, and convenient public transit.	Transit bus stops/connections for several municipalities are currently provided at LAX, in addition to the LAWA shuttle system between the CTA and the existing Metro Green Line Station. With the exception of Alternative 4, all of the SPAS alternatives include facilities that can improve and encourage transit use at the airport, such as the ITF (Alternatives 1, 2, 8, and 9), the GTC and ITC (Alternative 3), and the elevated/dedicated busway or APM that would connect the CTA to the ITF and the future LAX/Crenshaw Metro Light Rail Station (Alternatives 1, 2, 8, and 9).
Implement street improvements that are designed to relieve pressure on a region's most congested roadways and intersections.	Beyond the scope/control of the project.
Limit idling time for commercial vehicles, including delivery and construction vehicles.	The LAX Master Plan MMRP and state law include provisions to limit construction vehicle idling, which would apply to all of the SPAS alternatives.
Urban Forestry	
Plant trees and vegetation near structures to shade buildings and reduce energy requirements for heating/cooling.	The incorporation of trees and other landscaping into development plans for all of the SPAS alternatives will be considered, giving due consideration to federal requirements and guidelines related to airport safety (i.e., avoid/discourage bird attractants which may increase risk of birdstrike incidents).
Preserve or replace on-site trees (that are removed due to development) as a means of providing carbon storage.	Please see above regarding the planting of trees at the airport. Removal of existing mature trees due to development of any of the SPAS alternatives could be replaced off-site.
Green Buildings	
Encourage public and private construction of LEED®-certified (or equivalent) buildings.	LAWA requires new terminal facilities to achieve LEED® Silver certification.[1]

Table SRA-2.3.6-4

Evaluation of Potential GHG Reduction Measures from the Governor's Office of Planning and Research

Measure	Discussion
Energy Conservation Policies and Actions	
Recognize and promote energy saving measures beyond Title 24 requirements for residential and commercial projects.	The Green Building Code requires a project to exceed CEC 2008 Energy Efficiency Standards by 15 percent. All of the SPAS alternatives would be subject to the requirements of the Green Building Code.
Where feasible, include in new buildings facilities to support the use of low/zero carbon fueled vehicles, such as charging of electric vehicles from green electricity sources.	Electric vehicle charging stations are available to the public near Parking Structure 1 within the CTA. Such facilities would continue to be available and possibly expanded, if/as feasible, in conjunction with all of the SPAS alternatives. Additionally, aircraft gate improvements associated with concourse modifications or additions under any of the SPAS alternatives, except for Alternative 4 which does not include such improvements, would accommodate eGSE charging stations.
Educate the public, schools, other jurisdictions, professional associations, business, and industry about reducing GHG emissions.	Provisions for education of LAWA contractors, suppliers, tenants, and the community relative to the benefits of sustainability measures are included in the LSAG, which would apply to all of the SPAS alternatives.
Replace traffic lights, street lights, and other electrical uses to energy efficient bulbs and appliances.	The use of energy efficient lighting is standard practice by LAWA and would also occur in meeting the energy conservation requirements of the Green Building Ordinance, which would be applicable to all of the SPAS alternatives. With regard to traffic lights, LAWA and LADOT install LEDs for any major upgrades to existing signals or addition of new signals, which would also be the case with all of the SPAS alternatives.
Purchase Energy Star equipment and appliances for public agency use.	The utilization of Energy Star equipment is required by the Green Building Ordinance, as would apply to all of the SPAS alternatives.
Incorporate on-site renewable energy production, including installation of photovoltaic cells or other options.	Although separate from SPAS, the LAX CUP Replacement Project, currently under construction, includes a thermal energy storage system (i.e., large tank below grade to store cooled water, which can reduce needs during peak energy use periods). It also includes cogeneration for the production of electricity from heat generated during the production of steam. The new CUP will help provide for the heating and cooling needs of the terminal improvements associated with all of the SPAS alternatives, except Alternative 4, which does not include terminal improvements.
Execute an Energy Savings Performance Contract with a private entity to retrofit public buildings. This type of contract allows the private entity to fund all energy improvements in exchange for a share of the energy savings over a period of time.	Beyond the scope/control of the project.
Design, build, and operate schools that meet the Collaborative for High Performance Schools best practices.	Beyond the scope/control of the project.
Retrofit municipal water and wastewater systems with energy efficient motors, pumps, and other equipment, and recover wastewater treatment methane for energy production.	LAX has water efficient computer controlled irrigation systems. Energy efficient utility systems, including water conservation, are reflected in the requirements of the Green

Table SRA-2.3.6-4

Evaluation of Potential GHG Reduction Measures from the Governor's Office of Planning and Research

Measure	Discussion
	Building Ordinance, as would apply to all of the SPAS alternatives.
Convert landfill gas into energy sources for use in fueling vehicles, operating equipment, and heating buildings.	Beyond the scope/control of the project.
Purchase government vehicles and buses that use alternative fuels or technology, such as electric hybrids, biodiesel, and ethanol. Where feasible, require fleet vehicles to be low-emission vehicles. Promote the use of these vehicles in the general community.	The majority of LAWA's vehicle fleet is comprised of low-emission vehicles, and LAWA continues to increase that percentage. LAWA would continue that program agency-wide, which is not particular to any specific SPAS alternative. Also, as noted above, electric vehicle charging stations are available to the public near Parking Structure 1 within the CTA. Such facilities would continue to be available and possibly expanded, if/as feasible, in conjunction with all of the SPAS alternatives. Additionally, aircraft gate improvements associated with concourse modifications or additions under any of the SPAS alternatives, except for Alternative 4 which does not include such improvements, would accommodate eGSE charging stations.
Offer government incentives to private businesses for developing buildings with energy and water efficient features and recycled materials. The incentives can include expedited plan checks and reduced permit fees.	Beyond the scope/control of the project.
Offer rebates and low-interest loans to residents that make energy-saving improvements on their homes.	Beyond the scope/control of the project.
Create bicycle lanes and walking paths directed to the location of schools, parks, and other destination points.	Beyond the scope/control of the project.
Programs to Reduce Vehicle Miles Traveled	
Offer government employees financial incentives to carpool, use public transportation, or use other modes of travel for daily commutes.	LAWA has a comprehensive rideshare and vanpool program available to all employees. LAWA's Rideshare Program offers financial incentives and discounts to participating employees. This program would continue agency-wide and is not particular to any specific SPAS alternative.
Encourage large businesses to develop commute trip reduction plans that encourage employees who commute alone to consider alternative transportation modes.	Please see above.
Develop shuttle systems around business district parking garages to reduce congestion and create shorter commutes.	Beyond the scope/control of the project.
Create an online ridesharing program that matches potential carpoolers immediately through email.	LAWA's Rideshare Program, noted above, uses RideMatch.info which provides one-stop ride-matching services to employees. This program would continue agency-wide and is not particular to any specific SPAS alternative.
Develop a Safe Routes to School Program that allows and promotes bicycling and walking to school.	Beyond the scope/control of the project.

Table SRA-2.3.6-4

Evaluation of Potential GHG Reduction Measures from the Governor's Office of Planning and Research

Measure	Discussion
Programs to Reduce Solid Waste	
Create incentives to increase recycling and reduce generation of solid waste by residential users.	Beyond the scope/control of the project.
Implement a Construction and Demolition Waste Recycling Ordinance to reduce the solid waste created by new development.	LSAG includes provisions for waste reduction and management, including, but not limited to, reuse and recycling of construction and demolition waste, which would be applicable to all of the SPAS alternatives.
Add residential/commercial food waste collection to existing greenwaste collection programs.	LAWA has an ongoing waste reduction program.

[1] Los Angeles World Airports, Sustainability Report, June 2010.

Source: CDM Smith, 2012.

2.3.6.3 Level of Significance After Mitigation

Continued implementation of LAWA's existing practices and programs that promote sustainability and reduction in GHG emissions, along with compliance with the City of Los Angeles Green Building Ordinance, would help reduce GHG emissions associated with the LAWA Staff-Recommended Alternative; however, the GHG emissions associated with the LAWA Staff-Recommended Alternative would remain significant and unavoidable.

2.3.7 Hazards/Hazardous Materials

2.3.7.1 Human Health Risk Assessment

2.3.7.1.1 Impacts Analysis

As noted in Sections 2.3 and 2.3.1.1, emissions of toxic air contaminants (TAC) associated with the airfield/terminal components of Alternative 1 were combined with the TAC emissions associated with the ground access components of Alternative 9 to obtain TAC emissions associated with the LAWA Staff-Recommended Alternative. Risk calculations were then performed for these combined TAC emissions to identify human health risks.

This section describes incremental health impacts associated with inhalation of TAC released during construction and during airport operations following implementation of the LAWA Staff-Recommended Alternative. Environmental consequences considered in this analysis include cancer risks, chronic (long-term) non-cancer health hazards, and acute (short-term) non-cancer health hazards. Health impacts for on-airport workers from inhalation of TAC are also considered.

The discussion of TAC concentrations in air and associated health impacts focuses on MEI. A review of previous health risk assessments conducted for LAX projects[24,25] indicate that maximum TAC concentrations associated with LAX activities occur at the airport fence-line, and the concentrations decrease as one moves away from the airport. For this analysis, MEI were conservatively identified as individuals that work, reside, or attend school at the LAX fence-line. Since no such individuals currently work, reside, or attend school at the LAX fence-line, estimates of risk and hazard overestimate health risk that may actually accrue as a result of implementation of the LAWA Staff-Recommended Alternative. No exposures or risks within the community would be higher than those calculated for MEI, and the HHRA is protective for all people within the study area. Risks and hazard estimates evaluate incremental risk associated with releases of TAC from construction and operational activities (aircraft operations, on-site mobile sources, and off-site regional traffic). The baseline year for evaluating incremental impacts is 2009, which is representative of 2010 conditions. The horizon year for buildout of the LAWA Staff-Recommended Alternative for purposes of analysis is 2025.

Cancer risk and non-cancer health hazards are based on combined emission rates estimated for construction and airport operations after buildout of the LAWA Staff-Recommended Alternative, and on basic exposure assumptions used in the HHRA for the LAX Master Plan EIR, as revised to be consistent with recent USEPA and CalEPA guidance.[26,27] Cancer risks and non-cancer health hazards for MEI were calculated for adult residents, child residents 0 to 6 years of age, adult workers, and elementary-aged school children near or at fence-line locations where air concentrations for TAC were predicted. The discussion of human health risk emphasizes results for adult residents for cancer risks and for child residents for chronic non-cancer health hazards because these populations are expected to incur the greatest exposures to LAX-related emissions and would hence be subject to the greatest risks and hazards. For the acute non-cancer health hazard impact analysis, receptors were assumed to be located at grid points near or at the fence-line.

Methods used in the HHRA are protective and are more likely to overestimate than underestimate possible health risks. For example, as noted above, risks were calculated for residents and school children for locations near or at the LAX fence-line where TAC concentrations are predicted to be highest. Individuals are assumed to be exposed for almost all days of the year and for many years (e.g., 70 years for adult residents) to maximize estimates of exposure. Resulting incremental risk estimates are therefore upper-bound or ceiling predictions for people living, working, or attending school in the study area. If these upper-bound estimates do not exceed significance thresholds, then actual members of the population near LAX would also not experience risks or hazards that exceed these thresholds.

Calculations supporting the results presented in the following sections are provided in Attachment 1 of Part II of this Final EIR.

2.3.7.1.1.1 Cancer Risks

Peak SPAS-related cancer risks for the LAWA Staff-Recommended Alternative are summarized in **Table SRA-2.3.7.1-1** and shown in **Figure SRA-2.3.7.1-1**. Peak incremental cancer risk locations are the locations with the smallest negative increments (i.e., where beneficial impacts would be smallest). These locations are used to determine the significance of project impacts. However, these locations are not

27 California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, August 2003, Available:
http://oehha.ca.gov/air/hot_spots/pdf/HRAguidefinal.pdf

necessarily the locations where cancer risks are highest (i.e., MEI) under either baseline conditions or conditions with implementation of the LAWA Staff-Recommended Alternative. Rather, MEI are identified as being at locations where DPM concentrations and, consequently, cancer risks are highest. At MEI locations, beneficial impacts are substantial - that is, incremental cancer risks are more negative than they are at most other locations along the LAX fence-line. Both peak incremental cancer risk locations and MEI locations are identified in **Figure SRA-2.3.7.1-1**.

Table SRA-2.3.7.1-1

Peak Incremental Cancer Risks for the LAWA Staff-Recommended Alternative

Receptor Type	Incremental Cancer Risks[1,2,3,4] (per million people)
Child Resident	-0.71
School Child	-0.14
Adult Resident	-8.3
Adult Worker	-4.8

Notes:

Peak incremental cancer risk locations are the locations with the smallest negative increments (i.e., where beneficial impacts would be smallest). These locations are used to determine the significance of project impacts.

1 Values provided are calculated using RAGS F methodology.
2 Incremental values indicate changes in the number of cancer cases per million people exposed as compared to baseline conditions. Estimates are rounded to two significant figures.
3 Negative values indicate a beneficial impact.
4 Maximum values indicated are not all located at the same grid location.

Source: CDM Smith, 2012.

As indicated in **Table SRA-2.3.7.1-1**, emissions from construction and operational activities for the LAWA Staff-Recommended Alternative would result in peak incremental cancer risks of -8 in one million for adult residents and -0.7 in one million for child residents. Peak incremental cancer risks for school children at the peak residential location and for adult workers are estimated to be -0.1 in one million and -5 in one million, respectively. These risk estimates are based on modeling that incorporates select quantifiable mitigation measures from the LAX Master Plan MMRP (see Section 4.7.1.5 of the SPAS Draft EIR), but otherwise assumes no additional mitigation. The incremental cancer risks for the adult resident and adult worker at the location for MEI are -467 in one million and -166 in one million, respectively.

The negative values indicate that, relative to baseline conditions in 2009, some TAC concentrations at the LAX fence-line and in the study area would decrease after implementing the LAWA Staff-Recommended Alternative. In most cases, these negative values are due primarily to reductions in emissions from on-road motor vehicles (cars and trucks carrying passengers and cargo to and from the airport). As emission standards for motor vehicles continue to become more stringent over time, and the motor vehicle fleet is replaced with newer, less-polluting cars and trucks, the daily emissions from these sources decrease substantially when compared to baseline (2009) conditions. The reduction in motor vehicle emissions occurs even though the total VMT for airport-related trips increases between the baseline (2009) period and 2025. This emissions reduction more than compensates for the growth in emissions from aircraft and APUs. Concentrations of DPM in air are anticipated to decrease, even considering releases of DPM during the construction phase (i.e., the increase in DPM emissions during construction would be less than the decrease in DPM emissions during operations). Since DPM is responsible for most of the cancer risk associated with emissions from LAX, a reduction in DPM results in an overall reduction in cancer risk.

Since all risks are reported as incremental with respect to 2009 baseline conditions, cancer risks are reported as negative values to indicate reduced cancer risk as compared to 2009 baseline conditions.[28]

For example, if a population of adult residents was exposed to TAC concentrations at the peak location for 70 years after complete buildout of the LAWA Staff-Recommended Alternative, approximately 8 fewer cancer cases per million people exposed might occur as a result of changes to airport operations. Thus, for this receptor under the LAWA Staff-Recommended Alternative, a beneficial impact is predicted. Note that incremental risks reported in this HHRA do not consider the background cancer incidence in the United States, which is reported to be in the range of 1 in 3 to 1 in 2. Cancer risk reduction would therefore be realized against a very high background incidence.

Adult residents, for whom it is assumed exposure starts at birth and continues for 70 years, would have a greater change in incremental cancer risk than would children because of the long exposure. Emphasis is therefore placed on adults for purposes of determining significance. Changes in incremental cancer risks for children are not used since predicted cancer risks at a given location are less overall for children than are risks for adults. Information on childhood risks is provided to demonstrate the range of risk reduction for this alternative.

Exposure to DPM released during construction and airport operations contributed 86 percent of cancer risks for residents (adults and children) and school children, and 95 percent of cancer risks for adult workers. DPM concentrations in air in the study area are anticipated to be less for the LAWA Staff-Recommended Alternative than for 2009 baseline conditions. Unlike DPM, formaldehyde and 1,3-butadiene concentrations increased and incremental cancer risks considered individually for these TAC also increased. However, relatively small increases in risks from exposure to these TAC were more than offset by substantial decreases in DPM-related risks anticipated in 2025.

These estimates show that program-related cancer risks for all evaluated receptors (residential adults, residential children, school children, and adult workers) are predicted to be below the threshold of significance of 10 in one million for the LAWA Staff-Recommended Alternative and are expected to result in decreases in cancer risks due to anticipated decreases in DPM emissions. Therefore, cancer risk impacts to human health under the LAWA Staff-Recommended Alternative would be less than significant and would be beneficial. As noted above, these beneficial impacts are primarily due to ongoing implementation of more stringent motor vehicle emissions standards, cleaner future fleet mixes, and the decrease in stationary source emissions attributable to the replacement CUP, currently under construction. These reductions in future emissions, particularly those associated with future motor vehicle emissions, are anticipated to more than offset the estimated increases in other types of emissions, such as from aircraft, APU, and GSE.

[28] Incremental cancer risk estimates in most of the study area suggest smaller absolute decreases as compared to MEI estimates. In these locations, TAC concentrations are lower than they are at locations for MEI and risk reductions are generally similar on a percent of total (as opposed to incremental) cancer risk. As a hypothetical example, if total cancer risks at two locations were 8 and 4 x 10^{-6}, incremental cancer risks might be -2 and -1 x 10^{-6}. Note, however, that the decrease in DPM at all grid nodes in the study area is not uniform because differences in source locations and source strength between 2009 baseline conditions and the LAWA Staff-Recommended Alternative result in somewhat different distribution of TAC in dispersion model output. Thus, the best illustration of possible beneficial impacts comes from the analysis of incremental cancer risks on a grid node-by-grid node basis.

2.3.7.1.1.2 Chronic Non-Cancer Health Hazards

Acrolein and formaldehyde are the primary TAC of concern in emissions from LAX with respect to chronic non-cancer health hazards. Acrolein is responsible for the majority of predicted chronic non-cancer health hazards associated with LAX SPAS operations under the LAWA Staff-Recommended Alternative and is primarily associated with aircraft emissions. (For a detailed discussion of uncertainties regarding the presence of acrolein in aircraft emissions, see Section 7.3 of Technical Report S-9a of the LAX Master Plan Final EIR.) Primary sources of formaldehyde are emissions from gasoline and diesel powered equipment.

SPAS-related chronic non-cancer hazard indices for MEI for operational impacts under the LAWA Staff-Recommended Alternative are summarized in **Table SRA-2.3.7.1-2** and shown in **Figure SRA-2.3.7.1-2**. Chronic non-cancer hazard indices for adult residents and child residents are the same because RAGS, Part F methodology does not normalize hazard indices to body weight. For this reason, an adult+child resident receptor was not evaluated. An incremental hazard index equal to or greater than 1, the threshold of significance for chronic non-cancer effects, indicates some potential for adverse chronic non-cancer health effects. A hazard index less than 1 suggests that adverse chronic non-cancer health effects are not expected.

Table SRA-2.3.7.1-2

Peak Incremental Chronic Non-Cancer Health Hazards for Maximally Exposed Individuals for the LAWA Staff-Recommended Alternative

Receptor Type	Incremental Chronic Non-Cancer Hazards[1,2,3]
Child Resident	0.47
School Child	0.09
Adult Resident	0.47
Adult Worker	0.13

Notes:

Peak incremental chronic non-cancer health hazard locations are the locations with the greatest increment (i.e., where hazard impacts would be highest). These locations are used to determine the significance of project impacts.

1 Values provided are calculated using RAGS Part F methodology.
2 Incremental values indicate change as compared to baseline conditions. Estimates are rounded to two significant figures.
3 Maximum values indicated are not all located at the same grid location.

Source: CDM Smith, 2012.

SPAS-related chronic non-cancer health hazard indices for chemicals affecting the same target (i.e., the respiratory system) for the LAWA Staff-Recommended Alternative after full buildout are below the threshold of significance (HI of 1) for all receptor types. Incremental hazard indices are estimated to be 0.5 for both adult and child residents living at the peak hazard residential location, 0.09 for school children, and 0.1 for adult workers working at the peak hazard commercial location. These risk estimates are based on modeling that incorporates select quantifiable mitigation measures from the LAX Master Plan MMRP (see Section 4.7.1.5 of the SPAS Draft EIR), but otherwise assumes no additional mitigation.

Hazard indices are primarily driven by release of acrolein in aircraft emissions. Acrolein at the peak hazard location contributes 78 percent to total hazard indices for residential receptors and school child receptors and formaldehyde contributes 15 percent. For the adult worker, the contributions are slightly

less, 74 percent from acrolein and 14 percent from formaldehyde. Similar to incremental cancer risks, decreases in modeled concentrations of some TAC, in this case DPM and chlorine, result in negative hazard indices that reduce the overall hazard index. However, although beneficial impacts attributable to decreases in modeled concentrations of DPM and chlorine offset the impacts attributable to increases in modeled concentrations of acrolein, overall total hazard indices are still positive (unlike cancer risks, where overall impact is negative (beneficial)). DPM contributes 5 percent to the total hazard indices for residential and school receptors, and 10 percent to the hazard index for the adult worker.

These estimates show that SPAS-related hazard indices for chemicals affecting the same target (i.e., the respiratory system) for all evaluated receptors (residential adults, residential children, school children, and adult workers) are predicted to be below the threshold of significance of 1 under the LAWA Staff-Recommended Alternative. Therefore, chronic non-cancer health hazard impacts under the LAWA Staff-Recommended Alternative would be less than significant.

2.3.7.1.1.3 Acute Non-Cancer Health Hazards

Acrolein and formaldehyde are the only TAC of concern in emissions from LAX that might be present at concentrations approaching the threshold for acute effects. Acrolein is responsible for the majority of all predicted acute non-cancer health hazards associated with LAX SPAS operations and is primarily associated with aircraft emissions. (For a detailed discussion of uncertainties regarding the presence of acrolein in aircraft emissions, see Section 7.3 of Technical Report S-9a of the LAX Master Plan Final EIR.) Acute exposures to acrolein may result in mild irritation of eyes and mucous membranes. Primary sources of formaldehyde are emissions from gasoline and diesel powered equipment. Acute effects for exposure to formaldehyde would typically include irritation to the eye and respiratory system and possibly adverse effects to the immune system. Maximum acute non-cancer health hazards associated with exposure to acrolein and formaldehyde from LAX SPAS operations under the LAWA Staff-Recommended Alternative are summarized in **Tables SRA-2.3.7.1-3** and **SRA-2.3.7.1-4**. **Figure SRA-2.3.7.1-3** shows the receptor locations with peak acrolein concentrations.

Acute non-cancer health hazards for TAC other than acrolein and formaldehyde are orders of magnitude below 1 and below the acute non-cancer health hazards estimated for short-term exposure to acrolein and formaldehyde. Potential acute non-cancer health hazard impacts resulting from other TAC and from combining TAC are discussed in the Uncertainties Section of Appendix G1, *Human Health Risk Assessment*. Acute results are provided in Attachment 1 of Part II of this Final EIR.

SPAS-related maximum acute hazard quotients for acrolein after buildout of the LAWA Staff-Recommended Alternative are estimated to be 3.0 for residents living at the peak hazard location, 1.2 for school children, 1.4 for recreational users, and 1.6 for off-site adult workers. 240 of 326 off-site grid nodes have incremental acute hazard quotients for acrolein of less than 1. Of the 86 grid nodes with incremental acute hazard quotients for acrolein greater than 1, only five of the grid nodes are greater than 2. These grid nodes are located north of Runway 6L/24R in the north airfield (grid nodes 66 to 70).

LAX Specific Plan Amendment Study Final EIR	**Geographic Representation of Operational Incremental Acute Non-Cancer Hazards from Acrolein by Receptor Type – LAWA Staff-Recommended Alternative**	Figure **SRA-2.3.7.1-3**

This page intentionally left blank.

The acute REL for acrolein has an uncertainty factor of 60.[29] This factor indicates a moderate uncertainty in the REL based on specific sources of variability not addressed in the toxicological studies, such as individual variation and interspecies differences. Although the maximum acute hazard quotient for acrolein after buildout of the LAWA Staff-Recommended Alternative is greater than 1, it should be noted that the acute REL is set at or below a level at which no adverse health impacts are expected for the majority of the population. Hence, it represents the tail-end of a distribution and not a specific "bright line" beyond which adverse effects are certain; instead any adverse acute non-cancer health effects (mucous membrane irritation) would be part of a complex probabilistic process. Although the maximum acute hazard quotient estimated as 3.0 is above the threshold of significance of 1, the value is still close to the threshold for acute effects, given the uncertainty in the toxicity factor, and may represent minimal actual acute non-cancer health hazards. Thus, an acute hazard quotient of 3.0 does not mean that adverse effects would definitely occur in the receptor population; rather, it indicates that such effects cannot be ruled out on the basis of current knowledge.

SPAS-related maximum acute hazard quotients for formaldehyde under the LAWA Staff-Recommended Alternative are estimated to be 0.6 for residents living at the peak hazard location, 0.2 for school children, 0.3 for recreational users, and 0.4 for off-site adult workers.

Because maximum acute hazard quotients for acrolein for all analyzed receptors (residents, recreational users, school child, and off-site adult workers are slightly above the threshold of significance of 1, acute non-cancer health hazard impacts under the LAWA Staff-Recommended Alternative would be significant.

2.3.7.1.1.4 Health Effects for On-Airport Workers

Effects on on-airport workers were evaluated by comparing estimated maximum 1-hour air concentrations of TAC for the LAWA Staff-Recommended Alternative to the CalOSHA 8-hour PEL-TWAs.[30] Estimated on-airport air concentrations and PEL-TWAs for TAC of concern for the LAWA Staff-Recommended Alternative are presented in **Table SRA-2.3.7.1-5**. All estimates are based on modeling that incorporates select quantifiable mitigation measures from the LAX Master Plan MMRP (see Section 4.7.1.5 of the SPAS Draft EIR), but makes no other assumptions regarding mitigation.

Estimated maximum 1-hour air concentrations at the on-airport grid point under LAWA Staff-Recommended Alternative are a few to several orders of magnitude below PELs for all TAC. As air concentrations from airport emissions with implementation LAWA Staff-Recommended Alternative would not exceed those considered "acceptable" by CalOSHA standards, health impacts to on-airport workers would be less than significant.

Table SRA-2.3.7.1-5

Comparison of CalOSHA Permissible Exposures Limits to Maximum Estimated 8-Hour On-Airport Air Concentrations for the LAWA Staff-Recommended Alternative

TAC[1]	CAL OSHA PEL-TWA (mg/m^3)[3]	On-Airport Air Concentrations (mg/m^3)[2]
acetaldehyde	45	0.011
acrolein	0.25	0.0051
Benzene	3.19	0.012
Formaldehyde	0.92	0.031
Methanol	260	0.0039
methyl ethyl ketone	590	0.00040
phenol	19	0.0015
styrene	215	0.0010

Table SRA-2.3.7.1-5

Comparison of CalOSHA Permissible Exposures Limits to Maximum Estimated 8-Hour On-Airport Air Concentrations for the LAWA Staff-Recommended Alternative

TAC[1]	CAL OSHA PEL-TWA (mg/m^3)[3]	On-Airport Air Concentrations (mg/m^3)[2]
toluene	37	0.016
m-xylene	NA[4]	0.0065
o-xylene	NA	0.0044
p-xylene	NA	0.0031
Xylene (total)	435	0.0141
arsenic	0.01	0.0000023
chlorine	1.5	0.00036
copper	1	0.000014
mercury	0.025	0.000014
nickel	0.5	0.000010
vanadium[5]	0.05	0.000013
sulfates	NA	0.009

1 All TAC that were modeled for hourly concentrations and for which PEL-TWAs are available. TAC PEL-TWAs are not available for diesel exhaust and sulfates. Further, air dispersion modeling was conducted only for TAC identified as of concern for cancer risks and chronic non-cancer health hazards. As a result, a few TAC that have PEL-TWAs are not listed in this table because modeled concentrations were not available. These TAC include: 1,3-butadiene, ethylbenzene, naphthalene, n-hexane, chromium +6, lead, and manganese. PEL-TWA comparisons for these TAC were addressed in the LAX Master Plan EIR, which indicated that none of these TAC would present an important acute non-cancer health hazard. Uncertainties in the PEL-TWA analysis are discussed in the uncertainties section in Appendix G1.

2 Values listed are maximum 1-hour concentrations at on-airport location, receptor location #327, which represents concentrations in the middle of the CTA. These values represent reasonable estimates of 8-hour concentrations on-airport.

3 California Occupational Safety and Health Administration, Permissible Exposure Limits for Chemical Contaminants, Table AC-1, 2008, Available: http://www.dir.ca.gov/title8/5155table_ac1.html, accessed June 21, 2012.

4 NA = Not Available

5 Value listed for vanadium is for vanadium pentoxide, the most common form of vanadium.

Sources: CDM Smith, 2012.

2.3.7.1.2 Mitigation Measures

LAWA is committed to mitigating emissions to the maximum extent feasible from construction activities, temporary changes in operations associated with construction of the LAWA Staff-Recommended Alternative, and long-term operational activities at LAX. A comprehensive mitigation program was developed as part of the LAX Master Plan Final EIR and the specific means for implementing the mitigation measures, described in Section 4.2.5 of the SPAS Draft EIR, would also be applied to the LAWA Staff-Recommended Alternative. Although developed to address air quality impacts, this program would also reduce impacts to human health associated with exposure to TAC. Because (1) this mitigation program establishes a commitment and process for incorporating all technically feasible air quality mitigation measures into each component of the LAWA Staff-Recommended Alternative as that element is constructed, and (2) cancer risks and chronic non-cancer health hazards are below levels of significance, and cumulative impacts are minor based on regional data (see Section 2.4.7.1 of this chapter), no mitigation measures to reduce impacts to human health specific to SPAS are required to address cancer risks and chronic non-cancer health hazards. Regarding acute non-cancer health hazard impacts, the comprehensive mitigation program developed as part of the LAX Master Plan Final EIR and the specific means for implementing the mitigation measures, described in Section 4.2.5 of the SPAS Draft EIR, in addition to the SPAS-specific mitigation measures identified in Section 4.2.7, provide the most comprehensive means of ensuring impacts will be reduced to the maximum extent feasible. At the programmatic level of this EIR, there are no additional feasible measures available to address acute non-cancer health hazard impacts, which would remain significant. In addition, LAWA's construction contract

specifications include requirements from the LAX Master Plan Community Benefits Agreement that serve to reduce construction equipment emissions, particularly those related to diesel emissions. Such measures include: reduce vehicle and equipment idling times, comply with Tier 4 emission standards for non-road diesel equipment, retrofit existing diesel equipment with particulate filters and oxidation catalysts, replace aging equipment with new low-emission models, consider the use of alternative fuels for construction equipment. These reductions in emissions would translate into reductions in risks and hazard impacts.

2.3.7.1.3 Level of Significance After Mitigation

LAX Master Plan mitigation measures and SPAS-specific mitigation measures would reduce TAC emissions associated with the LAWA Staff-Recommended Alternative. However, even with implementation of these measures, acute non-cancer health hazards at some fence-line receptors would exceed the threshold of significance under the LAWA Staff-Recommended Alternative, compared to 2009 baseline conditions. As such, acute non-cancer health hazard impacts under the LAWA Staff-Recommended Alternative are considered to be significant and unavoidable.

2.3.7.2 Safety

2.3.7.2.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on safety are only associated with the airfield components of Alternative 1, as evaluated in Section 4.7.2.6 of the SPAS Draft EIR, as the analysis of safety focuses on aviation safety.

Birdstrikes

Under the LAWA Staff-Recommended Alternative, the Dunes west of the airport, an existing bird attractant at LAX, would not be modified in any way that would increase its attractiveness to birds or otherwise increase birdstrike hazards. Improvements within the Dunes would be limited to the relocation of navigational aids; no water features, ornamental landscaping (including trees), or other facilities that may serve as attractants to birds, and therefore increase the potential for birdstrikes, would be installed/planted within the Dunes, In conjunction with the relocation of Runway 6L/24R 260 feet northward, the entire length of the Argo Drainage Channel would be structurally covered, removing an existing bird attractant from the LAX vicinity. In addition, the total undeveloped area within the airfield, a potential attractant to birds, would also be reduced as discussed in Section 2.3.3, *Biological Resources*, of this chapter. Given the smaller amount of open space available on the airfield for potential use by birds, there would likely be a related reduction in the potential for birdstrikes.

The LAWA Staff-Recommended Alternative would result in the extension of Runway 6R/24L and the extension and relocation of Runway 6L/24R in the north airfield; however, no runways would be located within 10,000 feet of a solid waste landfill. No new facilities would be constructed or operational conditions implemented that would serve as attractants to birds. In accordance with FAA requirements, the airfield would continue to be maintained to avoid the ponding of water, the growth of vegetation, and the development of other conditions that may serve as attractants to nuisance wildlife, including birds. Therefore, under the LAWA Staff-Recommended Alternative, impacts with respect to birdstrikes would be less than significant.

Aviation Accidents, Incidents, and Runway Incursions

Airspace Surfaces

Implementation of the LAWA Staff-Recommended Alternative would include relocating Runway 6L/24R 260 feet northward, extending it 604 feet westward, and establishing dual displaced landing thresholds. The northern relocation would shift the existing Part 77 "Transitional Surface" northward and the establishment of the displaced landing threshold at the east end of the runway (i.e., Runway 24R) would shift the existing Approach Surface westward (i.e., in conjunction with the westward extension of the

runway, the landing threshold would also move 604 feet westward, allowing the touchdown point for aircraft to occur farther down the runway than under current baseline conditions). The establishment of a displaced landing threshold at the west end of the runway (Runway 6L) would effectively require aircraft to land (touchdown) at the same location they do today even though the runway was extended on the west end by 604 feet. As such, there would be no shift in the existing Approach Surface for Runway 6L.

The northerly shift of the Part 77 Transitional Surface would result in the southern portion of the existing apartment complex near Westchester Parkway and Lincoln Boulevard extending into that imaginary surface.

The relocation of Runway 6L/24R under the LAWA Staff-Recommended Alternative would also shift the existing Approach Surface for Runway 24R northward, resulting in a penetration of that imaginary surface by the upper portion the existing 5-story office building located at the northwest corner of Sepulveda Boulevard and Westchester Parkway. In addition to the upper portion of the building, the rooftop utilities (i.e., air conditioning and mechanical equipment) and a rooftop billboard would also extend into the Approach Surface. The upper portions of that building and utilities are currently within the Part 77 Transitional Surface of Runway 6L/24R.

Upper portions of the existing multi-story parking structure located immediately south of the aforementioned office building, which currently penetrate the Part 77 Transitional Surface of Runway 6L/24R, may also fall within the runway Approach Surface as a result of the runway relocation proposed under the LAWA Staff-Recommended Alternative.

Part 77 imaginary surfaces provide a means of identifying objects that require a more detailed safety analysis. This analysis, performed by the FAA, considers the airspace operations and safety requirements applicable to the Part 77 surface, as well as the nature, location, and extent of the object's penetration into the Part 77 surface. The analysis requires detailed runway design and engineering data not available at this conceptual level of planning, and would occur during the normal course of FAA review and approval of proposed airfield improvements. The analysis would set forth and define the appropriate means and measures to address potential safety concerns related to objects located within the Part 77 surface. As described in Section 4.7.2.3 of the SPAS Draft EIR, options for addressing potential safety hazards associated with objects located within controlled airspace areas can range widely and can include (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification. Such measures would reduce this safety impact to a level that is less than significant. Secondary or indirect impacts associated with implementation of such options could range from no impact, such as in the case of low-risk objects that do not require any safety measures, to impacts typically associated with removal of an object/structure, such as temporary construction-related air quality, noise, and traffic impacts, visual impacts (i.e., changes in existing appearance), and land use impacts. Additional discussion and analysis of such secondary or indirect impacts is provided below at the end of the impacts analysis for the LAWA Staff-Recommended Alternative.

Airfield Surfaces

In conjunction with the northward relocation of Runway 6L/24R under the LAWA Staff-Recommended Alternative, construction of a centerfield parallel taxiway, along with associated exits and connections between the taxiway and two adjacent runways, would occur. Also occurring would be various extensions and realignments of Taxiway E and Taxilane D and the associated service road. The resultant runway and taxiway separation distances and allowances for various safety zone requirements (e.g., OFZ) would improve the ability of the north airfield to accommodate large aircraft including ADG V and ADG VI aircraft, compared to baseline conditions (2010). **Table SRA-2.3.7.2-1** delineates, for baseline conditions (2010) and each alternative, the maximum size aircraft, in terms of ADG, for which the

runways and parallel taxiways would meet FAA Airport Design Standards without needing approval of special operations restrictions, MOS, or waivers from FAA, unless otherwise noted in **Table SRA-2.3.7.2-1**.

As indicated in **Table SRA-2.3.7.2-1**, implementation of the LAWA Staff-Recommended Alternative would increase the separation distance between Runways 6L/24R and 6R/24L from 700 feet to 960 feet, but would not change the existing capabilities relative to allowing simultaneous arrivals and departures.

Under the LAWA Staff-Recommended Alternative, improvements to Taxiway E include straightening the western 2,190 feet and extending the east end by 950 feet (in conjunction with the easterly extension of Runway 6R/24L). Under the LAWA Staff-Recommended Alternative, improvements to Taxilane D would include extending it 745 feet west to provide a full-length taxilane and various segment relocations to straighten it and provide for ADG V capabilities. In conjunction with these taxiway/lane improvements, the adjacent vehicle service road would be relocated from between the active surface areas of those facilities to the northerly limit of the aircraft parking apron, south of Taxilane D. The improvements would enhance the accommodation of ADG IV, V, and VI aircraft on the north airfield.

The runway improvements proposed under the LAWA Staff-Recommended Alternative would modify several existing safety areas such as the RSA, runway OFA, RPZ, and runway OFZ. **Figure SRA-2.3.7.2-1** shows the runway safety areas associated with the LAWA Staff-Recommended Alternative. For Runway 6L/24R, the 260-foot northerly relocation would shift the runway safety areas accordingly, which, in turn, would require the realignment of Lincoln Boulevard, as shown in **Figure SRA-2.3.7.2-1**, and the covering of the Argo Drainage Channel. The combination of the runway improvements, associated improvements to Lincoln Boulevard and the Argo Drainage Channel, and establishment of displaced thresholds would bring all RSAs for the north airfield into compliance with FAA standards.

The proposed relocation of Runway 6L/24R 260 feet northward would shift the associated RPZ northward by that same amount, which would extend over existing developed uses near the east end of the runway that are not currently within the existing RPZ. **Figure SRA-2.3.7.2-2** delineates the location and current use of parcels within the RPZs associated with the LAWA Staff-Recommended Alternative and **Table SRA-2.3.7.2-2** summarizes the affected land uses. Although the RPZs would shift northward, the establishment of dual displaced landing thresholds would shift the existing approach RPZ for Runway 6L eastward by 104 feet and would shift the existing approach RPZ for Runway 24R westward by 604 feet. That westward shift would place the RPZ outside of any existing residential development (i.e., residences located east of Runway 24R would no longer be within the RPZ). Similarly, the establishment of dual displaced thresholds for Runway 6R/24L would maintain the length of the existing RPZ for Runway 24L even though the runway pavement would be extended eastward.

Table SRA-2.3.7.2-1

Summary of North Airfield Runways and Parallel Taxiways Compliance with FAA Airport Design Standards - LAWA Staff-Recommended Alternative

	Baseline Conditions (2010)	SRA
Maximum Aircraft Size (ADG Size) on Runways[1]		
Runway-to-Runway Separation		
Distance Between Rwy 6L/24R and Rwy 6R/24L	700 feet	960 feet
Simultaneous Arrivals and Departures		
In Visual Meteorological Conditions	Yes	Yes
In Instrument Meteorological Conditions	No	No
Runway-to-Taxiway Separation		
Distance Between Rwy 6L/24R and Centerfield Parallel Taxiway	NA[5]	500 feet
Good Weather - Maximum ADG Allowed On Runway 6L/24R[2]	NA[5]	VI[3]
Poor Weather - Maximum ADG Allowed On Runway 6L/24R[4]	NA[5]	V
Distance Between Rwy 6R/24L and Centerfield Parallel Taxiway/Taxiway E (Centerfield Taxiway/Taxiway E)	NA[5]/400 feet	460/400 feet
Good Weather - Maximum ADG Allowed On Runway 6R/24L[3]	VI[6]	V[8]
Poor Weather - Maximum ADG Allowed On Runway 6R/24L (Departures Only)[6]	VI[7]	V[8]
Maximum Aircraft Size (ADG Size) on Taxiways/lanes[1]		
Centerfield Parallel Taxiway - Maximum ADG Size Allowed (Distance between Runway 6L/24R and Runway 6R/24L)	NA[5]	500/460 feet
Good Weather[2]	NA[5]	V
Poor Weather[3]	NA[5]	V
Taxiway E - Maximum ADG Size Allowed	VI[7]	VI[9]
Taxilane D - Maximum ADG Size Allowed	III/VI[10]	V[11]

1 "Maximum ADG Allowed" defined as the largest aircraft, in terms of Aircraft Design Group (ADG), for which the subject runway or taxiway/lane meets FAA's Airport Design Standards without needing approval of special operations restrictions, modifications of standards (MOS), or waivers from FAA.

2 Good Weather = Approach visibility not lower than 1/2 mile.

3 Although separation meets standards for approach visibility above 1/2 mile, an MOS will be required because the runway is certified for approach visibility below 1/2 mile.

4 Poor Weather = Approach visibility below 1/2 mile; assumes Runway 6L/24R retains approach visibility minimums less than 1/2 mile.

5 No centerfield taxiway under this scenario.

6 Runway 6R/24L is designed to accommodate approaches when visibility is at or above 1/2 mile; departures may operate but no landings are permitted when approach visibility is below 1/2 mile.

7 Approved MOS allows ADG VI operations based on 400-foot separation.

8 Approved MOS allowing ADG VI operations based on 400-foot separation is applicable only to Taxiway E; assumes 460-foot separation between Runway 6R/24L and centerfield taxiway is controlling dimension dictating Maximum ADG size allowed.

9 Approved MOS allows ADG VI operations based on 400-foot separation and is assumed extension to east and/or realignment to west will not affect current MOS status.

10 Taxilane D currently exists in only the eastern half of the north airfield and, due to variations in its alignment and nearby obstructions, ADG design compliance ranges from ADG III in the eastern portion to ADG IV in most of the western portion, and ADG VI between Taxiways R and S.

11 New ADG capability would apply consistently along entire length of taxilane, including the western extension under this alternative, which would create a full length taxiway.

Source: U.S. Department of Transportation, Federal Aviation Administration, Advisory Circular 150/5300-13, Airport Design, September 29, 1989, as amended by Changes 1 - 18, December 30, 2011; LAWA Environmental Services Division, April 2011; Ricondo & Associates, Inc., May 2012.

Implementation of the LAWA Staff-Recommended Alternative would result in a change in the composition of land uses within the RPZ for Runway 6L/24R compared to baseline conditions. The presence of such uses under the LAWA Staff-Recommended Alternative may be considered incompatible with FAA design recommendations that RPZ areas be clear of all obstructions and occupied uses; however, it is not considered to pose a significant safety hazard compared to baseline conditions. The FAA, as the federal agency with primary responsible for aviation safety, takes into consideration the presence of potential obstructions and land uses within RPZ areas in the review of ALP amendments. Additionally, the FAA takes into consideration potential hazards, including but not limited to, obstructions and safety areas, as part of ongoing monitoring of requirements necessary for LAX to maintain federal Part 139 Airport Certification (14 CFR Part 139). Should the FAA determine that structures or land uses within RPZ areas pose a significant aviation safety hazard, appropriate means to reduce such potential hazards to acceptable levels would be identified. Such options can include, but not be limited to, marking/lighting obstructions, vacating occupied structures, or clearing a site of all uses and structures. Recognizing that neither FAA nor LAWA own the parcels within the RPZ for Runway 6L/24R that are highlighted in Figure 4.7.2-4 of the SPAS Draft EIR, the implementation of such measures would likely require that LAWA obtain sufficient control interest in the affected parcels, either through acquisition or establishment of an easement. In the event that FAA determines that structures or uses within the RPZ areas pose a significant safety hazard and measures such as those described above are required, implementation of

those measures could result in impacts to the environment. Such potential secondary or indirect impacts are described below, at the end of the impacts analysis for the LAWA Staff-Recommended Alternative.

The combination of physical lengthening of runways and establishment of displaced thresholds would change the existing declared distances for runways within the north airfield. Table 4.7.2-4 of the SPAS Draft EIR delineates the TORA, TODA, ASDA, and LDA distances resulting from implementation of the LAWA Staff-Recommended Alternative. As can be seen, in comparison to baseline conditions (2010), the majority (11 of 16) of the existing declared distances would increase in length, one would decrease in length (LDA for 24L), and the remaining four would remain unchanged. Increased distance provides greater length for aircraft to use, which is better particularly for large/heavy aircraft. Most commercial aircraft need approximately 8,000 linear feet for landing operations. In general, the changes in declared distances associated with the LAWA Staff-Recommended Alternative would benefit aircraft landing operations, particularly for large/heavy aircraft. The reduced length in the LDA for Runway 24L would still be well above the 8,000 feet normally required for most aircraft landing operations. Additionally, that runway is used primarily for departures, which would have additional take-off distances under this alternative.

Other Safety Considerations

As described in Section 4.7.2.3 of the SPAS Draft EIR, numerous safety studies have been prepared relative to aircraft operations on the north airfield. While the nature, approach, and scope of analysis may differ between the studies, there is general consensus between the studies that increased separation between runways and the addition of a centerfield parallel taxiway can reduce the potential for a runway collision or incursion and enhance safety, particularly as related to future operations involving a greater number of large aircraft. Additionally, the safety benefits of relocated and redesigned runway crossing points along the last-third of Runway 6R/24L, including the advantage of pilot visibility to the end of the runway, were noted in some of the studies. The airfield improvements proposed under the LAWA Staff-Recommended Alternative provide for these desired safety improvements.

Summary Conclusions Regarding the LAWA Staff-Recommended Alternative

Implementation of the LAWA Staff-Recommended Alternative would enhance the safety and efficiency of aircraft operating in the north airfield, compared to baseline conditions (2010), as follows:

- Achieves full compliance with RSA requirements;
- Shifts the arrival RPZ for Runway 24R westward, resulting in residences and the vehicle staging area west of Sepulveda Boulevard no longer being located within the RPZ;
- Provides greater amount of runway and taxiway facilities that meet FAA Airport Design Standards for ADG V and VI aircraft, particularly as related to separation requirements, thereby reducing the need for special operations restrictions, MOS, and waivers from FAA;
- Provides increased separation between runways and between runways and taxiways, which better enables taxiing and holding aircraft to stay clear of runway OFZ and RSA surfaces;
- Allows addition of a centerfield parallel taxiway that includes high-speed exits from Runway 6L/24R, which provides more time and options for FAA air traffic controllers to handle aircraft exiting the runway; more time and distance for the pilot of an arriving aircraft to exit the runway, slow down and hold before crossing Runway 6R/24L; and reduced potential for safety hazards/incursions;
- Improves the locations and design of crossing points (i.e., 90-degree crossing angle) at Runway 6R/24L, which provides better pilot visibility down Runway 6R/24L before crossing;
- Realigns/straightens Taxilane D to provide a full-length parallel taxiway designed for ADG V aircraft;
- Relocates vehicle service road adjacent to Taxiway E and Taxilane D out from between two active surfaces; and
- Provides more aircraft holding areas near the end of runways, thereby improving the ability for sequencing departures.

Implementation of the LAWA Staff-Recommended Alternative would not involve construction of a runway within 10,000 feet of a solid waste landfill or create an attractant to birds. In general, implementation of this alternative would enhance aircraft safety and efficiency, as summarized above, particularly with respect to better achieving compliance with FAA Airport Design Standards for operation of large aircraft.

The 260-foot northward shift of Runway 6L/24R would, however, result in a northward shift of the Part 77 imaginary surfaces placing or increasing portions of two multi-story structures within Part 77 Surfaces. As described above, a detailed safety evaluation would be completed in conjunction with FAA review of runway plans and an ALP amendment to determine what, if any, measures are warranted to address potential safety hazards associated with objects being located within controlled airspace areas. Such measures range from doing nothing (i.e., for low-risk objects), to placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps, to lowering, reducing, or removing the object, and, in some cases, an approach or departure procedure will be modified to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. Such measures would reduce this safety impact to a level that is less than significant. Secondary or indirect impacts associated with implementation of such options could range from no impact, such as in the case of low-risk objects that do not require any safety measures, to impacts typically associated with removal of an object/structure, such as temporary construction-related air quality, noise, and traffic impacts, visual impacts (i.e., changes in existing appearance), and land use impacts. Such secondary or indirect impacts are further addressed below. Implementation of the LAWA Staff-Recommended Alternative would result in a change in the composition of land uses within the RPZ for Runway 6L/24R compared to baseline conditions. The presence of such uses under the LAWA Staff-Recommended Alternative may be considered incompatible with FAA design recommendations that RPZ areas be clear of all obstructions and occupied uses; however, it is not considered to pose a significant safety hazard compared to baseline conditions. In the event that the FAA, as the lead federal agency responsible for aviation safety at LAX, considers that the structures and uses within the existing or future RPZ pose an aviation hazard, modifications to, or removal of, structures and uses in the RPZ may be required.

Potential Secondary or Indirect Impacts Associated with Measures to Address Potential Airspace Obstructions (Part 77) or Incompatible Structures/Uses Within RPZ Areas

To the extent that implementation of measures required to address potential airspace obstructions or incompatible structures/uses with RPZ areas, as determined in conjunction with FAA reviews, contemplates the removal or modification of existing structures and/or uses, the following types of secondary or indirect environmental impacts may occur. It is important to note that the certainty, timing, nature, and extent of, and the approach to, such removals or modifications have not been determined at this programmatic level of conceptual planning. Such information would be developed at more detailed levels of planning and is subject to consultation with the FAA. It should also be noted that if/when such removal or modification actions are required, the discretional approval(s) associated with such activity would be subject to CEQA compliance, at which time additional CEQA review specific to the proposed activity would be completed.

Aesthetics

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal or modification of existing structures, it is not anticipated that there would be impacts related to obstructing, interrupting, or diminishing existing views, or impacts related to the introduction of features that conflict/contrast with the aesthetic elements of the area (such as theme, style, setbacks, density, massing, etc.). The removal or substantial modification of existing structures could impact the existing aesthetic character of the southern portion of the Westchester business district. It is possible that such an impact would be significant; however, given that the need for, and nature and timing of, any such removal or modification actions are currently unknown, it would be premature and speculative to reach a final conclusion of significance at this time.

Given the existing developed/urbanized nature of the affected areas, significant impacts related to new sources of light and glare are not expected to occur. It is likely that there would be a change in existing lighting and lighting intensity if/as existing structures and uses are removed or modified. Such impacts are anticipated to be less than significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Air Quality

The removal of existing structures, if required to address potential airspace obstructions or incompatible structures/uses, would result in construction-related air quality impacts from equipment operations, worker commute, materials deliveries, hauling off of demolition debris, and ground disturbance. Such activities would be greatest for the removal of multi-story structures located along Sepulveda Boulevard and on Westchester Parkway. Most notable from the equipment operation would be emissions from diesel-powered equipment, which can be particularly high in oxides of nitrogen (NO_x) emissions. This would also be the case for emissions associated with the use of diesel-powered trucks associated with the transport of materials to and from the work site. Such impacts would be reduced through implementation of the LAX Master Plan mitigation measures presented in Section 4.2, *Air Quality*, of the SPAS Draft EIR, for construction-related air quality impacts. For larger demolition projects involving substantial amounts of large equipment or scheduled to be completed within a relatively short period of time, it is possible that air quality impacts would be significant and unavoidable even with mitigation. As noted above, however, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Regarding operations-related air quality impacts, it is anticipated that pollutant emissions at each affected site would be reduced from existing conditions, based on the removal of existing uses; however, to the extent that affected uses move to other locations nearby, there would only be a partial reduction in existing emissions. As noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Biological Resources

Areas most likely to be affected would be those that are currently developed (i.e., pose obstruction hazard or are an incompatible use), which, for the most part, are devoid of notable biological resources. Impacts to such resources would likely be less than significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Coastal Resources

Potentially affected areas are located on the east side of the north airfield. No impacts to coastal resources would occur.

Cultural Resources

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires modification or removal of existing structures and site grading, there is the potential for impacts to cultural resources including historic and archaeological resources, if any. Based on a review of aerial photographs of the Westchester business district in the 1950s and 1960s, it is possible that some structures along Sepulveda Boulevard within potentially affected areas are more than 45 years old, which would qualify them as being potentially historic. Depending on whether a formal evaluation(s) of such properties confirms that they meet all the requirements to be considered an historical resource, the removal or modification of existing structures could result in a significant impact. Such an impact could be reduced through implementation of the LAX Master Plan commitment and mitigation measures presented in Section 4.5, *Cultural Resources*, of the SPAS Draft EIR, for historical resources; however, given the possibility that complete removal of a structure(s) may be necessary, there is the potential that impacts to historical resources would be significant and unavoidable. As noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

The subject area is largely developed/urbanized and natural surfaces and shallow subsurface areas have been subject to disturbance. As such, the potential for significant archaeological or paleontological resources to be present is generally considered to be low, particularly in instances where the necessary action is only to lower/remove a structure down to surface level. Implementation of the LAX Master Plan mitigation measures presented in Section 4.5, *Cultural Resources*, of the SPAS Draft EIR, for archaeological, would add to the likelihood that potential impacts to archaeological resources would be reduced to a level that is less than significant. Similarly, compliance with the LAX Master Plan MMRP Paleontological Management Treatment Plan[31] would reduce potential impacts to paleontological resources to a level that is less than significant.

Greenhouse Gases

Similar to air quality above, implementation of the measures identified above would likely result in emissions of greenhouse gases in conjunction with construction activities associated with removal or modification of existing structures, and a possible reduction in greenhouse gas emissions associated with the operation of existing uses within the affected areas. The reduction in operations-related greenhouse gas emissions would be partially offset or neutralized by the likelihood that many, if not most, affected uses would relocate elsewhere and continue operations. Greenhouse gas emissions could be significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Hazards/Hazardous Materials

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal or modification of existing structures, such activities could encounter hazardous materials, primarily in the form of hazardous building materials such as asbestos, lead-based paint, polychlorinated biphenyls (PCBs), and the like. Based on past and present uses within and around the area being mostly commercial, office, and residential, it is not anticipated that major subsurface contamination exists within the area. More thorough investigations, such as preliminary site assessments (PSAs), Phase I/II site investigations, building inspections, etc., would be necessary to determine more definitely the nature and extent of hazardous materials/contamination, if any. Compliance with LAWA's *Procedure for the Management of Contaminated Materials Encountered During Construction*, (which facilitates the implementation of LAX Master Plan Commitment HM-2, Handling of Contaminated Materials Encountered During Construction), would address such potential impacts. In light of the existing uses within the potentially affected areas being primarily office and commercial, current operations are unlikely to be notable users/generators of hazardous materials. The removal of existing uses or replacement with lower intensity uses is not expected to result in significant operations-related impacts for hazardous materials; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Hydrology/Water Quality

Potentially affected areas are mostly developed/urbanized; hence, surface hydrology is characterized primarily by runoff flowing across impervious surfaces into the existing storm drain system, and water quality is characterized by typical urban stormwater pollutants (i.e., oil and grease, metals, nitrogen, fecal coliform, trash, etc.). Implementation of the above measures could result in reduced surface runoff to the extent that existing structures and impervious surfaces are removed, and also reduce or change urban stormwater pollutants to the extent existing urban uses are taken out of service or replaced with lower intensity uses. Construction activities associated with the removal or modification of existing structures could result in short-term erosion and sedimentation and other construction-related water quality pollutants (i.e., from fueling/servicing of construction equipment, storage of materials including temporary stockpiles of demolition debris, etc.). Mitigation of such construction-related pollutants would be accomplished through adherence with the requirement of the State Water Resources Control Board

[31] City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program, Paleontological Management Treatment Plan, December 2005.

General (Construction) Permit (2009-0009-DWQ). Hydrology and water quality impacts are anticipated to be less than significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Land Use and Planning

The potentially affected areas are designated in the City's General Plan for Commercial (Community) land use. Similarly, the subject areas are zoned for commercial uses, primarily C1-Light Commercial and C2-General Commercial. The removal of existing uses would not require a General Plan amendment or a change in zoning. The potential replacement of existing uses with other uses compatible with an RPZ would need to be reviewed in light of the provisions of the existing zoning relative to permitted and conditional uses. In general, however, the removal of existing uses and replacement with lower intensity uses is not expected to conflict with the existing land use plans for the area. Similarly, it not expected to create physical or functional incompatibility with existing land uses nearby. To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal of existing uses, implementation of LAX Master Plan Commitment RBR-1, *Residential and Business Relocation Program*, and LAX Master Plan Mitigation Measure MM-RBR-1, *Phasing for Business Relocations*, would reduce impacts associated with business relocation. With implementation of the commitment and mitigation measure, impacts related to business relocation would likely be reduced to a level that is less than significant; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Noise

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal or modification of existing structures and site grading, construction-related noise could impact noise-sensitive receptors (i.e., residential development, a school, and a church) located along the east side of Sepulveda Eastway. These noise-sensitive receptors are located approximately 300 feet from structures along Sepulveda Boulevard. Based on the typical construction noise level of 89 dBA Community Noise Equivalent Level (CNEL) described in Section 4.10.3, *Construction Traffic and Equipment Noise*, of the SPAS Draft EIR, and an estimated existing ambient exterior noise level of approximately 70 dBA CNEL (based on the LAX Noise Standards Quarterly Report for Fourth Quarter 2010), construction-related noise at these receptors would be approximately 77 dBA CNEL. This would be more than 5 dBA above the existing ambient noise level and is considered a significant impact. Implementation of the LAX Master Plan commitments and mitigation measures presented in Section 4.10.3, *Construction Traffic and Equipment Noise*, of the SPAS Draft EIR, would reduce construction noise impacts. However, given that the design and effectiveness of such measures, such as the noise control plan, depend on site- and project-specific conditions that would be addressed at future, more detailed levels of planning, it cannot be definitively concluded at this time that all construction equipment noise impacts would be reduced to levels that are less than significant.

Public Services

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal of existing uses or replacement with lower intensity uses, it is anticipated that the need for public services at the site would, in general, be reduced. No significant impacts to public services are expected to occur; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

Transportation

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal of existing uses or replacement with lower intensity uses, it is anticipated that existing trip generation within affected areas would, in general, be reduced. Construction activities associated with the removal or modification of existing structures would result in temporary construction-related traffic and possible lane closures and detours. The LAX Master Plan

commitments and mitigation measure presented in Section 4.12.2, *Off-Airport Transportation*, of the SPAS Draft EIR, would reduce construction traffic impacts. The specific application and efficacy of such measures are dependent on the particular characteristics of the construction activities, such as location, timing, and approach. Such information would be developed in the future as plans for removal/modification of structures are formulated. As such, it cannot be definitively concluded at this time that all construction traffic impacts would be reduced to levels that are less than significant.

Utilities

To the extent that implementation of any measures required to address potential airspace obstructions or incompatible structures/uses requires the removal of existing uses or replacement with lower intensity uses, it is anticipated that existing demands on utilities would, in general, be reduced. No significant impacts to utilities are expected to occur; however, as noted above, it would be premature and speculative to reach a final significance conclusion at this time regarding this type of potential secondary impact.

2.3.7.2.2 Mitigation Measures

The LAWA Staff-Recommended Alternative would not have a significant impact with respect to safety; therefore, no mitigation is required.

2.3.7.3 Hazardous Materials

2.3.7.3.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to hazardous materials are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.7.3.6 of the SPAS Draft EIR.

Contamination of Soil or Groundwater

Under the LAWA Staff-Recommended Alternative, an increase in hazardous materials use and hazardous waste generation during routine fueling and/or maintenance of aircraft, vehicles, and the APM as well as during construction, would increase the chances of a spill or release of substances that could result in contamination of soil or groundwater. As discussed in Section 4.7.3.3 of the SPAS Draft EIR, the handling and storage of hazardous substances are stringently regulated, as are releases of hazardous materials, including emergency response and clean up requirements. In addition, LAWA's *Procedure for the Management of Contaminated Materials Encountered During Construction*, which was prepared in accordance with LAX Master Plan Commitment HM-2, Handling of Contaminated Materials During Construction, includes specific procedures for handling hazardous materials, identifying risks and monitoring site conditions, and implementing best management practices (BMPs) and spill prevention and control measures to prevent spills, as well as emergency response procedures and notification requirements in the event of a spill.

Compliance with the Procedure would ensure that spills and releases would not create a hazard to the public or the environment, and would not result in contamination of soil or groundwater. Therefore, impacts would be less than significant.

Impacts to Current or Planned Remediation Efforts

Under the LAWA Staff-Recommended Alternative, grading and excavation would be conducted within various areas of the airport and in acquisition areas, including areas of known contamination and remediation, which are shown in Figure 4.7.3-1 of the SPAS Draft EIR. All of the sites identified in Figure 4.7.3-1 of the SPAS Draft EIR currently have, or have had, soil and/or groundwater contamination. Some of these sites have been closed (i.e., remediation has been completed to the satisfaction of regulatory agencies); at other sites, remediation is planned or underway, and some sites are still under investigation. There also may be areas of contamination not yet discovered. The LAWA Staff-

Recommended Alternative improvements that would require substantial excavation in areas of known contamination include:

- Intermodal Transportation Facility (ITF)
- Redesigned Entry Roadways
- Terminal 0
- Southerly relocation of Taxilane D and demolition of a portion of Terminal 1 concourse
- Automated People Mover

Numerous soil and groundwater remediation efforts are planned or underway both at LAX and within the acquisition areas. In some cases, the LAWA Staff-Recommended Alternative improvements would be in areas where remediation systems are located or may be planned in the future. Construction of these improvements and associated demolition of existing facilities have the potential to require temporary closure or reconfiguration of some of these remediation systems. Specifically, Park One (Former Honeywell/Allied Signal Aerospace) and Budget Rent-A-Car, have existing soil and groundwater remediation systems in areas of improvements. Improvements are also proposed near the Terminal 1 and 2 hydrant systems, both of which may require remediation in the future. As contamination at the Resort Rent-A-Car site has not been determined at this time, and no remediation is underway or planned, there would be no known conflicts with this site. The locations of these remediation sites are shown in Figure 4.7.3-1 of the SPAS Draft EIR. The LAWA Staff-Recommended Alternative improvements in the vicinity of these facilities may be initiated before the soil and groundwater remediation is complete.

The following LAWA Staff-Recommended Alternative components would have the potential for conflicts with ongoing remediation efforts within LAX and acquisition areas due to the substantial excavation required for their implementation and the nature and extent of remediation underway in these areas:

- ITF, located between 96th and 98th Streets and between Vicksburg Avenue and Airport Boulevard, and a portion of the APM alignment, both of which would be constructed on the Budget Rent-A-Car site.
- Redesigned entry roadways and Terminal 0, located between Sepulveda Boulevard and Terminal 1, which would be constructed on the Park One site.
- Southerly relocation of Taxilane D and demolition of a portion of the Terminal 1 concourse, which would occur at Terminals 1 and 2.
- Construction of parking east of Lot C may interfere with ongoing remediation at the Avis Rent-A-Car and Former National Car Rental sites.

Due to the extent of the VOC contamination associated with the Park One (Former Honeywell/Allied Signal Aerospace) site, it is possible that remediation will still be underway when construction of Terminal 0 and the redesigned entry roadways is initiated. Remediation for this site consists of an SVE system that includes small aboveground vessels for treating the soil vapor, pipes connecting the dry wells to the vessels, and groundwater monitoring wells. Due to the extent of excavation needed for the LAWA Staff-Recommended Alternative improvements, it is likely that part, or all, of the remediation system would have to be removed during construction, if it is still in operation at the time the SPAS improvements are constructed. This would entail destruction of the extraction wells and removal of underground piping and aboveground vessels. Removing the active remediation system at Park One for an extended period would interfere with existing clean up efforts. However, temporary cessation of remediation would not have any impacts on human health as groundwater beneath the site is not used for municipal purposes and contaminated soils lie beneath asphalt and would not be exposed.

Construction of the ITF and a portion of the APM is unlikely to interfere with ongoing remediation at the Budget Rent-A-Car site. The landowner is pursuing closure of this site and it is possible that such closure will be obtained prior to implementation of these improvements. If remediation systems are still in place at the time of construction, destruction and removal of these facilities is not expected to be required to construct the ITF and APM. If the landowner obtains closure of the site prior to implementation of these

improvements, there would be no potential for the LAWA Staff-Recommended Alternative improvements to interfere with remediation efforts.

The demolition of the northernmost portion of Terminal 1 and the southerly relocation of Taxilane D may come in contact with contaminated soils in the vicinity of Terminals 1 and 2. Contamination at these sites is currently being characterized, and no remediation has been planned at this time. If remediation is required at these sites, and is still ongoing when Taxilane D is relocated and the northern portion of Terminal 1 is demolished, these activities have the potential to interfere with remediation activities. Due to the localized nature of contamination at these locations, it is expected that remediation activities, if required, could be maintained during taxiway relocation and modifications to Terminal 1.

To prevent SPAS-related construction from interfering with planned or ongoing remediation such that environmental contamination is exacerbated or permanent clean up of sites prevented, LAWA would implement LAX Master Plan Commitment HM-1, Ensure Continued Implementation of Existing Remediation Efforts. Implementation of this commitment would ensure that remediation projects would be completed to the extent possible and necessary before constructing SPAS improvements, or that alternate clean up methods would be implemented during construction to prevent contaminant migration, if necessary. As part of this commitment, remediation systems would be reinstated following the completion of construction, if required. Therefore, impacts associated with interference with remediation efforts would be less than significant.

Impacts to Construction Workers from Exposure to Hazardous Materials

As noted above, the LAWA Staff-Recommended Alternative improvements that pose the potential for construction workers to encounter contamination during construction include the ITF, APM, Terminal 0, redesigned roadways, southerly relocation of Taxilane D, and demolition of a portion of Terminal 1 concourse, as they would entail major excavation in areas of known soil and/or groundwater contamination. In addition, it is possible that, during other construction activities for implementation of the LAWA Staff-Recommended Alternative, previously unidentified soil and/or perched groundwater contamination could be encountered.

Exposure of construction workers to contaminated materials would be minimized by implementing the measures required by federal, state, and local laws and regulations. These include OSHA and CalOSHA standards, which establish exposure limits for workers; require protective equipment or other protective measures, when warranted; and require employers to provide a written health and safety program, worker training, emergency response training, and medical surveillance. Nevertheless, due to the amount of grading and excavation that would be undertaken to implement the LAWA Staff-Recommended Alternative, and the number of SPAS improvements that may be undertaken concurrently by different contractors throughout the construction period, LAWA would comply with the *Procedure for the Management of Contaminated Materials Encountered During Construction*, which was prepared in accordance with LAX Master Plan Commitment HM-2, Handling of Contaminated Materials During Construction, and identifies procedures associated with identification and handling of excavated contaminated materials. The Procedure requires, among other things, preparation of a site-specific Health and Safety Plan that incorporates OSHA and CalOSHA regulations, as well as FAA and LAWA health and safety requirements in order to minimize the risk of injury to site workers and the general public; trained hazardous waste operations and emergency response (HAZWOPER) personnel; characterization of areas where contaminated soils are encountered through preparation of Site Sampling and Analyses Plans, as well as specific procedures for handling such materials, identifying risks, and monitoring site conditions; and implementation of BMPs and spill prevention and control measures to prevent spills, as well as emergency response procedures and notification requirements in the event of a spill. Compliance with the Procedure would ensure that contaminated materials encountered during construction are properly identified, stored, remediated, and disposed of in accordance with all applicable regulations, including those governing worker health and safety. As such, impacts to construction workers associated with the excavation of contaminated materials would be less than significant.

Impacts Related to the Implementation of Emergency Response Activities

Implementation of the LAWA Staff-Recommended Alternative would alter ground access to, from, and around LAX. A lack of adequate access could impair the effective implementation of emergency response activities by impeding the movement of emergency vehicles. During construction, local roadway and/or lane closures would occur for varying periods; however, local access would be adequately maintained through detours and diversions, and emergency access would be coordinated and ensured through LAX Master Plan Commitment C-1, Establishment of a Ground Transportation/Construction Coordination Office, and LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22. In addition, as indicated in Section 2.3.12.1, *On-Airport Transportation*, of this chapter, roadways within the CTA would operate at an acceptable level of service under the LAWA Staff-Recommended Alternative. As a result, the implementation of emergency response activities would not be impaired, and impacts would be less than significant.

2.3.7.3.2 Mitigation Measures

Implementation of LAX Master Plan Commitment HM-1, and compliance with the *Procedure for the Management of Contaminated Materials Encountered During Construction*, developed in accordance with LAX Master Plan Commitment HM-2, would ensure that impacts related to hazardous materials associated with the LAWA Staff-Recommended Alternative would be less than significant. Implementation of LAX Master Plan Commitments C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would ensure that impacts relating to the impairment of the implementation of emergency response activities associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to SPAS are required.

2.3.8 Hydrology/Water Quality

2.3.8.1 Impacts Analysis

This section describes the environmental impacts specific to the LAWA Staff-Recommended Alternative as they relate to hydrology (drainage) and water quality. As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on hydrology and water quality are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.8.6 of the SPAS Draft EIR. It should be noted that the increase in impervious area within the hydrology/water quality study area (HWQSA) under the LAWA Staff-Recommended Alternative, discussed below, is the same as that associated with Alternative 1. Although the LAWA Staff-Recommended Alternative includes parking in the existing Avis rental car lot, whereas Alternative 1 does not, the Avis rental car lot is impervious under baseline conditions and this area would remain impervious under all of the SPAS alternatives. See Figures 2 through 9 in Appendix H of the SPAS Draft EIR.

The drainage analysis addresses changes in impervious area and how these changes would be expected to affect the potential for flooding to occur, and the potential to substantially alter the existing drainage pattern of the site or area through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site. As described in Section 4.8.2 of the SPAS Draft EIR, the drainage analysis is based on calculations of total impervious area. Detailed land use designations and impervious area calculations and results for the LAWA Staff-Recommended Alternative are presented in Appendix H, *Hydrology and Water Quality*, of the SPAS Draft EIR.[32] A summary of impervious area values by land use that are used as the indicator for potential for hydrology impacts for the baseline conditions and for the LAWA Staff-Recommended Alternative are presented in **Table SRA-2.3.8-1**.

[32] The analysis of the LAWA Staff-Recommended Alternative in Appendix H is provided under the designation "Alternative 1."

The water quality analysis estimates the storm water pollutant loads that would be discharged to receiving water bodies, describes potential sources for dry weather flows as compared to baseline conditions, and evaluates the effects of construction associated with the LAWA Staff-Recommended Alternative. As described in Section 4.8.2 of the SPAS Draft EIR, storm water pollutant loads are based on EMC data and calculations of annual runoff volumes. Detailed land use designations, average annual runoff volumes, pollutant load calculations and results for the LAWA Staff-Recommended Alternative are presented in Appendix H, *Hydrology and Water Quality*, of the SPAS Draft EIR. A summary of the storm water pollutant loading related to the LAWA Staff-Recommended Alternative is presented in **Table SRA-2.3.8-2**. Water quality impacts associated with dry weather flows and construction activities are evaluated qualitatively.

Table SRA-2.3.8-2

Estimated Average Annual Pollutant Loads and Percent Change Within HWQSA - Baseline (2010) Conditions, LAWA Staff-Recommended Alternative

		Total Pollutant Load (lb/yr)	
Pollutant	**2010 Baseline**	**SRA**	**Change from Baseline (%)**
Total Suspended Solids	267,761	236,371	-11.7
Total Phosphorus	1,758	1,794	2.0
Total Kjeldahl Nitrogen	8,144	8,166	0.3
Total Copper	371	390	4.9
Total Lead	67	70	3.7
Total Zinc	1,988	2,060	3.6
Oil and Grease	15,245	15,997	4.9
5-Day Biochemical Oxygen Demand	55,976	55,268	-1.3
Chemical Oxygen Demand	321,325	328,690	2.3

Source: CDM Smith, 2012.

Under the LAWA Staff-Recommended Alternative, there would be improvements to the airfield, terminal, and ground access as described in Section 2.2, LAWA Staff-Recommended Alternative Description, of

this chapter. The distinguishing changes associated with this alternative relative to hydrology and water quality are the northerly movement and westerly extension of Runway 6L/24R, conversion of the unlined Argo Drainage Channel into a concrete box culvert (9,857 linear feet), conversion of open space to accommodate the realignment of Lincoln Boulevard, conversion of industrial area for the Intermodal Transportation Facility (ITF), conversion of the Manchester Square area to parking use and a CONRAC, and the addition of an APM system.

Hydrology

Under the LAWA Staff-Recommended Alternative, the total impervious area within the HWQSA would increase by approximately 92 acres as compared to baseline conditions of 3,082 acres.[33] Since much of the area surrounding the airport in both the Santa Monica Bay and Dominguez Channel watersheds is developed (i.e., impervious) under baseline conditions, this change would represent a marginal increase (3.0 percent) in regional impervious area.

The changes in impervious area would not be evenly distributed between the Santa Monica Bay and Dominguez Channel watersheds when compared to baseline conditions. The impervious area within the Santa Monica Bay Watershed would increase 32 acres or 1.6 percent, occurring primarily within the Argo sub-basin due to the runway and taxiway improvements, while the impervious area within the Dominguez Channel Watershed would increase by 61 acres or 5.5 percent (see Table 4 in Appendix H, *Hydrology and Water Quality*, of the SPAS Draft EIR).

Previous studies indicate that, under baseline conditions, the conveyance capacity of drainage infrastructure within the Argo sub-basin and the Imperial sub-basin (in this case, including both the Pershing and Imperial components of the sub-basin) is adequate for the LADPW 50-year storm, while the Dominguez Channel sub-basin infrastructure would flood under these same conditions.[34,35] Detailed analysis of the Argo and Imperial sub-basins and the Dominguez Channel sub-basin capacities under this design storm for the LAWA Staff-Recommended Alternative was not conducted, given the conceptual level of planning associated with all SPAS alternatives at this time as discussed in Section 4.8.2 of the SPAS Draft EIR. As shown in **Table SRA-2.3.8-1**, the increase in impervious surface in the portion of the HWQSA tributary to Santa Monica Bay, which includes both the Argo and Imperial sub-basins, is 1.6 percent, which would result in a very small net increase in peak flow rates to be conveyed by the drainage systems serving these areas. It is possible that this increase could cause one or more existing on-site or off-site storm drains to reach or exceed the design capacity, which would be a significant impact. Also as shown in **Table SRA-2.3.8-1**, the increase in impervious surface in the portion of the HWQSA tributary to Dominguez Channel is 5.5 percent, which would result in a net increase in peak flow rates to be conveyed by the drainage systems serving these areas. As previously noted, the Dominguez Channel is currently over capacity off-site and downstream from LAX; therefore, a 5.5 percent increase in peak flow rates from LAX, which represents a portion of the total tributary area to the Dominguez Channel, would add to the capacity deficiency, which would be a significant impact.

LAWA would continue to implement applicable recommendations resulting from LAX Master Plan Commitment HWQ-1, Conceptual Drainage Plan, including improvements designed to address deficiencies, if any, in the drainage system that would occur at buildout of the LAX Master Plan. Such improvements would reduce flooding impacts associated with development of the LAWA Staff-Recommended Alternative; however, given that those recommended improvements were designed based on the approved LAX Master Plan development program, flooding impacts of the LAWA Staff-

---

33 As noted previously, this increase in impervious area within the HWQSA is the same as that associated with Alternative 1. Although the LAWA Staff-Recommended Alternative includes parking in the existing Avis rental car lot, whereas Alternative 1 does not, the Avis rental car lot is impervious under baseline conditions and this area would remain impervious under all of the SPAS alternatives. See Figures 2 through 9 in Appendix H of the SPAS Draft EIR.

34 City of Los Angeles, Los Angeles World Airports, Revised Hydrology Report for Los Angeles International Airport North Perimeter Storm Drain, prepared by Parsons, Brinckerhoff, Quade & Douglas, Inc., December 2001.

35 City of Los Angeles, Los Angeles World Airports, Final On-Site Hydrology Report for Los Angeles International Airport, prepared by Parsons, Brinckerhoff, Quade & Douglas, Inc., October 2002.

Recommended Alternative would be significant. As described in Section 2.3.8.2 below, a new mitigation measure, MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, is proposed to tailor the Conceptual Drainage Plan recommendations to the specific characteristics of the selected SPAS alternative. With implementation of Mitigation Measure MM-HWQ (SPAS)-1, the hydrology impacts associated with the LAWA Staff-Recommended Alternative would be less than significant.

Under the LAWA Staff-Recommended Alternative, all facilities receiving and conveying storm water from the airport would be below ground pipes or concrete lined, including the Argo Drainage Channel, which would be structurally covered to support the weight of an aircraft for its entire length. Therefore, any increases in storm water peak flow rates or changes in the drainage infrastructure would not result in substantial erosion or siltation either on-site or off-site and the impact of erosion or siltation due to runoff from the airport would be less than significant for all drainage facilities.

Water Quality

Storm Water Pollutant Loads

Under the LAWA Staff-Recommended Alternative, the estimated annual total pollutant load generated within the HWQSA would increase for most constituents compared to baseline conditions. Specifically, greater estimated loads are predicted for all constituents except for total suspended solids, 5-day Biochemical Oxygen Demand (BOD_5), and fecal enterococcus bacteria when compared to baseline conditions. The increases in estimated loads would range from 0.3 percent for total Kjeldahl Nitrogen to 4.9 percent for copper and oil and grease.

With respect to debris loads, activities within airfield improvement areas are not a significant generator of debris compared to the potential load generated within ground access improvement areas (e.g., parking lots). Within the airport improvement areas, there is no public access to these areas so sources of debris are minimal compared to public access areas. Additionally, debris sources are minimized as a result of implementation of source control measures conducted by LAWA and its tenants under the SWPPP. The LAWA Staff-Recommended Alternative does include ground access improvements which could potentially increase debris loads. The complete model results are presented in Table 6 in Appendix H, *Hydrology and Water Quality*, of the SPAS Draft EIR. The increases in pollutant loads would be a significant impact.

LAWA would continue to implement applicable recommendations resulting from LAX Master Plan Commitment HWQ-1, Conceptual Drainage Plan, including BMPs to address water quality impacts associated with increased pollutant loads from buildout of the LAX Master Plan. Such BMPs would reduce the water quality impacts associated with development of the LAWA Staff-Recommended Alternative; however, given that those recommended improvements were designed based on the approved LAX Master Plan development program, pollutant load increases associated with the LAWA Staff-Recommended Alternative are assumed to be significant. As described in Section 2.3.8.2 below, a new mitigation measure, MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, is proposed to tailor the Conceptual Drainage Plan recommendations, including BMPs, to the specific characteristics of the selected SPAS alternative. As part of the update to the existing Conceptual Drainage Plan for LAX, LAWA would integrate the applicable BMP requirements related to SUSMP and the City's LID Ordinance. Additionally, the existing source control BMPs currently employed by LAWA as identified in the LAX SWPPP would also serve to decrease the potential for additional pollutant loading as a result of intensification of airport activities. Routine maintenance such as sweeping and inspections would be performed more frequently and in direct proportion to the increase in frequency of airport activities. With implementation of Mitigation Measure MM-HWQ (SPAS)-1, the water quality impacts associated with the LAWA Staff-Recommended Alternative would be less than significant.

Dry Weather Flows

As discussed in Section 4.8.2 of the SPAS Draft EIR, sources of dry weather flows within the HWQSA are associated with activities that include outdoor maintenance of vehicles; building and grounds maintenance; aircraft and ground vehicle fueling, painting, stripping, and washing; limited de-icing; and

chemical and fuel transport and storage. While implementation of the LAWA Staff-Recommended Alternative, would not in itself result in an intensification of such airport-related activities, the natural growth in airport activity projected to occur by 2025 (i.e., growth from 56.5 million annual passengers (MAP) in 2009 to 78.9 MAP in 2025 under all alternatives, including the LAWA Staff-Recommended Alternative) would increase such activities. These activities would likely result in an increase in the source of pollutants within the HWQSA and the potential for release of dry weather flows containing pollutants. However, LAWA and its tenants would continue to implement measures required under the SWPPP and periodically update the SWPPP as necessary to reflect the current conditions and level of activity to prevent or minimize the introduction of pollutants and discharge of dry weather flows.

In addition, within the Santa Monica Bay Watershed, the Imperial retention basin is designed to capture dry weather flows. While the increase potential for spills and leaks as a result of increasing level of activity under all alternatives, including the LAWA Staff-Recommended Alternative, could result in an increase in pollutant loads to receiving water bodies, compliance with existing regulations and airport procedures, particularly the LAX SWPPP, would reduce the likelihood of dry weather discharges and impacts associated with hazardous materials spills. With such continued compliance, the pollutant load generated from dry weather flows would not be expected to increase and the associated impact would be less than significant.

Construction Impacts

As required under the SWRCB General Permit for Construction Activities, LAWA has prepared stormwater BMP guidance instructions in the Design and Construction Handbook applicable to airport improvement projects.[36] This document outlines the procedures for preparing and implementing a construction SWPPP before beginning any construction operations so that the activities are in compliance with the general permit. These requirements include:

- Developing and implementing a construction SWPPP, specifying BMPs that will prevent all construction pollutants from contacting storm water with the intent of keeping all products of erosion from moving off-site into receiving waters
- Eliminating or reducing non-storm water discharges to storm sewer systems and surface waters
- Performing inspections of all BMPs

Temporary construction BMPs specified in the manual include:

- Soil stabilization (erosion control) techniques such as seeding and planting, mulching, and check dams
- Sediment control methods such as detention basins, silt fences, and dust control
- Contractors' training programs
- Material transfer practices
- Waste management practices such as providing designated storage areas and containers for specific waste for regular collection
- Roadway cleaning/tracking control practices
- Vehicle and equipment cleaning and maintenance practices
- Fueling practices

Construction under the LAWA Staff-Recommended Alternative would likely create sources of pollution that would affect water quality if not controlled through implementation of BMPs. Since the improvements under this alternative would affect an area greater than one acre, LAWA's existing construction policy would require the development of project-specific construction SWPPPs in compliance with the state's

[36] City of Los Angeles, Los Angeles World Airports, Design and Construction Handbook, June 2011.

construction permit. Temporary construction BMPs that would likely be considered and incorporated into each project-specific SWPPP, as appropriate, could include:

- Soil stabilization (erosion control) techniques such as seeding and planting, mulching, and check dams
- Sediment control methods such as detention basins, silt fences, and dust control
- Contractor training programs
- Material transfer practices
- Waste management practices such as providing designated storage areas and containers for specific waste for regular collection
- Roadway cleaning/tracking control practices
- Vehicle and equipment cleaning and maintenance practices
- Fueling practices

By following the procedures outlined in the SWPPP and employing the appropriate BMPs from the list above and any additional BMPs required in project-specific construction SWPPPs, impacts to water quality associated with construction activities would be less than significant.

2.3.8.2 Mitigation Measures

Hydrology and Water Quality

To address impacts to hydrology and water quality associated with the LAWA Staff-Recommended Alternative, the following mitigation measure specific to SPAS is proposed:

- **MM-HWQ (SPAS)-1. Conceptual Drainage Plan Revision and Update.**

  In conjunction with the design of any SPAS alternative that may be selected, LAWA will revise and update the Los Angeles International Airport Conceptual Drainage Plan (CDP), to account for changes in the nature, location, design, and timing, if known, of the improvements under that alternative as compared to the LAX Master Plan approved in 2004, which is the basis for the 2005 CDP. Consistent with the requirements of LAX Master Plan Commitment HWQ-1, which established the framework for the CDP, the necessary revisions and updates will occur in accordance with FAA guidance and to the satisfaction of the City of Los Angeles Department of Public Works, Bureau of Engineering and Bureau of Sanitation - Watershed Protection Division based on the drainage/flood control and storm water quality requirements of each agency. The CDP revision and update shall take into account:

  - Changes in existing surface hydrology and water quality characteristics at LAX since preparation of the 2005 CDP;
  - Current regulatory programs related to water quality, such as the application of Standard Urban Stormwater Mitigation Plan (SUSMP) and Low Impact Development (LID) requirements by the City Bureau of Sanitation - Watershed Protection Division;
  - Surface hydrology and water quality improvements proposed separate from SPAS, such as the City of Los Angeles Bureau of Sanitation Stormwater Infiltration and Treatment Facility, but related to treatment of storm water from/at LAX; and
  - Changes in projected future area-wide drainage flows and surface water pollutant loading within the LAX Master Plan project area, as affected by the selected SPAS alternative and by other existing or proposed improvement projects at LAX that were not assumed in the 2005 CDP.

  The CDP revision and update will provide the basis and specifications by which detailed drainage improvement plans shall be designed in conjunction with site engineering specific to each improvement associated with any selected SPAS alternative, as well as the remaining LAX Master Plan improvements that would not change due to the SPAS alternative, including, if necessary,

improvements to address increased erosion and sedimentation. Consistent with the requirements for the 2005 CDP, the drainage system design and identification of needed improvements shall be based upon providing flood protection for a minimum 10-year storm event. As also required in the 2005 CDP, water quality treatment BMPs, which may include infiltration basins/systems, bioretention, vegetated swales, detention/retention basins/systems, media filtration, water quality inlets, catch basin inlet devices, and hydrodynamic separators, in addition to source control measures and good housekeeping practices, shall be incorporated to minimize the effect of airport operations on surface water quality to below the level of significance and to prevent a net increase in pollutant loads to surface water resulting from the overall LAX Master Plan improvements including if/as modified by any selected SPAS alternative.

2.3.8.3 Level of Significance After Mitigation

Hydrology

Implementation of Mitigation Measure MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, would reduce the hydrology impacts associated with the LAWA Staff-Recommended Alternative to a level that is less than significant.

Water Quality

Implementation of Mitigation Measure MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, would reduce the water quality impacts associated with the LAWA Staff-Recommended Alternative to a level that is less than significant.

2.3.9 Land Use and Planning

2.3.9.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to land use and planning are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.9.6 of the SPAS Draft EIR.

This analysis of land use impacts addresses inconsistencies with applicable general plans, specific plans, and regional plans, and policies as well as land use incompatibility due to physical impacts associated with aircraft noise exposure within the study area. A project is consistent with a general plan and related planning documents, if considering all its aspects, it will further the objectives and policies of the general plan or not obstruct their attainment.[37] Nevertheless, in certain instances, amendments to the various plans are proposed to ensure precise consistency. As part of this analysis, the discussion below evaluates the consistency of the LAWA Staff-Recommended Alternative with the existing LAX Specific Plan, as amended, recognizing that as part of SPAS, the LAX Specific Plan may be amended. The land use incompatibility analysis is focused on incompatibility associated with aircraft noise exposure. The analysis evaluates future (2025) noise levels associated with the LAWA Staff-Recommended Alternative compared to baseline (2009) conditions. However, the vast majority of the change in future conditions compared to baseline conditions is attributable to growth in aviation activity anticipated to occur at LAX by 2025. Aircraft-related noise impacts that are attributable to project-related changes in the airfield configuration are identified in Section 2.3.10.1, *Aircraft Noise*, of this chapter.

While operational and construction impacts associated with noise, air quality, traffic, safety, and degraded views have the potential to impact land uses, these effects are addressed in Sections 2.3.10.2, *Road Traffic Noise*; 2.3.10.3, *Construction Traffic and Equipment Noise*; 2.3.10.4, *Transit Noise and Vibration*;

[37] A given project need not be in perfect conformity with each and every policy nor does state law require precise conformity of a proposed project with every policy or land use designation for a site. (*Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490; see also *San Franciscans Upholding the Downtown Plan v. City & County of San Francisco* (2002) 102 Cal.App.4th 656; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 719.)

2.3.2, *Air Quality*; 2.3.12.2, *Off-Airport Transportation*; 2.3.7.2, *Safety*; and 2.3.1, *Aesthetics*, of this chapter.

Changes in Development

The LAWA Staff-Recommended Alternative includes various components that are particularly pertinent to the analysis of land use impacts. These components are the relocation of Runway 6L/24R 260 feet north; extension of Runway 6R/24L; construction of a new Intermodal Transportation Facility (ITF); public parking and a Consolidated Rental Car Facility (CONRAC) within Manchester Square; employee parking in the existing Avis Rent-A-Car lot (east of lot C); a commercial vehicle holding lot; and construction of an elevated Automated People Mover (APM) primarily along 98th Street, to connect Manchester Square, the ITF, and stations within the Central Terminal Area (CTA), with a planned connection to the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards; realignment of Lincoln Boulevard to the north with a portion below grade and covered; and modifications to navigational aids in the Dunes.

To accommodate airfield, terminal, ground access, and parking improvements, this alternative would acquire approximately 26 acres of primarily airport-related uses, such as parking, transportation, and rental car facilities, and would convert a site owned by the Los Angeles Unified School District (LAUSD), and currently occupied by two charter schools, to airport uses, as presented in **Table SRA-2.3.9-1**. The locations of the acquisition areas and school site associated with the LAWA Staff-Recommended Alternative are shown in Figure 2-12, in Chapter 2, *Project Description*, of the SPAS Draft EIR. As shown in Figure 2-12, the area to be acquired is between 96th and 98th Streets, west of Airport Boulevard. Upon acquisition, this area would be used for the ITF. The 5-acre LAUSD-owned site is located within Manchester Square and includes two charter schools (Bright Star Secondary Charter Academy and Stella Middle Charter Academy). Under the LAWA Staff-Recommended Alternative, this area would be developed as airport parking and a CONRAC. The need, if any, for acquisition associated with changes in the Runway 6L/24R RPZ would be determined by FAA in later stages of planning and, therefore, is not addressed in this EIR. However, Section 2.3.7.2, *Safety*, of this chapter, identifies land uses within the RPZ.

ac = acres

[1] The two charter schools are Bright Star Secondary Charter Academy (grades 9-12) and Stella Middle Charter Academy (grades 5-8), with a respective 2011-2012 enrollment of 246 and 505 students.
[2] All totals are approximate.

Source: City of Los Angeles, Los Angeles World Airports, LAX Master Plan Program Alternative D Draft Relocation Plan, April 2004.

Implementation of the LAWA Staff-Recommended Alternative would result in the removal of some community-serving uses within the eastern portions of the airport on property owned by LAWA, including an urgent care facility, Burger King Restaurant, Travelodge Hotel, Denny's Restaurant, and Avis Rental Car facility in order to accommodate ground access, parking, and rental car facilities.

Consistency with Land Use Plans - On-Airport Land

LAX Plan

The LAX Plan is the community plan that establishes the land use policy framework for LAX and it is also a part of the City General Plan. The proposed airfield, concourse, and terminal improvements, commercial vehicle holding lot, parking areas, and CONRAC are consistent with the corresponding Airport Airside and Airport Landside land use designations shown on the LAX Plan. While the LAWA Staff-Recommended Alternative would be consistent with the LAX Plan, this alternative includes the following amendments to ensure precise consistency with the LAX Plan. Figures 1 and 2 of the LAX Plan would be amended to reflect the relocation of Runway 6L/24R 260 feet north, easterly extension of Runway 6R/24L, realignment of Lincoln Boulevard and related conversion of a small portion of area designated as LAX Northside to Airport Airside, as well as modifications to the airport boundaries associated with the smaller acquisition area of the LAWA Staff-Recommended Alternative as compared to the approved LAX Master Plan. In addition, the listing of uses within the Airport Landside area, and policies specifically associated with these uses, would be amended to reflect the elimination of Yellow Light and non-Yellow Light Projects associated with the LAX Master Plan (specifically, restricted access within the CTA; the GTC; ITC; the location of the CONRAC; APM 1 between the ITC, CONRAC, and CTA; and West Employee Parking facility).

The relocation of Runway 6L/24R would require changes to navigational aids within the Dunes Specific Plan Area, which is designated as Open Space in the LAX Plan. Development within Open Space is limited to existing and relocated navigational aids. Since the planned navigational aids would be similar in function and number to the existing facilities and a Habitat Restoration Plan (HRP) is underway as part of the approved LAX Master Plan, this use would be consistent with the Open Space designation of the LAX Plan, as further described below for the Dunes Specific Plan.

Therefore, as changes to on-airport facilities under the LAWA Staff-Recommended Alternative would be consistent with underlying LAX Plan land use designations, with amendment of the plan to reflect the changes noted above and ensure precise consistency, no conflicts with land use designations would occur.

The LAWA Staff-Recommended Alternative would be consistent with the goals and corresponding policies of the LAX Plan. The airfield, terminal, and ground access improvements would strengthen the role of LAX in the regional network and contribute to the local economy (Goals 1 and 3, respectively), while enhancing safety and security (Goal 2) by improvements in airfield design, decentralization of parking and ground access facilities, and provision of more queuing space for vehicles through the redesigned entryway, which would provide additional space for security screening. The LAWA Staff-Recommended Alterative would be consistent with Goal 4 by reducing the amount of acquisition required as compared to the LAX Master Plan, and limiting improvements within the Dunes to the required relocation of navigational aids. Under this alternative, LAX Master Plan measures would be incorporated into project design, and measures would be implemented to reduce air quality impacts (see Section 2.3.2, *Air Quality*, of this chapter). Consistent with Goal 5 to promote neighborhood compatibility, with the displaced landing threshold on Runway 6L/24R associated with this alternative, residences would no longer be located within the runway RPZ. Consistency with Goal 5 would also be achieved through the use of airport buffer areas, landscaping, and ongoing coordination with surrounding residences and property owners. Finally, the LAWA Staff-Recommended Alternative would be consistent with Goal 6 to improve ground access to LAX through a secure and efficient ground connection system and redirecting traffic away from local roads. Traffic to the CTA on local roadways would benefit from the development of parking and a CONRAC facility within Manchester Square, the ITF, and an APM between these facilities, as well as provision of a connection to the future Metro LAX/Crenshaw Light Rail Transit Station.

The LAWA Staff-Recommended Alternative would also be consistent with policies associated with the Airport Airside, Airport Landside, LAX Northside, and Open Space land use designations. Within the Airport Airside land use designation, the LAWA Staff-Recommended Alternative would develop a balanced airfield (P1), restrict the number of gates to 153 (P2), and improve parking, including employee parking (P3) through proposed airfield and ground access improvements. Proposed improvements are not located in proximity to residential areas (P4).

Regarding Airport Landside policies, as addressed later in this section, the LAWA Staff-Recommended Alternative would not result in significant land use incompatibilities with adjacent land uses (P1) and would not be located adjacent to residential areas (P6). In addition, the LAWA Staff-Recommended Alternative supports the intent of Airport Landside Policies P2, P3, and P4 by providing an APM that connects parking and a CONRAC facility within Manchester Square, the ITF, and the CTA, and links these facilities to the future Metro LAX/Crenshaw Light Rail Transit Station and the regional ground transportation network. This alternative also provides adequate parking facilities (P5).

Within LAX Northside, no changes are proposed with the exception of the Lincoln Boulevard realignment. Although this would reduce the amount of commercial areas proposed for development within LAX Northside east of Lincoln Boulevard, a landscaped buffer area would still be retained between LAX Northside and residential uses to the north (P1). Additional discussion of LAX Northside is provided below under the heading LAX Specific Plan.

As previously described, the LAWA Staff-Recommended Alternative would be consistent with Open Space Policies P1 and P2 to protect and restore habitat areas, since implementation of an HRP to complete restoration in the Dunes would be required in association with relocation of navigational aids.

The LAWA Staff-Recommended Alternative would be consistent with policies related to safety, by providing runway realignment and taxi separation for larger aircraft maneuvering areas and clearances (P1), adequate aircraft queue space (P2), and a center taxiway (P3); relocation of Terminal 3 to provide for improved taxiway spacing (P5); and RPZs in conformance with FAA safety requirements (P7 and P8).

Based on the above, the LAWA Staff-Recommended Alternative would be consistent with policies of the LAX Plan, with precise consistency supported through the specified amendments to the LAX Plan. Therefore, impacts would be less than significant.

LAX Specific Plan

The LAX Specific Plan provides regulatory controls and ensures the orderly development of LAX and LAX Northside, consistent with the LAX Plan. The proposed airfield, concourse, and terminal improvements,

commercial vehicle holding lot, parking areas, APM, and CONRAC under the LAWA Staff-Recommended Alternative are consistent with the corresponding LAX-A Zone: Airport Airside Sub-Area and LAX-L Zone: Airport Landside Sub-Area as shown on the LAX Specific Plan. While the LAWA Staff-Recommended Alternative would be consistent with the LAX Specific Plan, this alternative includes amendments to ensure precise consistency with the LAX Specific Plan. The movement of Runway 6L/24R 260 feet to the north and the related realignment of Lincoln Boulevard would occur within most of Area 8 and a portion of Area 9 of the LAX Northside Sub-Area south of Westchester Parkway.[38] The realignment would reduce the use of Areas 8 and 9 for future development, and would require the relocation of an existing radar tower in Area 9. Since land uses proposed within LAX Northside would be affected, an amendment to the LAX Specific Plan would be included with the LAWA Staff-Recommended Alternative. In addition, Map 1 and Map 2 would be amended to reflect modifications to the airport boundaries associated with the smaller acquisition area of the LAWA Staff-Recommended Alternative as compared to the approved LAX Master Plan. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the LAX Specific Plan, with precise consistency supported through the specified amendments to the LAX Specific Plan. Therefore, impacts would be less than significant.

Los Angeles Airport/El Segundo Dunes Specific Plan

The Dunes Specific Plan[39] limits development within the Dunes and establishes a Dune Habitat Preserve. As stated in the Dunes Specific Plan, existing airport navigational and safety facilities are permitted within the Dune Habitat Preserve and development of additional navigational and safety facilities, to the extent consistent with federal requirements, requires a Coastal Development Permit.[40] Although this alternative would require changes to navigational aids within the Dune Habitat Preserve, the application for, and review and approval of, a Coastal Development Permit would include provisions for the preservation of habitat values (i.e., sensitive dune habitat is recognized as Environmentally Sensitive Habitat Area (ESHA), which are afforded special protection under Section 30240 the California Coastal Act). Furthermore, implementation of LAX Master Plan and proposed SPAS mitigation measures would ensure the conservation, enhancement, and restoration of state-designated sensitive habitat, as well as the protection of sensitive species in the Dunes, as described in Section 2.3.3, *Biological Resources*, of this chapter. Therefore, the LAWA Staff-Recommended Alternative would be consistent with the Los Angeles Airport/El Segundo Dunes Specific Plan, and impacts would be less than significant.

LAX Street Frontage and Landscape Development Plan Update

The LAWA Staff-Recommended Alternative would be subject to the design standards and review procedures presented in the LAX Street Frontage and Landscape Development Plan Update. Implementation of new airfield, terminal, and ground access improvements carried out in compliance with the Landscape Development Plan, would be consistent with the objectives of the plan relating to the enhancement of 1) the visual and aesthetic appeal of streets, buffer areas, and open spaces surrounding LAX; 2) pedestrian, bicycle, and vehicular circulation on streets internal to and surrounding LAX; and 3) LAX's compatibility with adjacent land uses, neighborhoods and communities. Additional aesthetic features of the Landscape Development Plan, as they relate to the LAWA Staff-Recommended Alternative and its perimeter, are also discussed in Section 2.3.1, *Aesthetics*, of this chapter and include the preparation of a Neighborhood Compatibility Program (NCP), which outlines interface treatments along the airport perimeter for the purpose of "ensuring that the airport complements surrounding properties and neighborhoods" and addresses issues relating to compatibility (i.e., landscape buffers,

---

38 Under the currently adopted LAX Specific Plan, Areas 8 and 9 of LAX Northside are designated for commercial uses. Under the proposed LAX Northside Plan Update, Areas 8 and 9 are designated as Airport Support, because their potential commercial uses is limited, due to the close proximity to the LAX north airfield and associated noise impacts, safety requirements, and height restrictions.

39 City of Los Angeles, Department of City Planning, Los Angeles Airport/El Segundo Dunes Specific Plan (Ordinance No. 167,940), June 28, 1992, amended by Ordinance 169,767, approved August 6, 1994.

40 In addition to, and separate from, the requirement for a Coastal Development Permit, federal approval(s) of any improvements within the Dunes (i.e., the Coastal Zone) would require a Coastal Act Consistency Determination/Consistency Certification - see Section 2.3.4, *Coastal Resources*, of this chapter.

noise, light spillover, odor, and vibration). These entail the provision and maintenance of landscaped buffer areas along the northerly boundary area of the airport, which include setbacks, landscaping, screening, or other appropriate view-sensitive measures with the goal of avoiding land use conflicts, shielding lighting, enhancing privacy, and better screening views of airport facilities from adjacent residential uses; locating airport uses and activities with the potential to adversely affect nearby residential land uses through noise, light spillover, odor, vibration, and other consequences of airport operations and development, as far from adjacent residential neighborhoods, as feasible; and providing community outreach efforts to property owners and occupants when new development on airport property is in proximity to and could potentially affect nearby residential uses. Furthermore, the Landscape Development Plan identifies street, landscaping, and neighborhood compatibility requirements specific to the main types of Master Planned projects and/or land uses, including LAX gateways and entry corridors, passenger terminals and facilities, airfield/open space areas, parking lots and parking structures, and the LAX Northside Plan area. Provisions of the Landscape Development Plan would be implemented for the LAWA Staff-Recommended improvements, through conformance with standard LAWA plan and design review procedures. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the LAX Street Frontage and Landscape Development Plan Update and, therefore, impacts would be less than significant.

Acquisition and Relocation

The businesses proposed for acquisition under the LAWA Staff-Recommended Alternative are identified within the LAX Master Plan Draft Relocation Plan. As such, they would be eligible for relocation assistance as described in LAX Master Plan Commitment RBR-1, Residential and Business Relocation Program. LAX Master Plan Mitigation Measures MM-RBR-1, Phasing for Business Relocations, and MM-RBR-2, Relocation Opportunities through Aircraft Noise Mitigation Program, would also serve to identify suitable relocation sites. Furthermore, the acquired areas would be subject to LAX Master Plan Commitment LU-2, Establishment of a Landscape Maintenance Program for Parcels Acquired Due to Airport Expansion, which requires that, following demolition, these areas would be fenced, landscaped, and maintained if there are delays in development for airport purposes.[41]

With implementation of the LAWA Staff-Recommended Alternative, existing leases for the urgent care facility, Travelodge Hotel, Burger King Restaurant, Denny's Restaurant, and Avis Rental Car facility would be terminated; these businesses are not subject to relocation provisions, as they are located on LAWA property. Relocation of these uses would be a business decision. The sites of the businesses affected by development of the LAWA Staff-Recommended Alternative would also be subject to LAX Master Plan Commitment LU-2, Establishment of a Landscape Maintenance Program incorporated in the LAX Street Frontage and Landscape Development Plan Update.

The acquisition areas presented in **Table SRA-2.3.9-1** above are all located within the boundaries of the LAX Plan and LAX Specific Plan, within land use and zoning designations of LAX Plan-Airport Landside and LAX Specific Plan LAX-L Zone: Airport Landside Sub-Area, which corresponds with the land uses proposed for these sites under the LAWA Staff-Recommended Alternative. Therefore, no changes to existing General Plan or zoning designations are required and no General Plan or zoning inconsistencies would occur, and impacts would be less than significant.

Consistency with Land Use Plans - Off-Airport Land

SCAG 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

The RTP/SCS has mobility as an important component of sustainability and integrated planning. The LAWA Staff-Recommended Alternative would be consistent with the policy framework of the RTP/SCS aviation forecast, as it would improve the transportation system without changing the practical capacity of LAX from 78.9 MAP, the same practical capacity included in the approved LAX Master Plan.

[41] These requirements are also incorporated in the LAX Street Frontage and Landscape Development Plan Update.

The LAWA Staff-Recommended Alternative would also be consistent with other policies of the RTP/SCS by providing substantial ground access improvements, including the modification of Sky Way, parking within a portion of Manchester Square, and development of an elevated APM along 98th Street connecting the CTA, the proposed ITF, and the future Metro LAX/Crenshaw Light Rail Transit Station near Century and Aviation Boulevards, while also providing connectivity to other public transit. Regional aviation demand forecasts and policies developed for the RTP/SCS are presented below in the discussion of the AAGA Appendix. Consistency with the majority of the policies presented in the AAGA Appendix, and incorporation of LAX Master Plan commitments and mitigation measures, would avoid potential conflicts with RTP/SCS policies. Therefore, the LAWA Staff-Recommended Alternative would be consistent with the RTP/SCS, and impacts would be less than significant. Please also see Response to Comment SPAS-AR00001-2 in Chapter 3, *Comments and Responses*, of Part II of this Final EIR which includes a table that analyzes the consistency of the SPAS alternatives, including the LAWA Staff-Recommended Alternative, with Goals 1 through 9 of the RTP/SCS.

SCAG 2012-2035 RTP/SCS Aviation and Airport Ground Access Appendix

As indicated in Section 4.9.3.1 of the SPAS Draft EIR, SCAG's adopted Aviation Decentralization Strategy calls for making substantial airport ground access improvements throughout the region, with the short-term program emphasizing the relief of bottlenecks around airports through arterial, intersection, and interchange improvements, and increasing transit access to the airports. As discussed above, the LAWA Staff-Recommended Alternative includes substantial ground access and transit improvements in the areas surrounding LAX, which would further the AAGA Appendix policies regarding Airport Land Use Compatibility and Environmental Impacts, as well as the broader RTP/SCS goals pertaining to mobility, accessibility, and productivity of the transportation system, as the additional improvements to arterials, intersections, and interchanges would continue to be supported and implemented in the areas surrounding LAX. Additional consistency discussion of the LAWA Staff-Recommended Alternative with applicable policies is provided in Appendix I-1, *Land Use and Planning* of the SPAS Draft EIR.[42] Furthermore, because the LAWA Staff-Recommended Alternative would not change activity levels at LAX, it would not conflict with policies focused on decentralization of aviation demand and promoting the use of airports in less populated areas.

The airport ground access project list in the AAGA Appendix contains major projects at and around LAX which have been completed, and progress with regards to the improvement of additional arterials, intersections, and interchanges is ongoing. The AAGA Appendix also proposes a new list of ground access improvement projects around LAX for 2012-2035.[43] In addition to these proposed and ongoing roadway improvements, the ground access improvements proposed under the LAWA Staff-Recommended Alternative would include the modification of Sky Way, parking within a portion of Manchester Square, and development of an APM connecting the CTA, the ITF, Manchester Square, and the future Metro LAX/Crenshaw Light Rail Transit Station near Century and Aviation Boulevards, while also providing connectivity to other public transit. Therefore, the LAWA Staff-Recommended Alternative would be consistent with the relevant policies and projects included in the AAGA Appendix, and impacts would be less than significant.

SCAG 2004 Compass Blueprint Growth Vision

The LAWA Staff-Recommended Alternative would be consistent with the underlying goals of the Growth Vision plan, through improvements within a Compass 2% Strategy Opportunity Area. As discussed above, development of the LAWA Staff-Recommended Alternative would involve major ground access improvements that would serve to further Growth Vision principles in the Compass 2% Strategy Opportunity Areas, therefore demonstrating consistency with SCAG's core principles, which are intended

---

42 The analysis of the LAWA Staff-Recommended Alternative in Appendix I-1 is provided under the designations of "Alternative 1" and "Alternative 9."

43 Southern California Association of Governments, 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy: Aviation and Airport Ground Access Appendix, adopted April 4, 2012, Available: http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_Aviation.pdf, accessed April 2012, pp. 122-124.

to improve mobility for all residents, foster livability in all communities, enable prosperity for all people, and promote sustainability for future generations. Implementation of the LAWA Staff-Recommended Alternative would improve mobility for residents and foster livability in nearby communities by constructing ground access improvements and providing transit connectivity, including the modification of Sky Way, parking within a portion of Manchester Square, and development of an APM connecting the CTA, the ITF, Manchester Square, and the future Metro LAX/Crenshaw Light Rail Transit Station. Implementation of the LAWA Staff-Recommended Alternative would enable prosperity by improving LAX airfield facilities, terminal facilities, and surface transportation systems, which would increase employment and foster economic growth. Additional discussion of consistency of LAWA Staff-Recommended Alternative with applicable Growth Vision principles is provided in Appendix I-1, *Land Use and Planning*, of the Draft EIR.

In addition, implementation of ground access improvements proposed under the LAWA Staff-Recommended Alternative would promote sustainability by focusing development in an existing urban center and would be integrated with existing and future public transit facilities, including but not limited to, the Crenshaw/LAX Transit Corridor, which is part of Metro's regional light rail/transit system, that would reduce vehicle miles traveled (VMT) by supporting alternative means of travel to and from LAX and other areas. Furthermore, terminal and other facility improvements would be designed in compliance with LAWA's Sustainability Plan and incorporate applicable performance standards in LAWA's Sustainable Airport Planning, Design and Construction Guidelines.[44] The replacement of old and inefficient terminal buildings and mechanical systems with new buildings, which incorporate state of the art energy-efficient materials and systems, would further promote sustainability. The LAWA Staff-Recommended Alternative would be consistent with the Growth Vision plan, and impacts would be less than significant.

Los Angeles County Airport Land Use Plan

As described in Section 4.9.3.1 of the SPAS Draft EIR, the ALUP provides policies to promote land use compatibility and limit noise and safety conflicts in areas surrounding airports. The LAWA Staff-Recommended Alternative, including proposed airfield, terminal, and ground access improvements, would require an amendment to, and determination of consistency with, the approved ALUP. The proposed airfield improvements would be designed in conformance with FAA safety requirements, as set forth in FAR Part 77, and would be consistent with ALUP policies that address RPZs and limit uses within these zones. For more information regarding RPZs and navigation, refer to the Section 4.7.2, *Safety*, of the SPAS Draft EIR.

The LAWA Staff-Recommended Alternative would not conflict with the general and noise-related policies of the ALUP. These policies focus on ensuring that new development in areas surrounding the airport is compatible with airport operations, encouraging the land recycling of incompatible uses, and encouraging local agencies to inform prospective property owners of aircraft noise exposure in areas where high noise levels exist or are anticipated. Although some areas would be newly exposed to high noise levels, LAWA would continue to adhere to the guidelines of the California Airport Noise Standards and make progress towards achieving full compatibility of all eligible land uses affected by aircraft noise under the ANMP, in compliance with ALUP policy.[45,46] As the LAWA Staff-Recommended Alternative includes amendments to the LAX Specific Plan, a review and consistency determination by the ALUC would be required, as described in Section 4.9.3.1, Regional and State Plans, of the SPAS Draft EIR. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the policies of the ALUP, and impacts would be less than significant.

---

44 LAWA's Sustainable Airport Planning, Design and Construction Guidelines and included checklists are currently being revised to ensure consistency with the recent changes to the State building code and the Los Angeles Green Building Ordinance.

45 LAX operates under a variance to the California Airport Noise Standards (Noise Standards) that was effective February 13, 2011 and was issued for a period of three years. The variance remains in effect so long as LAWA submits another application one month prior to the expiration date and continues to demonstrate that programs are being implemented to reduce noise impacts.

46 California Department of Transportation, "In the Matter of the Noise Variance Application of: City of Los Angeles, Los Angeles World Airports (Los Angeles International Airport)," Case No. L2010041216, ordered January 14, 2011, decision effective date February 13, 2011.

2011 Caltrans California Airport Land Use Planning Handbook

The LAWA Staff-Recommended Alternative would be consistent with the objectives of the Caltrans Handbook. With regard to the noise objective, which seeks to minimize the number of people exposed to frequent and/or high levels of aircraft noise capable of disrupting noise-sensitive uses, LAWA would continue to implement residential soundproofing under the ANMP. Concerning the overflight objective, which requires notification of people near airports of the presence of overflights in order to minimize or avoid annoyance associated with these conditions, LAWA would continue with programs in place which make available to the public information regarding the presence of overflights through the LAX Internet Flight Tracking System and Early Turn Notification Program. LAWA also provides the ability for residents and others to voice complaints regarding aircraft noise through the noise complaint hotline or online.[47] The Caltrans Handbook safety objective, which seeks to minimize risks associated with potential aircraft accidents by providing for the safety of people and property on the ground, and by enhancing the chances of survival of the occupants or aircraft involved in an accident, would be supported through implementation of runway, taxiway, taxilane, and other airfield improvements. In addition, the airspace protection objective, which seeks to avoid development of land use conditions that could pose hazards to flight and increase the risk of an accident occurring, would be upheld through compliance with requirements and criteria related to airspace obstructions, and through conformance with guidelines on the avoidance of wildlife.[48] In regard to airspace obstructions, the LAWA Staff-Recommended Alternative would avoid safety hazards that could result in incompatible land uses through compliance with City of Los Angeles Planning and Zoning Code, Section 12.50, Airport Approach and Zoning Regulations and FAR Part 77.[49,50] These regulations establish development restrictions and building height limits to minimize hazardous occurrences. The need, if any, for acquisition or other appropriate measures associated with changes in the RPZs will be determined by the FAA in later stages of planning and therefore are not addressed in this EIR. However, Section 2.3.7.2, *Safety*, of this chapter identifies land uses within the RPZ. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the objectives of the Caltrans Handbook and, therefore, impacts would be less than significant.

City of Los Angeles

Los Angeles Citywide General Plan Framework

The City of Los Angeles General Plan Framework's primary objective is to support the viability of the City's residential neighborhoods and commercial districts, particularly by encouraging sustainable growth in proximity to transportation corridors and transit stations. The LAWA Staff-Recommended Alternative would support this primary objective of the Framework by implementing the proposed airfield, terminal, and ground access improvements. Ground access improvements would be in proximity to transportation corridors surrounding LAX, such as Lincoln Boulevard and Century Boulevard, and the new connection to the LAX/Metro Light Rail Station would be developed along Aviation Boulevard and 98th Street, thereby encouraging sustainable growth in the City's commercial districts.

Policy 7.3.4 of the Economic Development Chapter of the Framework Element is to recognize the crucial role that LAX plays in future employment growth by supporting planned airport expansion and modernization that mitigates its negative impacts. Development of the LAWA Staff-Recommended

---

47 City of Los Angeles, Los Angeles World Airports, LAX Noise Management, Available: http://www.lawa.org/welcome_lax.aspx?id=788, accessed January 2012.

48 California Department of Transportation, "In the Matter of the Noise Variance Application of: City of Los Angeles, Los Angeles World Airports (Los Angeles International Airport)," Case No. L2010041216, ordered January 14, 2011, decision effective date February 13, 2011.

49 14 CFR, FAR Part 77, Safe, Efficient Use and Preservation of the Navigable Airspace, Subpart C, "Standards for Determining Obstructions to Air Navigation or Navigational Aids or Facilities."

50 Los Angeles Municipal Code, Planning and Zoning Code, Article 2, Specific Planning - Zoning, Comprehensive Zoning Plan, Section 12.50, "Airport Approach Zoning Regulations."

Alternative would implement this policy by modernizing airfield, terminal, and ground access facilities at LAX, while mitigating impacts, resulting in future economic and employment growth.

Objective 3.9 of the Land Use Chapter of the Framework Element is to reinforce existing and encourage new community centers which accommodate a broad range of uses that serve the needs of adjacent residents, promote neighborhood and community activity, are compatible with adjacent neighborhoods, and are developed to be desirable places in which to live, work, and visit, both in daytime and nighttime. The LAWA Staff-Recommended Alternative would not have an effect on this objective since development within the Lincoln Boulevard/Manchester Boulevard Community Center would be limited to the realignment of Lincoln Boulevard, which is not located adjacent to existing commercial or residential areas.

Objective 3.10 of the Land Use Chapter of the Framework Element calls for reinforcing existing regional centers that accommodate a broad range of uses that serve, provide job opportunities, and are accessible to the region, and are compatible with adjacent land uses and are developed to enhance urban lifestyles. The ground access improvements planned under the LAWA Staff-Recommended Alternative --including parking within a portion of Manchester Square, the ITF, and the APM that would link these uses to the CTA and to the future Metro LAX/Crenshaw Light Rail Transit Station near Century and Aviation Boulevards--would be located within the designated LAX/Century Boulevard Regional Center. By contributing to a hub of regional bus and rail transit both day and night, the ground access improvements proposed would directly support development of the Regional Center concept.

The Framework Open Space and Conservation Chapter includes a Citywide Greenways Network that shows an open space system established for active and passive recreational uses that includes portions of the Dunes, Dockweiler State Beach, and Vista del Mar. Under the LAWA Staff-Recommended Alternative, the only changes proposed within the Dunes are changes in navigational aids. The LAX Plan, which designates the Dunes as Open Space, limits uses to existing and relocated navigational aids, restoration and maintenance of the Dunes Habitat Reserve, a park, and other ancillary facilities. The policies that guide development in the area set a priority for protecting existing state-designated sensitive habitat areas and providing sites for habitat restoration or replacement with native habitat. The LAWA Staff-Recommended Alternative would not change uses in the Dunes and would therefore be consistent with the Framework's recommendation for active or passive recreational uses in this area. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the Framework Element and, therefore, impacts related to conflicts with plans and regulations would be less than significant.

City of Los Angeles Transportation Element

The LAWA Staff-Recommended Alternative would involve ground access improvements, including alterations to the existing circulation system. Changes to the surrounding roadways and transportation system, and their associated potential impacts, are discussed further in Section 2.3.12.2, *Off-Airport Transportation*, of this chapter. Roadway realignments, changes, and additions, once approved as an amendment to the Transportation Element would ensure precise consistency with the Transportation Element.

Implementation of the ground access features of the LAWA Staff-Recommended Alternative would be consistent with Policy 5.4 of the Transportation Element, regarding the establishment of master plans, including ground access plans, to guide future development of LAX. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the Transportation Element, and impacts related to conflicts with plans and regulations would be less than significant.

City of Los Angeles 2010 Bicycle Plan

The 2010 Bicycle Plan contains goals, objectives and policies aimed at promoting bicycling in the City and in the LAX Master Plan area, including the creation of the Backbone Network and the Neighborhood Network, which would link Regional Centers in the City. The 2010 Bicycle Plan updates the Bicycle Plan referenced in LAX Master Plan Commitment LU-5, Comply with City of Los Angeles Transportation Element Bicycle Plan.

The LAWA Staff-Recommended Alternative improvements, including the parking facility and CONRAC in Manchester Square and the ITF, would include provisions for bicycle parking and, therefore, would be consistent with the 2010 Bicycle Plan's main objectives, including Policy 1.2.3 (to increase the supply of quality bicycle parking), Policy 1.3.2 (to maximize bicycle amenities at transit stops, including the creation of Clean Mobility Hubs/Bicycle Commuter Centers) and Policy 2.3.5 (maintenance of safe bikeways, in coordination with City agencies). The LAWA Staff-Recommended Alternative would not conflict with the existing or planned bicycle lanes/paths in the LAX area, including those along Pershing Drive, Imperial Highway, Westchester Parkway, Sepulveda Boulevard, Century Boulevard, Vicksburg Avenue, Jenny Avenue, and Aviation Boulevard. Although the LAWA Staff-Recommended Alternative includes the realignment of Lincoln Boulevard, with a portion covered and below grade, the 2010 Bicycle Plan does not limit the use of bicycles in tunnels, which are an acceptable option for providing continuity of the bikeway network.[51] While the LAWA Staff-Recommended Alternative would be consistent with the 2010 Bicycle Plan, the realignment of Lincoln Boulevard (identified as a future Backbone Bikeway Network) would be included as amendments to the 2010 Bicycle Plan, including the Designated Bikeways Map to ensure precise consistency. Furthermore, LAX Master Plan Commitment LU-5, Comply with City of Los Angeles Transportation Element Bicycle Plan ensures bicycle access and parking facilities will be provided at ground access facilities and parking outside the CTA, to the extent feasible; and provide bicycle facilities, such as lockers and showers, where feasible, to promote employee bicycle use. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the 2010 Bicycle Plan. Therefore, impacts related to conflicts with plans and regulations would be less than significant.

City of Los Angeles Noise Element

The Noise Element contains goals, objectives, policies, and programs regarding transportation noise and land use compatibility in order to reduce airport-related noise impacts. The LAWA Staff-Recommended Alternative would be consistent with Objective 1, Policy 1.1, and related Programs P1, P2, P3 and Objective 3, Policy 3.1, and related Programs P11, P12, P13, P16, and P17 by participating in LAWA's current noise mitigation program. The LAWA Staff-Recommended Alternative would also include measures to address non-airport related noise (Objective 2) as described in Sections 2.3.10.2, *Road Traffic Noise*; 2.3.10.3, *Construction Traffic and Equipment Noise*; 2.3.10.4, *Transit Noise and Vibration*; and 2.4.10, *Cumulative Noise*, of this chapter. Although some areas would be newly exposed to high noise levels, LAWA would continue to adhere to the guidelines of the California Airport Noise Standards and make progress towards achieving full compatibility of all eligible uses affected by aircraft noise under the ANMP. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the City of Los Angeles Noise Element, and impacts related to conflicts with plans and regulations would be less than significant.

Westchester-Playa del Rey Community Plan

Implementation of the LAWA Staff-Recommended Alternative would be consistent with the goals and objectives of the Westchester-Playa del Rey Community Plan, by increasing safety, security, and efficient operational capabilities to serve passenger demand throughout the region. The LAWA Staff-Recommended Alternative would be consistent with Community Plan objectives created to address issues related to implementation of the LAX Master Plan, including Objective 20-1 to coordinate the development of LAX with that of Westchester-Playa del Rey and surrounding communities; Objective 20-2 to utilize land acquisition, buffering, transitional uses, and other effective measures to mitigate noise and other impacts to the Community Plan Area; Objective 20-3 to improve the system of transportation providing access to and within LAX and all of its ancillary facilities, in order to mitigate traffic impacts and congestion in the community; and Objective 20-4 to operate LAX in a manner that results in economic and other benefits for the Westchester-Playa del Rey community.

With regards to Objective 20-1, coordination of LAX development with the surrounding communities would continue through implementation of LAX Master Plan Commitment LU-4, Neighborhood

[51] City of Los Angeles, Department of City Planning, 2010 Bicycle Plan: A Component of the City of Los Angeles Transportation Element, adopted by Los Angeles City Council March 1, 2011, Chapter 3.

Compatibility Program, use of LAWA's website, public input opportunities through the environmental review process for individual LAX projects (including the SPAS EIR), and other ongoing outreach efforts through LAWA's LAX Master Plan Stakeholder Liaison Office. The LAWA Staff-Recommended Alternative would be consistent with Objective 20-2, as development would be subject to the design standards and review procedures presented in the LAX Street Frontage and Landscape Development Plan Update, and LAWA would implement LAX Master Plan Commitment LU-4, which include provisions to maintain a buffer between the airport and residents located in the communities of Westchester and Playa del Rey, as well as other provisions that serve to reduce or avoid airport-related impacts on the community. The ground access improvements proposed under the LAWA Staff-Recommended Alternative would be consistent with Objective 20-3, as the transportation system in the LAX area would be upgraded with ground access improvements, including an APM along 98th Street with connections to the CTA, the ITF, the future Metro LAX/Crenshaw Light Rail Transit Station, and other public transit. Objective 20-4 would be supported by the LAWA Staff-Recommended Alternative through the provision of economic opportunities associated with employment. As such, implementation of the LAWA Staff-Recommended Alternative would be consistent with the goals and objectives of the Community Plan and, therefore, impacts related to conflicts with plans and regulations would be less than significant.

South Los Angeles Community Plan

The South Los Angeles Community Plan includes policies to promote land use compatibility and preserve existing housing stock. The LAWA Staff-Recommended Alternative would not obstruct implementation of these policies. Although some areas would be newly exposed to high noise levels, LAWA would continue to adhere to the guidelines of the California Airport Noise Standards and make progress towards achieving full compatibility of all eligible uses affected by aircraft noise under the ANMP. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the policies of the South Los Angeles Community Plan, and impacts related to conflicts with plans and regulations would be less than significant.

West Adams-Baldwin Hills-Leimert Community Plan

The LAWA Staff-Recommended Alternative would be consistent with West Adams-Baldwin Hills-Leimert Community Plan policies related to residential land use compatibility. Furthermore, no areas would be newly exposed to high noise levels. Based on the above, the LAWA Staff-Recommended Alternative would be consistent with the policies of the West Adams-Baldwin Hills- Leimert Community Plan, and impacts related to conflicts with plans and regulations would be less than significant.

Incompatible Land Use

This analysis addresses the second significance threshold provided in Section 4.9.4 of the SPAS Draft EIR.

Noise

The environmental impacts of high noise levels on noise-sensitive uses under the LAWA Staff-Recommended Alternative are described here. This analysis identifies significant impacts on those noise-sensitive uses newly exposed to noise levels 65 CNEL or higher, increases of 1.5 CNEL or higher within the 65 CNEL or higher noise contours, and increases in noise levels below 65 CNEL compared to 2009 baseline conditions.

The acreage and number of residential uses and non-residential noise-sensitive facilities that would be exposed to noise levels of 65, 70, and 75 CNEL are presented in Table SRA-2.3.10.1-2, in Section 2.3.10.1, *Aircraft Noise*, of this chapter. Areas exposed to these high noise levels under the LAWA Staff-Recommended Alternative are also presented by jurisdiction and 65, 70, and 75 CNEL in Appendix I-2, *Land Use and Planning*, Table 5, and Table 6 of the SPAS Draft EIR.[52] These tables, as

[52] The analysis of the LAWA Staff-Recommended Alternative in Appendix I-2 is provided under the designation of "Alternative 1."

well as Table 1 and Table 2 in Appendix I-2, *Land Use and Planning*, of the SPAS Draft EIR provide the basis for comparison with 2009 baseline conditions.

Changes in Overall Noise Exposure

Shifts in the noise contours depicting changes in noise exposure from 2009 baseline conditions to the LAWA Staff-Recommended Alternative in 2025 are shown in **Figure SRA-2.3.9-1**. Compared to 2009 baseline conditions, the most notable changes under the LAWA Staff-Recommended Alternative would include an increase in noise exposure within the City of Inglewood and City of Los Angeles. As shown in Table SRA-2.3.10.1-2, under the LAWA Staff-Recommended Alternative, the overall net change in total area (on- and off-airport) exposed to 65 CNEL or higher noise levels in 2025 would increase by 1,450 acres compared to 2009 baseline conditions. Compared to 2009 baseline conditions, the overall number of incompatible land uses would be increased by 4,370 dwelling units, 13,160 residents, and 43 non-residential noise-sensitive facilities by 2025.

Newly Exposed Areas

Under the LAWA Staff-Recommended Alternative, some areas would be newly exposed to 65 CNEL or higher noise levels in 2025 compared to 2009 baseline conditions. Residential uses and non-residential noise-sensitive facilities newly exposed to 65 CNEL noise levels are presented in **Table SRA-2.3.9-2**. As shown in **Table SRA-2.3.9-2**, 4,918 dwelling units, 13,445 residents, and 44 non-residential noise-sensitive facilities would be newly exposed in 2025 compared to 2009 baseline conditions. Impacts on these noise-sensitive uses would be considered incompatible under Title 21. Also considered incompatible under Title 21 are all residential areas having habitable exterior areas including balconies, patios, and yards exposed to noise levels of 75 CNEL or higher (even if interior noise levels are reduced to 45 CNEL). This outdoor noise standard is also referenced in a more limited fashion under the 14 CFR Part 150 Land Use Compatibility Guidelines. As stated in 14 CFR Part 150, certain outdoor land uses, such as parks, that are exposed to noise levels above 75 CNEL may be considered incompatible. These standards recognize that high noise levels have the potential to affect outdoor speech and the quality of outdoor activities. Under this alternative, two parks and 4.07 acres (41 units) of residential uses would be newly exposed to noise levels of 75 CNEL or higher compared to 2009 baseline conditions. No schools would be newly exposed to these noise levels (see Appendix I-2, *Land Use and Planning*, Tables 7 and 8 of the SPAS Draft EIR). Although exposure of non-residential noise-sensitive facilities to outdoor noise levels in the 65 to 75 CNEL range is not considered to be a significant impact under CEQA, areas exposed to these noise levels would still have some impact on outdoor speech and the quality of outdoor activities. With implementation of LAX Master Plan Mitigation Measure MM-LU-1, these impacts would be less than significant with the exception of interim impacts prior to completion of noise insulation or land recycling, and impacts on residential uses with outdoor private habitable areas, or parks that would be newly exposed to noise levels of 75 CNEL or higher. These residual impacts would remain significant.

Increases in 1.5 CNEL

Some noise-sensitive uses would experience a noise increase of 1.5 CNEL or higher within the 65 CNEL or higher noise contours in 2025. The number of residential units, population, and non-residential noise-sensitive facilities experiencing this level of noise increase within the 65 CNEL contour in 2025 compared to 2009 baseline conditions is presented in **Table SRA-2.3.9-3**. As shown in **Table SRA-2.3.9-3**, 5,296

dwelling units, 13,608 residents, and 48 non-residential noise-sensitive facilities would experience substantial noise level increases in 2025. A listing of noise-sensitive receptors that would be newly exposed to 65 CNEL or higher noise levels or experience a 1.5 CNEL or higher increase within the 65 CNEL or higher noise contours as a result of the LAWA Staff-Recommended Alternative compared to 2009 baseline conditions is presented in Table 10 in Appendix I-2, *Land Use and Planning*, of the SPAS Draft EIR. With implementation of LAX Master Plan Mitigation Measure MM-LU-1, these impacts would be less than significant with the exception of interim impacts prior to completion of noise insulation or land recycling, and impacts on residential uses with outdoor private habitable areas, or parks that would be newly exposed to noise levels of 75 CNEL or higher. These residual impacts would remain significant.

Increase In Noise Levels Below 65 CNEL

As presented in Section 2.3.10.1, *Aircraft Noise*, of this chapter, under the LAWA Staff-Recommended Alternative, two non-residential noise-sensitive facilities (places of worship) would be exposed to increases of 3 CNEL between 60 and 65 CNEL. Both of these uses are located in the City of Los Angeles in the Westchester community. No noise-sensitive uses would be exposed to increases of 5 CNEL or higher below 60 CNEL.

Noise Exposure Effects by Jurisdiction

Noise exposure effects for residential uses and non-residential noise-sensitive facilities exposed to 65 CNEL or higher noise levels, 1.5 CNEL or higher increases at or above 65 CNEL, and 75 CNEL under the LAWA Staff-Recommended Alternative are presented by jurisdiction in **Table SRA-2.3.9-4**.

Table SRA-2.3.9-4

LAWA Staff-Recommended Alternative - Residential Uses and Non-Residential Noise-Sensitive Facilities Noise Exposure Effects by Jurisdiction (Compared to Baseline 2009 Conditions)

Impact Category	LA City	LA County	El Segundo	Inglewood	Hawthorne
65 CNEL					
Change in Acres Exposed[1]	443	243	128	514	0

[2] The number of non-residential noise-sensitive facilities exposed to 65 CNEL and higher and/or 1.5 CNEL increase above 65 CNEL is derived from Appendix I-2, *Land Use and Planning*, Table 10 of the SPAS Draft EIR.

Source: PCR Services Corporation, 2012.

2.3.9.2 Mitigation Measures

Implementation of LAX Master Plan Commitments LU-2 and RBR-1, and LAX Master Plan Mitigation Measures MM-RBR-1 and MM-RBR-2 would ensure that impacts relative to acquisition and relocation and other affected parcels on LAWA property (LAX Master Plan Commitment LU-2 only) associated with the LAWA Staff-Recommended Alternative would be less than significant. Implementation of LAX Master Plan Commitments LU-4, and LU-5 would ensure the impacts related to plan consistency associated with the LAWA Staff-Recommended Alternative would be less than significant. In addition, amendments to the LAX Plan and LAX Specific Plan; amendments to the City of Los Angeles Transportation Element; and amendments to the City of Los Angeles Bicycle Plan are included, and would ensure precise consistency with these plans. As consistency with these plans would be supported through these amendments, no mitigation measures associated with plan inconsistencies are required.

Implementation of LAX Master Plan Mitigation Measure MM-LU-1 would reduce, but not eliminate, aircraft noise impacts on residential uses and non-residential noise-sensitive facilities newly exposed to noise levels of 65 CNEL or higher associated with the LAWA Staff-Recommended Alternative. No additional mitigation measures are available to address aircraft noise.

2.3.9.3 Level of Significance After Mitigation

LAX Master Plan commitments and mitigation measures would reduce aircraft noise impacts associated with the LAWA Staff-Recommended Alternative. However, certain residential uses and non-residential noise-sensitive facilities affected by aircraft noise would still be exposed to high noise levels due to interim impacts prior to completion of noise insulation or land recycling. In addition, parks and certain residential uses with outdoor private habitable areas would be newly exposed to noise levels of 75 CNEL or higher. As such, residual aircraft noise impacts for the LAWA Staff-Recommended Alternative are considered to be significant and unavoidable.

2.3.10 Noise

2.3.10.1 Aircraft Noise

2.3.10.1.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to aircraft noise are only associated with the airfield components of Alternative 1, as evaluated in Section 4.10.1.6 of the SPAS Draft EIR. The evaluation of aircraft noise impacts (under the threshold provided in Section 4.10.1.4.1 of the SPAS Draft EIR) includes a comparison of aircraft noise levels associated with completion of the LAWA Staff-Recommended Alternative by 2025 to the aircraft noise levels associated with baseline (2009) conditions. Passenger activity levels at LAX between 2009 and 2025 are forecast to increase from approximately 56.5 MAP to 78.9 MAP for all SPAS alternatives, including the LAWA Staff-Recommended Alternative, which would be accompanied by an increase in the number of daily flights at LAX, as well as an anticipated change in the fleet mix (i.e., size and types of aircraft) during that time. As shown in **Table SRA-2.3.10.1-1**, the number of average annual daily aircraft operations is forecasted to increase from 1,493 in 2009 to 1,937 in 2025. The number of heavy (aircraft weighing over 300,000 pounds, identified as "SWB" (Small Wide-Body Aircraft), "LWB" (Large Wide-Body Aircraft), and "NLA" (New Large Aircraft) in **Table SRA-2.3.10.1-1**) jet operations in 2025 is projected to increase to 441 on an average day from 239 in 2009, while the number of non-jet (i.e., propeller) aircraft operations in 2025 is projected to decrease to 148 on an average day from 158 in 2009. The proportion of light jets in the fleet mix would shrink slightly in 2025 as compared to 2009.

Table SRA-2.3.10.1-1

LAWA Staff-Recommended Alternative
Forecast Daily Aircraft Operations (2025)

	Aircraft Operations by Category[1]								Percent of Annual Operations							
Condition	NJT	SJT	SNB	LNB	SWB	LWB	NLA	Total	NJT	SJT	SNB	LNB	SWB	LWB	NLA	Total
2009 Conditions	158	259	630	207	87	151	1	1,493	11%	17%	42%	14%	6%	10%	0%	100%
Future (2025) Conditions	148	344	741	263	218	194	29	1,937	8%	18%	38%	14%	11%	10%	2%	100%

Notes:

NJT = Non-Jet Aircraft
SJT = Small Jet Aircraft
SNB = Small Narrow-Body Aircraft
LNB = Long Narrow-Body Aircraft
SWB = Small Wide-Body Aircraft
LWB = Large Wide-Body Aircraft
NLA = New Large Aircraft
Totals may not add to 100 percent due to rounding.

[1] Data represents an AAD of operation (annual traffic/365).

Source: Ricondo & Associates, Inc., 2011 SIMMOD output files and 2011 INM output files.

Table 5 in Appendix J1-1, *Aircraft Noise Technical Analysis*, of the SPAS Draft EIR, shows the allocation of operations, by aircraft category, to the north and south airfields for baseline (2009) conditions and for future (2025) conditions associated with the LAWA Staff-Recommended Alternative.[53]

The following impacts analysis provides a discussion of operational conditions assumed as part of the LAWA Staff-Recommended Alternative and a comparison of the future (2025) aircraft noise levels of the LAWA Staff-Recommended Alternative to the baseline (2009) noise levels with respect to CNEL noise exposure contours, and classroom disruption. Also provided, for the purpose of calculating the LAWA Staff-Recommended Alternative's contribution to cumulative impacts, is a comparison of the future (2025) aircraft noise levels to the future (2025) aircraft noise levels that would otherwise occur without such improvements. Discussion of the nighttime awakening methodology is provided in Section 4.10.1.2.3.1 of the SPAS Draft EIR.

The improvements to the north airfield under the LAWA Staff-Recommended Alternative, operating in conjunction with the existing configuration of the south airfield, along with the forecasted growth in activity at LAX by 2025 would change the airport's 2009 noise exposure pattern. The following considerations contributing to the noise exposure pattern for the LAWA Staff-Recommended Alternative in 2025 include the following:

- An increase in the number of daily aircraft operations from 1,493 in 2009 to 1,937 in 2025.
- The number of average day heavy jet operations would increase from 239 in 2009 to 441 in 2025, while the number of average day propeller aircraft operations would decrease from 158 in 2009 to 148 in 2025. The proportion of light jets in the fleet mix would be less in 2025 as compared to 2009. See **Table SRA-2.3.10.1-1** for specific details regarding the fleet mix.
- Relocation of Runway 6L/24R 260 feet north of its existing location.
- Extension of Runway 24L end 1,250 feet east of existing location.

[53] The analysis of the LAWA Staff-Recommended Alternative in Appendix J1-1 is provided under the designation of "Alternative 1."

- An anticipated shift of 15 percent of the small wide-body aircraft operations from the south airfield to the north airfield, as facilitated by the north airfield and terminal improvements. Those and other assumptions regarding runway utilization proportions are shown in Appendix J1-1, *Aircraft Noise Technical Analysis*, of the SPAS Draft EIR.
- Provision of additional Runway 6L/24R high-speed runway exits.
- As in existing conditions, consistent with the airport's current Preferential Runway Use Policy, inboard Runways 6R/24L and 7L/25R would be used principally for takeoffs, and outboard Runways 6L/24R and 7R/25L would be used principally for landings.
- As assumed in the analysis of 2009 conditions and reflected in the airport's current Preferential Runway Use Policy, the inboard runways would be preferred for both landings and takeoffs between 10:00 p.m. and 7:00 a.m. to abate noise over communities north and south of the airport when demand levels are low.
- As assumed in the analysis of 2009 conditions, between midnight and 6:30 a.m., current Over-Ocean procedures would be used, weather permitting, to abate noise over communities east of the airport. Aircraft using Over-Ocean procedures typically land on Runway 6R and take off on Runway 25R, but can also land on Runway 7L and take off on Runway 24L.
- Turboprop aircraft departing to the west would not turn to the east/southeast below 3,000 feet mean sea level (MSL). With this measure, turboprop aircraft would reach higher altitudes and over the water before they turn south and then back to the east over the communities immediately south of the airport. The effects of this measure would be beyond the contours of significant noise exposure.

The first two of these factors would result in a general increase in the overall size of the LAWA Staff-Recommended Alternative noise exposure contour in 2025, as compared to 2009 conditions, because more total noise energy would be generated within the airport environs on an average day with an increase in aircraft operations, and particularly heavy jet aircraft operations. The 260 feet northward relocation of Runway 6L/24R for landings on Runway 24R is expected to change the arrival and landing noise 260 feet north compared to 2009 conditions. The relocation of the high-speed runway exits for landings on Runway 24R would provide additional exits for heavy aircraft to use when landing on Runway 24R, as the current locations of the exits preclude heavy aircraft from using them. This change is not expected to increase the overall size of the CNEL noise exposure contours, because aircraft would be able to exit with reduced reverse thrust. The Runway 24L extension of 1,250 feet to the east is expected to move start-of-takeoff roll noise levels to the northwest and northeast behind the runway end, and slightly increase due to the additional small wide-body departures from Runway 24L. With the extension, the enhanced balance of small wide-body aircraft departures between the south and north airfields is expected to decrease start-of-takeoff roll noise from Runway 25R to the east.

Figure SRA-2.3.10.1-1 presents the overall CNEL contours, ranging from 60 CNEL to 75 CNEL, estimated at buildout of the LAWA Staff-Recommended Alternative in 2025.

2.3.10.1.1.1 Comparison of LAWA Staff-Recommended Alternative Aircraft Noise and Baseline (2009) Conditions

The noise exposure contours for the LAWA Staff-Recommended Alternative 2025 Conditions are depicted in **Figure SRA-2.3.10.1-2** The area depicted by the magenta line indicates areas newly exposed to increases larger than 1.5 decibels and above 65 CNEL dBA. The most notable change from the baseline (2009) conditions to the LAWA Staff-Recommended Alternative conditions is attributable to the projected growth in aircraft activity from 2009 to 2025. As the number of aircraft operations grows, it is expected that the area exposed to significant levels of aircraft noise will grow as well. While the noise exposure contours for the LAWA Staff-Recommended Alternative are larger in comparison to baseline (2009) conditions, the overall shape of the contours remains similar. With the 260-foot shift of Runway 6L/24R to the north, the 65 CNEL noise exposure contour for the north airfield is expected to expand more to the north than to the south, particularly with respect to the north side along the arrival path to Runway 6L/24R.

The following provides a geographic description of the LAWA Staff-Recommended Alternative noise exposure contours compared to baseline (2009) conditions.

65 CNEL Contour

The LAWA Staff-Recommended Alternative 65 CNEL noise exposure contours east of I-405 would extend approximately 3,500 feet farther east than under the baseline (2009) conditions. The 65 CNEL noise exposure contour resulting from aircraft using the north airfield would extend to South 2nd Avenue and from aircraft using the south airfield would extend to South Hoover Street. The increase in the area exposed to aircraft noise to the east of the airport would largely result from the increase in aircraft operations and assumed change in fleet mix from 2009 to 2025. The north airfield 65 CNEL noise exposure contour east of I-405 is also expected to extend approximately 260 feet farther north as a result of the relocation of Runway 6L/24R.

West of I-405, the LAWA Staff-Recommended Alternative 65 CNEL noise exposure contour would widen along the approach to the north runways as a result of the north shift in Runway 6L/24R, the increase in operations, an increase in the proportion of aircraft using the north airfield, and changing fleet mix. The 65 CNEL noise exposure contour along the approach to the south runways also widens to a lesser extent and can be attributed to the increase in operations.

The noise pattern along the departure sections to the north and south airfields would be wider under the LAWA Staff-Recommended Alternative than the baseline (2009) conditions, which is attributable to the north shift in Runway 6L/25R and the larger number of departures in 2025.

70 CNEL Contour

The reasons for changes in the LAWA Staff-Recommended Alternative 70 CNEL noise exposure contours as compared to baseline (2009) conditions are the same as those defined above for the 65 CNEL noise exposure contour. The north airfield 70 CNEL noise exposure contour extends just beyond South Cedar Street east of I-405. The south airfield 70 CNEL noise exposure contour extends slightly beyond England Avenue. East of I-405, the 70 CNEL noise exposure contours extend beyond West Westchester Parkway on the north and to South Sycamore Avenue on the south.

75 CNEL Contour

The 75 CNEL noise exposure contours for the LAWA Staff-Recommended Alternative exhibit the same patterns as baseline (2009) conditions, but for the north airfield, the 75 CNEL noise exposure area shifted northward matching the relocation of Runway 6L/24R and the westward extension of Runway 6R/24L. The additional length of Runway 6L/24R allows for additional heavy aircraft departures, slightly increasing the size of the 75 CNEL noise exposure contour departure area, but the 75 CNEL noise exposure contour still remains on airport property.

Affected Noise-Sensitive Uses

Table SRA-2.3.10.1-2 provides an overview of the land area, population, dwellings, and number of non-residential noise-sensitive facilities within the CNEL noise exposure contours associated with the LAWA Staff-Recommended Alternative, as well as the differences between these facilities' exposure to aircraft noise compared to baseline (2009) conditions. As indicated in **Table SRA-2.3.10.1-2**, the LAWA Staff-Recommended Alternative scenario would result in a net increase of the land area within the 65 CNEL noise exposure contours, as well as increase in the number of dwellings, population, and non-residential noise-sensitive facilities located within the 65 CNEL (or higher) noise exposure contours. Specifically, an additional 13,160 people, 4,370 additional dwelling units, and 43 additional non-residential noise-sensitive facilities are expected to be exposed to 65 CNEL or higher noise exposure levels, compared to baseline (2009) conditions.

Table SRA-2.3.10.1-2

LAWA Staff-Recommended Alternative Noise Exposure Effects - Comparisons to Baseline (2009) Conditions and to 2025 "No Additional Improvements" Conditions

Noise Level Range	Total Acreage Over Land[3]	Off-Airport Area (Acres)[3]	Total Dwellings	Estimated Population	Non-Residential Noise-Sensitive Facilities
LAWA Staff-Recommended Alternative (2025) Noise Exposure					
65-70 CNEL	3,502	2,973	11,113	29,914	75
70-75 CNEL	2,227	930	3,409	11,186	18
75 > CNEL	2,028	99	119	498	3

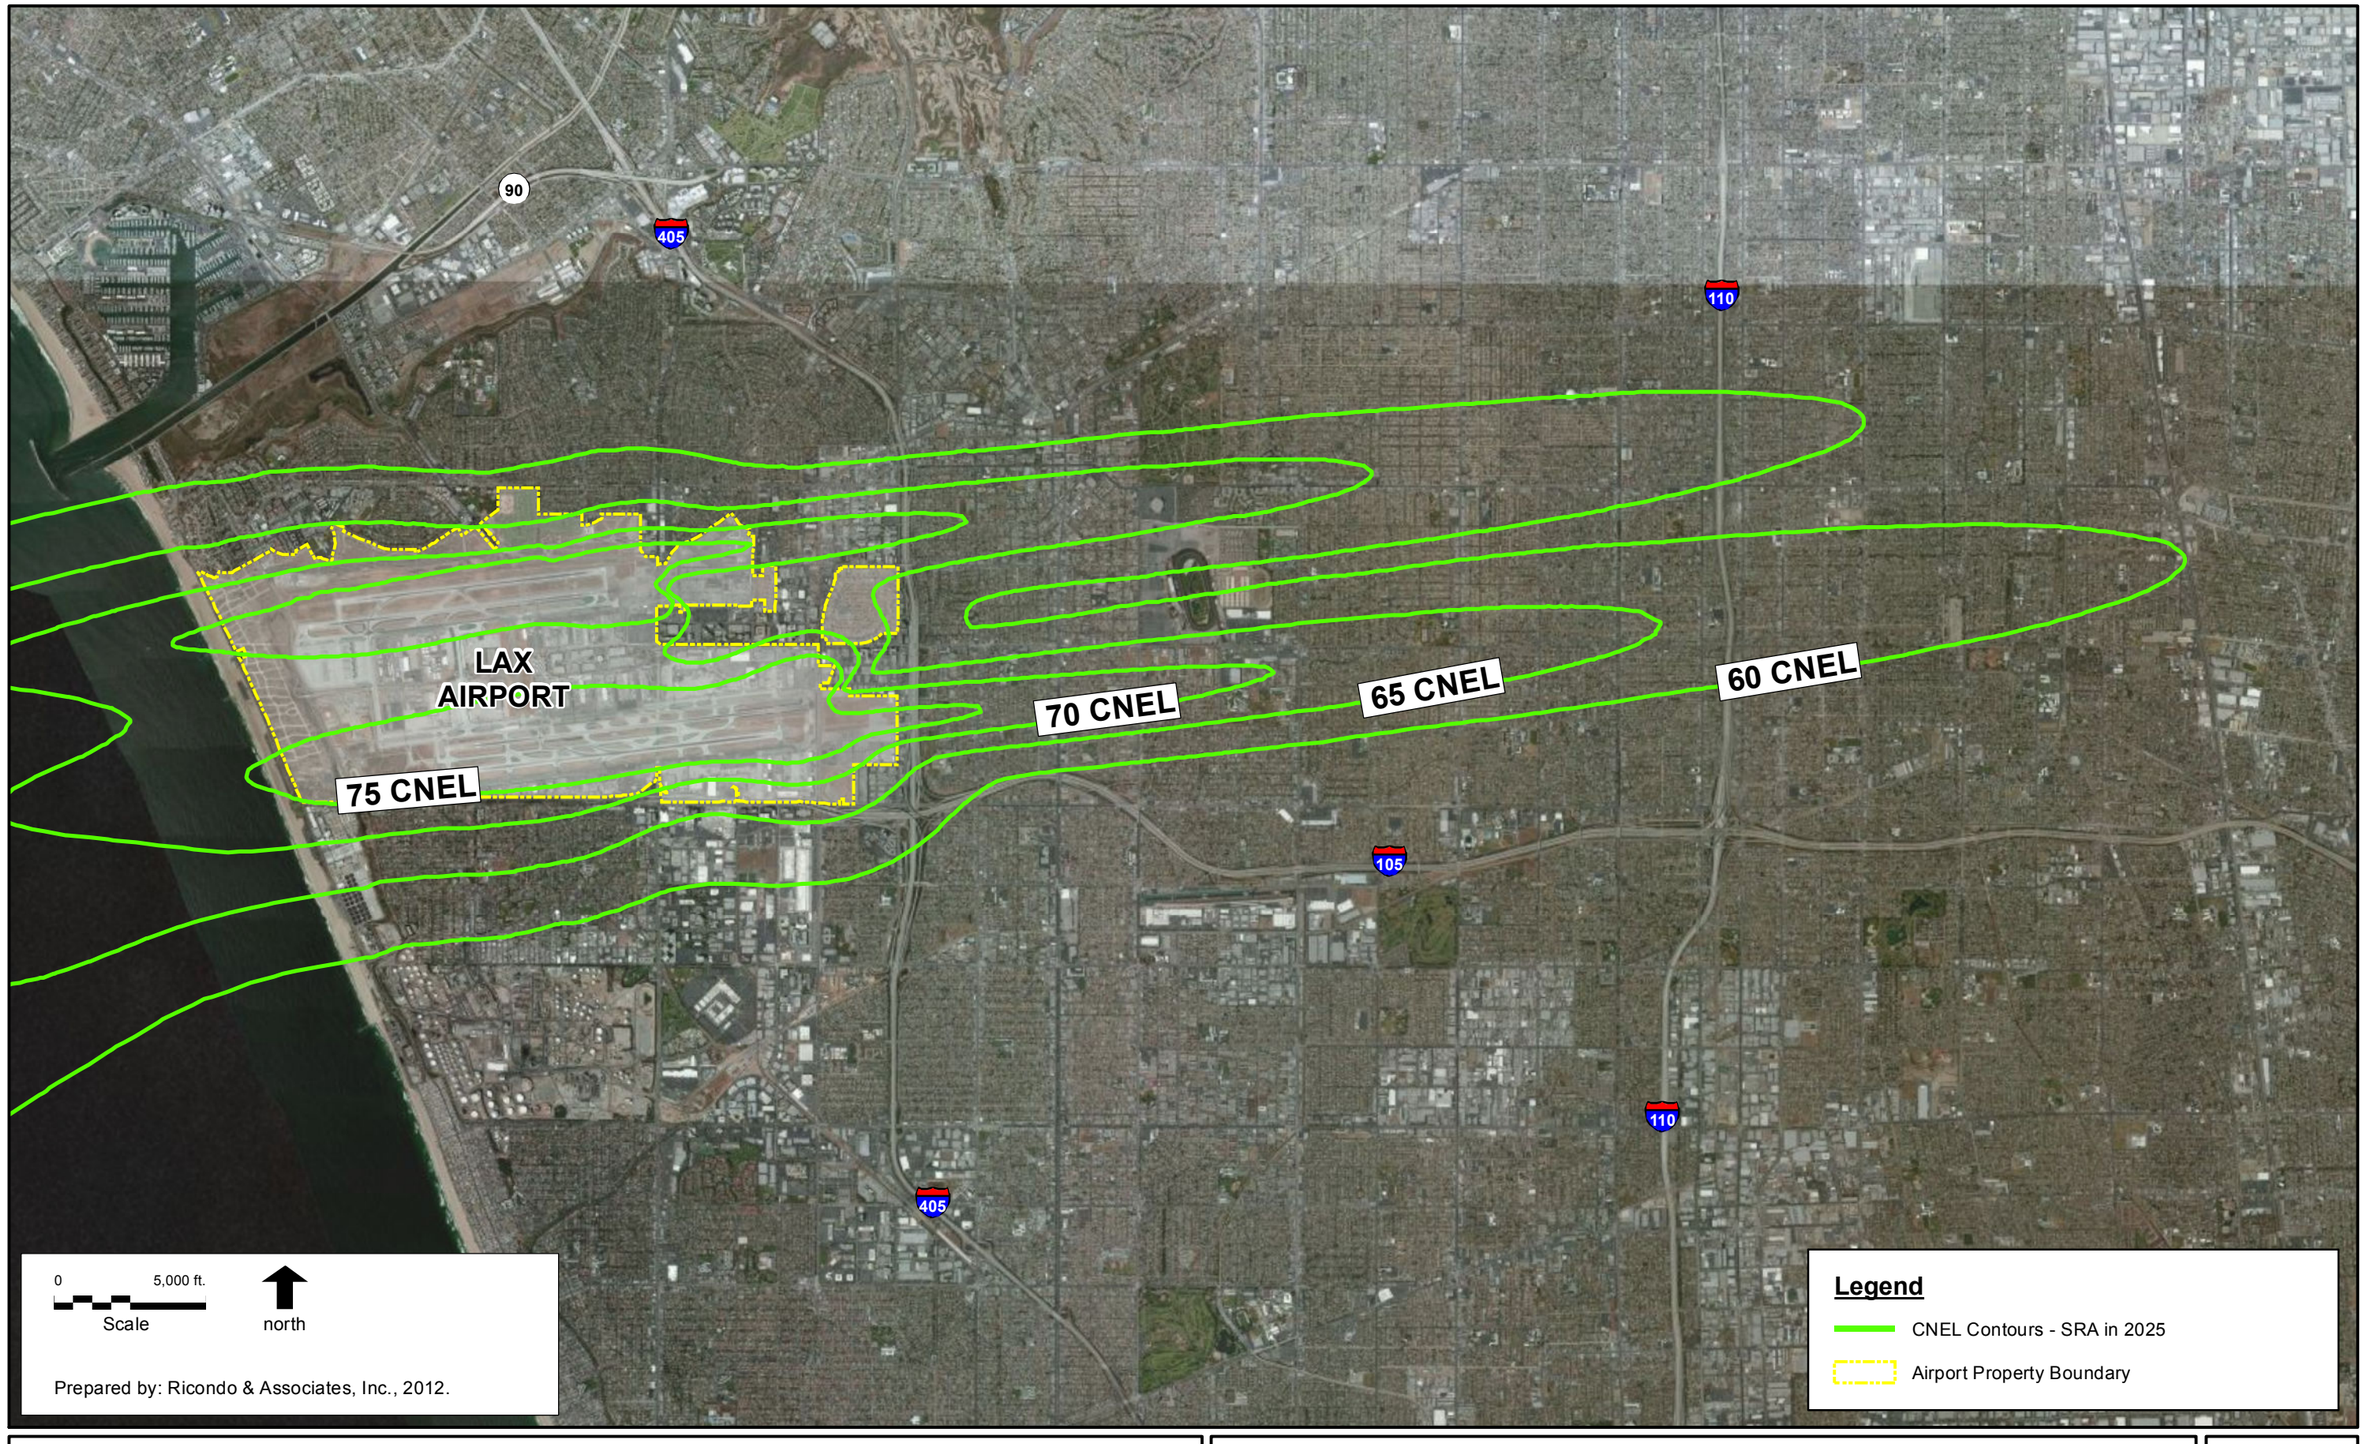
1 A positive value indicates that the future alternative increases the number of impacts; a negative number indicates that the future alternative decreases the number of impacts. The number indicates the net difference. Some areas would experience increased noise while other areas would experience a decrease in noise levels. Section 2.3.9, *Land Use and Planning*, of this chapter details the number of noise-sensitive uses newly exposed to 65 CNEL or higher noise levels.

2 Population and dwelling information is reported using a year 2010 U.S. Census data base for CNEL comparisons.

3 Acreage totals may not add due to rounding.

Source: Ricondo & Associates, Inc., 2012 (CNEL noise exposure contours); PCR, 2012 (population, dwelling unit, acreage, and non-residential noise-sensitive facilities; GIS spatial analysis).

For the purposes of the cumulative analysis, **Table SRA-2.3.10.1-2** also provides a comparison between the aircraft noise exposure levels associated with the LAWA Staff-Recommended Alternative in 2025 and the aircraft noise exposure levels projected to occur in 2025 without additional improvements to the north airfield (i.e., "2025 'No Additional Improvements' Conditions"). The comparison between the LAWA Staff-Recommended Alternative (2025) to 2025 "No Additional Improvements" is used to identify the alternative's contribution to cumulative impacts. Based on that comparison, implementation of the LAWA Staff-Recommended Alternative would result in 1,244 fewer people, 233 fewer dwelling units, and 3 less non-residential noise-sensitive facilities being exposed to 65 CNEL or higher aircraft noise levels in 2025 than would otherwise occur with no modifications to the north airfield.



LAX Specific Plan Amendment Study Final EIR	**CNEL Contours Overview - LAWA Staff-Recommended Alternative in 2025**	**Figure SRA - 2.3.10.1-1**

This page intentionally left blank.

Table SRA-2.3.10.1-3 details the numbers of residential and other noise-sensitive facilities that would be exposed to aircraft noise levels in excess of the threshold of significance for CNEL, as defined in Section 4.10.1.4.1 of the SPAS Draft EIR. Specifically, these noise-sensitive uses would be exposed to 65 CNEL or greater with at least a 1.5 CNEL increase as compared to baseline (2009) conditions. The totals shown in **Table SRA-2.3.10.1-3** not only include the noise-sensitive receptors that would be newly exposed to 65 CNEL or greater with at least a 1.5 CNEL increase, but also those that are currently/already exposed to 65 CNEL or higher and would experience at least a 1.5 CNEL increase, and therefore impacts would be significant.

Table SRA-2.3.10.1-3

Significant Noise Impacts - LAWA Staff-Recommended Alternative Compared to Baseline (2009) Conditions

	Exposed to ≥ 65 CNEL and 1.5 CNEL Increase LAWA Staff-Recommended Alternative
Population	13,608
Dwelling Units	5,296
Non-Residential Noise-Sensitive Facilities	
Schools	19
Places of Worship	19
Hospitals	0
Convalescent Hospitals	1
Parks	9
Libraries	0
Total Non-Residential Noise-Sensitive Facilities	**48**

Source: Ricondo & Associates, Inc., 2012 (1.5 CNEL or higher noise exposure contours); PCR, 2012 (population, dwelling unit, acreage, and non-residential noise-sensitive facilities; GIS spatial analysis).

As illustrated in **Figure SRA-2.3.10.1-2**, the significant impacts would be located principally along the approach to the north and south airfield. Within this area are an estimated 5,296 dwellings and 13,608 residents, as well as 48 non-residential noise-sensitive facilities, including 19 schools, 19 places of worship, 9 parks, and 1 convalescent hospital.

While there would also be increases in existing noise levels in areas beyond the 65 CNEL contour (i.e., areas with exterior noise levels less than 65 dBA CNEL), such increases would not rise to the level of being a significant impact. Relative to cumulative impacts, **Table SRA-2.3.10.1-4** discloses the population, dwellings, and non-residential noise-sensitive facilities that would, as a result of the LAWA Staff-Recommended Alternative, experience increases of 1.5 CNEL or higher within the 65 CNEL noise exposure contour, as compared to 2025 "No Additional Improvements" Conditions. Based on that comparison, an estimated 538 dwellings and 1,127 residents, as well as 5 non-residential noise-sensitive facilities, including 2 schools, 1 place of worship, and 2 parks would be affected.

Table SRA-2.3.10.1-4

Noise Impacts of LAWA Staff-Recommended Alternative Compared to 2025 "No Additional Improvements" Conditions

	Exposed to ≥ 65 CNEL and 1.5 CNEL Increase LAWA Staff-Recommended Alternative
Population	1,127
Dwelling Units	538
Non-Residential Noise-Sensitive Facilities	
Schools	2
Places of Worship	1
Hospitals	0
Convalescent Hospitals	0
Parks	2
Libraries	0
Total Non-Residential Noise-Sensitive Facilities	**5**

Source: Ricondo & Associates, Inc., 2012 (1.5 CNEL or higher noise exposure contours); PCR, 2012 (population, dwelling unit, acreage, and non-residential noise-sensitive facilities; GIS spatial analysis).

2.3.10.1.1.2 Single Event Aircraft Noise Exposure

In addition to the CNEL noise exposure contours prepared for the LAWA Staff-Recommended Alternative, a grid point analysis of single event aircraft noise was conducted to determine potential significant impacts associated with nighttime awakenings and classroom disruption. The results are presented below.

2.3.10.1.1.2.1 Nighttime Awakenings

The awakening probability contours, estimated using the ANSI method (see Section 4.10.1.2.3.1 of the SPAS Draft EIR), representing a 75 percent chance, a 50 percent chance, and a 25 percent chance of awakening at least once per night for the LAWA Staff-Recommended Alternative at buildout in 2025 are shown in **Figure SRA-2.3.10.1-3**. Also shown in **Figure SRA-2.3.10.1-3** are the equivalent percentage contours estimated to occur in 2025 if no airfield improvements were implemented (i.e., 2025 Without Alternative). Specifically, where the probability of awakening contour associated with aircraft operations under the LAWA Staff-Recommended Alternative extends beyond the equivalent contour associated with operations under the existing airfield configuration, the difference area (i.e., the area between the two contours) shaded in yellow represents an increase in the probability of awakening. Conversely, where the probability of awakening contour associated with the LAWA Staff-Recommended Alternative contracts and does not extend as far as the equivalent contour associated with the existing airfield configuration, the difference area shaded in green represents a decrease in the probability of awakening. The depiction of contours for the three different probabilities of awakenings (75 percent, 50 percent, and 25 percent) is intended to provide an overall indication of generally where and how the probability of sleep awakenings would change with implementation of the LAWA Staff-Recommended Alternative. Changes in the intervening areas (i.e., areas beyond and between the 75 percent and 50 percent contours, and beyond and between the 50 percent and 25 percent contours) would generally follow the same trends as shown in **Figure SRA-2.3.10.1-3**. While the color shading shown in **Figure SRA-2.3.10.1-3** delineates the contribution of the LAWA Staff-Recommended Alternative to change in the cumulative probability of awakening, the general nature, direction, and change in the probability of awakenings shown in the figure is also generally representative of the changes that would occur under the LAWA Staff-Recommended Alternative to the 2009 contours shown in Figure 4.10.1-13 of the SPAS Draft EIR.

LAX Specific Plan Amendment Study Final EIR

LAWA Staff-Recommended Alternative vs. Baseline (2009) Conditions - 1.5 CNEL or Higher Increase within the 65 CNEL or Higher Contour

Figure
SRA - 2.3.10.1-2

This page intentionally left blank.

As shown in **Figure SRA-2.3.10.1-3**, there would be a slight increase in the probability of awakenings in areas towards the north, decreases in the probability of awakenings in the central areas east of the airport along the flight paths between the north airfield and the south airfield, and a negligible change in the probability of awakenings in areas towards the southeast and south. **Table SRA-2.3.10.1-5** indicates the project's contribution to cumulative changes in affected population within each of the three probability of awakenings contours under the LAWA Staff-Recommended Alternative. The changes shown in the table represent the populations that would occur within each probability contour with implementation of the airfield improvements proposed under the LAWA Staff-Recommended Alternative compared to the populations that would otherwise be within each probability contour if there were no airfield improvements (i.e., 2025 With Alternative vs. 2025 Without Alternative). That latter population, against which the alternative's impact is measured, includes 6,074 people within the 75 percent probability contour, 69,429 people within the 50 percent probability contour, and 260,088 people within the 25 percent probability contour. **Table SRA-2.3.10.1-5** shows an overall net decrease in population within the three probability contours evaluated.

Table SRA-2.3.10.1-5

LAWA Staff-Recommended Alternative's Contribution to the Cumulative Change in Affected Population for 75 Percent, 50 Percent, and 25 Percent Probability of Awakening At Least Once - Compared to 2025 "No Additional Runway Improvements"

	Probability of Awakening at Least Once During the Night			
LAWA Staff-Recommended Alternative	**75%**	**50%**	**25%**	**Average**
Change in Affected Population - Increase or (Decrease)	(210)	(984)	(5,843)	
Percent Change in Affected Population - Increase or (Decrease)	(3.46%)	(1.42%)	(2.25%)	(2.37%)

Note:

Numbers in parentheses () are negative (i.e., a decrease in affected population).

Source: Ricondo & Associates, 2012.

Based on the information presented above, implementation of the LAWA Staff-Recommended Alternative would not result in a substantial increase in the probability of nighttime awakenings under the project level and cumulative analyses; therefore, the impact would be less than significant and the project's contribution to cumulative impacts would not be cumulatively considerable (i.e., less than significant).

2.3.10.1.1.2.2 Classroom Disruption

Baseline (2009) conditions related to school facilities and classroom disruption is provided in Tables 4.10.1-4, 4.10.1-5, and 4.10.1-6 of the SPAS Draft EIR. The numbers of schools that would exceed the thresholds of significance for classroom disruption, as defined in Section 4.10.1.4.3 of the SPAS Draft EIR, under the LAWA Staff-Recommended Alternative are presented in **Table SRA-2.3.10.1-6**. Under the LAWA Staff-Recommended Alternative, as compared to baseline (2009) conditions, one additional school is projected to be newly exposed at the 55 interior dBA (L_{max}), which relates to momentary disruption of speech intelligibility, and the overall number of individual noise events at schools would increase. **Table SRA-2.3.10.1-7** provides the names and locations of the schools that would be exposed to single noise events above 55 interior dBA. The school identified in bold text, Jefferson Elementary School, would be newly exposed to average number of daily events and duration above 55 interior dBA, as compared to baseline (2009) conditions, and impacts would therefore be significant.

Table SRA-2.3.10.1-6

**Schools Exposed to Single Event Noise Levels -
LAWA Staff-Recommended Alternative Compared to Baseline (2009) Conditions**

Impact Category	LAWA Staff-Recommended Alternative Exposed	Compared to Baseline (2009) Conditions

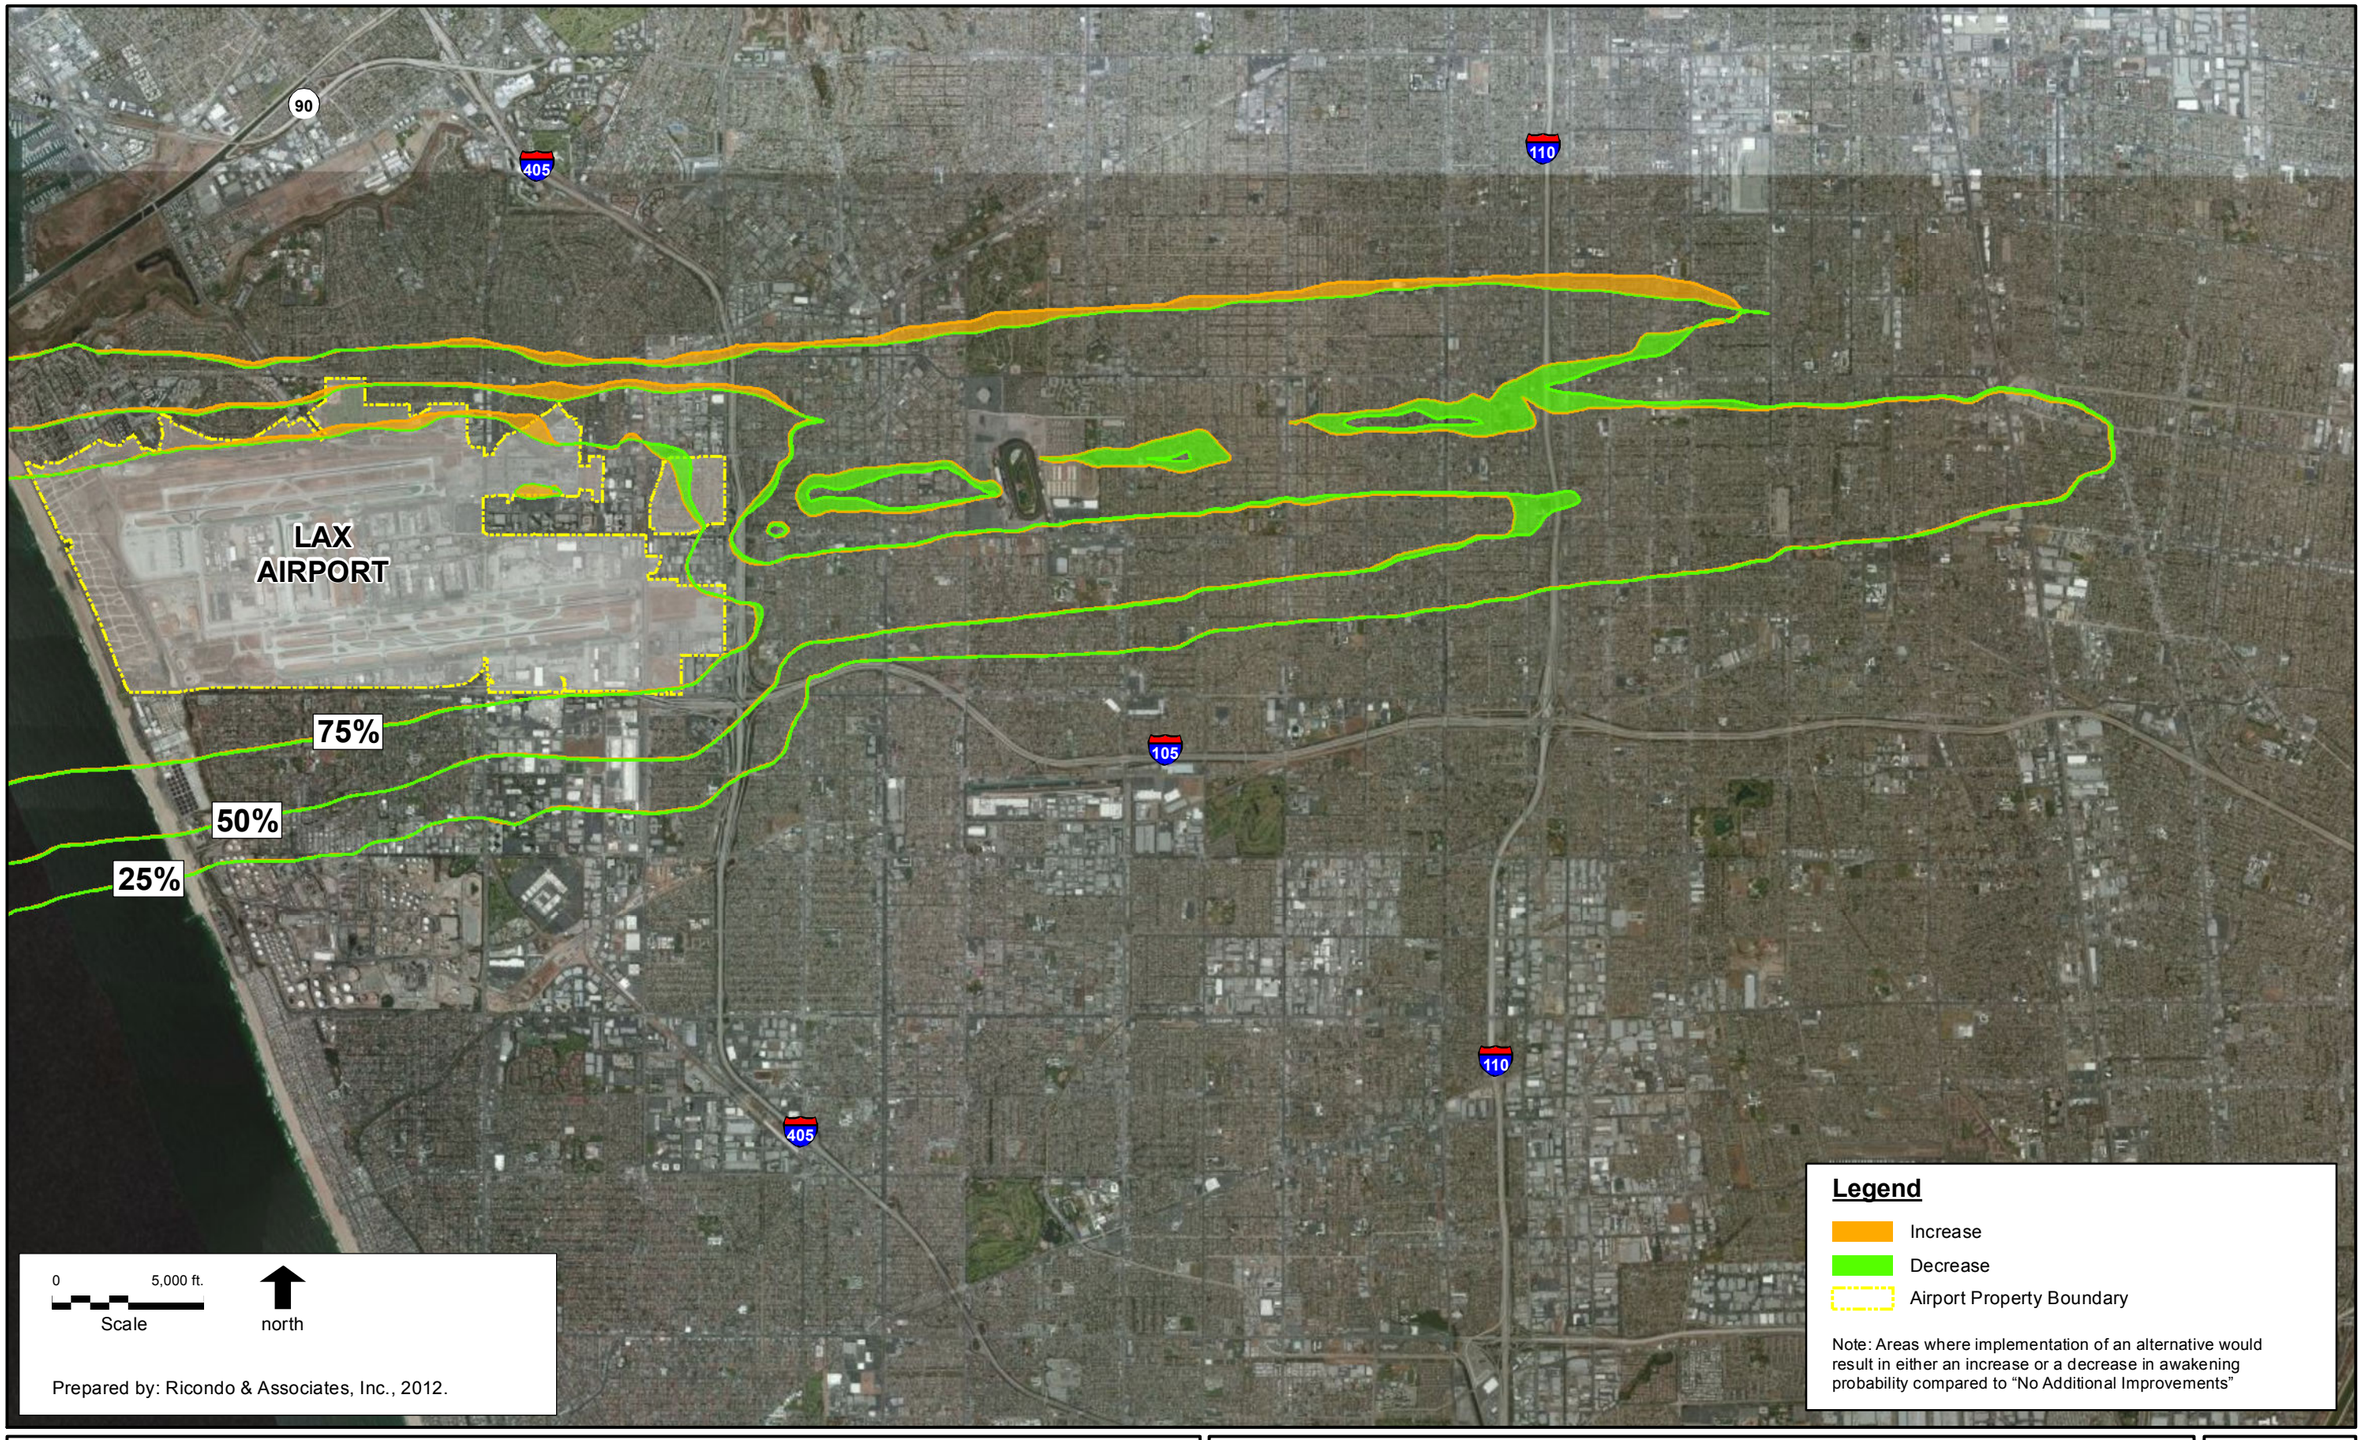
Notes:

TA-84 = Total number of minutes (events multiplied by average durations) per school day that exceed an exterior noise level of 84 decibels (L_{max}), which equates to an interior noise level of 55 dBA (L_{max}) at indicated school.
Events = number of events to which the site is exposed on an average annual school day that exceed 84 dBA (L_{max}).
Avg. D = average duration of each event in seconds during the average annual school day that exceeds 84 dBA (L_{max}).
School(s) identified in bold text would be newly exposed to significant impacts.

Source: Ricondo & Associates, Inc., 2012 (INM school location exterior noise levels); PCR, 2012 (school location and name database; GIS spatial analysis).

No schools would be newly exposed above 65 interior dBA (L_{max}) speech interference Levels.



LAX Specific Plan Amendment Study Final EIR	**ANSI Awakening Probability Contours - LAWA Staff-Recommended Alternative Compared to 2025 "No Additional Improvements" Conditions**	**Figure SRA - 2.3.10.1-3**

This page intentionally left blank.

The assessment of the number of schools that would experience interior dBA $L_{eq(h)}$ levels equal to or higher than 35 dBA $L_{eq(h)}$ in the classroom indicates that under the LAWA Staff-Recommended Alternative, seven public schools and one private school would be newly exposed to this level as compared to baseline (2009) conditions. **Table SRA-2.3.10.1-8** provides the names and locations of the schools that would be exposed to noise levels above 35 $L_{eq(h)}$, and therefore impacts would be significant.

Table SRA-2.3.10.1-8

Hourly Equivalent Noise Level at LAX Area Schools Newly Exposed to ANSI 35 $L_{eq(h)}$ Thresholds - LAWA Staff-Recommended Alternative During the Average School Day (8:00 a.m. - 4:00 p.m.)

[1] Noise levels are computed by converting 24-hour exterior L_{eq} data to 8-hour exterior L_{eq} data by adding 4.8 L_{eq} to the computed 24-hour level, and then subtracting 28.8 decibels for exterior to interior attenuation produced by average construction techniques at area schools (as measured by LAWA), to result in interior hourly L_{eq} values interior attenuation produced by average construction techniques at area schools (as measured by LAWA), to result in interior hourly L_{eq} values.

Source: Ricondo & Associates, Inc., 2012 (INM school location exterior noise levels); PCR, 2012 (school location and name database; GIS spatial analysis).

2.3.10.1.2 Mitigation Measures

As discussed in Section 4.10.1.7 of the SPAS Draft EIR, the abatement and mitigation of aircraft noise may be accomplished in two general ways: 1) by reducing the loudness of the noise source or increasing the distance of the noise source from the receptor on the ground or 2) by modifying the receptor to make it less affected by noise.

This section discusses potential abatement of noise by modifications of the noise source. Section 2.3.9, *Land Use and Planning*, of this chapter, discusses the modification of the noise-sensitive receptors for noise mitigation.

The LAWA Staff-Recommended Alternative would entail a northbound shift of the centerlines of Runways 6L/24R. Relocated Runway 6L/24R is planned 260 feet north of the existing Runway 24R centerline. The noise abatement measures and classroom disruption and children's ability to learn presented in Section 4.10.1.5 of the SPAS Final EIR would continue to be implemented, as would all other current measures. Land use measures to mitigate noise impacts, that are not related to classroom disruption are identified and discussed in Section 2.3.9, *Land Use and Planning*, of this chapter. To continue noise abatement techniques, new/replacement procedures are assumed for westerly departures from each relocated runway end to ensure that aircraft reach the coastline before making turns.

2.3.10.1.3 Level of Significance After Mitigation

Although LAX Master Plan Commitment N-1 and LAX Master Plan Mitigation Measure MM-N-4 would reduce aircraft noise impacts compared with conditions that would exist without those measures, they cannot fully mitigate the noise impacts associated with implementation of the LAWA Staff-Recommended Alternative. Further, no other operational noise abatement measures are available to fully mitigate the noise impacts of the LAWA Staff-Recommended Alternative.

Table SRA-2.3.10.1-9 summarizes the number of dwellings and noise-sensitive facilities subject to significant noise impacts.

Table SRA-2.3.10.1-9

LAWA Staff-Recommended Alternative
Increase of 1.5 CNEL Within 65 CNEL Compared to Baseline (2009) Conditions

Effect Category	LAWA Staff-Recommended Alternative
Dwellings	5,296
Non-Residential Noise-Sensitive Facilities	48

Source: Ricondo & Associates, Inc., 2012 (1.5 CNEL or higher noise exposure contours); PCR, 2012 (population, dwelling unit, acreage, and non-residential noise-sensitive facilities; GIS spatial analysis).

Table SRA-2.3.10.1-10 summarizes the increase in schools subject to significant single event noise exposure.

Table SRA-2.3.10.1-10

Additional Schools Exposed to Significant Noise Impacts for
LAWA Staff-Recommended Alternative
2025 Noise Exposure

	LAWA Staff-Recommended Alternative
Schools - Exposure to Interior Noise of	
$\geq$ 55 dBA L_{max}	1
$\geq$ 65 dBA L_{max}	0
$\geq$ 35 dBA $L_{eq(h)}$	8

Source: Ricondo & Associates, Inc., 2012 (INM school location exterior noise levels); PCR, 2012 (population, dwelling unit and school databases; GIS spatial analysis).

As described in Section 2.3.9, *Land Use and Planning*, of this chapter, LAX Master Plan Mitigation Measure MM-LU-1, Implement Revised Aircraft Noise Mitigation Program, would incorporate all eligible dwellings and non-residential noise-sensitive facilities that are newly exposed to noise levels 65 CNEL or higher into the Aircraft Noise Mitigation Program (ANMP) to mitigate the significant noise impacts described in **Table SRA-2.3.10.1-9**.

LAX Master Plan Mitigation Measures MM-LU-3, Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn, and MM-LU-4, Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise, would ultimately serve to mitigate adverse noise impacts on schools presented in **Table SRA-2.3.10.1-10**.

Together, the LAX Master Plan noise and land use mitigation measures are intended to fully mitigate the significant noise impacts that would be caused by the LAWA Staff-Recommended Alternative. Because the land use mitigation measures would take several years to fully implement, it is possible that significant noise impacts would be experienced in the area after implementation of the LAWA Staff-Recommended Alternative but before the mitigation measures are fully implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time. In addition, as further discussed in Section 2.3.9, *Land Use and Planning*, of this chapter, certain residential uses with outdoor private habitable areas, or parks would be newly exposed to noise levels of 75 CNEL or higher. These noise impacts would also be significant and unavoidable.

2.3.10.2 Road Traffic Noise

2.3.10.2.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to road traffic noise are only associated with the ground access components of Alternative 9, as evaluated in Section 4.10.2.6 of the SPAS Draft EIR.

Table SRA-2.3.10.2-1 presents the predicted road traffic noise level, in terms of CNEL, for each receptor location for baseline (2010) conditions with a hypothetical assumption that the LAWA Staff-Recommended Alternative is in place, and also shows the associated change in CNEL as compared to baseline (2010) conditions without SPAS. **Table SRA-2.3.10.2-2** provides similar type information for future (2025) conditions, that is, predicted road traffic noise levels, in CNEL, at buildout of the LAWA Staff-Recommended Alternative in 2025 as compared to the future noise levels that are predicted to occur in 2025 without the LAWA Staff-Recommended Alternative. The following describes the impacts specific to the LAWA Staff-Recommended Alternative.

Table SRA-2.3.10.2-1

Change in Roadway Noise Levels - Baseline (2010) Conditions Without and With the LAWA Staff-Recommended Alternative

	dBA CNEL Baseline (2010)		
	Baseline (2010)	With SRA	
Receptor ID	Without SPAS		Change from Baseline

RD12	64.6	64.5	-0.1
RD13	69.5	69.4	-0.1
RD14	54.8	55.6	0.8
RD15	72.2	72.3	0.1

Source: CDM Smith, 2012.

The changes in baseline (2010) road traffic noise with implementation of the LAWA Staff-Recommended Alternative, as compared to baseline (2010) conditions without SPAS, would range from a decrease of 1.5 dBA CNEL at RD7 to a maximum increase of 1.1 dBA CNEL at RD8.

The changes in future (2025) road traffic noise with implementation of the LAWA Staff-Recommended Alternative, as compared to future (2025) conditions without SPAS, would range from a decrease of 0.7 dBA CNEL at RD2 to a maximum increase of 1.5 dBA CNEL at RD7. The predicted changes in road traffic noise levels for future (2025) conditions at the 15 receptor locations would all be less than a 3 dBA increase in CNEL; therefore, the road traffic noise impacts associated with the LAWA Staff-Recommended Alternative would be less than significant.

2.3.10.2.2 Mitigation Measures

Impacts associated with road traffic noise under the LAWA Staff-Recommended Alternative would be less than significant; therefore, no mitigation measures specific to SPAS are required.

2.3.10.3 Construction Traffic and Equipment Noise

2.3.10.3.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to construction traffic and equipment noise are associated with construction activities associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.10.3.6 of the SPAS Draft EIR.

Construction Traffic Noise

Construction traffic noise would be generated by both trucks and employee vehicles. As part of the traffic-related LAX Master Plan commitments identified in Section 4.10.3.5 of the SPAS Draft EIR, a construction traffic management plan would be prepared with each improvement project and would seek

to locate haul routes away from noise-sensitive receptors. Additionally, construction-related trucks would be restricted to designated routes ensuring that these vehicles utilize the nearby freeways and major arterials to the maximum extent and minimize use of local roadways. As indicated in Section 4.10.3.2 of the SPAS Draft EIR, traffic volumes on roads with good operating conditions (i.e., LOS B or better) would have to increase more than three-fold to reach the CEQA threshold of significance of a 5 dBA increase, and would need to increase even more on roads with poor operating conditions (i.e., LOS C or worse). The construction routes applicable to the LAWA Staff-Recommended Alternative are intentionally designated for freeways and major arterials around the airport, avoiding minor arterials and local streets. These freeways and major arterials are high-volume routes that are already at LOS C or worse. Although specific construction-related information such as schedules, durations, equipment and manpower estimates, are not known at this time for the LAWA Staff-Recommended Alternative, construction-related traffic would not result in a doubling or tripling of existing daily traffic volumes on streets around the airport, particularly given the LAX Master Plan commitments to utilize freeways and major arterials. For a recent major construction project at LAX, the Bradley West Project, the highest peak-hour construction trip estimate for the highest peak-quarter of construction activity, which included the possibility of a 60 percent temporary surge in construction activity over normal peak construction activities, projected a total of 1,226 construction trips.[54] That estimate includes a "passenger car equivalent" adjustment to all truck trips, whereby each medium-duty truck trip is counted as two passenger car trips and each heavy-duty truck trip is counted as 2.5 passenger car trips. Notwithstanding that total trip generation would be distributed to, and dispersed between, several different streets, that total trip generation is well below the existing traffic volumes on the freeways and major arterial streets around LAX and would not result in a tripling of traffic volumes (please see the traffic count data in Appendix K2, *Off-Airport Transportation*, of the SPAS Draft EIR[55]). As a result, the construction traffic noise impact associated with the LAWA Staff-Recommended Alternative would be less than significant.

Construction Equipment Noise

As described in Section 4.10.3.3 of the SPAS Draft EIR, the existing ambient CNEL within noise-sensitive areas to the north, east, and south of LAX, range from approximately 65 to 70 dBA. A significant impact is considered to occur if construction equipment noise exceeds the baseline ambient exterior noise level by 5 dBA or more at a noise sensitive use. Based on the 24-hour construction site CNEL of 89 dBA at 50 feet from the source, which would dissipate at 4.5 dB per doubling of distance, the approximate distances from construction activities to the 70 and 75 dBA CNELs (i.e., points at which construction equipment noise would result in a 5 dBA increase over the baseline ambient exterior noise level of 65 to 70 dBA CNEL) would be 925 feet and 425 feet, respectively. In other words, noise-sensitive uses in areas with an existing ambient CNEL of 65 dBA would be significantly impacted if SPAS-related construction activity occurred within a distance of 925 feet or less. If the existing ambient CNEL is 70 dBA, a significant impact would occur if construction activities occurred within 425 feet or less. These distances do not account for any intervening topography, buildings, or other obstructions that would reduce the noise reaching the receptors; hence, the impacts analysis is conservative.

It should be noted that the second and third thresholds of significance presented in Section 4.10.3.4 of the SPAS Draft EIR indicate a significant construction noise impact would occur if one or both of the following conditions occur: (1) if project-related construction noise results in a 5 dBA or more increase in the existing ambient noise level at noise-sensitive uses; or (2) if project-related construction noise results in a 5 dBA increase over ambient exterior noise levels at noise-sensitive uses during particular times of the week - specifically, between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday. As further described below, the first of those two conditions is considered to be the more restrictive of the two. Therefore, the analysis in this section addresses the second and third significance thresholds.

---

54 City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport (LAX) Bradley West Project, Table 4.3-7, September 2009.

55 The analysis of the LAWA Staff-Recommended Alternative in Appendix K2 is provided under the designation "Alternative 9."

As described in Section 4.10.3.2 of the SPAS Draft EIR and delineated in Table 4.10.3-2 of the SPAS Draft EIR, it is anticipated that the majority of construction activities would occur during daytime hours, primarily within a Monday through Friday work week. It is likely, however, that there may be some limited periods when construction is scheduled to occur during both the daytime and nighttime hours. During such periods, it is anticipated that nighttime construction would have lower equipment activity levels than otherwise would occur during the daytime and certain hours are unlikely to have any activity. Table 4.10.3-2 of the SPAS Draft EIR indicates the estimated construction activity level for each hour of the day under this conservative "worst-day" construction scenario and Table 4.10.3-3 of the SPAS Draft EIR, delineates the hourly average sound level for each hour. In focusing on the hourly activity levels and associated hourly average sound levels for the greatest time span when this significance criterion would be applicable (i.e., 9:00 p.m. on a Friday to 8:00 a.m. on a Saturday, the overall construction-related hourly average noise level at 50 feet during this period would be 82.3 dBA L_{eq} (Note: Although the affected time period for a Saturday starts earlier than 9:00 p.m., construction activities are not anticipated to occur on Sundays; hence, the longer duration of 9 p.m. to 8 a.m. was assumed for the analysis).

As indicated above, under the second significance threshold, 24-hour construction site CNEL would dissipate and be less than significant at approximately 925 feet (where existing levels are 65 dBA CNEL), and 425 feet (where existing levels are 70 dBA CNEL).

As described in Section 4.10.3.3 of the SPAS Draft EIR, the existing ambient average hourly noise level during the evening/nighttime period at the subject noise-sensitive areas is estimated to range from approximately 59 dBA L_{eq} to 65+ dBA L_{eq}. Based on an evening/nighttime construction activity average hourly noise level of 82.3 dBA L_{eq} at 50 feet, construction activities would be less than significant at 830 feet, under the third significance threshold, assuming the quieter nighttime ambient noise level of 59 dBA L_{eq}.

Given that a significant impact would occur under the second significance threshold at 925 feet of a noise-sensitive use, and 830 feet under the third significance threshold, the analyses below use the more conservative distance under the second significance threshold.

The impact analyses below discuss various noise-sensitive receptors which are considered representative of other nearby noise-sensitive receptors, described in Section 4.10.3.3 of the SPAS Draft EIR.

Impacts from Airfield Improvements

Residential Uses In Playa del Rey

Residential development at the south end of Playa del Rey would be over 1,300 feet from the closest point of construction associated with the LAWA Staff-Recommended Alternative, that being the relocation of navigational aids within the Los Angeles/El Segundo Dunes due to the 260-foot northward shift of Runway 6L/24R. Given the existing ambient noise level of 68 dBA CNEL in that area of Playa del Rey, construction activities would need to occur within a distance of approximately 585 feet in order to result in construction noise that is 5 dBA higher than the baseline exterior noise level.[56] As such, construction equipment noise impacts in Playa del Rey would be less than significant.

Saint Bernard High School

This facility, located on the east side of Fallmouth Avenue north of Westchester Parkway, could be impacted by construction noise from the improvements required for the Argo Drainage Channel (i.e., cover/enclose the channel to meet runway safety requirements associated with relocation of Runway 6L/24R). Although the western portion of the Argo Drainage Channel is approximately 950 feet from the southern tip of the school site, it is likely that the limits of construction would extend northward, to provide

[56] This is a worst-case analysis that assumes a full complement of construction equipment producing a combined noise level of 89 dBA at 50 feet; however, the relocation of navigational aids would likely require very few pieces of construction equipment, resulting in noise levels of less than 89 dBA.

for equipment maneuvering on top of the banks along the channel, and be less than 925 feet from the school site, which would result in significant construction equipment noise impacts.

Residential Uses Along Southern Edge of Westchester

The existing residences closest to LAX, along the south side of West 91st Street, generally between and near Stanmoor Drive and Rayford Drive, would potentially be affected by construction noise from the improvements required for the Argo Drainage Channel. Similar to the discussion above under Saint Bernard High School, the Argo Drainage Channel is located approximately 950 feet from the nearest residence; hence, significant construction equipment noise impacts would occur.

Park West Apartments Northwest on Lincoln Boulevard South of La Tijera Boulevard

This apartment complex is near the west end of the Lincoln Boulevard improvement (i.e., realignment) area associated with relocation of Runway 6L/24R. Construction activity for the nearby roadway improvements (i.e., the realignment of Lincoln Boulevard) would result in significant construction equipment noise impacts to apartment residents. Additionally, the southern end of the apartment complex is approximately 650 feet from the Argo Drainage Channel and approximately 750 feet from the 260-foot northward shift of Runway 6L/24R; hence, the apartment complex would also be subject to significant construction equipment noise impacts from those improvements proposed under the LAWA Staff-Recommended Alternative.

Residential Uses Along West 88th Street between Liberator Avenue and Sepulveda Westway

The northward realignment of Lincoln Boulevard, which would accompany the northward relocation of Runway 6L/24R under the LAWA Staff-Recommended Alternative, would occur approximately 1,100 feet away from (south of) the residential uses along West 88th Street between Liberator Avenue and Sepulveda Westway. Based on distance alone, not including the noise attenuation function of the existing 8-foot-high noise wall along West 88th Street and the 15- to 20-foot high noise walls along portions of La Tijera and West 88th Place, no significant construction noise impacts are expected to occur in this area under the LAWA Staff-Recommended Alternative.

Impacts from Ground Access Improvements

Remaining Residences Within Belford

The majority of the Belford area has been cleared of residential uses; however, there are a few residences currently remaining, including along the west side of Belford Avenue south of 96th Street, which are approximately 500 feet from the eastern edge of the Intermodal Transportation Facility (ITF) proposed under the LAWA Staff-Recommended Alternative, and approximately 500 feet north of the APM proposed along 98th Street. Should those residences still remain and be occupied at the time of ITF, parking, and APM development, there is the potential for significant impacts from construction equipment noise. Additionally, the existing Avis Car Rental facility located directly west of Belford would be converted to surface parking. Given the proximity of this site to residences that currently remain at the eastern edge of Belford, the construction activities associated the removal of the rental car facilities and development of new parking would result in significant noise impacts. As such, the potential construction equipment noise impacts from development of the ITF, parking, and APM under the LAWA Staff-Recommended Alternative are considered significant.

Noise-Sensitive Uses Within Manchester Square

Similar to Belford, the majority of Manchester Square has been cleared of residential development; however, there are currently some remaining units, primarily apartment complexes. There are also school facilities (Bright Star Secondary Charter Academy and Stella Middle Charter Academy) within Manchester Square. It is possible that the development of surface parking and the CONRAC under the LAWA Staff-Recommended Alternative would be sequenced to occur in phases over the course of several years. Should noise-sensitive uses still be present at the time Manchester Square is developed for surface parking, significant construction equipment noise impacts would occur. Additionally, construction of the eastern end of the APM system, which would terminate at Manchester Square, would

result in significant construction equipment noise impacts should occupied residential units be present in the southwest portion of Manchester Square at the time of development. As such, the potential for construction equipment noise from development of surface parking, CONRAC, and APM system under the LAWA Staff-Recommended Alternative are considered significant.

Animo Leadership Charter High School[57]

This school facility is located at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. Under the LAWA Staff-Recommended Alternative, development of surface parking in Manchester Square would result in significant construction equipment noise impacts at the school site (i.e., construction activities would occur as close as approximately 75 feet from the school site).

Residential Uses Within City of Inglewood

Although there are residential units in Inglewood that are nominally within 925 feet of the Manchester Square surface parking lot proposed under the LAWA Staff-Recommended Alternative, such units are on the east side of the I-405 Freeway, which effectively removes them from the project site area and would mask the SPAS-related construction noise with the intervening freeway noise that is not otherwise attenuated by the existing noise wall/barrier located along the eastern edge of the freeway. Therefore, construction equipment noise impacts would be less than significant.

Construction Noise Control Measures

LAX Master Plan Commitments ST-16, ST-18, and ST-22 and LAX Master Plan Mitigation Measures MM-N-7 through MM-N-10 would reduce construction equipment noise impacts. However, at this level of planning, it cannot be concluded that the construction equipment noise impacts described above would be fully mitigated; hence, the impacts above for the LAWA Staff-Recommended Alternative are considered at this time to be significant.

Construction Staging Areas

As described in Section 4.10.3.2 of the SPAS Draft EIR, the analysis of construction noise impacts addresses impacts associated with the airfield/terminal improvements and the ground access improvements under the LAWA Staff-Recommended Alternative. That analysis is presented in Section 2.3.10.3.1 above. The construction noise analysis also addresses impacts associated with the potential construction staging areas associated with the LAWA Staff-Recommended Alternative. The following describes potential noise impacts associated with the development and use of each construction staging area.

Construction Staging Area A

Residential Uses In Playa del Rey

The western edge of Construction Staging Area A is approximately 1,000 feet from Playa de Rey. The western portion of Construction Staging Area A is already developed for, and used as, a construction staging area; consequently, the need for major grading or improvements at the site is unlikely. Site improvements, if any, would likely occur during daytime hours, which would avoid the evening and nighttime penalties associated with CNEL values. Based on the average construction activity noise level (non-penalized) of 86 dBA at a distance of 50 feet and an existing ambient noise level of 68 dBA CNEL in

[57] At the publication time of the Notice of Preparation for the SPAS Draft EIR, October 2010 (i.e., the baseline year for the EIR impacts analysis), the Animo Leadership Charter High School was located at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. This school, however, has subsequently moved to a new location in Lennox, approximately 2.5 miles from the current site (see http://www.dailybreeze.com/news/ci_21358340/animo-leadership-has-new-lennox-campus-and-new, accessed on December 10, 2012). In order to provide a consistent basis of comparison, the impacts discussion for the LAWA Staff-Recommended Alternative contained herein assumes the location of the Animo Leadership Charter High School to be at its former location at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square.

that area of Playa del Rey, the distance at which that sound level would dissipate to 73 dBA (i.e., a 5 dBA increase over the baseline ambient exterior noise level) is approximately 370 feet, which is well short of Playa de Rey. While the specifics of how Construction Staging Area A would be used are not currently known and would be determined in the future in conjunction with more detailed development plans, it is generally anticipated that use of the site would be for construction contractor trailers/offices, equipment and materials storage, and light- to medium-assembly of construction components. Construction staging activity is likely to occur primarily, if not entirely, in the daytime hours and largely involve street-legal vehicles that are quieter than off-road construction equipment. Based on existing information, construction equipment noise impacts to residential uses in Playa del Rey from the development and use of Construction Staging Area A would be less than significant.

Saint Bernard High School

As described above, construction activity associated with improvements to Construction Area A would likely be limited in nature and have a noise level of approximately 86 dBA at 50 feet. Based on an existing ambient noise level of 65 dBA CNEL estimated for the school site, construction activities would need to be approximately 585 feet or more away in order to avoid a 5 dBA increase over existing ambient noise levels. The distance between the southern portion of the school site and northern edge of Construction Staging Area A is slightly less than this distance (i.e., separation distance is approximately 550 feet). As such, construction equipment noise impacts to Saint Bernard High School from development and use of Construction Staging Area A would be significant.

Residential Uses Along Southern Edge of Westchester

Construction noise impacts to the residential uses along the southern edge of Westchester associated with the development and use of Construction Staging Area A, which is approximately 650 feet south of the nearest residence in the subject residential area, would be less than significant.

Park West Apartments Northwest on Lincoln Boulevard South of La Tijera Boulevard

The eastern portion of Construction Staging Area A is situated approximately 250 feet south of the apartment complex, across Westchester Parkway. The subject area is already fully improved for and currently used as a construction staging area; consequently, no other notable improvements are anticipated to occur. Given the past and present construction staging uses at the site and the fact that it does not have direct access to the airfield or other main areas of the airport, it is anticipated that future use of the area would primarily involve materials storage and light assembly during daytime hours, and possibly construction contractor trailer/offices. It is possible, however, that other types of construction staging activities could occur within the subject area from time to time that would result in noise levels reaching 86 dBA at 50 feet. Such occurrences would result in significant construction noise impacts to the nearby apartments.

Construction Staging Areas B, C, and D

Residential Uses Along West 88th Street between Liberator Avenue and Sepulveda Westway

Construction Staging Areas C and D are proposed immediately south of the residential area north of West 88th Street between Liberator Avenue and Sepulveda Westway. Potential Construction Staging Area B is situated south of Areas C and D.

Construction Staging Area B is flat and not expected to require notable improvements. It is anticipated that future use of the area for most of the alternatives would likely involve materials storage and light assembly during daytime hours, and possibly construction contractor trailer/offices. Under the LAWA Staff-Recommended Alternative, which involves northward relocation of Runway 6L/24R, it is anticipated that Construction Staging Area B may be more actively used in conjunction with the associated realignment of Lincoln Boulevard. The proposed realignment would extend through much of Construction Staging Area B, placing it in close proximity of, and use for, the Lincoln Boulevard realignment construction activities. Given its distance from the nearest residential development (i.e., approximately 1,000 feet away) and the presence of the existing 8-foot-high block wall along the north side of West 88th

Street, between residents to the north and the subject construction staging area, no significant noise impacts would occur from the use of Construction Staging Area B.

Construction Staging Area C is flat and not expected to require notable improvements. Given its distant location from the airfield and other main areas of the airport, it is anticipated that future use of the area would likely involve materials storage and light assembly during daytime hours, and possibly construction contractor trailer/offices. An existing 8-foot-high block wall is located along the north side of West 88th Street, between residents to the north and the subject construction staging area.

Construction Staging Area D is already improved as, and has long been used for, staging of LAX construction and soundproofing activities and includes a block wall approximately 15 to 20 feet tall along the northern and western edges of the site (i.e., between the interior of the site and residential areas to the north and northwest, in addition to the aforementioned block wall along the north side of West 88th Street). No additional construction staging area improvements are expected.

Based on the nature, location, and anticipated use of Construction Staging Areas B, C, and D, construction equipment noise impacts to nearby residential areas would be less than significant.

Construction Staging Area E

Remaining Residences Within Belford

The improvement and use of Belford for Construction Staging Area E poses the potential for construction equipment noise to occupied residences if they are still remaining at the time the area is needed for construction staging. Given that the portions of Belford that would likely be used for construction staging have been, or will have been, cleared and leveled, it is not expected that substantial improvements would be necessary to ready the site for construction staging. Although most of the site has been cleared and portions with residential uses remaining are very limited, it is possible that construction staging activities could occur within 575 feet of occupied residential uses, if any, remaining at the time. Therefore, construction equipment noise impacts are considered significant.

Construction Staging Area F

Noise-Sensitive Uses Within Manchester Square

The potential improvement and use of Manchester Square for construction staging poses the potential for construction equipment noise impacts to noise-sensitive uses at the site such as any remaining occupied residential units and/or the existing school facilities, if active. For the same reasons described above for Belford, construction equipment noise impacts to residential uses and schools within Manchester Square from staging activities could occur in close proximity. Therefore, construction equipment noise impacts are considered significant.

Animo Leadership Charter High School[58]

This school facility is located at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. Under the LAWA Staff-Recommended Alternative, development of surface parking in Manchester Square would result in significant construction equipment noise impacts at the school site (i.e., construction activities would occur as close as approximately 75 feet from the school site).

Residential Uses Within City of Inglewood

Although there are residential units in Inglewood that are nominally within 925 feet of the Manchester Square surface parking lot proposed under the LAWA Staff-Recommended Alternative, such units are on the east side of the I-405 Freeway, which effectively removes them from the project site area and would mask the SPAS-related construction noise with the intervening freeway noise that is not otherwise

[58] See footnote 57 with regard to the pending relocation of this facility.

attenuated by the existing noise wall/barrier located along the eastern edge of the freeway. Therefore, construction equipment noise impacts would be less than significant.

Construction Staging Area G

Residential Uses Within Del Aire

Development and use of the Continental City site for construction staging would occur north of the Del Aire residential area. Although such activity would occur as close as 800 feet from residences in Del Aire, such construction staging activity would occur at approximately the same elevation as Del Aire, at which the existing 8-foot-high cinderblock wall along the northern edge of Del Aire would serve to attenuate potential noise impacts. Based on the above, construction equipment noise impacts are less than significant.

2.3.10.3.2 Mitigation Measures

Implementation of LAX Master Plan Mitigation Measures MM-N-7 through MM-N-10 and LAX Master Plan Commitments ST-16, ST-18, and ST-22 would reduce construction equipment noise impacts associated with the LAWA Staff-Recommended Alternative. No additional measures are available to address construction equipment noise.

2.3.10.3.3 Level of Significance After Mitigation

LAX Master Plan commitments and mitigation measures would reduce construction equipment noise impacts associated with the LAWA Staff-Recommended Alternative. However, given that the design and effectiveness of such measures, such as the noise control plan, depend on site- and project-specific conditions that would be addressed at future, more detailed levels of planning, it cannot be definitively concluded at this time that all construction equipment noise impacts would be reduced to levels that are less than significant. No additional measures are available to address construction equipment noise. As such, construction equipment noise impacts for the LAWA Staff-Recommended Alternative are considered to be significant and unavoidable.

2.3.10.4 Transit Noise and Vibration

2.3.10.4.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to transit noise and vibration are only associated with the ground access components of Alternative 9, as evaluated in Section 4.10.4.7 of the SPAS Draft EIR.

2.3.10.4.1.1 Transit Noise

Table SRA-2.3.10.4-1 presents the estimated project-related transit noise levels at each receptor location for the LAWA Staff-Recommended Alternative. The calculation assumptions and worksheets for the estimated noise levels shown in **Table SRA-2.3.10.4-1** are presented in Appendix J3, *Transit Noise and Vibration*.[59] The following describes the impacts particular to the LAWA Staff-Recommended Alternative.

[59] The analysis of the LAWA Staff-Recommended Alternative in Appendix J3 is provided under the designation "Alternative 9."

Table SRA-2.3.10.4-1

Ambient Noise Levels With Addition of Transit Noise Associated the LAWA Staff-Recommended Alternative

Receptor	Baseline Ambient Noise Level (CNEL)	Transit Noise Levels: Ambient Noise Level With Addition of Transit Noise (CNEL) APM
Receptor 1 - Radisson Hotel	68 dBA	68 dBA
Receptor 2 - Courtyard by Marriott[1]	67 dBA	68 dBA
Receptor 2A - Courtyard by Marriott[2]	67 dBA	NA
Receptor 3 - Sheraton Hotel[1]	69 dBA	69 dBA
Receptor 3A - Sheraton Hotel[2]	69 dBA	NA
Receptor 4 - Crown Plaza Hotel	68 dBA	68 dBA
Receptor 5 - Embassy Suites[1]	68 dBA	69 dBA
Receptor 5A - Embassy Suites[2]	68 dBA	NA
Receptor 6 - Renaissance Hotel[1]	67 dBA	68 dBA
Receptor 6A - Renaissance Hotel[2]	67 dBA	NA
Receptor 7 - Four Points Sheraton	67 dBA	68 dBA
Receptor 8 - Marriott Hotel	69 dBA	69 dBA
Receptor 9 - Hilton Hotel[1]	70 dBA	72 dBA
Receptor 9A - Hilton Hotel[2]	70 dBA	NA

Notes:

NA = Not applicable
Noise levels shown in bold text indicate an increase of 3 dBA or more.
LAX Master Plan Mitigation Measure MM-N-11 was not quantitatively accounted for in Table SRA-2.3.10.4-1.

[1] Receptor location nearest to 98th Street - see Figure 4.10.4-2 of the SPAS Draft EIR.
[2] Receptor location nearest to Century Boulevard - see Figure 4.10.4-2 of the SPAS Draft EIR.

Source: CDM Smith, 2012.

Under the LAWA Staff-Recommended Alternative, an elevated APM would be constructed between Manchester Square and the CTA, primarily using the 98th Street corridor. The APM would be fully automated (driverless). The pinched-loop system would operate with a round trip time of approximately 19 minutes. The system would operate 24 hours a day. The nature and design of the APM system for the LAWA Staff-Recommended Alternative, relative to rubber-tire or steel-wheel, are unknown at this time. For analysis purposes, it is assumed that the system would be steel-wheel, recognizing that the noise characteristics of a rubber-tire system would be generally similar.

The additional noise from the APM operations proposed under the LAWA Staff-Recommended Alternative would result in an increase in ambient noise levels of approximately 2 dBA CNEL or less at all of the receptor locations. As such, the LAWA Staff-Recommended Alternative would not result in significant transit noise impacts. It should be noted that, although the APM route along 98th Street for the LAWA Staff-Recommended Alternative is the same as the same segment of APM1 under Alternative 3, the APM noise levels along 98th Street for the LAWA Staff-Recommended Alternative would be substantially lower than those of Alternative 3 because the former has far fewer hourly trips and shorter trains than the latter. Under Alternative 3, all passenger traffic to and from the CTA, except for FlyAways, would utilize the APM system, whereas under the LAWA Staff-Recommended Alternative, the CTA would remain open to various modes of traffic and only a limited portion of the passenger traffic would utilize the APM.

2.3.10.4.1.2 Transit Vibration

Based on the adjusted vibration level curve for Rapid Transit or Light Rail Vehicles described in Section 4.10.4.3.2 of the SPAS Draft EIR, the highest ground-borne vibration level associated with the APM system under the LAWA Staff-Recommended Alternative would be 72.3 VdB at a distance of 10 feet from the APM centerline. The hotel nearest to the APM route along 98th Street would be approximately 35+ feet from the APM centerline (Receptor 9 - the Hilton Hotel). As such, the estimated ground-borne vibration levels at the nearest hotel area would be approximately 67 VdB, which is less than the threshold of significance of 72 VdB. Therefore, transit-related ground-borne vibration under the LAWA Staff-Recommended Alternative would be less than significant.

2.3.10.4.2 Mitigation Measures

Impacts associated with transit noise and vibration under the LAWA Staff-Recommended Alternative would be less than significant; therefore, no mitigation measures specific to the LAWA Staff-Recommended Alternative are required.

2.3.11 Public Services

As discussed in the revised LAX SPAS EIR Notice of Preparation/Initial Study (October 2010), provided in Appendix A, *Notice of Preparation/Scoping*, of the SPAS Draft EIR, the proposed project does not include any residential development, schools, park/recreation areas, or library facilities. Furthermore, the proposed project would not result in a direct physical impact or alteration to any public park/recreation areas or public libraries. The LAWA Staff-Recommended Alternative would require the acquisition of a Los Angeles Unified School District (LAUSD) parcel with two charter schools. Impacts related to these schools are address in Section 2.3.9, *Land Use and Planning*, of this chapter, and were determined to be less than significant.

Employment and visitor-related demand for parkland, libraries, and schools is considered to be less than significant. Therefore, impacts related to schools, parks/recreation areas, and libraries do not require any further analysis and are not addressed herein.

2.3.11.1 Fire Protection

2.3.11.1.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on fire protection are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.11.1.6 of the SPAS Draft EIR. The LAWA Staff-Recommended Alternative includes various features that are particularly relevant to the analysis of impacts to fire protection services. These features include airfield facility and terminal improvements, ground access improvements and parking, and the reconfiguration or relocation of the on-airfield fuel truck filling station.

Airfield Improvements

Airfield improvements under the LAWA Staff-Recommended Alternative would include the movement of Runway 6L/24R 260 feet north, the addition of a centerfield taxiway, extension of Runway 6R/24L, improvements to Taxilane D and Taxiway E, and relocation of the service road. These improvements would provide a greater amount of runway and taxiway facilities that meet FAA Airport Design Standards for Aircraft Design Group (ADG) V and VI aircraft under certain operating conditions, particularly as related to separation requirements, thereby reducing the need for special operations restrictions, modifications of standards, and waivers from FAA. Additionally, the LAWA Staff-Recommended Alternative includes the addition of a center parallel taxiway, which would provide safety benefits related to arriving and departing aircraft on the adjacent runways. As described in Section 2.3.7.2, *Safety*, of this chapter, these improvements to the north airfield under the LAWA Staff-Recommended Alternative would enhance the safety and efficiency of the airfield, thereby decreasing the potential need for emergency fire

response associated with airfield accidents. Furthermore, Fire Station 80 was recently relocated and expanded to better accommodate the size, volume, and emergency response equipment associated with future operations and newer generation aircraft. The relocated ARFF Fire Station 80 is currently better situated relative to the midpoints of the outermost runways (Runway 6L/24R on the north airfield and Runway 7R/25L on the south airfield), and this more centralized location enables personnel to better respond to emergencies on the airfield. In addition, LAX Master Plan Commitments FP-1, LAFD Design Recommendations, and PS-2, Fire and Police Facility Space and Siting Requirements, as well as enforcement of FAR and fire code requirements, would ensure maintenance of adequate response times, staffing, equipment, facilities, and emergency access in association with airfield improvements. Therefore, impacts to fire protection services related to airfield improvements under the LAWA Staff-Recommended Alternative would be less than significant.

Terminal Modifications

Under the LAWA Staff-Recommended Alternative, terminal improvements include the addition of Terminal 0, modifications to concourse area and/or gates at Terminals 1 and 2, replacement of the Terminal 3 concourse, and the northern extension of concourse areas and gates at Tom Bradley International Terminal (TBIT) and the future Midfield Satellite Concourse (MSC).

Development of new terminal areas could increase demand for fire protection and emergency services and the need for new, expanded, consolidated, or relocated fire protection facilities compared to baseline conditions due to expanded terminal areas and increases in passenger activity over time. However, LAX Master Plan Commitments FP-1, LAFD Design Recommendations, and PS-2, Fire and Police Facility Space and Siting Requirements, as well as enforcement of FAR and fire code requirements, would ensure maintenance of adequate response times, facilities, and emergency access. Potential impacts associated with staffing, equipment, and facilities would also be continually evaluated and addressed pursuant to standard LAFD procedures and fire code requirements. Furthermore, as previously indicated, Fire Station 80 located at LAX was recently expanded substantially in size to better serve future airport operations, and Fire Station 5 was substantially increased in size when it was relocated in 2006. These upgraded facilities and the recently completed ARCC are expected to enhance fire protection and support demand for fire services at LAX into the foreseeable future. Therefore, impacts to fire protection services associated with terminal improvements would be less than significant.

Ground Access Improvements and Parking

Under the LAWA Staff-Recommended Alternative, a new Intermodal Transportation Facility (ITF) would be constructed that would include public parking, bus/shuttle areas, and remote passenger pick up/drop off. Additional public parking and a CONRAC would be located in Manchester Square. An APM would be constructed linking the Manchester Square parking to the CTA, with stops at the future Metro LAX/Crenshaw Light Rail Station and the new ITF.

Construction of the ITF, APM, and other ground access improvements would reduce traffic congestion and curb-front demands, which would reduce the potential for automobile collisions, automobile/pedestrian conflicts, and automobile-related emergency response incidents at the airport compared to baseline conditions. Improved traffic flow associated with the new ground access facilities is also expected to improve response times for fire protection services. Nonetheless, development of these new ground access facilities may increase the need for fire protection services in order to respond to calls and provide service to these areas.

Relative to the need for new, expanded, consolidated, or relocated fire protection facilities, recent expansion and upgrades to Fire Station 80 and Fire Station 5 have substantially upgraded fire protection services at LAX and, as a result, any need for new or expanded fire protection facilities is expected to be limited. Furthermore, potential impacts to fire protection and emergency services would be reduced by LAX Master Plan Commitments FP-1 and PS-2. LAX Master Plan Commitment FP-1, LAFD Design Recommendations, addresses coordination with LAFD regarding emergency access and other design needs to ensure that fire protection service levels are maintained. LAX Master Plan Commitment PS-2, Fire and Police Facility Space and Siting Requirements, would require ongoing consultation with LAFD to

evaluate and refine, as necessary, program requirements for fire facilities. This coordination would ensure that final plans for ground access-related improvements under the LAWA Staff-Recommended Alternative adequately support future facility needs, including space requirements, siting, and design. Potential impacts associated with staffing and equipment would also be continually evaluated and addressed pursuant to standard LAFD procedures and fire code requirements. Furthermore, fire facilities serving LAX have been recently expanded to improve service at LAX. Therefore, impacts to fire protection services associated with ground access improvements would be less than significant.

Removal/Reconfiguration of Existing Facilities

Under the LAWA Staff-Recommended Alternative, the on-airfield fuel truck filling station located at the north end of the LAXFUEL Fuel Farm would be reconfigured or relocated within the Airfield Operations Area (AOA). If relocation of the on-airfield fuel truck filling station is necessary, existing fire protection and safety features associated with the station would be maintained at the relocated site. In addition, LAFD personnel are trained in techniques for fighting hydrocarbon fires. For these reasons, impacts to fire protection services associated with the potential relocation of the on-airfield fuel truck filling station would be less than significant. Additional discussion of emergency response is provided in Section 2.3.7.3, *Hazardous Materials*, of this chapter.

Construction

Under the LAWA Staff-Recommended Alternative, traffic congestion associated with construction of the proposed improvements would have the potential to hamper or delay emergency response. However, temporary roadway delays would be reduced or avoided through LAX Master Plan Commitment C-1, Establishment of a Ground Transportation/Construction Coordination Office. The Ground Transportation/Construction Coordination Office, which is now in place, would ensure, among other things, proper coordination and planning with fire protection agencies to reduce effects from construction on traffic, emergency access, and response times. In addition, LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would serve to further reduce potential traffic congestion during construction. In the event construction activities were to result in deterioration of traffic conditions, use of emergency sirens, alternate response routes, and multiple station responses when necessary would help facilitate emergency access and response as occurs under current congested conditions. Therefore, impacts to emergency response times related to construction of the proposed improvements would be less than significant.

2.3.11.1.2 Mitigation Measures

Implementation of LAX Master Plan Commitments FP-1, PS-1, PS-2, C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would ensure that impacts relative to fire and emergency services associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to SPAS are required.

2.3.11.2 Law Enforcement

2.3.11.2.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative on law enforcement are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.11.2.6 of the SPAS Draft EIR.

The LAWA Staff-Recommended Alternative contains various features that are particularly relevant to the analysis of law enforcement impacts. These features include airfield facility and terminal improvements, ground access improvements and parking, and removal and relocation of a future LAWAPD facility.

Airfield Improvements

Airfield improvements under the LAWA Staff-Recommended Alternative would include movement of Runway 6L/24R 260 feet north, the addition of a centerfield taxiway, extension of Runway 6R/24L, improvements to Taxilane D and Taxiway E, and relocation of the service road. These improvements would provide a greater amount of runway and taxiway facilities that meet FAA Airport Design Standards for Aircraft Design Group (ADG) V and VI aircraft under certain operating conditions, particularly as related to separation requirements, thereby reducing the need for special operations restrictions, modifications of standards, and waivers from FAA. Additionally, the LAWA Staff-Recommended Alternative includes the addition of a center parallel taxiway, which would provide safety benefits related to arriving and departing aircraft on the adjacent runways. As described in Section 2.3.7.2, *Safety*, of this chapter, the safety and efficiency of the north airfield would be enhanced under the LAWA Staff-Recommended Alternative compared to baseline condition, thereby decreasing demand on law enforcement services associated with airfield accidents. Therefore, impacts to law enforcement services and facilities associated with these improvements would be less than significant.

Terminal Modifications

Under the LAWA Staff-Recommended Alternative, terminal improvements include the addition of Terminal 0, modifications to concourse area and/or gates at Terminals 1 and 2, replacement of the Terminal 3 concourse, and the modification and northern extension of concourse areas and gates at Tom Bradley International Terminal (TBIT) and the future Midfield Satellite Concourse (MSC).

Development of new terminal areas could increase demand for law enforcement services and police functions compared to baseline conditions due to expanded terminal areas and increases in passenger activity over time. Additional LAWAPD officers would be needed for staffing at TSA screening checkpoints in accordance with TSA regulations. However, significant impacts on law enforcement services due to terminal modifications would be avoided with implementation of LAX Master Plan Commitments LE-1, Routine Evaluation of Manpower and Equipment Needs, and LE-2, Plan Review. These LAX Master Plan commitments would ensure that LAWAPD and LAPD continue to routinely evaluate and provide additional officers, supporting administrative staff, facilities, and equipment to keep pace with forecast increases in activity and development at LAX in order to maintain a high level of law enforcement services. This would be achieved through LAWA notification to LAWAPD and LAPD regarding pending development and construction and through LAWA review of status reports on law enforcement services at LAX. LAX Master Plan Commitment LE-2, Plan Review, would ensure that, during the design phase of terminal improvements and other major airport development, LAPD, LAWAPD, and other law enforcement agencies would be consulted to review plans so that, where possible, environmental contributors to criminal activity, such as poorly-lit areas and unsafe design, are reduced. Thus, impacts to law enforcement services and facilities due to terminal improvements under the LAWA Staff-Recommended Alternative would be less than significant.

Ground Access Improvements and Parking

Under the LAWA Staff-Recommended Alternative, a new Intermodal Transportation Facility (ITF) would be constructed that would include public parking, bus/shuttle areas, and remote passenger pick-up/drop-off. Additional parking and a CONRAC would be located in Manchester Square. An APM would be constructed linking the Manchester Square parking to the CTA, with stops at the future Metro LAX/Crenshaw Light Rail Station and the new ITF.

Construction of the ITF, APM, and other ground access improvements would reduce traffic congestion and curb-front demands, which would reduce the potential for automobile collisions, automobile/pedestrian conflicts, and automobile-related emergency response incidents, and improve the overall safety and security characteristics of the airport. Improved traffic flow associated with the new ground access facilities is also expected to improve response times for law enforcement. Nonetheless, additional LAWAPD and LAPD personnel may be required to provide security and police functions in association with the new ITF and APM. Additionally, parking facility improvements under the LAWA Staff-Recommended Alternative would increase the number of vehicles parked at LAX that could potentially

result in a corresponding increase in vehicle-related incidents (e.g., auto thefts and auto break-ins) compared to baseline conditions.

Potential impacts on law enforcement staffing and services due to ground access improvements would be reduced to a less than significant level with implementation of LAX Master Plan Commitments LE-1, Routine Evaluation of Manpower and Equipment Needs, and LE-2, Plan Review. These commitments would ensure that law enforcement staffing, facilities, and equipment keep pace with forecast increases in activity and development at LAX, and would require consultation with law enforcement agencies in the development of new facilities, including ground access facilities. Thus, impacts to law enforcement services and facilities associated with ground access and parking improvements under the LAWA Staff-Recommended Alternative would be less than significant.

Removal of Existing Facilities

Under the LAWA Staff-Recommended Alternative, the existing LAWAPD station and associated facilities located at West 96th Street would be removed. LAWA is planning a future LAX Public Safety Building and Supporting Facilities independent of SPAS. The site for this planned facility is still under consideration. The future LAX Public Safety Building and Supporting Facilities would consolidate existing facilities and personnel under one roof, creating a larger, more modern and efficient facility that would result in an improvement and expansion of LAWAPD facilities. In addition, the new facility would be sited to ensure that adequate response times are maintained. The LAX Public Safety Building and Supporting Facilities is proposed to occur within approximately the next 5 years and is considered in this EIR as a cumulative project (see Chapter 5, *Cumulative Impacts*, of the SPAS Draft EIR). LAX Master Plan Commitments PS-1, Fire and Police Facility Relocation Plan, and PS-2, Fire and Police Facility Space and Siting Requirements, would reduce impacts associated with removal of the LAWAPD facilities. Nevertheless, because the location, timing, and characteristics of the replacement LAX Public Safety Building and Supporting Facilities have yet to be determined, and these factors as well as gaps in service could occur and degrade service and response times, impacts on LAWAPD facilities would be significant. Mitigation for these impacts is provided in Section 2.3.11.2.2 below.

Construction

Under the LAWA Staff-Recommended Alternative, traffic congestion associated with construction activities would have the potential to hamper or delay response times and increase traffic patrol and other law enforcement activities. Potential impacts related to construction would be reduced or avoided with implementation of LAX Master Plan Commitment C-1, Establishment of a Ground Transportation/Construction Coordination Office. The Ground Transportation/Construction Coordination Office, which is now in place, would ensure, among other things, proper coordination and planning with law enforcement agencies to reduce effects from construction on traffic, emergency access, and response times. In addition, LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would serve to reduce traffic impacts during construction. Nonetheless, in the event construction activities were to result in deterioration of traffic conditions, use of emergency sirens, alternate response routes, and multiple station responses when necessary would help facilitate law enforcement access and response as occurs under current congested conditions. Therefore, impacts to law enforcement services related to construction of improvements under the LAWA Staff-Recommended Alternative would be less than significant.

2.3.11.2.2 Mitigation Measures

Implementation of LAX Master Plan Commitments LE-1 and LE-2 would ensure that impacts to law enforcement related to terminal modifications and/or ground access improvements associated with the LAWA Staff-Recommended Alternative would be less than significant. LAX Master Plan Commitments C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would ensure that traffic impacts during construction under the LAWA Staff-Recommended Alternative would be less than significant. LAX Master Plan Commitments PS-1 and PS-2 would reduce, but not eliminate, impacts to LAWAPD facilities

associated with the LAWA Staff-Recommended Alternative as a result of the removal and relocation of LAWAPD station and facilities located at West 96th Street.

To address the potential significant impacts to law enforcement services as a result of the removal and relocation of the LAWAPD station and facilities located at West 96th Street associated with the LAWA Staff-Recommended Alternative, the following mitigation measure specific to SPAS is proposed:

- **MM-LE (SPAS)-1. LAWAPD Replacement Facilities.**

  Prior to removal of the existing LAWAPD station and facilities located at West 96th Street, LAWA shall complete an effective phased transition to the planned LAX Public Safety Building and Supporting Facilities. In the event the LAX Public Safety Building and Supporting Facilities is not yet completed, LAWA shall make arrangements for interim facilities to temporarily accommodate the displaced facilities. Plans and provisions for temporary and/or permanent replacement facilities shall be developed in consultation with LAWAPD and the facility shall be sited to support adequate emergency response times and distances. The existing LAWAPD station and facilities shall not be removed unless and until adequate emergency response times and distances can be achieved without it, as determined in consultation with LAWAPD.

2.3.11.2.2.1 Environmental Impacts of Mitigation Measure MM-LE (SPAS)-1

To the extent that implementation of Mitigation Measure MM-LE (SPAS)-1, LAWAPD Replacement Facilities, requires interim facilities to temporarily accommodate displaced LAWAPD facilities, secondary or indirect environmental impacts may occur under the LAWA Staff-Recommended Alternative. It is important to note that such facilities would not be required if the LAX Public Safety Building and Supporting Facilities is constructed prior to the need to remove the existing LAWAPD station and facilities. It should also be noted that if/when such temporary facilities are required, the discretional approval(s) associated with such activity would be subject to CEQA compliance, at which time additional CEQA review specific to the proposed activity would be completed.

If interim facilities are required, it is expected that such facilities would be housed within existing available building space and/or would consist of temporary structures, such as trailers and modular buildings. Functions such as patrols and emergency response would have to be located in relatively close proximity to the existing LAWAPD facilities in order to provide adequate response times and distances to the uses served by the existing facilities. Administrative functions could be housed in a separate location, which could include the western portion of the airport, LAX Northside, or another location. As potential temporary sites at or near LAX are highly developed and are surrounded by urban uses, impacts associated with the temporary facilities would be limited. Interim facilities would not be expected to change transportation patterns at or around the airport, nor would such facilities be located in an aesthetically sensitive area, as the airport and its environs are highly developed. As the interim facilities would be housed in existing building space and/or trailers and modular buildings, construction activities, if any, would be limited and construction-related impacts, such as noise and air quality, would be less than significant.

2.3.11.2.3 Level of Significance After Mitigation

Implementation of SPAS Mitigation Measure MM-LE (SPAS)-1, LAWAPD Replacement Facilities, would reduce potential impacts to law enforcement facilities associated with the LAWA Staff-Recommended Alternative to a level that is less than significant.

2.3.12 Transportation

2.3.12.1 On-Airport Transportation

2.3.12.1.1 Impacts Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to on-airport transportation are only associated with the ground access components of Alternative 9, as evaluated in Section 4.12.1.9 of the SPAS Draft EIR. As described in Section 4.12.1.2 of the SPAS Draft EIR, traffic-related impacts pertaining to SPAS alternatives, including the LAWA Staff-Recommended Alternative, were assessed by conducting the following comparisons: (1) the baseline (2009) conditions with addition of the SPAS alternative measured against baseline (2009) conditions without the alternative; and (2) future (2025) conditions with addition of the SPAS alternative measured against the future (2025) conditions without the alternative to calculate the SPAS alternatives' contribution to cumulative impacts. The thresholds described in Section 4.12.1.4 of the SPAS Draft EIR were used to determine the significance of impacts. The following presents the results of those comparisons for the LAWA Staff-Recommended Alternative.

2.3.12.1.1.1 Analysis Relative to Baseline (2009) Conditions

This comparison focuses on the change in traffic conditions in 2009 if the proposed improvements included as part of the LAWA Staff-Recommended Alternative were in place in 2009, as measured against the baseline (2009) conditions.

LAWA Staff-Recommended Alternative

Curbside Impacts

Table SRA-2.3.12.1-1 provides the impact comparison of the terminal curbside operations for the Baseline (2009) With LAWA Staff-Recommended Alternative traffic conditions compared to the baseline (2009) traffic conditions. The associated LOS worksheets for the curbside analyses are provided in Appendix K1, *On-Airport Transportation*, of the SPAS Draft EIR.[60] As indicated in **Table SRA-2.3.12.1-1**, implementation of the LAWA Staff-Recommended Alternative would not result in significant impacts to the airport's arrivals or departures level curbsides.

CTA Intersection Impacts

Table SRA-2.3.12.1-2, provides the impact comparison of the signalized intersection operations for the Baseline (2009) With LAWA Staff-Recommended Alternative traffic conditions compared to the baseline (2009) traffic conditions. As shown in **Table SRA-2.3.12.1-2**, implementation of the LAWA Staff-Recommended Alternative would not result in significant impacts to on-airport intersections.

[60] The analysis of the LAWA Staff-Recommended Alternative in Appendix K1 is provided under the designation "Alternative 9."

CTA Roadway Link Impacts

Table SRA-2.3.12.1-3 provides the impact comparison of the roadway link operations for the Baseline (2009) With LAWA Staff-Recommended Alternative traffic conditions compared to the baseline (2009) traffic conditions. As shown in **Table SRA-2.3.12.1-3**, implementation of the LAWA Staff-Recommended Alternative would not result in significant impacts to on-airport roadway links.

2.3.12.1.1.2 Analysis Relative to Future (2025) Conditions (Cumulative Analysis)

This comparison focuses upon the project's contribution to cumulative impacts by calculating the change in traffic for the Future (2025) With Alternative traffic conditions compared to the Future (2025) Without Alternative traffic conditions. This analysis addresses whether the change in future (2025) conditions with implementation of the LAWA Staff-Recommended Alternative would exceed the thresholds defined in Section 4.12.1.4 of the SPAS Draft EIR (i.e., whether the alternative's contributions would be cumulatively considerable). These cumulative scenarios were also compared against baseline conditions.

LAWA Staff-Recommended Alternative

Curbside Impacts

Table SRA-2.3.12.1-4 delineates the contribution of the LAWA Staff-Recommended Alternative to cumulative impacts by comparing the terminal curbside operations for the Future (2025) With LAWA Staff-Recommended Alternative traffic conditions to the Future (2025) Without Alternative traffic conditions. The associated LOS worksheets for the curbside analyses are provided in Appendix K1, *On-Airport Transportation*. As shown in **Table SRA-2.3.12.1-4**, implementation of the LAWA Staff-Recommended Alternative, in conjunction with other cumulative projects, would not result in a change to the volume to capacity levels at the airport's departures or arrivals level curbsides that exceeds the aforementioned thresholds, with the exception of the TBIT arrivals level inner curbsides. The cumulative impact at the TBIT inner curbside is considered to be significant, and the contribution of the LAWA Staff-Recommended Alternative would be cumulatively considerable. Mitigation Measure MM-ST(OA) (SPAS)-1, defined in Section 2.3.12.1.2 below, is proposed to mitigate this impact.

CTA Intersection Impacts

Table SRA-2.3.12.1-5 delineates the contribution of the LAWA Staff-Recommended Alternative to cumulative impacts by comparing the Future (2025) With LAWA Staff-Recommended Alternative traffic conditions measured against the Future (2025) Without Alternative traffic conditions. As shown in **Table SRA-2.3.12.1-5**, implementation of the LAWA Staff-Recommended Alternative, in conjunction with other cumulative projects, would not result in a change to the volume to capacity levels of on-airport intersections that exceeds the aforementioned thresholds, with the exception of the World Way South and Center Way intersection (Intersection #9) during the arrivals level peak hour. The cumulative impact to this intersection is considered to be significant, and the contribution of the LAWA Staff-Recommended Alternative to this cumulative impact would be cumulatively considerable. This impact is unavoidable as potential measures to mitigate this impact are infeasible, as explained in Section 2.3.12.1.2 below.

CTA Roadway Link Impacts

Table SRA-2.3.12.1-6 delineates the contribution of the LAWA Staff-Recommended Alternative to cumulative impacts by comparing the CTA roadway link operations for the Future (2025) With LAWA Staff-Recommended Alternative traffic conditions measured against the Future (2025) Without Alternative traffic conditions. As shown in **Table SRA-2.3.12.1-6**, implementation of the LAWA Staff-Recommended Alternative, in conjunction with other cumulative projects, would not result in a change to the volume to capacity levels of on-airport roadway links that exceeds the aforementioned thresholds, with the exception of Link "LF" on the arrivals level outer curbside adjacent to Terminal 1. The cumulative impact to this roadway link is considered to be significant and the contribution of the LAWA Staff-Recommended

Alternative to this cumulative impact would be cumulatively considerable. Mitigation Measure MM-ST(OA) (SPAS)-2, defined in Section 2.3.12.1.2 below, is proposed to mitigate this impact.

2.3.12.1.1.3 Analysis of Public Parking Impacts

As discussed in Section 4.12.1.3.6 of the SPAS Draft EIR, the airport offers public parking in both the CTA and remotely. To estimate the airport's future (2025) public parking demands for spaces in both the CTA parking structures and in the airport's remote lots, the baseline daily public parking demands for both types of facilities were used. These baseline (2009) daily parking space demands were converted to Future (2025) conditions based on the change in the baseline (2009) and future (2025) peak month originating and terminating passengers at the airport. **Table SRA-2.3.12.1-7** shows that the airport's public parking supply in each of the Future (2025) alternative scenarios is sufficient to accommodate the airport's estimated future (2025) public parking demand for all the alternatives, including the LAWA Staff-Recommended Alternative, which are assumed to be 15 percent greater than the space demand to account for fluctuations in vehicle arrivals in the facilities. Therefore, impacts associated with parking are considered less than significant.

2.3.12.1.1.4 Analysis of Construction Impacts

2.3.12.1.1.4.1 Project Impacts

Construction activities and related construction vehicle trips associated with the LAWA Staff-Recommended Alternative would impact on-airport traffic conditions including those related to existing curbside, intersection, and roadway link operations.

At this programmatic level of planning and analysis, there are not yet any particular construction plans or construction schedules for the LAWA Staff-Recommended Alternative. It would be speculative at this time to estimate the numbers, locations, and timing of construction-related trips for the LAWA Staff-Recommended Alternative and quantify the on-airport transportation system impacts. In general terms, it is anticipated that construction-related traffic generated within the CTA, such as that associated with terminal modifications, realignment of Sky Way, construction of the west end of the APM segment within the CTA, would add to existing traffic volumes within the CTA, which, in turn, could adversely affect curbside operations, intersection movements, and roadway link flows. To the extent that LAWA Staff-Recommended Alternative-related construction within the CTA requires temporary lane closures and detours, on-airport traffic conditions could be impacted. The above types of construction-related impacts to the on-airport surface transportation system could result in substantial congestion and substantial inconvenience to motorists on a regular or frequent basis.

	ITC						
	Sub-Total	**10,028**	**10,251**	**11,390**	**10,251**	**11,390**	**16,400**
	Percent Occupied (Remote Spaces)						69.5%
All Airport Parking Facilities	**TOTAL**	**18,605**	**15,519**	**17,574**	**15,519**	**17,574**	**23,441**
	Percent Occupied (Total Spaces)						75.0%

1 On-airport parking demand is assumed to be 85 percent of the parking requirements.
2 Assumes 2% of on-airport parkers are long-term.
3 Off-airport parking demand is assumed to be 90 percent of the parking requirements.

Source: LAWA, 2011.

Similar to projects currently under construction within the CTA, such as the replacement of the CUP, any LAWA Staff-Recommended Alternative-related project that affects the normal operation of ground transportation in the CTA would be required, pursuant to LAX Master Plan Commitment ST-18, to submit a Construction Traffic Management Plan (CTMP) for review and approval by LAWA staff prior to starting work. Depending on the extent and duration of construction, the CTMP may be in multiple phases. To maintain appropriate traffic flow at all times within the CTA, project construction may be limited by LAWA to certain hours of the day, days of the week, and/or times of year. CTMPs may include but not be limited to changeable message signs, arrow boards, temporary striping, detours, signal timing and phasing changes, pedestrian re-routing, temporary relocation of commercial curb zones and construction, and regulatory and wayfinding signs. In addition, LAWA would alert passengers of more extensive construction activity on its website and through other social media. Other LAX Master Plan commitments and mitigation measures described in Section 4.12.1.5 of the SPAS Draft EIR would also serve to avoid or reduce construction-related impacts to the on-airport transportation system. In the current absence of specific construction plans, schedules, and approaches for the LAWA Staff-Recommended Alternative, which would be determined during more detailed planning and design stages in the future, it is not possible to conclude whether the on-airport transportation system construction impacts would be fully mitigated by the aforementioned measures. As such, construction impacts to the on-airport transportation system are considered at this time to be significant.

2.3.12.1.1.4.2 Cumulative Impacts

Construction activities associated with past, present, and reasonably foreseeable future projects within the CTA, along with the improvements proposed under the LAWA Staff-Recommended Alternative, pose the potential for cumulative impacts to the on-airport transportation system.

Projects, in conjunction with the improvements associated with the LAWA Staff-Recommended Alternative, that pose the potential for cumulative on-airport transportation system impacts include the Bradley West Project, the Midfield Satellite Concourse new passenger processor, the North Terminals Improvements, the South Terminals Improvements, Miscellaneous Terminal Improvements, the Central Utility Plant Replacement Project, the "New Face" of the Central Terminal Area Improvements/Enhancements, Replacement of Elevators and Escalators, the CTA Second Level Roadway Expansion Joint and Deck Repairs, the LAX Sign District, and, depending upon the alternative selected, the Airport Metro Connector Project. To the extent that construction activities within the CTA overlap between these projects, both in terms of timing and location, significant impacts related to traffic congestion and delays within the CTA roadway system could occur. All of these projects would require the preparation of traffic control plans and implementation of other measures to reduce construction traffic impacts, as described in Section 4.12.1.5 of the SPAS Draft EIR. In the current absence of detailed construction plans for most of these projects, many of which are still in the conceptual stages of planning such as the LAWA Staff-Recommended Alternative, it is not possible to conclude that cumulative construction-related impacts to the on-airport surface transportation system would be reduced to a level that is less than significant with implementation of such measures. Therefore, cumulative impacts to the on-airport transportation system associated with construction would be significant. Based on the anticipated schedules for the above projects, implementation of the improvements associated with the LAWA Staff-Recommended Alternative would result in a cumulatively considerable contribution to those impacts.

2.3.12.1.2 Mitigation Measures

2.3.12.1.2.1 Mitigation Measures for Project Impacts (2009)

As indicated above, no significant impacts to curbside operations, intersections, or roadway links would occur under the LAWA Staff-Recommended Alternative relative to the Baseline (2009) versus Baseline (2009) With Alternative analyses; therefore, no mitigation is required.

Relative to construction-related traffic impacts, implementation of the LAX Master Plan commitments and mitigation measures described in Section 4.12.1.5 of the SPAS Draft EIR would reduce such impacts;

however, in the absence of specific project construction details at this conceptual level of planning, it cannot be concluded whether those commitments and measures would fully mitigate the impacts under the LAWA Staff-Recommended Alternative or whether additional project-specific construction traffic mitigation measures are needed to reduce impacts to the on-airport transportation system a level that is less than significant. It would be speculative at this level of planning to formulate additional mitigation measures for improvement-specific construction traffic impacts.

2.3.12.1.2.2 Mitigation Measures for Cumulative Impacts (2025)

As described above in Section 2.3.12.1.1, the contribution of the LAWA Staff-Recommended Alternative to significant cumulative impacts at certain curbside locations, intersections, and roadway links would be cumulatively considerable under the future (2025) conditions. In developing the proposed mitigation program for the LAWA Staff-Recommended Alternative, LAWA evaluated possible improvements that could be made at the significantly impacted curbside sections, as well as the roadway segments and intersection that would be impacted under future (2025) conditions. The discussion below presents both those improvements that were considered but determined to be infeasible, as well as those improvements that would be feasible and are thereby included in the recommended mitigation program for SPAS.

Improvements Considered but Determined to be Infeasible

CTA Signalized Intersection Impacts

- **World Way South and Center Way - Intersection #9** - Under future (2025) conditions, this intersection would experience a cumulatively considerable contribution from the LAWA Staff-Recommended Alternative that exceeds the threshold of significance. To mitigate the anticipated impacts, one additional through lane would be required on the eastbound approach to the intersection. In addition, the east leg of the intersection would need to be widened to allow for the additional eastbound through lane. The separation distance between the existing support columns for the departures level recirculation roadway is insufficient to allow for an additional eastbound through lane without demolishing and reconstructing the departures level recirculation roadway. If an additional lane were to be added to the airport's exit roadway, the bridge spanning Sepulveda Boulevard would also require widening to accommodate an additional lane so that an exclusive acceleration/deceleration lane for the ramps connecting to Sepulveda Boulevard can be maintained. Further, the addition of a fifth eastbound lane on the bridge spanning Sepulveda Boulevard would require, at a minimum, a partial reconstruction of the ramps to and from Sepulveda Boulevard to accommodate a reduced turning radius for each ramp. To implement this proposed mitigation measure, at least one of the two existing support columns for the departures level recirculation roadway would need to be relocated. This would require an extended closure of the departures level recirculation roadway for the demolition and reconstruction of the affected upper level span. This extended closure would impact upper level vehicles recirculating to either the departures level or vehicles such as commercial vehicles traveling to the arrivals level curbsides or exiting the CTA northbound on Sky Way. Based on existing physical constraints, implementation of improvements necessary to mitigate the impact at this intersection is not feasible and, therefore, is not recommended.

Improvements Determined to be Feasible

CTA Curbside Impacts

- **TBIT Arrivals Level Inner Curbside** - Under future (2025) conditions, this curbside would experience a cumulatively considerable contribution to a cumulatively significant impact from the LAWA Staff-Recommended Alternative that exceeds the threshold of significance. To mitigate the anticipated impacts, additional curbside parking may be provided by moving the taxi staging zone further downstream to the vacant area between TBIT and Terminal 4.

CTA Roadway Link Impacts

- **Roadway Link "LF"** - Under the cumulative future (2025) conditions, this roadway link would experience a cumulatively considerable contribution to a cumulatively significant impact from the LAWA Staff-Recommended Alternative that exceeds the threshold of significance.

To mitigate the anticipated impacts defined above, various operational changes that would involve allowing some commercial modes to change from a dual level (dual loop) operation to a single level (single loop) operation, where customers would be picked up and dropped off on the same curbside, may be considered. For example, one such alternative considered for this analysis would allow the hotel shuttles to single loop on the departures level, rental car shuttles to single loop on the arrivals level, and remove the assigned employee shuttle zones on the departures level allowing employee shuttles to drop off on the upper level and pick up on the lower level. The resultant decrease in traffic volumes along the subject roadway link on the departures level would reduce the impact to a level that is less than significant. The proposed change in operations for the hotel, rental car, and employee shuttles is presented as an illustration of the possible operational changes which may be implemented by LAWA to mitigate the impacts presented above. LAWA will determine at the time of implementation which commercial mode(s) should be relocated to mitigate the impacts from the LAWA Staff-Recommended Alternative that exceed the threshold of significance.

Recommended Mitigation Program

Based on the information provided above, the following mitigation measures are proposed to address on-airport transportation impacts associated with the LAWA Staff-Recommended Alternative:

- **MM-ST(OA) (SPAS)-1. Relocate Existing Taxi Loading Zone at TBIT (the LAWA Staff-Recommended Alternative).**

  LAWA will relocate the existing taxi loading zone at TBIT to the curve located between TBIT and Terminal 4. This change would provide a larger passenger loading area for the private vehicles along the TBIT inner curbside.

- **MM-ST(OA) (SPAS)-2. Change Departures and Arrivals Level Commercial Vehicle Curbside Operations (the LAWA Staff-Recommended Alternative).**

  LAWA will implement operational changes to commercial modes such that LAWA Staff-Recommended Alternative-related impacts to roadway links would not exceed the threshold of significance. LAWA will determine at the time of implementation which commercial mode(s) should be relocated. LAWA will consider options such as changing hotel and rental car shuttle operations from their current dual loop operation to a single loop operation on the departures and arrivals level curbsides respectively, while the employee shuttle operation could be changed from its existing single level operation on the departures level to a dual loop operation.

2.3.12.1.3 Level of Significance After Mitigation

2.3.12.1.3.1 Project Impacts (2009)

For the reasons described above, construction-related impacts to on-airport transportation cannot be concluded as being fully mitigated; therefore, for the purposes of this EIR, significant construction-related impacts to the on-airport transportation system would occur with implementation of the LAWA Staff-Recommended Alternative.

2.3.12.1.3.2 Cumulative Impacts (2025)

Table SRA-2.3.12.1-8 shows the results of the analysis for the proposed mitigation on the TBIT arrivals level inner curbsides while **Table SRA-2.3.12.1-9** provides the results for the proposed mitigation of the CTA roadways. As indicated in **Table SRA-2.3.12.1-8**, implementation of Mitigation Measure MM-ST(OA) (SPAS)-1, Relocate Existing Taxi Loading Zone at TBIT, would reduce impacts to curbsides

associated with the LAWA Staff-Recommended Alternative to a level that is less than significant. As indicated in **Table SRA-2.3.12.1-9**, implementation of Mitigation Measure MM-ST(OA) (SPAS)-2, Change Departures and Arrivals Level Commercial Vehicle Curbside Operations, would reduce impacts to all departures and arrivals level roadways under the LAWA Staff-Recommended Alternative in the future (2025) condition to a level that is less than significant. The results of the analysis are presented in Appendix K1, *On-Airport Transportation*, of the SPAS Draft EIR.

Table SRA-2.3.12.1-8

Curbside Impact Mitigation - LAWA Staff-Recommended Alternative

	Before Mitigation		After Mitigation		Impact	
TBIT Curbside	V/C	LOS	V/C	LOS	Mitigated Change in V/C	Significant Impact/ Cumulatively Considerable
Future Without Alternative	0.422	A	0.422	A	-	
Future (2025) SRA	0.584	C	0.464	B	0.042	No

Source: Ricondo & Associates, Inc., 2012.

As discussed above, the physical constraints at the intersection of World Way South and Center Way (Intersection #9) would render the improvements identified in Section 2.3.12.1.2 infeasible. As a result, impacts to this intersection under the LAWA Staff-Recommended Alternative could not be feasibly reduced to a level that is less than significant. Therefore, the cumulative impact at World Way South and Center Way (Intersection #9) would be significant and unavoidable, and the contribution of the LAWA Staff-Recommended Alternative to this impact would be cumulatively considerable and unavoidable. However, Mitigation Measure MM-ST(OA) (SPAS)-2, while developed to address impacts to roadway links, would improve the level of service at this intersection from LOS D to LOS C. Although the volume to capacity level at this intersection would continue to exceed the thresholds of significance under cumulative conditions associated with the LAWA Staff-Recommended Alternative, LOS C is considered to be a generally good level of service.

For the reasons described above, it cannot be concluded that cumulative construction-related impacts to on-airport transportation would be fully mitigated. Therefore, for the purposes of this EIR, cumulative construction impacts would be significant and unavoidable, and the contribution of the LAWA Staff-Recommended Alternative to this impact would be cumulatively considerable and unavoidable.

Table SRA-2.3.12.1-9

Roadway Link Impact Mitigation - LAWA Staff-Recommended Alternative

Roadway Links		Future Without Alternative Volume to Capacity Before Mitigation	Future Without Alternative Volume to Capacity After Mitigation	Future (2025) SRA Volume to Capacity Before Mitigation	Future (2025) SRA Volume to Capacity After Mitigation	Future (2025) SRA Mitigated LOS	Future (2025) SRA Mitigated Difference	Significant Impact/ Cumulatively Considerable
LF	Outer curb, west of inner curb entrance from Terminal 1	0.538	0.355	0.702	0.357	A	0.002	No

Note:

Following the implementation of the proposed mitigation measures, the volume to capacity ratios for all roadway links in the LAWA Staff-Recommended Alternative will improve or remain the same as those prior to mitigation.

Source: Ricondo & Associates, Inc., 2012.

2.3.12.2 Off-Airport Transportation

2.3.12.2.1 Impact Analysis

As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to off-airport transportation are only associated with the ground access components of Alternative 9, as evaluated in Section 4.12.2.6 of the SPAS Draft EIR.

As described in Section 4.12.2.2 of the SPAS Draft EIR, off-airport traffic-related impacts pertaining to operation of the LAWA Staff-Recommended Alternative were assessed in two ways; one by comparing Baseline (2010) With Alternative scenarios against Baseline (2010) Without Alternative scenarios, and the other by comparing the Future (2025) With Alternative scenarios against the Future (2025) Without Alternative scenarios. The comparison of Future (2025) scenarios involves holding the airport-related trip generation at current levels and evaluates it against the LAWA Staff-Recommended Alternative with the airport at 2025 trip generation levels. This growth in trip generation is expected to occur with or without the SPAS and therefore yields a conservative analysis.

The subject comparisons, particularly the comparison to Baseline (2010) Without Alternative conditions, help account for the fact that the physical improvements proposed under the LAWA Staff-Recommended Alternative play a large role in influencing the travel patterns of localized airport-related trips (passengers, employees, rental cars, cargo, etc.) and the timing of those trips. The shifts in trips that occur for these new facilities have an effect on the non-airport related vehicular traffic. The change in airport trip patterns can influence existing and future background trip patterns, resulting in drivers choosing alternate routes and modifying their travel patterns.

2.3.12.2.1.1 Impacts Relative to Baseline (2010) Without Alternative Conditions

The impact comparison for the LAWA Staff-Recommended Alternative is depicted in **Table SRA-2.3.12.2-1**. The associated LOS worksheets used to calculate those impacts is provided in Appendix K2-6.[61] The traffic volume estimates for the Baseline (2010) Without Alternative scenario and the Baseline (2010) With Alternative scenario are provided in Appendix K2-5. Also described below are impacts related to CMP facilities. Detailed worksheets and resultant calculation tables are provided in Appendix K2-7.

Based on the aforementioned comparison calculations, all of the alternatives would result in significant impacts relative to Baseline (2010) Without Alternative conditions. The following summarizes the impacts associated with each alternative.

[61] The analysis of the LAWA Staff-Recommended Alternative in Appendix K2 is provided under the designation "Alternative 9."

Table SRA-2.3.12.2-1

Intersections

Table SRA-2.3.12.2-2 delineates the intersection impacts of the LAWA Staff-Recommended Alternative by comparing the Baseline (2010) With Alternative scenario and the Baseline (2010) Without Alternative scenario. As indicated in **Table SRA-2.3.12.2-2**, five of the 200 intersections would be significantly impacted in one or more peak hours.

CMP Facilities

Table 5 in Appendix K2-7 delineates the impacts of the LAWA Staff-Recommended Alternative to the 15 arterial monitoring stations by comparing the Baseline (2010) With Alternative scenario and the Baseline (2010) Without Alternative scenario. For this alternative, no CMP arterial monitoring stations would be significantly impacted.

Table 14 in Appendix K2-7 delineates the impacts of the LAWA Staff-Recommended Alternative to the 30 CMP freeway monitoring stations by comparing the Baseline (2010) With Alternative scenario and the Baseline (2010) Without Alternative scenario. As indicated in Table 14, no CMP freeway monitoring stations would be significantly impacted.

With regard to CMP transit analysis, transit demand is not expected to increase when comparing the Baseline (2010) With Alternative scenario and the Baseline (2010) Without Alternative scenario; therefore, no impact is identified.

2.3.12.2.1.2 Impacts Relative to Future (2025) Conditions

The impact comparison for the LAWA Staff-Recommended Alternative is depicted in **Table SRA-2.3.12.2-3**. This comparison provides the LAWA Staff-Recommended Alternative's contribution to cumulative impacts and determines whether the LAWA Staff-Recommended Alternative's contribution would be significant (cumulatively considerable). The associated LOS worksheets used to calculate those impacts are provided in Appendix K2-6. The traffic volume estimates for the Future (2025) Without Alternative scenarios and the Future (2025) With Alternative scenarios are provided in Appendix K2-5. Also described below are impacts related to CMP facilities. Detailed worksheets and resultant calculation tables are provided in Appendix K2-7.

Based on the aforementioned comparison calculations, the LAWA Staff-Recommended Alternative would result in significant impacts relative to Future (2025) conditions. The following summarizes the impacts associated with the LAWA Staff-Recommended Alternative.

Table SRA-2.3.12.2-2

	Number of Significant Impacts	26	31	45
	Number of Significantly Impacted Intersections		57	

Source: Fehr & Peers, 2012.

Intersections

Table SRA-2.3.12.2-4 delineates the intersection impacts of the LAWA Staff-Recommended Alternative by comparing the Future (2025) With Alternative scenario and the Future (2025) Without Alternative scenario. As indicated in **Table SRA-2.3.12.2-4**, 58 of the 200 intersections would be significantly impacted in one or more peak hours.

CMP Facilities

Table 10 in Appendix K2-7 delineates the impacts of the LAWA Staff-Recommended Alternative to the 14 arterial monitoring stations by comparing the Future (2025) With Alternative scenario and the Future (2025) Without Alternative scenario. For this alternative, the following CMP arterial monitoring station would be significantly impacted:

- 164. Manchester Avenue and Crenshaw Boulevard (CMP ID #24)

Table 18 in Appendix K2-7 delineates the impacts of the LAWA Staff-Recommended Alternative to the 30 CMP freeway monitoring stations by comparing the Future (2025) With Alternative scenario and the Future (2025) Without Alternative scenario. As indicated in Table 18, the following three CMP freeway monitoring stations would be significantly impacted (without LAX Master Plan Commitment ST-24, Fair Share Contribution to CMP Improvements):

- Route 405, at postmile 0.40, north of Route 22
- Route 405, at postmile 8.02, Santa Fe Avenue
- Route 405, at postmile 11.90, south of Route 110

Table SRA-2.3.12.2-5

CMP Transit Analysis Future (2025) With the LAWA Staff-Recommended Alternative

	AM Peak Hour			PM Peak Hour		
SRA	**Capacity**	**Change in Demand**	**Change in D/C**	**Capacity**	**Change in Demand**	**Change in D/C**
North/South Corridor	13,145	--	--	13,210	--	--
East/West Corridor	6,440	--	--	6,595	--	--
Total	**19,585**	**240**	**1.23%**	**19,805**	**261**	**1.32%**

Source: Fehr & Peers, 2012.

Table 4.12.2-6 of the SPAS Draft EIR shows the total incremental estimated transit demand due to airport-related growth under each alternative, including the LAWA Staff-Recommended Alternative,[62] and **Table SRA-2.3.12.2-5** indicates the resulting impact on the utilization of the major north/south and east/west CMP transit corridors in the LAX vicinity. As indicated in **Table SRA-2.3.12.2-5**, implementation of the LAWA Staff-Recommended Alternative would increase transit system utilization by approximately 1.23 percent in the a.m. peak hour and 1.32 percent in the p.m. peak hour, which would not represent a substantial increase in transit demand. At this level of increase, impacts to the regional transit system would be considered less than significant.

2.3.12.2.1.3 Construction Impacts

The LAWA Staff-Recommended Alternative is only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for the LAWA Staff-Recommended Alternative. As such, it would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods. The following provides a qualitative evaluation of the key factors that would influence construction traffic generation under the LAWA Staff-Recommended Alternative, how such traffic generation would relate, in general, to the roadway system around LAX, and which existing provisions of the LAX Master Plan would serve to reduce or avoid construction traffic impacts. Applicable LAX Master Plan commitments and mitigation measures cited below are discussed fully in Section 4.12.2.5 of the SPAS Draft EIR.

For the LAWA Staff-Recommended Alternative, construction activities at LAX would extend over the course of several years. As individual projects are underway, traffic impacts would likely be experienced in the immediate area around the active development site(s). Three key considerations that would influence potential traffic impacts of these construction activities are:

- Deliveries of various construction materials
- Provision of labor to the construction sites
- Maintenance of traffic in the immediate construction zones

Section 2.3.1.12 of the SPAS Draft EIR identifies seven potential construction staging areas that could be utilized in some combination during development of the LAWA Staff-Recommended Alternative. Four of the potential construction staging areas are located within the LAX Northside planning area, which is planned for future development independent from SPAS. Depending on the nature and timing of such future development, use of those construction staging areas for SPAS-related construction staging may be limited.

[62] The LAWA Staff-Recommended Alternative in Table 4.12.2-6 of the SPAS Draft EIR is designated as "Alternative 9."

Regional access for construction-related vehicles would occur via the I-405 and I-105 freeways. Pursuant to LAX Master Plan Commitment ST-22, Designated Truck Routes, designated truck routes for construction would include Pershing Drive (Westchester Parkway to Imperial Highway); Florence Avenue (Aviation Boulevard to I-405); Manchester Boulevard (Aviation Boulevard to I-405); Aviation Boulevard (Manchester Avenue to Imperial Highway); Westchester Parkway/Arbor Vitae Street (Pershing Drive to I-405); Century Boulevard (Sepulveda Boulevard to I-405); Imperial Highway (Pershing Drive to I-405); La Cienega Boulevard (north of Imperial Highway); Airport Boulevard (Arbor Vitae Street to Century Boulevard); Sepulveda Boulevard (Westchester Parkway to Imperial Highway); I-405; and I-105. LAX Master Plan Commitment ST-17, Maintenance of Haul Routes, provides for the maintenance of haul routes.

It is anticipated that implementation of the LAWA Staff-Recommended Alternative would, from time to time, require substantial deliveries of equipment, materials, and personnel to the construction site and the hauling and return of equipment, materials (i.e., excavated soils), and personnel from the site. Potential traffic impacts associated with such deliveries, haul trips, and construction worker trips would be reduced through the use of designated truck/haul routes, as described above, and by LAX Master Plan Commitment ST-12, Designated Truck Delivery Hours, which requires such activities be scheduled to avoid peak traffic hours (i.e., avoid 7:00 a.m. to 9:00 a.m. and 4:30 p.m. to 6:30 p.m.). Additionally, LAX Master Plan Commitment ST-18, Construction Traffic Management Plan, and LAX Master Plan Mitigation Measure MM-ST-14, Ground Transportation/Construction Coordination Office Outreach Program, require each construction project to have a construction traffic management plan and coordinate with the LAX Ground Transportation/Construction Coordination Office for specific means to manage and reduce both worker-related traffic impacts and delivery/haul-related traffic impacts.

The LAWA Staff-Recommended Alternative includes major construction projects that would be substantial generators of construction traffic, including substantial numbers of truck trips for materials delivery, removal of spoil materials, and other construction functions, as well as employee trips. A large construction work force would be required, which would also generate traffic. Potential traffic impacts associated with worker trips would be reduced through several LAX Master Plan commitments and an LAX Master Plan mitigation measure. LAX Master Plan Commitment ST-14, Construction Employee Shift Hours, requires that construction worker shift hours do not coincide with the heaviest commuter traffic periods (7:00 a.m. to 9:00 a.m., 4:30 p.m. to 6:30 p.m.). LAX Master Plan Commitment ST-21, Construction Employee Parking Locations, provides that during construction of improvements at or near the eastern portion of the airport, employee parking locations be selected as close to I-405 and I-105 as possible and be accessible by employee vehicles with minimal disruption to adjacent streets. Similarly, LAX Master Plan Commitment ST-20, Stockpile Locations, provides for situating stockpile locations as close to the I-405 and I-105 as possible.[63] LAX Master Plan Commitment ST-18, Construction Traffic Management Plan, and LAX Master Plan Mitigation Measure MM-ST-14, Ground Transportation/Construction Coordination Office Outreach Program, described in Section 4.12.2.5 of the SPAS Draft EIR, provide additional mechanisms to manage and reduce worker-related traffic impacts.

In addition to potential disruption of local traffic conditions due to the addition of construction-related vehicle trips, there is the potential for additional disruption in the event a project-related improvement requires temporary closure of at least one lane adjacent to its site. Closures of key roadways and intersections could cause delays, except if done for short durations during periods of very low vehicular volumes. In addition to potential traffic disruption impacts, such closures could affect pedestrian access and/or bicycle lanes due to the need to temporarily close sidewalks, and transit service may be affected

[63] The intended construction traffic mitigation benefits of LAX Master Plan Commitments ST-20 and ST-21 would be best achieved relative to Alternative 3 based on the size, nature, and location of improvements proposed at the east end of the airport under that alternative; however, those benefits would not be realized relative to the other alternatives given the comparatively smaller and fewer improvements at the east end of the airport under those alternatives. The need for, and potential traffic implications of, placing construction employee parking and construction stockpile areas at the east end of the airport would be further assessed in conjunction with the preparation of the construction traffic management plan required under LAX Master Plan Commitment ST-18 as required for all alternatives, including the LAWA Staff-Recommended Alternative.

due to the need to temporarily relocate bus stops. The potential for, and impacts associated with, such lane closures are addressed by LAX Master Plan Commitment ST-9, Construction Deliveries, requiring that construction deliveries involving lane closures must receive prior approval from the LAX Ground Transportation/Construction Coordination Office and notification of deliveries shall be made with sufficient time to allow for any modifications to approved traffic detour plans. Additionally, LAX Master Plan Commitment ST-19, Closure Restrictions of Existing Roadways, requires that, other than short time periods during nighttime construction, existing roadways remain open until they are no longer needed for regular traffic or construction traffic, unless a temporary detour route is available to serve the same function. The related requirements associated with LAX Master Plan Commitment ST-18, Construction Traffic Management Plan, and LAX Master Plan Mitigation Measure MM-ST-14, Ground Transportation/Construction Coordination Office Outreach Program, described above, would also help reduce potential impacts associated with construction-related lane closures.

In summary, implementation of the LAWA Staff-Recommended Alternative would result in temporary construction-related traffic impacts. Although there are a number of Master Plan commitments and a mitigation measure specifically designed to reduce such impacts, it cannot be concluded at this time that all construction-related traffic impacts would be reduced to a level that is less than significant. As such, in addition to the intersection impacts described above, construction-related traffic could, at times, result in temporary significant and unavoidable impacts on the streets surrounding LAX.

2.3.12.2.2 Mitigation Measures

Potential intersection improvements were identified and evaluated for all intersections identified in **Table SRA-2.3.12.2-1** and **Table SRA-2.3.12.2-3** as being significantly impacted. Such improvements include the addition of, or improvements to, travel lanes and turn lanes, traffic signal enhancements, and intersection restriping. Locations where additional right-of-way may be required are noted. The proposed and/or adopted pedestrian and bike plans[64] from the local jurisdictions in the SPAS off-airport transportation study area were evaluated to ensure the feasibility of the proposed mitigation measures such that these mitigation measures would not affect nor conflict with the proposed pedestrian or bike facilities as shown in the adopted plans. In some cases, it was determined that the improvements would not be feasible and that the impact would be significant and unavoidable. In other cases, it would be feasible to implement the mitigation under consideration. For all locations where jurisdiction is shared with agencies other than the City of Los Angeles, or which lie wholly outside of the City of Los Angeles, review and approval by the responsible agencies would be required. The discussion below in Section 2.3.12.2.2.1 presents both those improvements that were considered but determined to be infeasible, as well as those improvements that would be feasible and are thereby included in the recommended mitigation program for the LAWA Staff-Recommended Alternative, which is presented in Section 2.3.12.2.2.2.

2.3.12.2.2.1 Identification and Evaluation of Mitigation Measures

The following discussion proposes mitigation measures, where feasible, for significant impacts identified in the impact analysis above.

[64] The adopted and proposed bike plans in the SPAS off-airport transportation study area include the following documents: Draft Culver City Bicycle & Pedestrian Master Plan, October 2010, Available: http://ccwalkbike.org/documents/; City of Los Angeles, Department of City Planning, 2010 Bicycle Plan, adopted March 1, 2011, Available: http://cityplanning.lacity.org/cwd/gnlpln/transelt/NewBikePlan/Txt/LA%20CITY%20BICYCLE%20PLAN.pdf; County of Los Angeles Bicycle Master Plan, Final Plan, March 2012, Available: http://dpw.lacounty.gov/pdd/bikepath/bikeplan/; and South Bay Bicycle Coalition, South Bay Bicycle Master Plan, August 2011, Available: http://www.southbaybicyclecoalition.org/pass-the-plan-action-plan/south-bay-bicycle-master-plan-review-copy/.

Baseline (2010) with Alternatives

Intersection Improvements

- **9. Airport Boulevard and Manchester Avenue.**

  The potential improvement that would fully mitigate the project impact at this location would be to restripe the eastbound approach to provide one left-turn lane, two through lanes, and a shared through/right-turn lane. Implementation of this improvement would entail removal of three parking spaces on the south side of Manchester Avenue west of Belford Avenue, and two parking spaces on the south side of Manchester Avenue east of Belford Avenue would need to be restricted during the p.m. peak period. However, the proposed restriping of the eastbound approach would conflict with the City of Los Angeles's vision for future bicycle lanes on this segment of Manchester Avenue, and therefore is considered infeasible. No other feasible improvements were identified. This impact would be significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **36. La Cienega Boulevard and Century Boulevard.**

  The potential improvements evaluated at this location for the LAWA Staff-Recommended Alternative involves modifying each of the alternatives' assumptions for lane configuration to the following: the northbound and southbound lane configurations from one left-turn lane, two through lanes, and two right-turn lanes to two left-turn lanes, two through lanes, one shared through/right-turn lane, and one right-turn lane; the eastbound lane configuration from one left-turn lane, three through lanes, and one right-turn lane to two left-turn lanes, three through lanes, and two right-turn lanes; and the westbound lane configuration from one left-turn lane, three through lanes, and one shared through/right-turn lane to two left-turn lanes, four through lanes, and two right-turn lanes with a westbound right-turn overlap phase.

  The proposed physical improvements for the LAWA Staff-Recommended Alternative cannot be accommodated within the existing right-of-way. They would require removal of existing business (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore are considered infeasible.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **71. Sepulveda Boulevard and Imperial Highway.**

  Potential improvements evaluated at this location are to modify the traffic signal to include a northbound right-turn overlap phase and to restripe the northbound approach on Sepulveda Boulevard to provide one left-turn lane, three through lanes, and two right-turn lanes. Implementation of these improvements would fully mitigate the impact at this location under the LAWA Staff-Recommended Alternative.

- **85. La Brea Avenue and Manchester Boulevard.**

  The potential improvement evaluated at this location is to restripe the northbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would require removal of up to approximately six metered parking spaces. This improvement would fully mitigate the impact under the LAWA Staff-Recommended Alternative.

- **96. La Cienega Boulevard and Southbound I-405 Ramps (North of Century Boulevard).**

  The potential mitigation evaluated at this location under the LAWA Staff-Recommended Alternative involves widening the I-405 Freeway southbound off-ramp (the westbound approach) to provide one left-turn lane, one shared left-turn/through lane, one shared through/right-turn lane and widening the northbound approach to provide two left-turn lanes, one through lane, one shared through/right-turn lane, and one right-turn lane. The proposed physical improvements would not be sufficient to

mitigate the identified impact under the LAWA Staff-Recommended Alternative. No other feasible improvement is available to fully mitigate the project impact under Baseline (2010) with the LAWA Staff-Recommended Alternative scenario.

Future (2025) with Alternatives

Intersection Improvements

- **6. Airport Boulevard and Arbor Vitae Street/Westchester Parkway.**

  The potential improvement for this location is to restripe the northbound approach and departure to provide a third through lane so that the resulting northbound lane configuration would be one left-turn lane, two through lanes, and one shared through/right-turn lane. Implementation of this improvement alone would partially mitigate the significant impact identified at this location under the LAWA Staff-Recommended Alternative.

  To provide full mitigation for the LAWA Staff-Recommended Alternative impacts, the improvement evaluated is to reconfigure the northbound approach and departure to provide a third through lane, and widen the eastbound and westbound approaches to add a third through lane in each direction. The proposed improvements for the north approach could be accommodated within the existing right-of-way; however, widening of the east and west legs could not be accommodated within the existing right-of-way and would require removal of existing business (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc. The Westchester Community Plan, an element of the City's General Plan, includes policies to improve Airport Boulevard between La Tijera Boulevard and Century Boulevard to six through lanes and to improve Arbor Vitae Street between Airport Boulevard and Aviation Boulevard to six through lanes. Given the uncertainty of the implementation plan for the Westchester Community Plan, the widening of the eastbound and westbound approaches may not be feasible.

  Therefore, the LAWA Staff-Recommended Alternative can only be partially mitigated with the proposed improvements for the northbound approach and departure (which is to provide a third through lane so that the resulting northbound lane configuration would be one left-turn lane, two through lanes, and one shared through/right-turn lane). No other feasible improvements are available to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **7. Airport Boulevard and Century Boulevard.**

  Potential improvements evaluated at this location are to reconfigure the traffic signal to add a southbound right-turn overlapping phase, and reconfigure the northbound approach to provide additional left-turn capacity. The resulting northbound approach would provide one left-turn lane, one shared through/left-turn lane, one through lane, and one right-turn lane. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. The combined effect of the physical improvement and the employee vanpool program would only partially mitigate the identified impact. No other feasible improvements have been identified to fully mitigate the project impact at this location. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **9. Airport Boulevard and Manchester Avenue.**

  The potential improvements evaluated at this location are to restripe the eastbound and westbound approach to provide one left-turn lane, two through lanes, and a shared through/right-turn lane. These improvements would partially mitigate the identified impact under the LAWA Staff-Recommended Alternative.

  Implementation of this improvement would entail removal of three parking spaces on the south side of Manchester Avenue west of Belford Avenue, and two parking spaces on the south side of Manchester Avenue east of Belford Avenue would need to be restricted during the p.m. peak period.

However, the proposed restriping of the eastbound approach would conflict with the City of Los Angeles's vision for future bicycle lanes on this segment of Manchester Avenue; therefore, this improvement is considered infeasible. No other feasible improvements were identified. This impact would be significant and unavoidable.

- **10. Arbor Vitae Street and Aviation Boulevard.**

  The mitigation measure at this location is to widen the eastbound approach to the intersection of Arbor Vitae Street and Aviation Boulevard to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes and one right-turn lane. Implementation of this improvement can be accomplished within the existing right of way and would fully mitigate the significant impacts under the LAWA Staff-Recommended Alternative.

- **11. Arbor Vitae Street and Inglewood Avenue.**

  The mitigation measure for this location under the LAX Master Plan is to restripe the southbound approach to provide a separate right-turn lane, which would require removal of two parking stalls on the west side of Inglewood Avenue north of Arbor Vitae Street. Implementation of this improvement would fully mitigate the significant impact identified at this location under the LAWA Staff-Recommended Alternative.

- **12. La Brea Avenue and Arbor Vitae Street.**

  The impact at this location could be mitigated through fair share contribution to the City of Inglewood's ITS improvement program. The contribution to the system would be equivalent to a 0.10 reduction in volume/capacity. This would fully mitigate the impacts under the LAWA Staff-Recommended Alternative.

- **14. Aviation Boulevard and Century Boulevard.**

  The potential improvement evaluated at this location is to widen the northbound, southbound, and westbound approaches, resulting in northbound two left-turn lanes, three through lanes, and one right-turn lane; southbound two left-turn lanes, two through lanes, and one shared through/right-turn lane; and westbound two left-turn lanes, four through lanes, and one right-turn lane. Implementation of these improvements would improve the intersection operations; however, they would only partially mitigate the significant impact at this location and the proposed physical improvement conflicts with the City of Los Angeles' vision for a planned bike lanes on Aviation Boulevard, which may result in policy infeasibility and impacts to alternative modes of transportation. Therefore, the proposed improvements are considered infeasible. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **17. Aviation Boulevard/Florence Avenue and Manchester Avenue.**

  The potential improvement evaluated at this location involves restriping both the eastbound and westbound lane configurations from one left-turn lane, two through lanes, and one right-turn lane to one left-turn lane, two through lanes, and one shared through/right-turn lane. This improvement would require the elimination of parking on the south side of Manchester Boulevard east of Aviation Boulevard and on the north side of Manchester Boulevard west of Aviation Boulevard in order to provide appropriate merging distances. This improvement would fully mitigate the identified project impact under the LAWA Staff-Recommended Alternative.

- **25. La Brea Avenue and Centinela Avenue.**

  The potential improvement evaluated at this location is to restripe the northbound and southbound approaches to provide separate right-turn lanes. The resulting lane configuration would be

northbound one left-turn lane, two through lanes, and one right-turn lane; and southbound one left-turn lane, two through lanes, and one right-turn lane. Implementation of this improvement would fully mitigate the identified project impact at this location.

- **26. La Cienega Boulevard and Centinela Avenue.**

  The potential improvement evaluated at this location is to modify the southbound approach to provide dual left-turn lanes. This improvement would require modification of the raised median on La Cienega Boulevard north of Centinela Avenue. The resulting configuration would be two left-turn lanes, two through lanes, and one shared through/right-turn lane. Implementation of this improvement would fully mitigate the significant impact at this location under the LAWA Staff-Recommended Alternative.

- **27. La Tijera Boulevard and Centinela Avenue.**

  The addition of a second southbound left-turn lane would fully mitigate the project impact at this location. However, this improvement could not be accommodated within the existing right-of-way and would require narrowing of existing sidewalks on La Tijera Boulevard, which would result in policy infeasibility and impacts to alternative modes of transportation. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable.

  It is noted that a recent study conducted for SCAG developed grade separation concept designs for the adjacent intersection of La Cienega Boulevard at Centinela Avenue, La Tijera Boulevard, and Fairview Boulevard. If this grade separation concept becomes feasible, LAWA can provide fair share contribution, subject to FAA approval, to this improvement to fully mitigate the project impact at the adjacent intersection of La Cienega Boulevard at Centinela Avenue. This would then reduce the project traffic passing through the intersection of La Tijera Boulevard and Centinela Avenue and reduce the project impact at this location. In addition, if permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location.

- **34. La Brea Avenue/Hawthorne Boulevard and Century Boulevard.**

  To fully mitigate the project impact at this location under the LAWA Staff-Recommended Alternative would require the fair share contribution to Inglewood's ITS improvement program (the contribution to the system would be equivalent to a 0.10 reduction in volume/capacity), increased service levels of the airport employee TDM/Vanpool program, and physical roadway improvements such as additional through lanes on the northbound, southbound, eastbound, and westbound approaches. However, these physical improvements could not be accommodated within the existing right-of-way and would require removal of existing business on Hawthorne Boulevard and narrowing of existing sidewalks on Century Boulevard, which may result in impacts to alternative modes of transportation. Therefore, the physical improvements are considered infeasible. No feasible improvements have been identified to fully mitigate the project impact at this location under the LAWA Staff-Recommended Alternative. This impact could be partially mitigated through contribution to the ITS program and the TDM/Vanpool program at the airport. Therefore, the impact at this location would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **35. Inglewood Avenue and Century Boulevard.**

  The impact at this location could be mitigated through fair share contribution to the City of Inglewood's ITS improvement program. The contribution to the system would be equivalent to a 0.10 reduction in volume/capacity. This would fully mitigate the impacts under the LAWA Staff-Recommended Alternative.

- **36. La Cienega Boulevard and Century Boulevard.**

  The potential improvements evaluated at this location for the LAWA Staff-Recommended Alternative involves modifying the LAWA Staff-Recommended Alternative assumptions for lane configuration to the following: the northbound and southbound lane configurations from one left-turn lane, two through lanes, and two right-turn lanes to two left-turn lanes, two through lanes, one shared through/right-turn lane, and one right-turn lane; the eastbound lane configuration from one left-turn lane, three through lanes, and one right-turn lane to two left-turn lanes, three through lanes, and two right-turn lanes; and the westbound lane configuration from one left-turn lane, three through lanes, and one shared through/right-turn lane to two left-turn lanes, four through lanes, and two right-turn lanes with a westbound right-turn overlap phase.

  The physical improvements proposed above for the LAWA Staff-Recommended Alternative could not be accommodated within the existing right-of-way. They would require removal of existing business and therefore are considered infeasible.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. In addition, if permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, the impact at this location would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **37. Prairie Avenue and Century Boulevard.**

  The impact at this location could be mitigated through fair share contribution to the City of Inglewood's ITS improvement program. The contribution to the system would be equivalent to a 0.10 reduction in volume/capacity. This would fully mitigate the impacts under the LAWA Staff-Recommended Alternative.

- **38. Sepulveda Boulevard and Century Boulevard.**

  The potential improvement evaluated at this location is to restripe the westbound approach to allow triple left turns from Century Boulevard westbound to southbound Sepulveda Boulevard. The westbound configuration would be two left turns, one shared left-turn/through/right-turn lane, and one right-turn lane. This would require removal of the raised median island on the westbound departure, which is considered physically feasible. Implementation of this physical improvement would fully mitigate the impacts for the LAWA Staff-Recommended Alternative.

- **46. Douglas Street and El Segundo Boulevard.**

  The potential improvements that would fully mitigate the project impact at this location would involve widening of the northbound approach to provide two left-turn lanes, two through lanes, and one shared through/right-turn lane; and widening of the eastbound approach to provide an additional eastbound through lane. Both improvements could not be accommodated within the existing right-of-way and would require removal of off-street surface parking spaces of existing businesses, and are therefore considered infeasible. Therefore, this impact would be significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **51. Hawthorne Boulevard and El Segundo Boulevard.**

  To fully mitigate the project impact at this location, the southbound configuration would need to provide one right-turn lane, four through lanes, and two left-turn lanes. However, this improvement is not feasible due to physical constraints such as removal of recently constructed streetscape improvements and on-street parking on the southbound departure. No feasible improvements have

been identified. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **57. La Brea Avenue and Florence Avenue.**

  The potential improvement evaluated at this location is to restripe the northbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would fully mitigate the identified impact under the LAWA Staff-Recommended Alternative.

- **58. La Cienega Boulevard and Florence Avenue.**

  Potential improvements evaluated at this location are to modify the north/south split phasing to Protected-Variable and to restripe the southbound approach to provide two left-turn lanes, one through lane, and one shared through/right-turn lane. Implementation of these improvements would partially mitigate the identified project impact under the LAWA Staff-Recommended Alternative. To fully mitigate the intersection would require the following configuration: northbound one left-turn lane, three through lanes, and one right-turn lane; southbound two left-turn lanes, three through lanes, and two right-turn lanes; eastbound two left-turn lanes, one through lane, and one shared through/right-turn lane; and westbound two left-turn lanes, one through lane, and one shared through/right-turn lane. These improvements would require obtaining right-of-way from the adjoining freeway and would conflict with the planned Metro LAX/Crenshaw light rail line, resulting in policy infeasibility and impacts to alternative modes of transportation. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **60. Sepulveda Boulevard and Grand Avenue.**

  The potential improvement evaluated at this location is to restripe the eastbound approach to provide additional right-turn capacity. The resulting eastbound lane configuration would be one left-turn lane, one shared left-turn/through/right-turn lane, and one right-turn lane. Implementation of this improvement would fully mitigate the project impact.

- **62. Hawthorne Boulevard and Imperial Avenue.**

  The potential improvement evaluated at this location is to restripe the southbound approach to provide a separate right-turn lane, resulting in one left-turn lane, three through lanes, and one right-turn lane. Implementation of this improvement would only partially mitigate the identified impact under the LAWA Staff-Recommended Alternative. To fully mitigate the impact at this location under the LAWA Staff-Recommended Alternative would require the provision of additional eastbound and westbound through lanes. This physical improvement could not be accommodated within the existing right-of-way and would require removal of existing businesses (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore is considered infeasible. No other feasible improvements are available to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **63. Hawthorne Boulevard and Lennox Boulevard.**

  The potential improvement evaluated at this location is to restripe the southbound approach to provide an additional left-turn lane and one additional through lane, which would require removal of the raised center median on Hawthorne Boulevard. The resulting southbound configuration would be two left-turn lanes, three through lanes, and one shared through/right-turn lane. This improvement would fully mitigate the identified impact; however, it could not be accommodated within the existing right-of-way and would require removal of existing business on Hawthorne Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc. Therefore, this improvement is considered infeasible. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts.

Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **64. Highland Avenue/Vista del Mar and Rosecrans Avenue.**

  The addition of a second westbound right-turn lane or a free westbound right-turn lane would fully mitigate the project impact at this location; however, it would require removal of off-street parking space and disrupt the existing business at the northeast corner of the intersection. Therefore, due to the existing right-of-way constraints on Highland Avenue, the proposed mitigation is infeasible. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **66. Inglewood Avenue and Imperial Highway.**

  The potential improvement evaluated at this location is to restripe the southbound approach to provide additional through capacity, resulting in one left-turn lane, one through lane, and one shared through/right-turn lane. This improvement would partially mitigate the identified impact under the LAWA Staff-Recommended Alternative. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **71. Sepulveda Boulevard and Imperial Highway.**

  Potential improvements evaluated at this location are to modify the traffic signal to include a northbound right-turn overlap phase, restripe the westbound approach to provide a second right-turn lane, and restripe the northbound approach on Sepulveda Boulevard to provide one left-turn lane, three through lanes, and two right-turn lanes. The improvement to the westbound approach can be accommodated within the existing right-of-way, but would require relocation of the existing bike lane to south of the dual right-turn lanes. Implementation of these improvements would fully mitigate the impact at this location under the LAWA Staff-Recommended Alternative.

- **76. Inglewood Avenue and Lennox Boulevard.**

  The addition of a second through lane on both the northbound and southbound approaches would fully mitigate the project impact at this location, however this widening of the northbound and southbound approaches would require narrowing of existing sidewalk on Inglewood Avenue, resulting in policy infeasibility and impacts to alternative modes of transportation. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location. No other feasible improvements have been identified. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **77. Inglewood Avenue and Manchester Boulevard.**

  The addition of a third eastbound through lane would fully mitigate the project impact at this location; however, it would require removing of existing mature landscaped raised median and removal of off-street surface parking spaces on existing business properties, and therefore is considered infeasible. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **85. La Brea Avenue and Manchester Boulevard.**

  The impact at this location could be mitigated through fair share contribution to the City of Inglewood's ITS improvement program. The contribution to the system would be equivalent to a 0.10 reduction in

volume/capacity. This would fully mitigate the impacts under the LAWA Staff-Recommended Alternative.

- **86. La Brea Avenue/Overhill Avenue and Stocker Street.**

  The potential improvement evaluated at this location would modify the southbound approach to provide additional through capacity by converting the southbound free right-turn lane to a shared through/right-turn lane, resulting in two left-turn lanes, two through lanes, and one shared through/right-turn lane. Implementation of this improvement could be accomplished within the existing right-of-way, but would remove the raised island on the northwest corner of the intersection. Because this improvement would only partially mitigate the project impact in certain peak hours but would worsen conditions in others, it is not recommended. To fully mitigate the impact at this location would require the provision of a southbound through lane, which is not feasible within the existing right-of-way and would require narrowing sidewalks on La Brea Avenue, which would result in policy infeasibility and impacts to alternative modes of transportation. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **87. La Brea Avenue and Slauson Avenue.**

  The potential improvement evaluated at this location is to restripe the southbound approach to provide one left-turn lane, two through lanes, and one shared through/right-turn lane and to eliminate the existing southbound right-turn overlap phase. Implementation of this improvement would partially mitigate the project impact at this location. If permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **88. La Cienega Boulevard and La Tijera Boulevard.**

  Due to right-of-way and physical constraints at this intersection, no feasible improvements have been identified. It is noted that a recent study conducted for SCAG developed grade separation concept designs for La Cienega Boulevard at Centinela Avenue, La Tijera Boulevard, and Fairview Boulevard. Pending further study of these concepts to determine their feasibility, however, this impact would remain significant and unavoidable. If this grade separation concept becomes feasible, LAWA can provide fair share contribution, subject to FAA approval, to this improvement to fully mitigate the project impact at this location.

- **90. La Cienega Boulevard and Manchester Boulevard.**

  The improvement for this location included in the LAX Master Plan involves changing the north/south split phasing from split to protected and restriping La Cienega Boulevard from north of Florence Avenue to south of Olive Street in order to reconfigure the southbound approach to provide two left-turn lanes, one through lane, and one shared through/right-turn lane. Implementation of this improvement would only partially mitigate the identified project impact under the LAWA Staff-Recommended Alternative. To fully mitigate the impact at this location for the LAWA Staff-Recommended Alternative would require the provision of a second eastbound left-turn lane, a second westbound left-turn lane, and an additional northbound through lane. These additional improvements would require removal of an existing retaining wall on the eastside of La Cienega Boulevard and would require widening of the Manchester Boulevard Bridge over the I-405 Freeway. These additional improvements would require further engineering study and Caltrans review and approval,

and therefore may not be feasible. No feasible improvements have been identified to fully mitigate the project impact at the LAWA Staff-Recommended Alternative.

Although the partial mitigation of changing the north/south split phasing from split to protected and restriping the southbound approach to provide two left-turn lanes, one through lane, and one shared through/right-turn lane is physically feasible; therefore, the project impact at this location would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **93. La Cienega Boulevard and Stocker Street.**

  Due to right-of-way and physical constraints at this intersection, no feasible improvements have been identified. It is noted that a recent study conducted for SCAG developed a grade separation concept design for La Cienega Boulevard at Stocker Street. Pending further study of these concepts to determine their feasibility, however, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative. If this grade separation concept becomes feasible, LAWA can provide fair share contribution to this improvement, subject to FAA approval, to fully mitigate the project impact at this location. If permitted by the FAA, LAWA will also make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location and the impact is considered to be significant and unavoidable.

- **95. La Cienega Boulevard and 120th Street.**

  The addition of a second southbound left-turn lane would fully mitigate the project impact at this location. However, this improvement could not be accommodated within the existing right-of-way, but would require removal of existing business on the east side La Cienega Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc. Therefore, this improvement is considered infeasible. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location. No feasible improvements have been identified that would fully mitigate the identified impact. Therefore, this impact would remain significant and unavoidable.

- **96. La Cienega Boulevard and Southbound I-405 Ramps (north of Century Boulevard).**

  The potential improvement evaluated at this location involves widening of the I-405 Freeway southbound off-ramp (the westbound approach) to provide one left-turn lane, one shared left-turn/through lane, and one shared through/right-turn lane. This proposed improvement would only partially mitigate the impact under the LAWA Staff-Recommended Alternative. Full mitigation of the impacts under the LAWA Staff-Recommended Alternative would also require widening the northbound approach to provide two left-turn lanes, one through lane, one shared through/right-turn lane, and one right-turn lane. The proposed physical improvements are considered feasible and would fully mitigate the project impacts at this location under Future (2025) with the LAWA Staff-Recommended Alternative scenario.

- **102. Northbound I-405 Ramps and La Tijera Boulevard.**

  A potential improvement that would fully mitigate the project impact at this location is the addition of a second eastbound left-turn lane from La Tijera Boulevard onto the I-405 northbound on-ramp and the widening of the westbound approach of La Tijera Boulevard from four to five through lanes plus a westbound right-turn lane. This improvement is identified as a potential improvement in the Coastal Corridor Specific Plan, but is subject to additional feasibility analysis and is not considered feasible at this time.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only

partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative.

If the widening of the La Tijera Boulevard Bridge becomes feasible, LAWA can provide fair share contribution to this improvement, subject to FAA approval, to fully mitigate the project impact at this location.

- **109. Lincoln Boulevard and Venice Boulevard.**

  The addition of one northbound through lane would fully mitigate the project impact at this location. However, this improvement could not be accommodated within the existing right-of-way and would require narrowing sidewalks on Lincoln Boulevard, which would result in policy infeasibility and impacts to alternative modes of transportation.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **110. Lincoln Boulevard and Washington Boulevard.**

  The addition of a southbound through lane would fully mitigate the project impact at this location. However, adding a southbound through lane would require widening of the southbound approach and departure, which would require removal of existing business on the west side of Lincoln Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore is considered infeasible. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **115. Ash Avenue and Manchester Avenue.**

  The potential improvement evaluated at this location is to restripe the northbound approach to provide additional left-turn capacity, resulting in two left-turn lanes and one shared through/right-turn lane. Implementation of this improvement would partially mitigate the impact at this location under the LAWA Staff-Recommended Alternative. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **119. Ocean Avenue/Via Marina and Washington Boulevard.**

  The potential improvement for this location would be restriping the westbound approach to provide a separate right-turn lane. Because it would not fully mitigate the project impact and because it would entail removal of approximately six on-street parking spaces, this improvement is not considered feasible. To fully mitigate the project impact at this location would require the provision of additional eastbound and westbound through lanes.

  However, these improvements would require widening of the eastbound and westbound approaches and departures, which would require removal of existing business on Washington Boulevard (economic and policy infeasibility) and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore are considered infeasible. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no

quantitative V/C reduction can be taken for this location. No feasible improvements have been identified to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **125. Sepulveda Boulevard and Rosecrans Avenue.**

  Addressing the significant impact at this location would require widening of the northbound approach to provide two left-turn lanes, five through lanes, and one right-turn lane. This physical improvement could not be accommodated within the existing right-of-way and would require removal of existing business (economic and policy infeasibility) on Sepulveda Boulevard and create additional environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore is considered infeasible.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **139. Sepulveda Boulevard and I-105 Westbound Ramps (North of Imperial Avenue).**

  The addition of a fourth northbound through lane would fully mitigate the project impact at this location. However, the proposed improvement could not be accommodated within the existing right-of-way and would require relocation of existing supporting structures of the I-105 Freeway and modification to the I-105 westbound off-ramp at Sepulveda Boulevard, which would require further engineering study and may not be acceptable to Caltrans. In addition, the merge from four lanes to the existing three lanes in the Sepulveda Tunnel north of this intersection could not be achieved using Caltrans standards.

  The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **143. Vicksburg Avenue and 96th Street.**

  The potential improvement evaluated at this location is to widen the westbound approach to provide dual right-turn movements from Vicksburg Avenue to 96th Street Bridge, resulting in the following westbound configuration: one left-turn lane, one through lane, and two right-turn lanes. Implementation of this improvement would fully mitigate the project impact under the LAWA Staff-Recommended Alternative.

- **147. Crenshaw Boulevard and Century Boulevard.**

  The addition of a fourth southbound through lane would fully mitigate the project impact at this location. However, the proposed improvements could not be accommodated within the existing right-of-way and would require removal of existing business on the west side of Crenshaw Boulevard, which would result in economic and policy infeasibility, and therefore is considered infeasible. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **149. Crenshaw Boulevard and Imperial Highway.**

  The addition of one through lane in both the eastbound and westbound directions would fully mitigate the project impact at this location. However, the proposed improvement could not be accommodated within existing right-of-way and would require removal of existing business on Imperial Highway, which would result in economic and policy infeasibility, and therefore is considered infeasible. No feasible improvements have been identified to fully mitigate the project impact. This impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **154. Overland Avenue and Sawtelle Boulevard.**

  This stop-controlled intersection meets the standard traffic signal warrants[65] recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines and the criteria for installation of a traffic signal under existing conditions. Installation of a signal would improve the traffic operations at this location and could fully mitigate the project impact. However, installation of a traffic signal at this location would be the responsibility of Culver City. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, the impact at this location would remain significant and unavoidable under the LAWA Staff-Recommended Alternative. If installation of the signal becomes feasible, LAWA would provide a fair share contribution, subject to FAA approval, to this improvement, which would fully mitigate the project impact at this location.

- **156. Walgrove Avenue and Washington Boulevard.**

  This stop-controlled intersection meets the standard traffic signal warrants[66] recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines and the criteria for installation of a traffic signal under existing conditions. Installation of a signal would improve the traffic operations at this location and could fully mitigate the project impact. However, installation of a traffic signal at this location would be the responsibility of Culver City and, given the close proximity to upstream/downstream signals, may not be acceptable to Culver City. No other feasible improvements have been identified to fully mitigate the project impact. Therefore, the impact at this location would be significant and unavoidable under the LAWA Staff-Recommended Alternative. If installation of a signal becomes feasible at this location, LAWA would provide a fair share contribution, subject to FAA approval, to this improvement, which would fully mitigate the project impact at this location.

- **159. Hindry Avenue and Manchester Boulevard.**

  The potential improvement evaluated at this location is to reconfigure the eastbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. Implementation of this improvement would require removal of approximately seven metered

---

65 This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. It estimates future development-generated traffic compared against a sub-set of the standard traffic signal warrants recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines. This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured, rather than forecast, traffic data and a thorough study of traffic and roadway conditions by an experienced engineer. Furthermore, the decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible local agency should undertake regular monitoring of actual traffic conditions and accident data, and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

66 This analysis is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. It estimates future development-generated traffic compared against a sub-set of the standard traffic signal warrants recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines. This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured, rather than forecast, traffic data and a thorough study of traffic and roadway conditions by an experienced engineer. Furthermore, the decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions. The responsible local agency should undertake regular monitoring of actual traffic conditions and accident data, and timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

parking spaces. This improvement would fully mitigate the project impact under Alternative 4 and partially mitigate the project impact under the LAWA Staff-Recommended Alternative. No feasible improvements have been identified to fully mitigate the project impact for the LAWA Staff-Recommended Alternative. Therefore, the impact at this location would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **162. Sepulveda Boulevard and Manhattan Beach Boulevard.**

  The addition of a second northbound left-turn lane would fully mitigate the project impact at this location. Implementation of this improvement would require removal of the raised median on Sepulveda Boulevard and would require narrowing of existing sidewalk on the east side of Sepulveda Boulevard, which would result in policy infeasibility and impacts to alternative modes of transportation. Therefore, this improvement is considered infeasible due to right-of-way and physical constraints. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, it would only partially mitigate the significant impact at this location. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **164. Manchester Avenue and Crenshaw Boulevard.**

  The addition of one through lane in the eastbound and westbound directions would fully mitigate the project impact at this location. Implementation of this improvement would require additional right-of-way and would require removal of the raised median and on-street parking on Manchester Boulevard, and therefore is considered infeasible. No other feasible improvements have been identified to fully mitigate the impact at this location. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **165. La Cienega Boulevard and Rodeo Road.**

  The project impact at this location would be fully mitigated with the addition of a separate southbound right-turn lane to serve the channelized free right-turn lane that exists at the intersection. Extending the southbound right-turn lane would require additional right-of-way and would significantly disrupt the existing business on the northwest corner of the intersection, which would result in economic and policy infeasibility; and is therefore determined to be infeasible. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

  In addition, it is noted that a recent study conducted for SCAG developed a grade separation concept designs for La Cienega Boulevard at Rodeo Road. Pending further study of this concept to determine its feasibility, this impact, however, would remain significant and unavoidable. If this grade separation concept becomes feasible, LAWA can provide fair share contribution, subject to FAA approval, to this improvement to fully mitigate the project impact at this location.

- **169. Prairie Avenue and Manchester Boulevard.**

  The potential improvement evaluated at this location is to reconfigure the eastbound approach to provide dual left-turn lanes. This improvement would require removing the raised center median and restriping the westbound departure lanes northward in the existing right-of-way. The resulting eastbound approach would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. This improvement would only partially mitigate the project impact under the LAWA Staff-Recommended Alternative. No other feasible improvements have been identified to fully mitigate the project impacts under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **172. Western Avenue and Manchester Avenue.**

  The project impact at this location would be fully mitigated with the addition of westbound dual left-turn lanes. However, this improvement would require additional right-of-way acquisition from private

properties on the west side of Western Avenue and would significantly disrupt those existing business due to loss of off-street parking spaces, which would result in economic and policy infeasibility; and is therefore determined to be infeasible. No feasible improvements are available to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **173. Western Avenue and Imperial Highway.**

  The addition of a separate eastbound right-turn lane would fully mitigate the project impact at this location. However, this improvement would require additional right-of-way acquisition from private property on the southwest corner of this intersection, and would significantly disrupt that existing business due to loss of off-street parking spaces, which would result in economic and policy infeasibility. Therefore, this improvement is determined to be infeasible. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction can be taken for this location. No feasible improvements are available to fully mitigate the project impact. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **188. Prairie Avenue and El Segundo Boulevard.**

  The project impact at this location would be fully mitigated with the addition of separate eastbound and westbound right-turn lanes. However, these improvements would require additional right-of-way acquisition from the private property on the southwest corner of this intersection and public space from Hawthorne Memorial Park, which would result in economic and policy infeasibility. No other feasible improvements have been identified to fully mitigate the project impact at this location. Therefore, this impact would remain significant and unavoidable under the LAWA Staff-Recommended Alternative.

- **197. Prairie Avenue and Lennox Boulevard.**

  The potential improvement evaluated at this location is to restripe the eastbound approach to provide one left-turn lane, one shared through/left-turn lane, and one right-turn lane. This improvement would only partially mitigate the project impact under the LAWA Staff-Recommended Alternative. No other feasible improvements have been identified to fully mitigate the project impact under the LAWA Staff-Recommended Alternative. Therefore, this impact would remain significant and unavoidable for the LAWA Staff-Recommended Alternative.

Freeway Segment Improvements

No feasible improvements have been identified for the three freeway segments that could be significantly impacted under the LAWA Staff-Recommended Alternative:

- Route 405, at postmile 0.40, north of Route 22
- Route 405, at postmile 8.02, Santa Fe Avenue
- Route 405, at postmile 11.90, south of Route 110

To fully mitigate the project impact at these locations would require the construction of an additional northbound travel lane at each location and an additional southbound travel lane on I-405 south of Route 110. Due to right-of-way and physical constraints, such as existing bridge structures and auxiliary lane and ramp configurations, the addition of travel lanes at these locations is not feasible. Therefore, impacts would remain significant and unavoidable.

2.3.12.2.2.2 Recommended Mitigation Program

Implementation of LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-20, ST-21,[67] and ST-22 and LAX Master Plan Mitigation Measure MM-ST-14 would reduce construction-related off-airport transportation impacts associated with the LAWA Staff-Recommended Alternative. No additional measures are available to address construction-related off-airport transportation impacts at this stage of planning.

There would be significant impacts to some CMP arterial monitoring intersections and freeway monitoring stations under the LAWA Staff-Recommended Alternative. Physical mitigation is available for Intersection 26 (La Cienega Boulevard and Centinela Avenue) as shown below under MM-ST (SPAS)-10. No additional measures are feasible and available to address the impacts to other impacted arterial and freeway facilities.

Based on the information provided in Section 2.3.12.2.2.1, the following mitigation measures are proposed to address off-airport transportation impacts associated with the LAWA Staff-Recommended Alternative:

Intersection Mitigation Measures

- **MM-ST (SPAS)-1. Transportation Demand Management Program.**

  To reduce the impacts associated with the LAWA Staff-Recommended Alternative, LAWA will provide additional vanpool services to airport employees. This would reduce vehicular trips on the major roadways that provide direct access to and from the airport facilities (e.g., Sepulveda Boulevard, Lincoln Boulevard, Century Boulevard, La Tijera Boulevard, Aviation Boulevard, and La Cienega Boulevard). The upgrades to the existing vanpool program would entail providing sufficient vehicles to accommodate up to 500 employees that would shift from driving to the airport to the program.

  The increased vanpool service will result in removal of approximately 740 daily vehicular trips to and from the airport parking facilities on a typical weekday. The net effect of this program would result in partial mitigation of project impacts at multiple locations associated with the LAWA Staff-Recommended Alternative.

- **MM-ST (SPAS)-2. Modify the Intersection of Airport Boulevard and Arbor Vitae Street/ Westchester Parkway (Intersection 6).**

  The mitigation measure for this location is to restripe the northbound approach and departure to provide a third through lane so that the resulting northbound lane configuration would be one left-turn lane, two through lanes, and one shared through/right-turn lane. This would be a partial mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-3. Modify the Intersection of Airport Boulevard and Century Boulevard (Intersection 7).**

  The mitigation measure for this location is to reconfigure the traffic signal to add a southbound right-turn overlapping phase, and reconfigure the northbound approach to provide additional left-turn capacity. The resulting northbound approach would provide one left-turn lane, one shared through/left-turn lane, one through lane, and one right-turn lane. The impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program. This program would improve intersection operations; however, the combined effect of the physical

[67] As discussed in Section 4.12.2.6.3, the construction traffic mitigation benefits of LAX Master Plan Commitments ST-20 and ST-21, which involve locating construction worker parking and construction stockpiles at the east end of the airport, would best be realized under Alternative 3, given the size, location, and nature of improvements proposed in that area; however, the mitigation benefits and traffic implications of those measures relative to other alternatives, including the LAWA Staff-Recommended Alternative, would need to be further assessed in conjunction with development of construction traffic control plans required under ST-18.

improvement and the employee vanpool program would partially mitigate the identified impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-4. Modify the Intersection of Arbor Vitae Street and Inglewood Avenue (Intersection 11).**

  The mitigation measure for this location is to restripe the southbound approach to provide a separate right-turn lane. This improvement would be a full mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-5. La Brea Avenue and Arbor Vitae Street (Intersection 12).**

  The mitigation involves Fair share contribution to the City of Inglewood's ITS improvement program for this intersection. Implementation of the ITS improvement would be full mitigation for the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-8. Modify the Intersection of Aviation Boulevard/Florence Avenue and Manchester Avenue (Intersection 17).**

  The mitigation measure for this location is to restripe both the eastbound and westbound lane configurations from one left-turn lane, two through lanes, and one right-turn lane to one left-turn lane, two through lanes, and one shared through/right-turn lane. This would be a full mitigation for the project impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-9. Modify the Intersection of La Brea Avenue and Centinela Avenue (Intersection 25).**

  The mitigation measure for this location is to restripe the northbound and southbound approaches to provide separate right-turn lanes. The resulting lane configuration would be northbound one left-turn lane, two through lanes, and one right-turn lane; and southbound one left-turn lane, two through lanes, and one right-turn lane. This would be a full mitigation for the project impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-10. Modify the Intersection of La Cienega Boulevard and Centinela Avenue (Intersection 26).**

  The mitigation measure for this location is to modify the southbound approach to provide dual left-turn lanes. This improvement would require modification to the raised median on La Cienega Boulevard north of Centinela Avenue. The resulting configuration would be two left-turn lanes, two through lanes, and one shared through/right-turn lane. This improvement would be a full mitigation for project impacts identified at this location under the Future (2025) With the LAWA Staff-Recommended Alternative scenario. This would also be the mitigation for this impacted CMP arterial intersection.

- **MM-ST (SPAS)-12. La Brea Avenue/Hawthorne Boulevard and Century Boulevard (Intersection 34).**

  The mitigation involves fair share contribution to the City of Inglewood's ITS improvement program for this intersection. Implementation of the ITS improvement would be partial mitigation for the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-13. Inglewood Avenue and Century Boulevard (Intersection 35).**

  The mitigation involves fair share contribution to the City of Inglewood's ITS improvement program for this intersection. Implementation of the ITS improvement would be provide full mitigation for the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-14. Prairie Avenue and Century Boulevard (Intersection 37).**

  The mitigation involves fair share contribution to the City of Inglewood's ITS improvement program for this intersection. Implementation of the ITS improvement would provide full mitigation for the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-15. Modify the Intersection of Sepulveda Boulevard and Century Boulevard (Intersection 38).**

  The mitigation measure for this location is to restripe the westbound approach to provide two left-turn lanes, one shared left-turn/through/right-turn lane, and one right-turn lane. This improvement would be a full mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-17. Modify the Intersection of La Brea Avenue and Florence Avenue (Intersection 57).**

  The mitigation measure for this location is to restripe the northbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would be a full mitigation for project impacts identified at this location under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-18. Modify the Intersection of La Cienega Boulevard and Florence Avenue (Intersection 58).**

  The mitigation measure for this location is to modify the north/south split phasing to Protected-Variable and restripe the southbound approach to provide two left-turn lanes, one through lane, and one shared through/right-turn lane. This improvement would be a partial mitigation for the project impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-19. Modify the Intersection of Sepulveda Boulevard and Grand Avenue (Intersection 60).**

  The mitigation measure for this location is to restripe the westbound approach to provide additional left-turn capacity by restriping a through lane to a shared through/left-turn lane. Minor changes to the lane assignment signage would also be necessary. The resulting westbound lane configuration would be two left-turn lanes, one shared through/left-turn lane, one through lane and one right-turn lane. This improvement would be a full mitigation for project impacts under the Future (2025) With Alternatives 1-2, 8, and 9 scenarios.

- **MM-ST (SPAS)-20. Modify the Intersection of Hawthorne Boulevard and Imperial Avenue (Intersection 62).**

  The mitigation measure for this location is to restripe the southbound approach to provide a separate right-turn lane, resulting in one left-turn lane, three through lanes, and one right-turn lane. This improvement would be a partial mitigation for project impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-21. Modify the Intersection of Inglewood Avenue and Imperial Highway (Intersection 66).**

  The mitigation measure for this location is to restripe the southbound approach to provide additional through capacity, resulting in one left-turn lane, one through lane, and one shared through/right-turn lane. This improvement would be a partial mitigation for impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-23. Modify the Intersection of Sepulveda Boulevard and Imperial Highway (Intersection 71).**

  The mitigation measure for this location is to modify the traffic signal to include a northbound right-turn overlap phase, restripe the westbound approach to provide a second right-turn lane, and restripe the northbound approach on Sepulveda Boulevard to provide one left-turn lane, three through lanes, and two right-turn lanes. These would be a full mitigation for the project impacts under the Baseline (2010) with the LAWA Staff-Recommended Alternative scenario and also those impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-25. Modify the Intersection of La Brea Avenue and Manchester Boulevard (Intersection 85).**

  The mitigation involves fair share contribution to the City of Inglewood's ITS improvement program for this intersection. Implementation of the ITS improvement would provide full mitigation for the project impact found Baseline (2010) With the LAWA Staff-Recommended Alternative and under the Future (2025) With the LAWA Staff-Recommended Alternative.

- **MM-ST (SPAS)-26. Modify the Intersection of La Brea Avenue and Slauson Avenue (Intersection 87).**

  The mitigation measure for this location is to restripe the southbound approach to provide one left-turn lane, two through lanes, and one shared through/right-turn lane and to eliminate the existing southbound right-turn overlap phase. This would be a partial mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-27. Modify the Intersection of La Cienega Boulevard and Manchester Boulevard (Intersection 90).**

  The mitigation measure for this location is to change the north/south split phasing from split to protected and restripe La Cienega Boulevard from north of Florence Avenue to south of Olive Street in order to reconfigure the southbound approach to provide two left-turn lanes, one through lane, and one shared through/right-turn lane. This would be a partial mitigation for project impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-28. Modify the intersection of La Cienega Boulevard and Southbound I-405 Ramps (north of Century Boulevard) (Intersection 96).**

  The mitigation measure for this location is to widen the I-405 Freeway southbound off-ramp (the westbound approach) to provide one left-turn lane, one shared left-turn/through lane, and one shared through/right-turn lane.

  Full mitigation of the impacts under Future (2025) with the LAWA Staff-Recommended Alternative would also require widening the northbound approach to provide two left-turn lanes, one through lane, one shared through/right-turn lane, and one right-turn lane.

- **MM-ST (SPAS)-31. Modify the Intersection of Ash Avenue and Manchester Avenue (Intersection 115).**

  The mitigation measure for this location is to restripe the northbound approach to provide additional left-turn capacity, resulting in two left-turn lanes and one shared through/right-turn lane. This would be a partial mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-32. Vicksburg Avenue and 96th Street (Intersection 143).**

  The mitigation measure for this location is to widen the westbound approach to provide dual right-turn movements from Vicksburg Avenue to 96th Street Bridge, resulting in the following westbound configuration: one left-turn lane, one through lane, and two right-turn lanes. This would be a full mitigation for the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-34. Modify the Intersection of Hindry Avenue and Manchester Boulevard (Intersection 159).**

  The mitigation measure for this location is to reconfigure the eastbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This would partially mitigate the impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-35. Modify the Intersection of Prairie Avenue and Manchester Boulevard (Intersection 169).**

  The mitigation measure for this location is to reconfigure the eastbound approach to provide dual left-turn lanes. This improvement would require removing the raised center median and restriping the westbound departure lanes northward in the existing right-of-way. The resulting eastbound approach would provide two left-turn lanes, two through lanes, and one shared through/right-turn lane. This would partially mitigate the impacts under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-36. Modify the Intersection of Prairie Avenue and Lennox Boulevard (Intersection 197).**

  The mitigation measure for this location is to restripe the eastbound approach to provide one left-turn lane, one shared through/left-turn lane, and one right-turn lane. This improvement would partially mitigate the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative scenario.

- **MM-ST (SPAS)-37. Modify the Intersection of Arbor Vitae Street and Aviation Boulevard (Intersection 10).**

  The mitigation measure for this location is to widen the eastbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would fully mitigate the project impact under the Future (2025) With the LAWA Staff-Recommended Alternative.

- **MM-ST (SPAS)-38. Modify the Intersection of La Tijera Boulevard and Centinela Avenue (Intersection 27).**

  The mitigation measure for this location is to provide a fair share contribution to the improvement of this intersection as part of a grade separation project that would also affect the adjacent section of La Cienega Boulevard, subject to FAA approval and should the grade separation project be found to be feasible and implementation pursued by the affected local agencies. In addition, if permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts. Because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Because the grade separation project is in the early design and conceptual planning stages, however, it is not fully defined nor adopted at this time and the impact at this location would remain significant and unavoidable.

- **MM-ST (SPAS)-40. Fair Share Contribution to a Traffic Signal at the Intersection of Overland Avenue and Sawtelle Boulevard (Intersection 154).**

  The mitigation measure for this location is to provide a fair share contribution to the installation of a traffic signal, subject to FAA approval and should it be implemented by the City of Culver City. Because it is uncertain that it will be implemented, however, the impact at this location would remain significant and unavoidable.

- **MM-ST (SPAS)-41. Fair Share Contribution to a Traffic Signal at the Intersection of Walgrove Avenue and Washington Boulevard (Intersection 156).**

  The mitigation measure for this location is to provide a fair share contribution to the installation of a traffic signal, subject to FAA approval and should it be implemented by the City of Culver City. Because it is uncertain that it will be implemented, however, the impact at this location would remain significant and unavoidable.

- **MM-ST (SPAS)-42. Contribute to ITS (Intelligent Transportation Systems) Improvements at 11 Study Intersections within the Jurisdiction of Los Angeles County (Intersections 27, 36, 52, 63, 76, 86, 87, 93, 95, 119, and 173.**

  Los Angeles County Department of Public Works staff determined that improvements to the County's intelligent transportation systems (ITS) equipment would improve traffic operations where no feasible physical mitigation measures have been identified. As partial mitigation for the identified cumulative impacts, LAWA will make a monetary contribution to upgrading the County's ITS system at these intersections, if permitted by the FAA. Because the contribution to Los Angeles County is conditional pending approval by FAA and because the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location and these impacts would remain significant and unavoidable.

As described, several types of improvements to the off-airport transportation system are recommended to mitigate the impacts associated with the LAWA Staff-Recommended Alternative. Such improvements include the addition of, or improvements to, travel and turn lanes, and traffic signal phasing modifications, fair share contribution to improve the computer-controlled traffic signal control systems in the City of Inglewood, and provision of additional vanpool services to LAWA, airport and cargo employees to and from the airport.

The potential environmental impacts associated with the proposed improvements to the off-airport transportation system would depend on the specific nature, location, and extent of such improvements. For example, the addition or improvement of travel and/or turn lanes that is accomplished by restriping of lanes within existing roadway segments would, in general, have a low potential for significant environmental effects other than improvement in traffic flows. The addition of lanes accomplished by the removal or modification of existing raised medians would have some level of environmental impacts such as construction-related noise, air quality impacts, temporary lane closures, and visual impacts if the removed median is currently landscaped. The addition of lanes accomplished with elimination of on-street parking could impact nearby off-street parking areas and/or remaining on-street parking areas to the extent that the affected parking redistributes to such areas. The addition of lanes accomplished by the physical widening of roadway segments could result in the types of potential environmental impacts described above relative to the removal or modification of raised medians, and could also result in the reduction of the widths of sidewalks or parkways, possibly impacting trees, utilities, or other existing improvements, if any, located within the needed rights-of-way.

2.3.12.2.3 Level of Significance After Mitigation

This section evaluates the level of significance after implementing the recommended mitigation measures identified above in Section 2.3.12.2.2.2. A summary of the effectiveness of the proposed intersection mitigation measures under Baseline (2010) with Alternative conditions is presented in **Table SRA-2.3.12.2-6** and a detailed listing of these intersections is shown above in **Table SRA-2.3.12.2-1**. As shown in **Tables SRA-2.3.12.2-6** and **SRA-2.3.12.2-7**, under Baseline (2010) with Alternative, there are three fully mitigated intersections and two intersections for which there are no feasible physical mitigation measures, for a total of two intersections with significant and unavoidable impacts under the LAWA Staff-Recommended Alternative.

A summary of the effectiveness of the proposed intersection mitigation measures under Future (2025) with Alternative conditions is presented in **Table SRA-2.3.12.2-8**, and a detailed listing for the impacted peak hours of these intersections is shown above in **Table SRA-2.3.12.2-3**. As shown in **Tables SRA-2.3.12.2-8** and **SRA-2.3.12.2-9**, under Future (2025) with Alternative, there are 15 fully mitigated intersections, 17 partially mitigated intersections, and 25 intersections for which there are no feasible mitigation measures for a total of 42 intersections with significant and unavoidable residual impacts under the LAWA Staff-Recommended Alternative. Under the LAWA Staff-Recommended Alternative, impacts at one CMP arterial monitoring intersection and three CMP freeway monitoring stations would be significant and unavoidable. Under the LAWA Staff-Recommended Alternative, transit impacts would be less than significant.

LAX Master Plan commitments and an LAX Master Plan mitigation measure would help reduce construction-related impacts to the off-airport transportation system under the LAWA Staff-Recommended Alternative. However, no additional measures are available at this stage of planning to address these construction-related impacts. As such, construction-related off-airport traffic could, at times, result in temporary significant and unavoidable impacts on the streets surrounding LAX.

Notes:

Full - Intersections that can be fully mitigated to a level less than significant with recommended mitigation measures.
Partial - Intersection operating conditions would be improved with recommended mitigation measures, however; would not be fully mitigated and would remain significant and unavoidable.
N.F.M. - No Feasible Physical Mitigation measures are available. Project impacts remain significant and unavoidable.

[1] This stop-controlled intersection is expected to operate at oversaturated condition, based on the vehicle delay reported for the worst-case approach. This intersection was also evaluated using the ICU methodology and the resulting project-related incremental increase in V/C ratio is greater than the City of Culver City adopted significance criteria.

[2] The impact at this intersection would be partially mitigated by a monetary contribution by LAWA, pending FAA approval, to the County's ITS system. Because the County does not have a method for quantifying the benefits of this type of improvement, however, no quantitative V/C reduction has been taken.

2.3.13 Utilities

2.3.13.1 Energy

2.3.13.1.1 Impacts Analysis

This section describes the impacts related to energy consumption for the LAWA Staff-Recommended Alternative. For the LAWA Staff-Recommended Alternative, the effects are discussed as they relate to projected energy consumption. As indicated in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to energy consumption are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as identified in Tables 4.13.1-1, 4.13.1-2 and 4.13.1-3 of the SPAS Draft EIR. **Tables SRA-2.3.13.1-1** and **SRA-2.3.13.1-2** identify building-related electricity and natural gas consumption, respectively, associated with the LAWA Staff-Recommended Alternative as well as under 2010 baseline conditions. **Table SRA-2.3.13.1-3** shows total energy consumption.

Note:

Numbers may not add due to rounding.

1 MWh/yr = megawatt-hours per year

2 Mcf/yr = thousand cubic feet per year

3 Construction-related energy consumption for the LAWA Staff-Recommended Alternative was derived from construction-related emissions developed for the analysis of greenhouse gas emissions, which combined the emissions associated with construction of the airfield and terminal components of Alternative 1 with those associated with the ground access components of Alternative 9.

Source: CDM Smith, 2012; Lea + Elliot, Inc. (Alternative 3 APM electricity).

Under the LAWA Staff-Recommended Alternative, aircraft operations, GSE, and vehicle miles traveled (VMT) by on-and off-airport vehicles would increase compared to baseline conditions. In addition, square footage associated with terminals and other passenger-related facilities would increase.

Electricity and Natural Gas

Under the LAWA Staff-Recommended Alternative, the passenger-related building area would increase compared to baseline conditions. Although concourse areas associated with Terminals 1 and 3 would decrease, there would be new concourse areas associated with Terminal 0 and the northerly extensions

of Bradley West and the Midfield Satellite Concourse (MSC). In addition, this alternative would include a passenger service area at the ITF. As shown in **Table SRA-2.3.13.1-1**, under the LAWA Staff-Recommended Alternative, total electricity use for passenger-related facilities in 2025 would be 28,503 MWh/yr in 2025. As shown in **Table SRA-2.3.13.1-3**, under the LAWA Staff-Recommended Alternative, total electricity consumption associated with water supply and wastewater generation would be 569 MWh/yr in 2025. In addition, the LAWA Staff-Recommended Alternative would include an APM system, which would likely be electric powered, using an estimated 12,494 MWh/yr in 2015. **Table SRA-2.3.13.1-2** shows that, under the LAWA Staff-Recommended Alternative, total natural gas use associated with passenger-related facilities would be 22,713 Mcf/yr, or 22.7 MMcf/yr, in 2025. The projected consumption of electricity and natural gas under the LAWA Staff-Recommended Alternative would represent 0.11 percent of the projected electrical energy demand within LADWP's service area in 2025 and 0.0025 percent of the projected Southern California regional natural gas demand.

In order to reduce electricity and natural gas consumption under the LAWA Staff-Recommended Alternative, LAWA would implement LAX Master Plan Commitment E-1, Energy Conservation and Efficiency Program, to maximize the energy efficiency of new facilities. This program would be consistent with federal policies and state requirements pertaining to energy efficiency and resource conservation. In addition, LAWA would apply sustainable design concepts to new facilities in accordance with its *Sustainability Plan*, and would pursue LEED® certification, both of which would increase energy efficiency in the new facilities and building areas.

Under the LAWA Staff-Recommended Alternative, a sufficient supply of electricity and natural gas is expected to be available based on the LADWP *Power IRP* and the *California Gas Report*.[68,69] Therefore, impacts with respect to electricity and natural gas consumption would be less than significant. Moreover, with implementation of the existing LAX Master Plan mitigation measures, the LAWA Staff-Recommended Alternative would not result in a wasteful, inefficient, or unnecessary consumption of electricity or natural gas.

Transportation-Related Fuel

As indicated in Section 4.13.1.3 of the SPAS Draft EIR, transportation-related fuels used at LAX include Jet A fuel for aircraft, and gasoline, diesel, and alternative fuels (LPG, LNG, and CNG, all of which are represented by LPG in this analysis) for vehicles and/or GSE. **Table SRA-2.3.13.1-3** shows all projected transportation-related fuel consumption resulting from the LAWA Staff-Recommended Alternative.

Jet A

Under the LAWA Staff-Recommended Alternative, Jet A fuel consumption by aircraft in the LTO cycle is estimated to be 93.9 million gallons in 2025. This represents an increase in Jet A fuel consumption over baseline conditions (63 million gallons). For the most part, this increase would result from increased flight operations at the horizon year (i.e., 2025) activity level of 78.9 MAP, which would occur in the future with or without the LAWA Staff-Recommended Alternative, although changes in airfield design and taxi-idle times would also affect Jet A fuel consumption.

The number of ADG VI aircraft would increase in 2025 compared to baseline conditions. As noted in Section 4.13.1.3 of the SPAS Draft EIR, ADG VI aircraft are more fuel efficient than other aircraft. Airfield improvements associated with the LAWA Staff-Recommended Alternative would also increase the efficiency of ADG VI operations on the airfield. These improvements include the northerly relocation of Runway 6L/24R, addition of a centerfield taxiway, the easterly extension of Runway 6R/24L and Taxiway E, increased separation between Taxiway E and Taxilane D, and the westerly extension of Taxilane D.

---

68 City of Los Angeles, Department of Water and Power, Power Integrated Resource Plan, December 11, 2011, Available: http://www.lapowerplan.org/.

69 The California Gas and Electric Utilities, 2010 California Gas Report, 2010, Available: http://www.socalgas.com/regulatory/cgr.shtml.

As indicated in Section 4.13.1.3 of the SPAS Draft EIR, petroleum product supplies, including Jet A fuel, are anticipated to be adequate well beyond 2025. Therefore, since a sufficient supply of Jet A fuel is expected to be available, the impact associated with an increase in Jet A fuel consumption under the LAWA Staff-Recommended Alternative would be less than significant. Moreover, with implementation of the design features noted above, the LAWA Staff-Recommended Alternative would not result in a wasteful, inefficient, or unnecessary consumption of Jet A fuel.

Gasoline and Diesel

Under the LAWA Staff-Recommended Alternative, total gasoline and diesel fuel consumption would be approximately 126.3 million gallons and 74.8 million gallons, respectively, in 2025. Gasoline and diesel consumption would both increase compared to baseline conditions. A substantial portion of these increases would result from greater flight operations and passenger activity in 2025, which would occur in the future with or without the LAWA Staff-Recommended Alternative.

Several design features associated with the LAWA Staff-Recommended Alternative would partially offset increases in fuel consumption due to increased vehicle trips. Development of the ITF, parking, and the CONRAC would encourage passengers to park or be dropped off outside the CTA, and enter the CTA on the proposed APM system. The APM would include a stop at the future Metro Crenshaw/LAX Transit Station, which would facilitate increased transit ridership to the airport. These features would reduce total VMT to and from the airport, and would reduce transportation-related fuel consumption compared to conditions in 2025 without implementation of the LAWA Staff-Recommended Alternative.

As discussed previously, petroleum products, including gasoline and diesel, are market-driven commodities for which the Energy Information Administration indicates adequate supplies are anticipated well beyond 2025. Since sufficient supplies of gasoline and diesel are expected to be available, the impact associated with an increase in gasoline and diesel consumption under the LAWA Staff-Recommended Alternative would be less than significant. Moreover, with implementation of the design features noted above, the LAWA Staff-Recommended Alternative would not result in a wasteful, inefficient, or unnecessary consumption of gasoline or diesel.

Liquefied Petroleum Gas

Under the LAWA Staff-Recommended Alternative, the total consumption of alternative fuels, as represented by LPG, would be 2.6 million gallons in 2025, an increase over baseline conditions. The increase would result from increased GSE associated with greater flight operations at the horizon year (i.e., 2025) activity level of 78.9 MAP, which would occur in the future with or without the LAWA Staff-Recommended Alternative. As indicated in Section 4.13.1.3 of the SPAS Draft EIR, petroleum product supplies, including LPG, are anticipated to be adequate well beyond 2025. Therefore, since a sufficient supply of LPG is expected to be available, the impact associated with an increase in LPG consumption under the LAWA Staff-Recommended Alternative would be less than significant.

2.3.13.1.2 Mitigation Measures

Implementation of LAX Master Plan Commitment E-1, Energy Conservation and Efficiency Program, would reduce energy consumption associated with the SPAS improvements and ensure that impacts related to energy use associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to SPAS are required.

2.3.13.2 Solid Waste

2.3.13.2.1 Impacts Analysis

This section describes the impacts related to solid waste for the LAWA Staff-Recommended Alternative. As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to solid waste would result from passenger activity associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.13.2.6 of the SPAS Draft EIR.

For the LAWA Staff-Recommended Alternative, the effects are discussed as they relate to overall solid waste generation and compliance with AB 939 diversion requirements. The analysis focuses on passenger-related solid waste generation. **Table SRA-2.3.13.2-1** identifies projected passenger-related municipal solid waste generation for the LAWA Staff-Recommended Alternative as well as under 2010 baseline conditions.

Passenger activity levels at LAX are forecasted to be 78.9 MAP by 2025 as a result of projected natural growth. This increase in passenger activity is expected with or without implementation of the LAWA Staff-Recommended Alternative. As noted in Section 4.13.2.2 of the SPAS Draft EIR, the municipal solid waste generation factor used for this analysis is 0.784 pounds per passenger, which accounts for a future diversion rate of 70 percent. Using this methodology, passenger-related activity would generate a total of 84.7 tpd (30,928 tpy) of passenger-related solid waste in 2025 (see **Table SRA-2.3.13.2-1**). This would be an increase of 15 tpd compared to baseline conditions (a 22 percent increase). Sunshine Canyon Landfill, which handles all solid waste from LAX, is permitted to accept 12,100 tpd of solid waste, but only averages 7,845 tpd. Therefore, Sunshine Canyon Landfill has enough capacity to accommodate the increase in solid waste associated with the LAWA Staff-Recommended Alternative without using any other regional landfills. As noted in Section 4.13.2.3 of the SPAS Draft EIR, Sunshine Canyon Landfill is estimated to close in 2031, which is well beyond the 2025 SPAS planning horizon. The solid waste generated by passenger activity in 2025 is projected to be within the capacity of Sunshine Canyon Landfill, an existing/permitted regional landfill; therefore, impacts to solid waste disposal capacity would be less than significant.

Under the LAWA Staff-Recommended Alternative, LAWA would continue to implement existing programs aimed at complying with LAX Master Plan Commitment SW-1, Implement an Enhanced Recycling Program, reducing overall waste generation and disposal, and meeting the 70 percent diversion rate. LAWA has adopted the LAWA *Sustainable Airport Planning, Design and Construction Guidelines* for implementation on all airport projects. These Guidelines provide goals and performance standards for recycling of materials during both construction and operation of airport facilities in accordance with the provisions of LAX Master Plan Commitment SW-1. LAWA has also implemented an enhanced recycling program at LAX as outlined in the *LAX Recycling Plan*, which provides updated guidelines for recycling operations at LAX, and is developing new programs to increase diversion rates at LAX. With the implementation and continued enhancement of existing recycling programs in accordance with LAX Master Plan Commitment SW-1, and compliance with future diversion requirements, the LAWA Staff-Recommended Alternative would not conflict with solid waste policies and objectives intended to help achieve the requirements of AB 939 and impacts to such policies and objectives would be less than significant.

Table SRA-2.3.13.2-1

Passenger-Related Solid Waste Generation at LAX - LAWA Staff Recommended Alternative

Year	Solid Waste Factor (Per Year)	Units	Total Generation (tons per day)[1]	Total Generation (tons per year)[1]
Baseline Conditions (2010)	431 tons/MAP	59.1 MAP	69.7	25,472
Future Conditions (2025)	392 tons/MAP	78.9 MAP	84.7	30,928

[1] Approximate calculations; numbers are rounded.

Source: CDM Smith, 2012.

2.3.13.2.2 Mitigation Measures

Implementation of LAX Master Plan Commitment SW-1, Implement an Enhanced Recycling Program, would ensure that impacts related to solid waste disposal associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to the LAWA Staff-Recommended Alternative are required.

2.3.13.3 Wastewater Generation

2.3.13.3.1 Impacts Analysis

This section describes the impacts related to wastewater for the LAWA Staff-Recommended Alternative. As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to wastewater generation are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.13.3.6 of the SPAS Draft EIR. For the LAWA Staff-Recommended Alternative, the effects are discussed as they relate to projected wastewater generation. The analysis focuses on wastewater generation associated with passenger-related facilities. **Table SRA-2.3.13.3-1** identifies wastewater generation associated with passenger-related facilities for the LAWA Staff-Recommended Alternative as well as under 2010 baseline conditions.

Under the LAWA Staff-Recommended Alternative, the passenger-related building area would increase compared to baseline conditions. Although concourse areas associated with Terminals 1 and 3 would decrease, there would be new concourse areas associated with Terminal 0 and the northerly extensions of Bradley West and the Midfield Satellite Concourse (MSC). In addition, this alternative would include a passenger service area at the ITF and the CONRAC customer service area. As shown in **Table SRA-2.3.13.3-1**, under the LAWA Staff-Recommended Alternative, wastewater generation from passenger-related facilities would be 119,696 gpd (0.12 mgd) in 2025. As noted in Section 4.13.3.3 of the SPAS Draft EIR, Hyperion Treatment Plant (HTP) had baseline wastewater flows of 299 mgd in 2010, and currently has a design capacity of 450 mgd. Therefore, the increased wastewater generation from the LAWA Staff-Recommended Alternative could be accommodated by the existing wastewater treatment facilities at HTP. Moreover, as shown in Figure 4.13.3-1 of the SPAS Draft EIR, if the SCAG and HSA flow trendlines are extended beyond the City's 2020 planning horizon for wastewater facilities, the HSA would have sufficient capacity to handle projected wastewater flows in 2025, including flows associated with the LAWA Staff-Recommended Alternative. In addition, LAWA would implement LAX Master Plan Commitment W-2, Enhance Existing Water Conservation Program, and would comply with its Sustainability Plan and LSAG, all of which would reduce wastewater flows associated with the LAWA Staff-Recommended Alternative. For these reasons, wastewater generation related to the LAWA Staff-Recommended Alternative would not exceed the existing or future capacity of regional wastewater treatment facilities. Therefore, impacts from increased wastewater generation under this alternative would be less than significant.

Table SRA-2.3.13.3-1

Baseline (2010) and Projected (2025) Wastewater Generation - LAWA Staff-Recommended Alternative

Building Components	Baseline Conditions	SRA Airfield/ Terminals	SRA Ground Access	SRA Total SRA
Terminals				
Terminal 0	NA	330,000	NA	330,000
Terminal 1 Concourse	138,000	114,000	NA	114,000

Source: CDM Smith, 2012.

2.3.13.3.2 Mitigation Measures

Implementation of LAX Master Plan Commitment W-2, Enhance Existing Water Conservation Program, would ensure that impacts relative to wastewater generation would be less than significant. Therefore, no mitigation measures specific to the LAWA Staff-Recommended Alternative are required.

2.3.13.4 Water Supply

2.3.13.4.1 Impacts Analysis

This section describes the impacts related to water supply for the LAWA Staff-Recommended Alternative. As noted in Section 2.3, impacts of the LAWA Staff-Recommended Alternative related to water supply are associated with the airfield/terminal components of Alternative 1 and the ground access components of Alternative 9, as evaluated in Section 4.13.4.6 of the SPAS Draft EIR. For the LAWA Staff-Recommended Alternative, the effects are discussed as they relate to projected water demand. This analysis focuses on water use associated with passenger-related facilities. **Table SRA-2.3.13.4-1** identifies water demand associated with passenger-related facilities for the LAWA Staff-Recommended Alternative as well as under 2010 baseline conditions.

Table SRA-2.3.13.4-1

Baseline (2010) and Projected (2025) Water Use (AF/yr) - LAWA Staff-Recommended Alternative

Building Components	Baseline Conditions	SRA

Under the LAWA Staff-Recommended Alternative, the passenger-related building area would increase compared to baseline conditions. Although concourse areas associated with Terminals 1 and 3 would decrease, there would be new concourse areas associated with Terminal 0 and the northerly extensions of Bradley West and the Midfield Satellite Concourse (MSC). In addition, this alternative would include a passenger service area at the ITF and the CONRAC customer service area. As shown in **Table SRA-2.3.13.4-1**, under the LAWA Staff-Recommended Alternative, water demand from passenger-related facilities would be 134.06 AF/yr in 2025. This would represent less than 0.02 percent of anticipated LADWP water demand in 2025, for which LADWP forecasts sufficient water supplies, as explained below. This increase in demand would not be significant compared to the total future regional water supply.

LADWP's 2010 UWMP projects that there will be adequate water supply to meet City demands through 2035.[70] As indicated in Section 4.13.4.3 of the SPAS Draft EIR, the LADWP projections are based on the 2008 RTP, which, in turn, includes a passenger activity level of 78.9 MAP for LAX.[71] Therefore, LADWP's UWMP projections account for future passenger activity at LAX of 78.9 MAP, the same level associated with the LAWA Staff-Recommended Alternative.

The WSA prepared by LADWP for the LAX Master Plan indicates that "adequate water supplies will be available to meet the water demands of the project." As noted in Section 4.13.4.3 of the SPAS Draft EIR,

[70] City of Los Angeles, Department of Water and Power, Urban Water Management Plan, 2010.

[71] SCAG recently adopted the 2012-2035 RTP/SCS. However, the current UWMP is based on the 2008 RTP. It should be noted that the 2012-2035 RTP/SCS also includes a future (2035) passenger activity level of 78.9 MAP for LAX.

the WSA for the LAX Master Plan is based on the 2001 UWMP, which projected water demand to 2020. The WSA was based on a projected activity level at LAX of 78.9 MAP. Therefore, even though the WSA was based on a UWMP with a 2020 timeframe, as LAX passenger activities in 2025 would be the same as assumed in the WSA, the WSA findings remain valid. Furthermore, terminal and ground access passenger-related facilities under the LAWA Staff-Recommended Alternative would be substantially smaller than the analogous facilities under the LAX Master Plan (1,496,200 square feet under the LAWA Staff-Recommended Alternative compared to 5,125,000 square feet under the LAX Master Plan (i.e., Alternative 3)). Therefore, the WSA finding that adequate water supplies would be available to meet the water demand of the project would remain unchanged under the LAWA Staff-Recommended Alternative. This was confirmed by LADWP, which stated that a new WSA is not needed for the LAX SPAS EIR.[72]

Under the LAWA Staff-Recommended Alternative, LAWA would implement LAX Master Plan Commitments W-1, Maximize Use of Reclaimed Water, and W-2, Enhance Existing Water Conservation Program, to reduce water use associated with the LAWA Staff-Recommended Alternative. As a result, water demand related to the LAWA Staff-Recommended Alternative would not exceed regional water supply, and impacts related to water use would be less than significant.

2.3.13.4.2 Mitigation Measures

Implementation of LAX Master Plan Commitments W-1, Maximize Use of Reclaimed Water, and W-2, Enhance Existing Water Conservation Program, would ensure that impacts related to water use associated with the LAWA Staff-Recommended Alternative would be less than significant. Therefore, no mitigation measures specific to the LAWA Staff-Recommended Alternative are required.

2.4 Cumulative Impacts of the LAWA Staff-Recommended Alternative

Introduction

This section presents the cumulative environmental impacts of the LAWA Staff-Recommended Alternative described in Section 2.2, *LAWA Staff-Recommended Alternative Description*, as derived from the analysis presented in the SPAS Draft EIR. The cumulative impacts analyses in this section are based upon the same methodology and specific projects at and near LAX as described in Sections 5.1 through 5.4 in Chapter 5, *Cumulative Impacts*, of the SPAS Draft EIR.

As described in Section 2.1 of this chapter, the LAWA Staff-Recommended Alternative couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. Thus, the impacts analysis in this section for the LAWA Staff-Recommended Alternative is representative of the impacts analysis of Alternatives 1 and 9 in Chapter 5 of the SPAS Draft EIR. For some topics, such as aircraft noise, impacts from the LAWA Staff-Recommended Alternative would only result from airfield improvements; the impacts for these topics are equivalent to the impacts associated with Alternative 1 as presented in the SPAS Draft EIR. For other sections, such as on- and off-airport transportation, impacts from the LAWA Staff-Recommended Alternative would only result from the ground access improvements; the impacts for these sections are identical to the impacts associated with Alternative 9 in the SPAS Draft EIR. For some topics, such as aesthetics, impacts from the LAWA Staff-Recommended Alternative would result from both the airfield/terminal and the ground access improvements; in these cases, the impacts associated with the LAWA Staff-Recommended Alternative represent a combination of the impacts associated with Alternative 1 and Alternative 9 of the SPAS Draft EIR. As noted in Section 2.3, calculations of air pollutant concentrations and human health risks conducted for the LAWA Staff-Recommended Alternative are provided in Attachment 1 of Part II of this Final EIR

[72] Kwan, Delon, City of Los Angeles, Department of Water and Power, Personal Communication, June 13, 2012.

2.4.1 Aesthetics

Cumulative projects that are located at or adjacent to LAX that might have an impact on views or would introduce new features or the loss of existing aesthetic elements that would alter, decrease, or contrast with the existing valued visual character of LAX or surrounding areas were considered in the analysis of cumulative aesthetics impacts. Because LAX and the surrounding area are highly urbanized, impacts to views generated by individual projects tend to be geographically isolated, and are not always visible from adjacent areas. The projects listed below, which are at or adjacent to LAX, involve visible, above ground physical improvements that due to proximity have the potential, in conjunction with SPAS airfield, terminal, and ground access improvements, to result in combined adverse effects associated with degradation of visual quality or diminishment of important views.

Projects within and in the vicinity of LAX would also result in an increase in ambient nighttime light levels and potentially generate glare. However, this increase would occur in the context of infill development within a lit and glare-generating urban environment. Compliance with regulatory requirements and applicable design plans, including Los Angeles Municipal Code (LAMC) Sec. 93.0117, which prohibits light spillover and requires that light sources be shielded and directed downward, and LAX Master Plan commitments would ensure that cumulative projects would not result in either a change in lighting/lighting intensity that would spill off and adversely affect light-sensitive uses or a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, cumulative impacts related to increases in ambient light levels on sensitive receptors would be less than significant.

The following cumulative projects were considered in conjunction with the LAWA Staff-Recommended Alternative in the analysis of cumulative impacts to aesthetics and visual resources:

- Within the Century Corridor/eastern boundary area, the Metro Crenshaw/LAX Transit Corridor and Station, Airport Metro Connector Project (depending upon the selected alternative), Airfield Operating Area (AOA) Perimeter Fence Enhancements, and Central Utility Plant (CUP) Replacement Project off-site water treatment plant;
- Within the Central Terminal Area (CTA), the Bradley West Project, North Terminals Improvements, CUP Replacement Project, central processor component of the Midfield Satellite Concourse (MSC) Program, LAX Sign District, New Face of the CTA Improvements/Enhancements, and, depending upon the selected alternative, the Airport Metro Connector Project (depending upon the selected alternative);
- Within the southern boundary area, the South Airfield Improvement Project (SAIP), Runway 7L/25R East End Reconstruction and West End Runway Safety Area (RSA) Improvements, AOA Perimeter Fence Enhancements, West Aircraft Maintenance Area, MSC, Relocatable Aircraft Maintenance Hangar, Bradley West Project, and Metro Crenshaw/LAX Transit Corridor;
- Within the western boundary area, the MSC, West Aircraft Maintenance Facility, Coastal Dunes Improvement Project, Stormwater Infiltration and Treatment Facility, and LAX Northside; and
- Within the northern boundary area, the Coastal Dunes Improvement Project, Stormwater Infiltration and Treatment Facility, LAX Northside,[73] Westchester Golf Course Three-Hole Restoration Project, MSC, Bradley West Project, and North Terminals Improvements.

Century Corridor/Eastern Boundary

Cumulative projects within the Century Corridor/eastern boundary area, listed above, in combination with ground access improvements, such as the APM, Intermodal Transportation Facility (ITF), and new parking facility and CONRAC in Manchester Square occurring under the LAWA Staff-Recommended Alternative, would contribute to cumulative impacts to aesthetic resources, views, and light and glare. Construction of the ITF, parking facilities, CONRAC, and APM under the LAWA Staff-Recommended

[73] The LAX Northside Plan Update is a probable future project for purposes of a cumulative impact analysis (Pub. Resources Code Section 21083(b)(2)). The cumulative analysis herein considers both the currently-approved LAX Northside project as well as the LAX Northside Plan Update project.

Alternative would occur within an area of poor visual quality that does not include any notable views, and the affected area already includes existing light sources, including street lights, parking lot lighting, security lighting, and lighting from building and parking structure interiors, typical of a highly urbanized environment. These new ground access improvements would be subject to airport design guidelines for screening, buffers, landscaping, setbacks, pedestrian amenities, and high architectural standards, including those set forth in the *LAX Street Frontage and Landscape Development Plan Update*, as well as LAX Master Plan Commitments DA-1, Provide and Maintain Airport Buffer Areas, and LU-4, Neighborhood Compatibility Program, to promote visual compatibility. Provisions addressing light and glare would also apply, including LAX Master Plan Commitment LI-2, Use of Non-Glare Generating Building Materials; LAX Master Plan Commitment LI-3, Lighting Controls; and LAMC Section 93.0117 (see Section 4.1.3 of the SPAS Draft EIR for a complete discussion of the applicable regulatory context). As a result, aesthetic and light and glare impacts associated with the LAWA Staff-Recommended Alternative would be less than significant.

The Metro Crenshaw/LAX Transit Corridor Project would not be located in areas of high visual quality, are not expected to degrade the character or visual quality of the potentially affected areas, and are located in areas with existing light sources (e.g., street lights, parking lot lighting, security lighting, and lighting from building and parking structure interiors) typical of a highly urbanized environment. In addition, mitigation measures for the project require incorporating features consistent with the recommendations and principles and community input. These measures would be implemented as part of the Metro Crenshaw/LAX Transit Corridor Project to ensure visual compatibility and reduce visual conflicts between the proposed transit system and surrounding community. These urban design principles and project features include incorporation of art, landscaping, pedestrian amenities, awnings, street furniture, and other visual treatments into the design of the station and alignment.[74] Finally, light and glare impacts from the Metro Crenshaw/LAX Transit Corridor Project were not identified as significant impacts because project features would be located in or adjacent to existing roadway or railroad rights of way which currently produce transport-related light and glare, in addition, some sections of the project alignment would be below grade.[75] Given the location of the Metro Crenshaw/LAX Transit Corridor Project and the urban design principles and mitigation measure identified above, the Metro Crenshaw/LAX Transit Corridor Project would not be expected to obstruct valued views within the Century Corridor/eastern boundary area or result in significant light and glare impacts.

As part of the Airport Metro Connector Project, Metro is examining ways to connect the transit system to LAX.[76] Modes under consideration including Light Rail Transit and an Automated People Mover (APM), and Bus Rapid Transit along a number of different alignments, including an underground option. Depending on the outcome, elevated elements of the Airport Metro Connector Project would contribute to cumulative impacts to views and aesthetic and visual resources within the Century Corridor area with potential routes along Century Boulevard and 98th Street. As discussed previously, similar to the Metro Crenshaw/LAX Transit Corridor and Station, this analysis assumes that a number of urban design principles and features would be implemented as part of the Airport Metro Connector Project per Metro's Rail Design Criteria to ensure visual compatibility and reduce visual and light and glare conflicts between the proposed transit system and the surrounding area. In addition, Federal Transit Administration (FTA) Circular 9400.1A, Design and Art in Transit Projects, encourages the use of design and artist

75 U.S. Department of Transportation, Federal Transit Administration and Los Angeles County Metropolitan Transportation Authority (Metro), Crenshaw/LAX Transit Corridor Project Final Environmental Impact Report/Environmental Impact Statement, August 2011.

76 Los Angeles County Metropolitan Transportation Authority (Metro), Metro Green Line to LAX, Project Overview Fact Sheet, Available: http://www.metro.net/projects_studies/green_line_lax/images/Green_Line_LAX_Overview.pdf, accessed June 21, 2012.

considerations in transit projects.[77] Furthermore, this project is not located in an area that is valued for or of high visual quality and it is not expected to obstruct valued views.[78]

The CUP Replacement Project would include development of an off-site water treatment plant near Jenny Avenue and West 96th Street. The proposed water treatment plant would occupy an approximately 14,000-square-foot site that is currently developed with a surface parking lot. The site is surrounded by surface parking lots to the north, west, and east, and commercial and industrial uses to the south. As such, the off-site water treatment plant would not be located in an area that has a high level of visual quality or contains notable views.

Improvements to the AOA perimeter fencing have been underway in phases for several years as a component of security improvements to the airport. Phase 4 of the AOA Perimeter Fence Enhancements Project, which is to be completed over the next several years, is the last phase of the security fencing program and will include improvements along Imperial Highway, Aviation Boulevard, and Century Boulevard. Improvements to existing fencing to incorporate new security features would not affect notable views or valued visual resources or introduce new light sources.

In light of applicable design guidelines, including the *LAX Street Frontage and Landscape Plan Update* and requirements incorporated into Metro environmental documents, LAX Master Plan commitments, and existing visual quality, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not degrade an area valued for its aesthetic character, or involve the removal of features that contribute to the aesthetic image of the area. Moreover, cumulative projects in combination with the LAWA Staff-Recommended Alternative improvements would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views. Similarly, cumulative development would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, cumulative impacts to aesthetic resources and views, and cumulative impacts related to light and glare, within the Century Corridor/eastern boundary area under the LAWA Staff-Recommended Alternative would be less than significant.

Central Terminal Area

Cumulative projects within the CTA, listed above, in combination with terminal improvements occurring under the LAWA Staff-Recommended Alternative, would contribute to cumulative impacts to aesthetic resources, views, and light and glare. However, cumulative projects would generally enhance existing visual and aesthetic quality because they would involve improvements and modernization of the existing structures, creation of new visual treatments, and would reflect a high level of attention to design due to imposition of LAWA design guidelines and associated reviews.

Terminal improvements under the LAWA Staff-Recommended Alternative include the addition of new Terminal 0, loss or modifications to concourse areas and/or gates at Terminals 1 and 2, replacement of the Terminal 3 concourse, and the modification and northern extension of concourse areas and gates at Tom Bradley International Terminal (TBIT) and the future MSC. Ground access improvements within the CTA consist of the easterly relocation of Sky Way (the primary access road connecting the CTA to southbound Sepulveda Boulevard and 96th Street Bridge). These improvements would be located in a highly lit environment. Since the existing terminal buildings are aging, functional in nature, and generally do not include extensive architectural features and/or landscaping, they do not contribute meaningfully to the aesthetic quality of the CTA. As such, modification and improvements of terminal buildings would not constitute the loss of valued visual and aesthetic resources. Furthermore, the new Terminal 0, and

---

77 U.S. Department of Transportation, Federal Transit Administration and Los Angeles County Metropolitan Transportation Authority (Metro), Crenshaw/LAX Transit Corridor Project Final Environmental Impact Report/Environmental Impact Statement, August 2011.

78 While the Airport Metro Connector Project has a horizon year 2035, the Airport Metro Connector Project is analyzed as part of the cumulative analysis of this EIR because it could contribute to long-term cumulative impacts in conjunction with the SPAS alternatives and other cumulative development.

reconstruction and modifications of the Terminal 3 concourse and gates would, pursuant to the LAX Plan and *LAX Street Frontage and Landscape Development Plan Update*, incorporate more modern design elements and greater architectural articulation than current conditions. In addition, the LAX Specific Plan requires the development of conceptual design guidelines for new central terminals. Thus, the new Terminal 0 and modified facilities are expected to represent an aesthetic improvement within the CTA that would promote the airport's image as a Gateway to the City of Los Angeles. Therefore, impacts to aesthetic and visual resources associated with terminal improvements within the CTA under the LAWA Staff-Recommended Alternative would be less than significant. Terminal and airfield improvements within/near the CTA under the LAWA Staff-Recommended Alternative would take place on the airfield and north of World Way. As addressed in Section 2.3.1, *Aesthetics*, of this chapter, within the CTA, the APM associated with the LAWA Staff-Recommended Alternative would affect views of the Theme Building. With incorporation of Mitigation Measure MM-HA Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, this impact would be less than significant.

An additional CTA improvement proposed as part of the LAWA Staff-Recommended Alternative is the relocation of Sky Way eastward between the future Terminal 0 and Sepulveda Boulevard. These modifications involve the relocation of an existing roadway, which would not detract from, and would not constitute a loss of, a valued visual resource. Existing views of Sky Way are not notable, and notable views within the CTA would not be altered with the relocation of Sky Way.

Since development of terminal improvements under the LAWA Staff-Recommended Alternative would not degrade features that contribute to the valued aesthetic character of the area, impacts to aesthetic and visual resources would be less than significant. As development of the terminal improvements under the LAWA Staff-Recommended Alternative would not affect views from a designated scenic highway, corridor, or parkway or obstruct valued focal or panoramic views, impacts to views would also be less than significant.

As noted above, a number of cumulative projects are proposed within the CTA. In particular, the New Face of the CTA is geared toward upgrading visual quality in the most visually prominent areas within the CTA, including terminal building exterior finishes and other improvements along walkways and curbside waiting areas. With incorporation of Mitigation Measure MM-HA Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, improvements under the LAWA Staff-Recommended Alternative would not obstruct or degrade views of the Theme Building within the CTA and there are no other notable views within the CTA that would be obstructed.

The LAX Sign District would codify specific regulations and standards regarding the location, type, and size of allowable signs associated with non-airport related advertising, and their placement within the CTA and on terminals and passenger boarding bridges visible from apron areas. Implementation of the LAX Sign District would enhance the ability for signage at the airport to be cohesive and fit within a unified design theme.

The Bradley West Project, currently under construction, will represent an aesthetic improvement within the CTA and will be complementary to existing aesthetically valued elements of the area. The project is part of an overall architectural design vision for the modernization of LAX.[79] The North Terminals Improvements and future central processor component of the MSC, neither of which has undergone preliminary design, would similarly be expected to represent an aesthetic improvement within the CTA, and would be designed to complement the other terminal improvements currently planned or underway. Together, these projects would result in beneficial impacts to aesthetics within the CTA.

The CUP Replacement Project would replace the existing, outdated CUP currently located west of the Airport Traffic Control Tower and the Theme Building with a new facility designed to current LAWA standards. While the replacement CUP would be located closer to the Theme Building and Airport Traffic Control Tower, notable visual features and views of the Airport Traffic Control Tower and Theme Building

[79] City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport (LAX) Bradley West Project, September 2009.

would not be affected. Scenic views from vantage points outside of the CTA of the City and coastline would not be affected as the facility would be well below the line-of-sight from these vantages. Furthermore, the existing CUP does not contribute meaningfully to the aesthetic quality within the CTA. As such, the replacement of the CUP would not constitute the loss of a valued aesthetic or visual resource. Impacts to views related to the CUP Replacement Project would be less than significant.[80]

As discussed earlier, as part of the Airport Metro Connector Project, Metro is examining ways to connect the transit system to LAX. Modes under consideration include Light Rail Transit, APM, and Bus Rapid Transit along a number of different alignments, including an underground option. Depending on the outcome, elevated elements of the project have the potential to contribute to cumulative impacts to views, aesthetics, and visual resources in the CTA. Within the CTA, components of the APM, Light Rail Transit, and Bus Rapid Transit options could be developed in a configuration that would extend to the eastern area of the CTA. Depending on the specific location, elevation, and design of the Light Rail Transit or Bus Rapid Transit options, focal views of the Theme Building from various vantage points in the CTA could be diminished. Although it is too early in the project development process to identify a route or specific project features for the Airport Metro Connector Project, this analysis assumes that, similar to the Metro Crenshaw/LAX Transit Corridor and Station, a number of urban design principles and features would be implemented as part of the Airport Metro Connector Project to ensure visual compatibility and reduce visual conflicts between the proposed transit system and the surrounding area. However, depending on the selected alternative, if the Airport Metro Connector alignment and any station locations include elevated elements, it could affect views of the Theme Building, a valued focal view, within the CTA. In light of applicable airport design guidelines, including the *LAX Street Frontage and Landscape Plan Update*, LAX Master Plan commitments, and existing visual quality, improvements under the LAWA Staff-Recommended Alternative, in combination with cumulative projects, would not degrade an area valued for its aesthetic character, or involve the removal of features that contribute to the aesthetic image of the area. Similarly, cumulative development would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare.

With the exception of the Airport Metro Connector Project, the cumulative projects would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views. Elevated elements related to the Airport Metro Connector Project could affect views of the Theme Building within the CTA. Although the Airport Metro Connector Project may contribute to a cumulatively significant impact on views of the Theme Building, in light of proposed Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, the contribution of the LAWA Staff-Recommended Alternative to cumulative impacts would not be cumulatively considerable.

Southern Boundary

Cumulative projects within the southern boundary area, listed above, in combination with airfield and terminal modifications occurring under the LAWA Staff-Recommended Alternative, would contribute to cumulative impacts to aesthetic resources, views, and light and glare. Various terminal and airfield modifications under the LAWA Staff-Recommended Alternative would not introduce a new land use that would materially alter the overall visual character of the airfield, CTA, or aircraft operations. Changes to the north airfield and terminal improvements in the northern portion of the CTA would not alter existing long-range views of the Santa Monica Mountains due to the distance of the improvements and the substantially higher vantage points to the south. Improvements under the LAWA Staff-Recommended Alternative would not alter valued views in El Segundo of airfield operations, such as arriving and departing aircraft, or introduce substantial new sources of light. Therefore, impacts to views or visual and

[80] City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport (LAX) Central Utility Plant Replacement Project, Appendix A, October 2009.

aesthetic characteristics from the south of LAX under the LAWA Staff-Recommended Alternative would be less than significant.

The West Aircraft Maintenance Area would involve the development of a new maintenance hangar, along with aircraft Remain Overnight (RON) apron area, and a ground run-up enclosure. These facilities would be visible from some western vantage points. However, the West Aircraft Maintenance Area project site is located in a highly disturbed area, and is mostly surrounded by airport uses that have limited aesthetic value. While development of the West Aircraft Maintenance Area would occur above grade and would be visible from western vantage points along Pershing Drive, aesthetic impacts from vantage points along Pershing Drive and from more distant points north and south of the airport would not be significant since the area does not currently support a high level of visual quality or contain important aesthetic elements. Furthermore, the improvements would not obstruct scenic views as the facility would be sited below and out of the line-of-sight of scenic views of the City and coastline.

Airfield improvements, including the SAIP and other taxiway and runway improvements, would not alter existing aircraft operations or the aesthetic character of the airfield. These improvements consist of pavement improvements and would not add any new structures to the viewshed.

The proposed Relocatable Aircraft Maintenance Hangar would be located south of World Way West, west of Taxiway R. The design of the proposed project allows it to be relocatable (i.e., consists of pre-fabricated pieces that are assembled at a site and can later be unassembled and moved elsewhere). Construction of the proposed facility would include site preparation, erection of the hangar frame, placement of exterior cover, and interior finishing. The project site is located in a highly disturbed area, and is mostly surrounded by airport uses that have limited aesthetic value. While development of the Relocatable Aircraft Maintenance Hangar would occur above grade and would be visible from western vantage points along Pershing Drive and from more distant points north and south of the airport, the area does not currently support a high level of visual quality or contain important aesthetic elements. Furthermore, the Relocatable Aircraft Maintenance Hangar would be similar in height to other nearby structures, such as the Aircraft Fire Fighting and Rescue (AFRR) station, the American Airlines High Bay Hangar, and the Bradley West Project (currently under construction) and would not introduce a notable new visual element to the area or impact focal views.

Various airfield modifications and terminal improvements related to cumulative projects, listed above, would not introduce land uses that would adversely alter the overall visual character of the airfield, CTA, or aircraft operations. Furthermore, views of the existing airfield, while of public interest, and more distant views to the CTA, are not scenic. Moreover, projects such as the Bradley West Project and the MSC would enhance views of the airport. Changes to the south airfield, enhancements to AOA perimeter fencing, development of the West Aircraft Maintenance Area, various terminal improvements, and the Metro Crenshaw/LAX Transit Corridor Project would not alter existing long-range views of the Santa Monica Mountains due to the distance of the improvements and the substantially higher vantage points to the south. Improvements would also not alter valued views in El Segundo of airfield operations, such as arriving and departing aircraft.

In light of applicable design guidelines, including the *LAX Street Frontage and Landscape Plan Update*, LAX Master Plan commitments, and existing visual quality, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not degrade an area valued for its aesthetic character, or involve the removal of features that contribute to the aesthetic image of the area. Moreover, cumulative projects in combination with the LAWA Staff-Recommended Alternative improvements would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views. Similarly, cumulative development would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, cumulative impacts to aesthetic resources and views, and cumulative impacts related to light and glare, within the southern boundary area under the LAWA Staff-Recommended Alternative would be less than significant.

Western Boundary

Cumulative projects within the western boundary area, listed above, in combination with airfield and terminal modifications occurring under the LAWA Staff-Recommended Alternative, would contribute to cumulative impacts to aesthetic resources, views, and light and glare. Development within the western boundary area would be somewhat limited under the LAWA Staff-Recommended Alternative. Runway 6L/24R would be extended to the west, and taxiways would be improved and extended near the western end of the site. These improvements would represent a continuation of existing airfield uses. Aesthetic and view impacts from vantage points along Pershing Drive and from more distant points north and south of the airport would not be significant since the area does not currently support a high level of visual quality or contain important aesthetic elements. The runway improvements would generally occur at grade level and would not block any valued focal or panoramic view. Additionally, with the exception of changes to existing navigational aids, no development would take place in the El Segundo Blue Butterfly Habitat Restoration Area (Habitat Restoration Area), and views of the Los Angeles/El Segundo Dunes (Dunes) and views along Vista del Mar, a City of Los Angeles-designated Scenic Highway, would not materially change.

In order to accommodate the relocation of Runway 6L/24R, and the adjustment to the Runway 6R/24L landing threshold, existing navigational aids under the LAWA Staff-Recommended Alternative would be removed and new facilities would be installed and modified to align with the runway configurations. No increase in navigational aids would occur. Similar to baseline conditions, new and modified navigational aids would be low in profile and would not comprise a noticeable portion of the overall viewshed. In addition, the relocated navigational aids would not introduce a new light source. Accordingly, with no increase in navigational aids, relocation or modification of these facilities would not change the character of the area or obstruct or degrade a scenic view.

As noted above, a number of cumulative projects are proposed within the western portion of the airfield and within the CTA. The impacts of several of these projects are discussed previously in this analysis. The Coastal Dunes Improvement Project involves restoration/improvement of coastal dune habitat west of Pershing Drive. This project would result in an improvement of coastal and biological habitat that would improve the visual character of the Dunes, would not impede views, and would not introduce a new light source. See Section 2.3.3, *Biological Resources*, of this chapter, for a discussion of measures in place to ensure restoration of the Dunes once construction of navigational aids related to the LAWA Staff-Recommended Alternative is completed.

The proposed Stormwater Infiltration and Treatment Facility to be located north of Westchester Parkway and east of Pershing Drive would treat urban runoff and would include stormwater flow diversion structures, debris removal and underground detention and infiltration facilities that would remove pollutants. These facilities would include underground and low-profile structures that would not be visually prominent, would not block valued views of visual resources such as the iconic Theme Building or a panoramic view, and would not introduce substantial new lighting to the area.

In light of applicable design guidelines, including the *LAX Street Frontage and Landscape Plan Update*, LAX Master Plan commitments, and existing visual quality, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not degrade an area valued for its aesthetic character, or involve the removal of features that contribute to the aesthetic image of the area. Moreover, cumulative projects in combination with the LAWA Staff-Recommended Alternative improvements would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views. Similarly, cumulative development would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, cumulative impacts to aesthetic resources and views, and cumulative impacts related to light and glare, within the western boundary area under the LAWA Staff-Recommended Alternative would be less than significant.

Northern Boundary

Cumulative projects within the northern boundary area, listed above, in combination with airfield, terminal, and ground access improvements occurring under the LAWA Staff-Recommended Alternative, would contribute to cumulative impacts to aesthetic resources, views, and light and glare. Implementation of the LAWA Staff-Recommended Alternative would involve changes to the north airfield and terminal improvements that would be visible from northern vantage points. The ground access improvements associated with the LAWA Staff-Recommended Alternative, including the CONRAC, public parking, and APM, would be constructed in northern boundary areas with poor visual quality and no notable views, but with existing light sources typical of a highly urbanized environment. Because these improvements would be compatible with surrounding land uses, and would be subject to design guidelines, impacts to aesthetic resources would be less than significant.

Under the LAWA Staff-Recommended Alternative, Lincoln Boulevard would be realigned to the north, with approximately 540 linear feet below grade and/or covered. Since the site of the new alignment is currently vacant and lies between two existing roadways, the area is not currently valued for its aesthetic character, and the improvements would not be at a height or location that would obstruct scenic views, impacts to aesthetic resources would be less than significant.

As noted above, a number of cumulative projects are proposed within the northern boundary area. The impacts of several of these projects are discussed previously in this analysis. In particular, the LAX Northside area is currently entitled for development of a mix of retail uses, hotels, offices, airport support facilities, education and community facilities, and open space under the adopted LAX Northside Plan. The approved development plan provides entitlements for 4.5 million square feet of development, subject to a limitation on the total number of daily trips. Formulation of a new land use development concept for the area is currently in process. The proposed LAX Northside Plan Update calls for less dense development as well as additional open space and community facilities while providing a mix of retail, office space, research and development, and non-profit uses.[81] The development of a mix of new land uses within this vacant area, even at a less dense level than previously entitled, would represent a substantial change in visual character and has the potential to affect views from residential development to the north. In addition, the conversion of the largely vacant LAX Northside would result in a noticeable increase in ambient light and glare as seen from existing adjacent light-sensitive uses in the Westchester area. However, the LAX Northside area is subject to height restrictions, setback requirements, and lighting and landscape guidelines and requirements contained in the *LAX Northside Design Plan and Development Guidelines* and the LAX Specific Plan with the goal of avoiding land use conflicts, creating a visually open appearance, and promoting design sensitivity to the residential interface, enhancing privacy. In addition, light spillover and substantial glare associated with the relocation of Lincoln Boulevard and its associated street lighting northward, in combination with development under LAX Northside, would be avoided. This is because the Lincoln Boulevard relocation improvements would be subject to LAX Master Plan Commitments LI-3, Lighting Controls, and DA-1, Construction Fencing, while both the Lincoln Boulevard relocation improvements and development in LAX Northside would be subject to LAMC Section 93.0117 and *LAX Northside Design Plan and Development Guidelines* regulating light spillover in residential areas.

Implementation of these design provisions would create an aesthetically pleasing interface with the Westchester community to the north, and setbacks and height limits would reduce visual intrusion and the obscuring of distant views. Implementation of the LAX Northside Plan would create intervening development between residential uses and existing views of the airfield would be limited. Although views from certain high-rise apartment buildings on the west side of Lincoln Boulevard would change, existing views of LAX Northside and LAX are not considered scenic or of high aesthetic quality. More distant views of the Theme Building would also be limited by the new development; however, due to the distance

[81] City of Los Angeles, Los Angeles World Airports, LAX Northside Plan Update, Available: http://www.lawa.org/GDZ., accessed December 30, 2012.

of the Theme Building from northern vantage points, existing views of the Theme Building that might be obstructed are not considered scenic.

The Westchester Golf Course Three-Hole Restoration Project, completed in 2010, involved the replacement of three holes at the Westchester Golf Course that were eliminated many years ago with the construction of Westchester Parkway, thereby returning the overall playing area to 18 holes. Landscaping for the project was provided in accordance with the *LAX Street Frontage and Landscape Development Plan Update*. The golf course is separated from nearby residences by a 12-foot-high masonry wall atop an 8-foot-high landscaped berm, effectively shielding any views of the golf course from nearby residences and preventing any light spillover or substantial glare. As such, impacts to aesthetic resources associated with this project were less than significant. Similarly, because of the masonry wall and berm, and given the light and glare controls discussed above (e.g., LAX Master Plan Commitments LI-3 and DA-1, LAMC Section 93.0117, and *LAX Northside Design Plan and Development Guidelines*), any increase in light and glare resulting from the combination of light from the Lincoln Boulevard relocation and development in LAX Northside would result in less than significant light and glare impacts.

Various airfield modifications and terminal improvements related to cumulative projects, listed above, would not introduce land uses that would adversely alter the overall visual character of the airfield, CTA, or aircraft operations. Furthermore, views of the existing airfield, while of public interest, are at a considerable distance from residences in Westchester and Playa del Rey. More distant views to the CTA are not scenic. Projects such as the Bradley West Project, the MSC, and the North Terminals Improvements would enhance views of the airport. Changes to the north airfield, enhancements to AOA perimeter fencing, and various terminal improvements, would not alter views of airfield operations, such as arriving and departing aircraft.

In light of applicable design guidelines, including the *LAX Street Frontage and Landscape Plan Update* and the *LAX Northside Design Plan and Development Guidelines*, LAX Master Plan commitments, and existing visual quality, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not degrade an area valued for its aesthetic character, or involve the removal of features that contribute to the aesthetic image of the area. Moreover, cumulative projects in combination with the LAWA Staff-Recommended Alternative improvements would not affect views from a designated scenic highway, corridor, or parkway or obstruct/diminish other valued focal or panoramic views. Similarly, cumulative development would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare. Therefore, cumulative impacts to aesthetic resources and views, and cumulative impacts related to light and glare, within the northern boundary area under the LAWA Staff-Recommended Alternative would be less than significant.

Construction

If construction of airfield, terminal, and ground access improvements associated with the LAWA Staff-Recommended Alternative were to occur at the same time as construction of other cumulative projects, the combined construction activity would generate cumulative impacts to aesthetics and light and glare that would be greater than would occur if these projects were not to overlap. Cumulative construction activities would cause some areas of the airport environs to have an incomplete, disrupted, and unattractive quality. In addition, construction activities would require temporary nighttime lighting of the construction sites and construction staging areas. Use of Construction Staging Areas A, B, C, and D may occur in conjunction with the construction of LAX Northside, the Stormwater Infiltration and Treatment Facility, and the Coastal Dunes Improvement Project. These construction activities would be visible from residential areas north of Westchester Parkway, the Westchester Golf Course, and elevated residential areas northwest of Pershing Drive. Although Construction Staging Areas A, B, C, and D and construction activities associated with other cumulative projects would be visible to some degree from off-site vantage points to the north, most of these construction staging areas already accommodate existing construction activities and associated construction lighting. Construction staging equipment, activities, and light and glare from cumulative construction activities would not contrast or be out of character with existing views,

which include existing construction staging activities, airfield runways, and auxiliary structures located to the south.

Use of Construction Staging Areas E and F in the mostly vacated Belford and Manchester Square areas may occur in conjunction with construction of cumulative projects, such as the Metro Crenshaw/LAX Transit Corridor and Station. These cumulative construction activities would be visible from surrounding commercial, industrial, and surface parking uses. Views of the Manchester Square area would also be visible from the limited number of multi-family homes to the north, some of which would have elevated views of the site from upper stories. Construction Staging Areas E and F would be also visible from surrounding roadways. While Construction Staging Areas E and F in conjunction with construction activities associated with other cumulative projects would be visible to surrounding uses and vantage points, most of these areas have some existing lighting and currently accommodate some construction activities. Moreover, cumulative construction activities would be located in a lit urban setting, the existing visual quality in these areas is low, and the areas do not support notable views.

Use of Construction Staging Area G (the Continental City site) may occur in conjunction with the construction of the Metro Crenshaw/LAX Transit Corridor, both of which would be visible along on Aviation Boulevard, 111th Street, and I-105. Residential areas south of I-105 have limited views of the Continental City site due to the presence of I-105 support pilings, a sound wall, and right-of-way fronting Imperial Highway. Construction Staging Area G and construction activities associated with cumulative projects, such as the Metro Crenshaw/LAX Transit Corridor, would not detract from an area with valued aesthetic quality. Currently, the Continental City site is vacant and does not contain valued aesthetic resources or notable views. Cumulative construction activities in this area would not alter existing long-range views of the Santa Monica Mountains due to the distance of the improvements and the substantially higher vantage points to the south, nor would these activities alter valued views in El Segundo of airfield operations, such as arriving and departing aircraft. Furthermore, the area is located within the highly lit and glare-generating Century, Sepulveda, and Aviation Boulevard corridors, which are dominated by street lights, surface parking lot lighting, and lighting from building and parking structure interiors, and any construction-related light and glare generate would represent a small incremental increase in existing light and glare in this area.

Impacts related to temporary construction activities on the airport property would be reduced by LAX Master Plan Mitigation Measure MM-DA-1, Construction Fencing. Specifically, MM-DA-1 would ensure construction fencing and pedestrian canopies would be installed by LAWA to the degree feasible and appropriate to ensure maximum screening of areas under construction along major public approach and perimeter roadways. Along Century Boulevard, Sepulveda Boulevard, and in other areas where the quality of public views are a high priority, treatment of the fencing to reduce temporary visual impacts would occur. Construction lighting associated with the LAWA Staff-Recommended Alternative and other LAX Master Plan projects would be oriented toward airport property and away from adjacent sensitive receptors in accordance with LAX Master Plan Commitment LI-3, Lighting Controls. Temporary construction impacts related to the Metro Crenshaw/LAX Transit Corridor and Station and Airport Metro Connector Project would be subject to screening measures enforced by Metro, such as the replacement of street trees and vegetation and siting of stockpile and staging areas in less visually-sensitive areas. Therefore, cumulative short-term aesthetic impacts related to temporary construction activities would be less than significant. Similarly, since construction activities associated with the cumulative projects, in combination with construction activities under the LAWA Staff-Recommended Alternative, would not result in a change in lighting or lighting intensity such that light would spill off and adversely affect light-sensitive areas, and would not result in a substantial new source of glare that would adversely affect nighttime views in adjacent areas sensitive to glare, cumulative construction-related light and glare impacts would also be less than significant.

2.4.2 Air Quality

2.4.2.1 Construction Impacts

Construction air quality impacts tend to be primarily local in nature (i.e., impacts such as fugitive dust and construction equipment emissions are mostly realized in the immediate area around a construction site), although construction-related air pollutant emissions also contribute incrementally to degradation of regional ambient air quality. Cumulative projects with the most notable potential to contribute to cumulative construction air quality impacts, adding to the construction-related impacts associated with the LAWA Staff-Recommended Alternative, would be those under construction at the same time and in the same general vicinity as the LAWA Staff-Recommended Alternative. As such, the geographic study area for evaluation of cumulative construction air quality impacts is focused primarily on projects at LAX and the immediate surroundings. It should be noted, however, that the basis used in this EIR for determining significant air quality impacts, whether project-specific or cumulative, are the thresholds established by the South Coast Air Quality Management District (SCAQMD). The SCAQMD is the regional air pollution control agency for the South Coast Air Basin, which includes all of Orange County and the urban portions of Los Angeles, Riverside and San Bernardino counties, and sets forth regulations, policies, and programs designed to address air quality on a regional (Basin-wide) basis.

As described in Section 5.3 of the SPAS Draft EIR, numerous past, present, and reasonably foreseeable development projects are located at and around LAX. Past and present projects involving substantial construction activities include the South Airfield Improvement Project, Taxiway R, the Bradley West Project including Taxiways S and T, and the Central Utility Plant (CUP) Replacement Project. Construction of these projects has been, or is anticipated to be, completed prior to start of construction of SPAS improvements in 2015. There are also several other smaller projects described in Section 5.3 of the SPAS Draft EIR that have been, or would be, completed prior to 2015 (see anticipated timeframes within the description of each project). Reasonably foreseeable projects involving substantial construction activities between 2015 and 2025, concurrent with construction of SPAS improvements, include the Midfield Satellite Concourse (MSC) and associated taxiways and passenger processor, LAX Northside, and the Metro Crenshaw/LAX Transit Corridor and Station. Additional smaller development projects anticipated to occur during this time period are described in Section 5.3 of the SPAS Draft EIR, as are several other projects for which construction schedules have not yet been determined but would nevertheless contribute to cumulative construction air quality impacts at some point.

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants.[82] Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

Construction of the past, present, and reasonably foreseeable future projects described above, along with the improvements proposed under the LAWA Staff-Recommended Alternative, would collectively exceed the SCAQMD thresholds of significance; hence, there would be significant cumulative impacts to air quality. As indicated in Sections 2.3.2.1.1 and 2.3.2.1.2, estimated emissions from construction of the LAWA Staff-Recommended Alternative would exceed the SCAQMD thresholds of significance for CO, VOC, NO_x, PM10, and PM2.5, and concentrations of criteria pollutants from construction would exceed the SCAQMD thresholds of significance for NO_2 and PM10. The contribution of the LAWA Staff-Recommended Alternative to cumulative emissions and concentrations of these specific pollutants would, therefore, be cumulatively considerable.

Construction emission and concentration impacts of SO_2 and construction concentration impacts of CO and PM2.5 would not exceed the SCAQMD thresholds of significance under the LAWA Staff-

[82] South Coast Air Quality Management District, White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution, August 2003, Appendix D, Available: http://www.aqmd.gov/hb/2003/030929a.html, accessed June 15, 2012.

Recommended Alternative and, therefore, would not be cumulatively considerable relative to these specific pollutants.

Overall, based on the above, construction of the LAWA Staff-Recommended Alternative would result in a cumulatively considerable impact on air quality.

2.4.2.2 Operational Impacts

Operational emissions associated with past, present, and reasonably foreseeable future projects such as those described in Section 5.3 of the SPAS Draft EIR would contribute to cumulative criteria pollutant emissions in excess of SCAQMD thresholds of significance; therefore, significant cumulative impacts would occur. Such operational emissions would be both localized, occurring at each project site, and regional in nature relative to mobile source emissions associated with vehicle travel to and from each site. According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants.

Operational emissions and concentrations associated with past, present, and reasonably foreseeable future projects, along with the LAWA Staff-Recommended Alternative, would contribute to cumulative criteria pollutant emissions in excess of SCAQMD thresholds of significance; therefore, significant cumulative impacts would occur. As discussed in Section 2.3.2.1.3 of this chapter, operational emissions associated with the LAWA Staff-Recommended Alternative would exceed the SCAQMD's threshold for SO_2, PM10, and PM2.5. The SO_2 exceedance is primarily due to aircraft emissions during takeoff and to auxiliary power units (APUs). Although SO_2 emissions from other cumulative projects would be much more limited, given that the vast majority of non-aviation fuel types are subject to existing regulatory requirements that limit sulfur content to very low levels (i.e., no more than 15 parts per million), the impact of the LAWA Staff-Recommended Alternative relative to SO_2, which exceeds the SCAQMD threshold of significance, would be a cumulatively considerable contribution to a significant impact for that pollutant. Emissions of PM10 and PM2.5 would, under the LAWA Staff-Recommended Alternative, exceed the SCAQMD thresholds of significance due primarily to off-airport vehicle travel, which would also occur with many of the other cumulative projects. The contribution of the LAWA Staff-Recommended Alternative to cumulative impacts for those pollutants would be cumulatively considerable. As discussed in Section 2.3.2.1.4 of this chapter, concentrations of NO_2 would exceed the SCAQMD's threshold of significance, due primarily to pollutant emissions associated with aircraft takeoffs, and concentrations of PM10 would also exceed the SCAQMD thresholds of significance. The LAWA Staff-Recommended Alternative would, therefore, also have a cumulatively considerable impact relative to those pollutants. As discussed in Section 2.3.2.2 of this chapter, mitigation measures would be implemented to address operational impacts; however, no feasible mitigation measures are available to reduce those impacts to a level that is less than significant.

Operational emission impacts of CO, VOC, and NO_x, and operational concentration impacts of CO, PM2.5, and SO_2 would not be significant under the LAWA Staff-Recommended Alternative and, therefore, would not be cumulatively considerable relative to those pollutants.

Overall, based on the above, operation of the LAWA Staff-Recommended Alternative would result in a cumulatively considerable impact on air quality.

2.4.3 Biological Resources

The cumulative study area related to biological resources includes the SPAS project area and the immediate vicinity of LAX; however, the cumulative study area varies among affected resource types. For example, the cumulative study area for El Segundo blue butterfly is limited to the Los Angeles/El Segundo Dunes (including the Dockweiler Beach Habitat Restoration area which is also part of the Airport Dunes Recovery Unit for this species as set forth by the U.S. Fish and Wildlife Service[83]) and other nearby populations because of the narrow habitat requirements for this species, while the cumulative

[83] U.S. Fish and Wildlife Service, Recovery Plan for the El Segundo Blue Butterfly (*Euphilotes battoides allyni*), 1998.

study area for nesting migratory birds includes any suitable nesting sites in the immediate vicinity of LAX. The area surrounding LAX is, and has long been, largely urbanized and there are few undeveloped areas that support sensitive biological resources. The nearest undeveloped areas are the Ballona Wetlands, Ballona Creek, and open space areas associated with the Playa Vista Project. Most of the area associated with the originally proposed Playa Vista Project, specifically areas northeast, northwest, and southwest of where Lincoln Boulevard crosses over the Ballona Channel, have been transferred to the State of California and/or are proposed to remain as natural habitat and permanent open space. The remaining quadrant of the original Playa Vista Project, located southeast of the Lincoln Boulevard/Ballona Channel, was previously occupied by the former Hughes Aircraft Company and McDonnell Douglas Corporation industrial complexes and has been largely redeveloped with residential, commercial, employment, recreational, and open space uses, beginning in 2001 and continuing to date. As the Playa Vista Project was located in an area that was already disturbed, project impacts to biological resources were limited, and included impacts to degraded wetlands in various locations in the Playa Vista Planning Area for construction of a freshwater wetland system and mixed-use development, as well as a reduction in undeveloped area for nesting birds and migrant raptors. These impacts were mitigated to a level that is less than significant by an extensive habitat restoration program.

The majority of projects in the surrounding area would add or increase the intensity of development in already urbanized settings (see Table 5-2 of the SPAS Draft EIR). Projects in these urbanized settings, whether sited on currently empty lots or already developed lots, are not generally considered a factor in reducing sensitive habitat or special status species populations. The projects at LAX that would contribute to cumulative impacts to biological resources, when combined with the SPAS project, include the proposed LAX Northside Project; various proposed, ongoing, and completed airside improvement projects; and the ongoing residential acquisition in Manchester Square. The ongoing Coastal Dunes Improvement Project would result in beneficial impacts to biological resources in the Los Angeles/El Segundo Dunes. The Los Angeles/El Segundo Dunes is a remnant of a more extensive dune ecosystem that once covered 2,900 acres. Development has eliminated the majority of the original Los Angeles/El Segundo Dunes complex, with the only remaining dunes being the 302 acres at LAX, about 55 acres of degraded dunes east of the Hyperion Treatment Plant south of LAX, 1.6 acres at the Chevron El Segundo blue butterfly preserve south of the Hyperion Treatment Plant, and 4 acres at Sand Dunes Park in Manhattan Beach, which is open to public recreation and has been highly degraded.[84] Impacts to the Los Angeles/El Segundo Dunes throughout much of their original area have resulted in the loss of both the native habitats/vegetation associations that occur on the Dunes, as well as alteration of coastal dune landforms through extensive grading. As discussed below, although the SPAS project would result in the loss of a small amount of native habitat area, the Los Angeles/El Segundo Dunes would not be impacted by large-scale landform alteration.

Vegetation Associations/Habitats

As discussed in Section 2.3.3 of this chapter, under the LAWA Staff-Recommended Alternative, impacts on ruderal vegetation, Disturbed Southern Dune Scrub, and Encelia Scrub in the north airfield and Construction Staging Areas A, B, C, D, and G would be less than significant. Projects in the LAX vicinity that would contribute to cumulative impacts to ruderal vegetation include the LAX Northside Project and various ongoing airside improvement projects, which collectively would reduce ruderal areas within LAX. The LAX Northside Project area is coincident with Staging Areas A, B, C, and D, as well as areas of ruderal vegetation north of Westchester Parkway. The construction staging areas do not support any known sensitive biological resources and, under the LAWA Staff-Recommended Alternative, impacts to ruderal vegetation in these areas would be less than significant. Similarly, the areas of ruderal vegetation north of Westchester Parkway do not support any sensitive biological resources. These areas are, and have been for many years, actively managed to discourage wildlife use that would present an aviation hazard. Moreover, the various completed, ongoing, and proposed airside improvement projects are sited in areas of ruderal vegetation that either do not support sensitive biological resources, or support

[84] Environmental Science Associates, Sapphos Environmental, and Rudolf H.T. Mattoni, Long-Term Habitat Management Plan for Los Angeles Airport/El Segundo Dunes, June 23, 1994.

sensitive biological resources for which significant impacts have been/would be reduced to a level that is less than significant with implementation of mitigation measures identified in the LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP). Therefore, cumulative impacts to ruderal vegetation resulting from the combination of the LAWA Staff-Recommended Alternative and other cumulative projects would be less than significant.

As discussed in Section 2.3.3 of this chapter, impacts from the LAWA Staff-Recommended Alternative on Disturbed Southern Dune Scrub would be less than significant with implementation of Mitigation Measure MM-BIO (SPAS)-14, Replacement of Habitat Units. The only other project in the LAX vicinity that would affect this habitat type is the ongoing Coastal Dunes Improvement Project, which will result in a beneficial impact on Disturbed Southern Dune Scrub habitat. As impacts from the LAWA Staff-Recommended Alternative on Disturbed Southern Dune Scrub would be less than significant, and the Coastal Dunes Improvement Project would result in beneficial impacts to Disturbed Southern Dune Scrub vegetation, cumulative impacts would be less than significant.

Impacts to Encelia Scrub from the LAWA Staff-Recommended Alternative would be less than significant. There are no other projects in the LAX vicinity that would result in impacts to Encelia Scrub. Therefore, no cumulative impacts would occur.

Under the LAWA Staff-Recommended Alternative, impacts on Sandbar Willow Thicket, California Bulrush Marsh, and ruderal vegetation within the Argo Drainage Channel would be less than significant, as none of these vegetation types is considered sensitive. There are no other reasonably foreseeable projects that would result in impacts to these vegetation associations within the Argo Drainage Channel, or these habitats/vegetation associations within the LAX vicinity. The area surrounding LAX is highly urbanized, and current and future projects in the study area generally consist of infill and redevelopment projects that would not impact riparian and wetland vegetation, as drainages in the LAX vicinity are generally either concrete box channels, or have been covered and converted to underground drains. Although the planned Runway 6L/24R East End Runway Safety Area (RSA) Improvements Project would also have impacts on these habitats, these runway improvements would only occur in the absence of the LAWA Staff-Recommended Alternative. As there are no other reasonably foreseeable projects in the vicinity of LAX, including projects in Table 5-2 of the SPAS Draft EIR, that would impact the vegetation associations found in the Argo Drainage Channel, and there are no other nearby drainages that contain riparian and wetland vegetation, no cumulative impacts to riparian and wetland vegetation would occur. Impacts related to jurisdictional issues associated with the Argo Drainage Channel are addressed below.

As discussed in Section 2.3.3 of this chapter, the LAWA Staff-Recommended Alternative would require new navigational aids and a related new service road within the north airfield and/or Los Angeles/El Segundo Dunes. Installation of navigational aids in the Dunes would have a significant impact on state-designated sensitive habitats in the Los Angeles/El Segundo Dunes, although these impacts would be reduced to a level that is less than significant with implementation of mitigation measures described in Section 2.3.3 of this chapter. The only project in the LAX vicinity that would contribute to cumulative impacts to state-designated sensitive habitats in the Dunes is the Coastal Dunes Improvement Project, which will result in beneficial impacts to biological resources in the Los Angeles/El Segundo Dunes, including state-designated sensitive habitats. There are no other reasonably foreseeable projects in the cumulative study area that would impact the vegetation associations found in the Los Angeles/El Segundo Dunes or the other remnants of the dune ecosystem at degraded dunes east of the Hyperion Treatment Plant south of LAX, the Chevron El Segundo blue butterfly preserve south of the Hyperion Treatment Plant, and the degraded Sand Dunes Park in Manhattan Beach. As impacts from the LAWA Staff-Recommended Alternative would be less than significant with implementation of mitigation measures, and the Coastal Dunes Improvement Project would result in beneficial impacts to the state-designated sensitive habitats in the Dunes, cumulative impacts would be less than significant.

Under the LAWA Staff-Recommended Alternative, operation of the proposed improvements would not have an impact on sensitive habitats and vegetation associations, as operation would not result in any additional physical disturbance leading to a substantial reduction in any federally-designated critical habitat, locally-designated natural communities including state-designated sensitive habitats,

Environmentally Sensitive Habitat Areas (ESHAs), and habitat preservation areas designated pursuant to local ordinances. Operation of the proposed improvements would also not conflict with any local policies or ordinances protecting biological resources. Therefore, no cumulative impacts from the operation of the improvements would occur.

Under both construction of and operation of the improvements associated with the LAWA Staff-Recommended Alternative, there would be no conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Communities Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plans, as no such plan covers any portion of the biological resources study area. Moreover, the LAWA Staff-Recommended Alternative would not cause a substantial reduction in a locally-designated natural habitat or plant community, as no locally-designated habitats or plant communities are associated with the biological resources study area. Therefore, no cumulative impacts would occur.

Sensitive Plants

As discussed in Section 2.3.3 of this chapter, impacts to sensitive plant species at the western end of the north airfield, in Construction Staging Areas B, C, and D, and in the Los Angeles/El Segundo Dunes under the LAWA Staff-Recommended Alternative would be significant. These impacts would be reduced to a level that is less than significant with implementation of mitigation measures described in Section 2.3.3 of this chapter. There are no other reasonably foreseeable projects proposed for the western end of the north airfield where Lewis' evening primrose has been documented to occur. The only other potentially suitable habitat for sensitive plants elsewhere in the project area east of Pershing Drive is within Construction Staging Areas B, C, and D, which are proposed for future development under the LAX Northside Project. If southern tarplant occurs within Construction Staging Areas B, C, and D, it would be impacted and mitigated prior to development of the LAX Northside Project. Therefore, cumulative impacts to sensitive plants east of Pershing Drive would be less than significant.

The project in the LAX vicinity that would contribute to cumulative impacts to sensitive plants within the Dunes is the Coastal Dunes Improvement Project. There are no other reasonably foreseeable projects within the geographical scope of this analysis that would impact suitable habitat, within the Dunes or elsewhere in the vicinity of LAX, for the sensitive plant species that occur or have potential to occur within the Dunes. Since impacts from the LAWA Staff-Recommended Alternative on sensitive plants within the Dunes would be less than significant with implementation of mitigation measures described in Section 2.3.3 of this chapter, and the Coastal Dunes Improvement Project will have beneficial impacts to sensitive plants in the Dunes, cumulative impacts would be less than significant.

Under the LAWA Staff-Recommended Alternative, there would not be a substantial loss of individuals or substantial reduction of existing habitat of a locally-designated species, as no locally-designated plant species are known to occur within the biological resources study area. Therefore, no cumulative impacts would occur.

Sensitive Wildlife

As discussed in Section 2.3.3 of this chapter, impacts to burrowing owl associated with the Argo Drainage Channel and other undeveloped areas where suitable habitat occurs under the LAWA Staff-Recommended Alternative would be significant. These impacts would be reduced to a level that is less than significant with implementation of the mitigation measure described in Section 2.3.3 of this chapter. The projects in the LAX vicinity that would contribute to cumulative impacts to burrowing owl include the LAX Northside Project and various ongoing airside improvement projects. It is possible that if ground squirrel activity changes in the future, potentially suitable burrows could occur in currently vacant portions of the LAX Northside Project not used as construction staging areas for SPAS, as well as areas that would be affected by various airside improvement projects. Impacts to burrowing owl associated with the LAWA Staff-Recommended Alternative would be reduced to a level that is less than significant with implementation of proposed mitigation. Many of the various ongoing airside improvement projects, as well as the LAX Northside Project, are subject to similar mitigation pursuant to the LAX Master Plan MMRP. Nevertheless, cumulative impacts to burrowing owl associated with the LAX Northside Project

and various airside improvement projects, in combination with the LAWA Staff-Recommended Alternative, would be significant. However, with implementation of mitigation described in Section 2.3.3 of this chapter, the contribution of the LAWA Staff-Recommended Alternative to this significant cumulative impact would not be cumulatively considerable.

As discussed in Section 2.3.3 of this chapter, the LAWA Staff-Recommended Alternative would result in significant impacts to sensitive wildlife species. These impacts would occur primarily within the Los Angeles/El Segundo Dunes, affecting sensitive arthropods, gastropods, and reptiles, loggerhead shrike, burrowing owl, and El Segundo blue butterfly. With implementation of LAX Master Plan mitigation measures, impacts to El Segundo blue butterfly under the LAWA Staff-Recommended Alternative would be less than significant. Potential impacts to the other sensitive wildlife species in the Los Angeles/El Segundo Dunes would be reduced to a level that is less than significant with implementation of mitigation measures described in Section 2.3.3 of this chapter. The project in the LAX vicinity that would contribute to cumulative impacts to sensitive wildlife associated with the Dunes is the Coastal Dunes Improvement Project. There are no other reasonably foreseeable projects that would impact El Segundo blue butterfly at its known population locations, including the Dockweiler Beach bluffs, the Chevron Preserve, Malaga Cove, scattered locations in the Palos Verdes bluffs, and recently colonized habitat restoration areas in Redondo Beach. Additionally, there are no reasonably foreseeable projects in the project vicinity that would impact, within the Dunes or elsewhere in the vicinity of LAX, the other sensitive wildlife that occur within the Dunes. Since impacts from the LAWA Staff-Recommended Alternative on sensitive wildlife within the Dunes would be less than significant with implementation of LAX Master Plan mitigation measures and mitigation measures described in Section 2.3.3 of this chapter, and the Coastal Dunes Improvement Project will have beneficial impacts on sensitive wildlife in the Dunes, cumulative impacts would be less than significant.

As discussed in Section 2.3.3 of this chapter, under the LAWA Staff-Recommended Alternative, any activity that would remove mature trees from the project area used for nesting by migratory birds or raptors, including the trees associated with the relocation of Lincoln Boulevard and the proposed use of Staging Areas B, C, D, and F, would have the potential to impact nesting birds/raptors protected under the Migratory Bird Treaty Act (MBTA) or Fish and Game Code Section 3503 or 3503.5, which would be a significant impact. Reasonably foreseeable projects in the LAX vicinity that would contribute to cumulative impacts to mature trees that could be utilized by nesting raptors include the LAX Northside Project and the residential acquisition in Manchester Square, since these two areas contain residential street trees have been or may be removed. As discussed in Section 2.3.3 of this chapter, none of the mature trees in the LAX Northside Project area or Manchester Square are known to support nesting raptors. Moreover, the removal of mature trees within LAX Northside is subject to mitigation pursuant to the LAX Master Plan MMRP. Nevertheless, the potential removal of mature trees used for nesting under the LAWA Staff-Recommended Alternative, in combination with the potential removal of such trees associated with the LAX Northside Project and residential acquisition in Manchester Square, would result in a significant cumulative impact on nesting raptors. However, with implementation of mitigation measures described in Section 2.3.3 of this chapter, the contribution of the LAWA Staff-Recommended Alternative to significant cumulative impacts would not be cumulatively considerable.

Any project within the vicinity of LAX that would remove vegetation that could be used by nesting migratory birds would result in significant impacts to nesting migratory birds. The Playa Vista Project resulted in significant impacts to nesting migratory birds due to loss of suitable nesting vegetation. Cumulative impacts to nesting migratory birds due to loss of suitable nesting vegetation associated with projects in the vicinity of LAX, including Playa Vista, in combination with the LAWA Staff-Recommended Alternative, would be significant. However, with implementation of mitigation measures described in Section 2.3.3 of this chapter, the contribution of the LAWA Staff-Recommended Alternative to this significant cumulative impact would not be cumulatively considerable.

Upon completion of construction, operation of the facilities associated with the LAWA Staff-Recommended Alternative would not result in significant impacts to sensitive wildlife species. Therefore, operation of the facilities associated with the LAWA Staff-Recommended Alternative would not contribute to cumulative impacts to sensitive wildlife species.

Under the LAWA Staff-Recommended Alternative, there would not be a substantial loss of individuals or substantial reduction of existing habitat of a locally-designated species, as no locally-designated wildlife species are known to occur within the biological resources study area. Moreover, there are no wildlife movement/migration corridors associated with any portion of the biological resources study area, including the Argo Drainage Channel. Therefore, no cumulative impacts would occur.

Jurisdictional Aquatic Features

As discussed in Section 2.3.3 of this chapter, the LAWA Staff-Recommended Alternative would affect all potential U.S. Army Corps of Engineers (USACOE) and California Department of Fish and Game (CDFG) jurisdictional areas associated with the Argo Drainage Channel. This impact would be reduced to a level that is less than significant with implementation of the proposed mitigation measure described in Section 2.3.3 of this chapter. As noted above, there are no other projects that would result in impacts within the Argo Drainage Channel, nor are there any reasonably foreseeable projects within the geographic scope of analysis that would impact jurisdictional aquatic features. Nevertheless, given the historical loss of jurisdictional aquatic features in the vicinity, including at Playa Vista, cumulative impacts to jurisdictional aquatic features are considered significant. With implementation of the mitigation measure described in Section 2.3.3 of this chapter, the contribution of the LAWA Staff-Recommended Alternative to this significant cumulative impact would not be cumulatively considerable.

2.4.4 Coastal Resources

Anticipated regional growth with the potential for cumulative impacts to coastal resources includes new development within or adjacent to the coastal zone. As shown in Figure 5-1 of the SPAS Draft EIR, there are a number of projects located northwest of LAX within or near the coastal zone. The projects are primarily mixed-use developments with residential and restaurant/retail uses. Generally, LAX is located in a highly urbanized area. Many of the cumulative projects would replace existing development, or be developed on vacant parcels in urbanized areas. Development within the coastal zone is strictly regulated by the California Coastal Commission. The most proximate cumulative project is the Coastal Dunes Improvement Project, located in the northernmost portion of the Los Angeles/El Segundo Dunes (Dunes), west of Pershing Drive. The Coastal Dunes Improvement Project consists of the restoration and improvement of coastal dune habitat through the removal of streetscape, retaining walls, sidewalks, light poles, and other abandoned structures; the removal of select invasive non-native plant species; the installation of native plant species in disturbed areas; the recontouring of, and installation of erosion control measures on, newly exposed sites; and the restoration of periphery curb and gutter to minimize direct discharges from runoff.

As discussed in Section 2.3.4, *Coastal Resources*, of this chapter, the LAWA Staff-Recommended Alternative would require installation of various navigational aids and a new service road within the Dunes associated with the reconfiguration of runways in the north airfield. Overall, the area of the Dunes to be occupied by navigational aids under the LAWA Staff-Recommended Alternative would be comparable to that under the existing conditions and would not conflict with the goals of the California Coastal Act (CCA); therefore, impacts would be less than significant. With implementation of existing LAX Master Plan and proposed SPAS mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter impacts on biological resources in the coastal zone as a result of the installation of navigational aids and an associated service road within the Dunes would be less than significant.

The Coastal Dunes Improvement Project would result in beneficial impacts to coastal resources. As such, there is no potential for the impacts of that project to combine with the impacts to coastal resources under the LAWA Staff-Recommended Alternative. Therefore, no significant cumulative impacts to coastal resources would occur.

2.4.5 Cultural Resources

Cumulative impacts to identified potentially eligible, eligible, and listed cultural resources would occur due to combined effects on such resources associated with the LAWA Staff-Recommended Alternative structural improvements and other projects at or adjacent to LAX involving improvements that could

materially impair the physical characteristics of the resources that justify their inclusion in, or eligibility for inclusion in, the National Register (NR), California Register (CR), or listing in the City of Los Angeles Historic-Cultural Monuments Register (LAHCM).

2.4.5.1 Cumulative Projects

Historical Resources

There are five eligible or listed historical resources within the SPAS cultural resources study area: Hangar One (NR listed), Theme Building and Setting (CR/LAHCM listed), World War II Munitions Storage Bunker (NR/CR/LAHCM eligible), Intermediate Terminal Complex (CR/LAHCM eligible), and the Union Savings and Loan Building (CR/LAHCM eligible), shown in Figure 4.5-1 in Section 4.5, *Cultural Resources*, of the SPAS Draft EIR. Of these historical resources, two have the potential to be affected by structural improvements proposed under the LAWA Staff-Recommended Alternative, the Theme Building and Setting, and the Union Savings and Loan Building. The LAWA Staff-Recommended Alternative would not have any impacts on Hangar One, the World War II Munitions Storage Bunker, or the Intermediate Terminal Complex due to the distance of these resources from SPAS-related improvements. Therefore, the LAWA Staff-Recommended Alternative would not contribute to cumulative impacts to these historical resources, and Hangar One, the World War II Munitions Storage Bunker, and the Intermediate Terminal Complex are not addressed further in this analysis.

The following cumulative projects at or adjacent to LAX involve visible, aboveground physical improvements that may directly or indirectly affect historical resources or their immediate surrounds, or the removal of features that may potentially contribute to the historic character or immediate surroundings of historical resources. Within the Central Terminal Area (CTA), these projects include the Bradley West Project, North Terminals Improvements, South Terminals Improvements, Central Utility Plant (CUP) Replacement Project, the new passenger processor component of the Midfield Satellite Concourse (MSC) Program, the LAX Sign District, the New Face of the CTA Improvements/Enhancements, and, the Airport Metro Connector Project, which, in conjunction with the LAWA Staff-Recommended Alternative improvements, such as the design and/or construction of terminals and the Automated People Mover (APM), have the potential for cumulative impacts to views/viewsheds associated with the NR-eligible Theme Building and Setting. The two cumulative project in proximity to the Union Savings and Loan Building are the Radisson Hotel project, which involves the construction of a new hotel and two parking structures on the site of an existing conference center and recreation building that lies adjacent to the Union Savings and Loan Building; and the Airport Metro Connector project, which has conceptual alignments near Sepulveda Boulevard in the vicinity of 96th Street, 98th Street, and Century Boulevard.

Archaeological Resources

Relative to archaeological resources, excavation associated with other development projects at or near LAX has the potential to encounter previously undiscovered archaeological resources, which could result in cumulative impacts. There are a number of cumulative projects with the potential to encounter archaeological resources, including the CUP Replacement Project, North Terminals Improvements, MSC Program including related taxiway improvements, new passenger processor component of the MSC Program, West Aircraft Maintenance Area Project, and Runway 7L/25R East End Reconstruction. Other projects at or adjacent to LAX with the potential for cumulative impacts on archaeological resources include LAX Northside, Coastal Dunes Improvement Project, Stormwater Infiltration and Treatment Facility, and Metro Crenshaw/LAX Transit Corridor and Airport Metro Connector projects. Excavation related to past and present projects at LAX, such as the South Airfield Improvement Project, Taxiway R, Bradley West Project and associated taxiway improvements, and Westchester Golf Course Three-Hole Restoration Project, did not reveal any undiscovered archaeological resources. Therefore, these projects would not contribute to cumulative impacts to archaeological resources.

2.4.5.2 Cumulative Impacts

Historical Resources

As indicated in Section 2.3.5, *Cultural Resources*, of this chapter, impacts to the Theme Building and Setting associated with the airfield and terminal improvements under the LAWA Staff-Recommended Alternative would be less than significant. The proposed the LAWA Staff-Recommended Alternative terminal improvements in the vicinity of the Theme Building and Setting include the addition of a new Terminal 0, loss/modifications to concourse areas and/or gates at Terminals 1, 2, and 3, and the modification and northern extension of concourse area and gates at the Tom Bradley International Terminal (TBIT) and the future MSC passenger processor. These improvements would be compatible in design, scale, proportion, and massing, and would be largely blocked from view from the Theme Building by the existing concourses. However, the LAWA Staff-Recommended Alternative includes an APM within the CTA, which would have potential indirect long-term visual impacts on the NR-eligible Theme Building and Setting. With implementation of Mitigation Measure MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, significant impacts would be avoided because views of the north and south elevations of the Theme Building would not be impaired by the APM. For these reasons, and with compliance with LAX Master Plan Commitment HR-1, Preservation of Historic Resources, and MM-HA (SPAS)-2, Preservation of Historic Resources: Theme Building and Setting, impacts on the Theme Building and Setting under the LAWA Staff-Recommended Alternative would be less than significant. Potential indirect impacts to the Union Savings and Loan Building from the proposed LAWA Staff-Recommended Alternative ground access improvements, specifically, an elevated APM structure along 98th Street and extending over Sepulveda Boulevard, would be less than significant due to their proposed location within or north of the 98th Street right-of-way, their distance from the eligible Union Savings and Loan Building, and the incorporation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources.

As noted above, related cumulative projects in proximity to the Theme Building and Setting include the Bradley West Project, North Terminals Improvements, South Terminals Improvements, the CUP Replacement Project, the new passenger processor component of the MSC Program, the LAX Sign District, the New Face of the CTA Improvements/Enhancements, and, depending upon the selected alternative, the Airport Metro Connector Project, which, in conjunction with the LAWA Staff-Recommended Alternative improvements, have the potential for cumulative impacts. The setting west of the new Airport Traffic Control Tower is altered and generally noncontributing to the Theme Building, as views from the Theme Building to the west are interrupted and obscured by the new Airport Traffic Control Tower. The CUP Replacement Project and the proposed new passenger processor component of the MSC Program are separated from the Theme Building by the Airport Traffic Control Tower and would not contribute to cumulative impacts to the Theme Building and Setting since these projects would not be visible from, or within view of, the Theme Building.

Although located west of the new Airport Traffic Control Tower, the Bradley West Project is visible from, and within view of, the Theme Building and Setting. The architectural design of the building areas is inspired by the adjacent Pacific Ocean and will include modern design elements, architectural articulation, and landscape amenities. The upgrades associated with the Bradley West Project are also designed to be complimentary of the regional airport theme of LAX and the iconic Theme Building and Airport Traffic Control Tower.[85] The North Terminals Improvements would occur in areas within and between the existing passenger processing facilities at Terminals 1, 2, and 3. The South Terminals Improvements include improvements and building system upgrades to Terminals 5 through 8. These improvements are largely to the building interiors and do not include substantive changes to the building footprints or exteriors. Collectively, these terminal improvements could have indirect long-term visual impacts on the setting of the Theme Building. These effects relate to the potential for the design, bulk, placement, and/or proximity of the new terminal buildings to alter the immediate surroundings and/or the setting that

[85] City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport (LAX) Bradley West Project, September 2009.

contributes to the eligibility of the Theme Building in relation to the airport context. However, height limitations, design, and distance of the proposed terminal improvements, and the incorporation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources, which requires careful review of design and development of projects adjacent to historical resources in a manner consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties, would address the effects related to these cumulative projects.

The LAX Sign District Project would place supergraphic and digital signs associated with non-airport-related advertising within approved areas at the airport, limited to areas within the CTA and on terminals and passenger boarding bridges visible from apron areas. Signs would not be visible from the surrounding community. The signs would be located along the faces of existing structures and columns, but would not extend above the height of the existing terminal buildings or parking garages. As a result, the signs would not interfere with scale, proportion, or massing of the Theme Building and Setting, and impacts on this resource would be less than significant.[86] The New Face of the CTA Improvements/Enhancements project will enhance and unify the aesthetic appearance of the CTA. The project includes enhancements to exterior lighting, signage, walkways, and curbside waiting areas. These improvements would be compatible in design, scale, proportion, and massing with the Theme Building, and would not interfere with views of the airport or airfield from the Theme Building.

As part of the Airport Metro Connector Project, Metro is examining ways to connect the transit system to LAX. Modes under consideration include Light Rail Transit, Automated People Mover (APM), and Bus Rapid Transit, along a number of different alignments, including an underground option. Depending upon the outcome, elevated elements of the project have the potential for cumulative impacts to historical resources within the Century Corridor area with potential routes along Century Boulevard and 98th Street. Similar to the Metro Crenshaw/LAX Transit Corridor and Station, a number of urban design principles and features would likely be implemented as part of the Airport Metro Connector Project per Metro's Rail Design Criteria to ensure architectural and visual compatibility between the proposed transit system and the surrounding area to reduce potential indirect impacts to historical resources. Project features would include incorporation of art, landscaping, pedestrian amenities, awnings, street furniture, and other visual treatments into the design of the station and alignment. The Federal Transit Administration (FTA) Circular 9400.1A, Design and Art in Transit Projects, encourages the use of design and artist considerations in transit projects. Within the CTA, components of the APM, Light Rail Transit, and Bus Rapid Transit options could be developed in a configuration that would extend to the eastern portion of the CTA. Depending on the project's specific location, design, and the elevation, implementation of the project could diminish focal views of the Theme Building from various vantage points in the CTA. Additionally, due to the close proximity of the project, construction of the Airport Metro Connector Project could alter or remove contributing features of the Theme Building and Setting.

With the exception of the Airport Metro Connector Project, the cumulative projects in the CTA would be compatible with the historic materials, features, size, scale and proportion, and massing of the Theme Building and Setting and would protect the integrity of the historical resource and its environment. Although implementation of the Airport Metro Connector Project may contribute to a cumulatively significant impact on the Theme Building and Setting depending on the alternative selected, with height limitations, design, and distance of the proposed the LAWA Staff-Recommended Alternative terminal improvements, and the incorporation of LAX Master Plan Commitment HR-1, Preservation of Historic Resources, the contribution of the LAWA Staff-Recommended Alternative would not be cumulatively considerable.

Cumulative projects located in proximity to the Union Savings and Loan Building are the Radisson Hotel project and a potential route of the Airport Metro Connector Project in the vicinity of Sepulveda Boulevard and 98th Street. As noted above, the Radisson Hotel project involves the construction of a new hotel and two parking structures. Options under consideration for the Airport Metro Connector Project include Light Rail Transit, Automated People Mover (APM), and Bus Rapid Transit, with potential routes along Century

[86] City of Los Angeles, Los Angeles World Airports, Notice of Preparation for the LAX Sign District Project, March 16, 2012.

Boulevard and 98th Street as well as an underground option. Depending upon the selected alternative, elevated elements of the project in the vicinity of Sepulveda Boulevard and 98th Street have the potential to result in cumulative impacts to the Union Savings and Loan Building. These cumulative projects, and the elevated APM structure along 98th Street associated with the LAWA Staff-Recommended Alternative, would be compatible with the features, size, scale and proportion, and massing of the Union Savings and Loan Building. Therefore, cumulative impacts to this resource would be less than significant.

Archaeological Resources

No known archaeological resources that are unique or eligible for federal, state, or local designation would be affected by the LAWA Staff-Recommended Alternative. However, the number of archaeological resources previously recorded within LAX and the surrounding area suggests that there is a possibility of discovering archaeological resources during construction. Impacts associated with the disturbance or destruction of undiscovered archaeological resources during construction of the LAWA Staff-Recommended Alternative improvements would be less than significant with implementation of Mitigation Measure MM-HA (SPAS)-4, Conformance with LAX Master Plan Archaeological Treatment Plan, discussed in Section 2.3.5.2.2 of this chapter.

This same potential for encountering undiscovered resources exists for other cumulative projects within LAX and nearby that would include construction excavations. These potential impacts, which would be less than significant at the project level, would be cumulatively significant when viewed in combination with the progressive cumulative loss of archaeological resources associated with other past, present, and reasonably anticipated future projects. Even though regulatory controls and project-level mitigation measures would reduce these effects, there would be a cumulatively significant impact to undiscovered archaeological resources associated with cumulative projects.

With the exception of the north airfield and the navigational aids in the Los Angeles/El Segundo Dunes, the improvements associated with the LAWA Staff-Recommended Alternative are located in disturbed areas. The north airfield improvements and navigational aids would not require deep excavations, and the area subject to excavation for the navigational aids would be small. The lack of deep excavations reduces the potential to encounter undiscovered archaeological resources because deep excavations may encounter previously undisturbed soils conducive to retaining undiscovered archaeological resources. Shallow excavations are likely to be conducted in previously disturbed soils that are likely not conducive to retaining undiscovered archaeological resources because resources in these soils may have been destroyed or displaced from prior disturbances (e.g., rough grading or trenching, road/airstrip construction). Since improvements associated with the north airfield and navigational aids would include shallow excavations in disturbed soils, the likelihood of encountering undiscovered significant archaeological resources during construction would be limited. In light of this circumstance, and compliance with Mitigation Measure MM-HA (SPAS)-4, Conformance with LAX Master Plan Archaeological Treatment Plan, the contribution of the LAWA Staff-Recommended Alternative to cumulative impacts would not be cumulatively considerable.

2.4.6 Greenhouse Gases

The analysis of greenhouse gases (GHG), by its nature, considers cumulative conditions in that it evaluates the contributions of the LAWA Staff-Recommended Alternative in the context of global changes in the concentrations of atmospheric pollutants and their cumulative impact on global climate change. Due to the global nature of GHG emissions and their potential effects, GHG emissions are typically addressed in a cumulative impacts analysis (see, e.g., EPA, Draft Endangerment Finding, 74 Fed. Reg. 18886, 18904 (April 24, 2009) [cumulative emissions are responsible for the cumulative change in the stock of concentrations in the atmosphere]; California Air Pollution Control Officers Association, CEQA and Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act (January 2008) (CAPCOA White Paper), at p. 35 [GHG impacts are exclusively cumulative impacts; there are no noncumulative GHG emission impacts from a climate change perspective].) The analysis below considers other projects that would contribute to cumulative

impacts related to GHG, as well as the contribution of the LAWA Staff-Recommended Alternative to those cumulative impacts.

As indicated in Section 2.3.6 of this chapter, construction and operation of the LAWA Staff-Recommended Alternative would result in a significant impact relative to GHG emissions, primarily related to construction activities, aircraft operations, ground support equipment (GSE), auxiliary power units (APU), and motor vehicle operations, when compared to baseline conditions. Cumulative development in the region, and at LAX specifically, would also result in increased GHG emissions as a result of construction and operational activity. As mentioned in Section 2.3.6 of this chapter, the LAWA Staff-Recommended Alternative would result in lower GHG emissions from aircraft operations, which is the primary source of GHG emission increases compared to baseline conditions, than would otherwise occur in 2025 without the project. The LAWA Staff-Recommended Alternative would comply with requirements of the City of Los Angeles Green Building Code, which includes a number of measures that serve to reduce GHG emissions. On a per capita (per passenger) basis, implementation of the LAWA Staff-Recommended Alternative would result in approximately 14.7 percent less GHG emissions that the per capita GHG emissions associated with baseline conditions. The California Assembly Bill (AB) 32 Scoping Plan indicates that at least a 16 percent reduction in GHG emissions is necessary to achieve the goal of reducing GHG emissions projected to occur in California by 2020 under "business as usual" down to levels that occurred in the state in 1990. Meeting this GHG reduction goal statewide is intended to address cumulative GHG emissions within the state. Given that the LAWA Staff-Recommended Alternative cannot achieve a 16 percent reduction in GHG emissions, on a per capita basis compared to baseline conditions, the resultant significant GHG emissions impact would be cumulatively considerable.

2.4.7 Hazards/Hazardous Materials

2.4.7.1 Human Health Risk Assessment

Unlike air quality, for which standards have been established that determine acceptable levels of pollutant concentrations, no federal standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts. Therefore, the discussion below addresses cumulative health risk impacts, and SPAS-related contributions to those impacts; however, no determination is made regarding the significance of cumulative impacts. Since these results are not used for significance determination and cumulative results do not provide sufficient resolution to distinguish cumulative impacts separately for each alternative the general discussion of the cumulative impacts is applicable to all of the SPAS alternatives, including the LAWA Staff-Recommended Alternative. Based on information available from the South Coast Air Quality Management District (SCAQMD) and U.S. Environmental Protection Agency (USEPA), relative to regional cancer risk estimates and toxic air contaminant (TAC) predictions, the geographic areas considered in the cumulative health risk impacts analysis include the South Coast Air Basin for cancer risk and the LAX area for non-cancer health hazards, as further described below.

2.4.7.1.1 Cumulative Cancer Risks

The SCAQMD conducted an urban air toxics monitoring and evaluation study for the South Coast Air Basin from April 2004 through March 2006 called Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-III).[87] MATES-III is a follow up to MATES-II[88] and provides an updated general evaluation of cancer risks associated with TAC from all sources within the South Coast Air Basin. According to MATES-III, cancer risks in the South Coast Air Basin range from 870 in one million to 1,400 in one million, with an average of 1,200 in one million. These cancer risk estimates are high and indicate that current impacts associated with ongoing releases of TAC (e.g., from vehicle exhaust) and from sources of TAC from past and present projects in the region are substantial. The MATES-III study is an

87 South Coast Air Quality Management District, Final Report, Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-III), September 2008, Available: http://www.aqmd.gov/prdas/matesIII/matesIII.html, accessed June 21, 2012.

88 South Coast Air Quality Management District, Final Report, Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-II), March 2000, Available: http://www.aqmd.gov/matesiidf/es.pdf, accessed June 21, 2012.

appropriate estimate of present cumulative impacts of TAC emissions in the South Coast Air Basin. It does not, however, have sufficient resolution to determine the fractional contribution of current LAX operations to TAC in the airshed. Only possible incremental contributions to cumulative impacts can be assessed.

Meaningful quantification of future cumulative health risk exposure in the entire South Coast Air Basin is not possible. Moreover, the threshold of significance used to determine cancer risk impacts associated with the LAWA Staff-Recommended Alternative is based on the cancer risks associated with individual projects; this threshold is not appropriately applied to conclusions regarding cumulative cancer risk in the South Coast Air Basin. However, based on the relatively high cancer risk level associated with current concentrations of TAC in air in the South Coast Air Basin, as represented by baseline (2009) conditions (i.e., an additional 1,200 cancer cases per million), the LAWA Staff-Recommended Alternative would not add incrementally to the already high cumulative cancer risk in the South Coast Air Basin. In fact, as discussed in Section 2.3.7.1 of this chapter, estimated incremental cancer risks for all receptors for the LAWA Staff-Recommended Alternative are negative. Negative values indicate that implementing the alternative would result in decreases of some TAC concentrations (most notably diesel particulate matter), which would then lead to decreases in cumulative cancer risk estimates when compared to 2009 baseline impacts (i.e., impacts may be beneficial).

The above comparisons do not account for possible positive changes in air quality in the South Coast Air Basin in the future. SCAQMD and other agencies are consistently working to reduce air pollution. In particular, reductions in emissions of diesel particulates are being considered and implemented. Since diesel particulate matter is the major contributor to estimated cancer risks, substantial reductions in diesel emissions would result in substantial reductions in cumulative cancer risks. These, and other such regulations intended to reduce TAC emissions within the South Coast Air Basin, would reduce cumulative impacts overall. While continued, if not increased, regulation by the SCAQMD of point sources as well as more stringent emission controls on mobile sources would reduce TAC emissions, whether such measures would alter incremental contributions of TAC releases to cumulative impacts under the LAWA Staff-Recommended Alternative cannot be ascertained.

2.4.7.1.2 Cumulative Chronic Non-Cancer Health Hazards

Acrolein is the TAC of concern that is responsible for the majority of all predicted chronic non-cancer health hazards associated with LAX operations. In 2011, USEPA published an independent study of possible annual average air concentrations within the South Coast Air Basin associated with a variety of TAC, including acrolein.[89] These estimates provide a means for assessing cumulative chronic non-cancer health hazard impacts of airport operations in much the same manner as cumulative cancer risks were assessed using the MATES-III results.

Within the Human Health Risk Assessment (HHRA) study area, USEPA predictions[90] for annual average acrolein concentrations yield a range of hazard indices from 0.3 to 15, with an average of 4. Maximum incremental hazard indices for the LAWA Staff-Recommended Alternative (discussed in Section 2.3.7.1 of this chapter) were estimated to range from 0.09 to 0.47, all less than the threshold of significance of one. Given the large uncertainty factor for the chronic toxicity value of acrolein (a factor of 1,000) and the relatively small hazard indices associated with airport emissions, the LAWA Staff-Recommended Alternative is not expected to add significantly to cumulative chronic non-cancer health hazards.

Because of the substantial uncertainties associated with the USEPA estimates,[91] the cumulative analysis for chronic non-cancer health hazard impacts is semi-quantitative and based on a range of possible contributions. This cumulative analysis does not address the issue of potential interactions among

89 U.S. Environmental Protection Agency, 2005 National-Scale Air Toxics Assessment, 2011, Available: www.epa.gov/ttn/atw/nata2005/tables.html.

90 U.S. Environmental Protection Agency, 2005 National-Scale Air Toxics Assessment, 2011, Available: www.epa.gov/ttn/atw/nata2005/tables.html.

91 U.S. Environmental Protection Agency, 2005 National-Scale Air Toxics Assessment, 2011, Available: www.epa.gov/ttn/atw/nata2005/tables.html.

acrolein and criteria pollutants. Such interactions cannot, at this time, be addressed in a quantitative fashion. A qualitative discussion of the issue is presented in the LAX Master Plan Final EIR[92] Technical Report S-9a, Section 7.

As discussed in the LAX Master Plan Final EIR[93] (Section 4.24.1.2), limited data are available for describing acrolein emissions. Therefore, estimates of chronic non-cancer health hazards are very uncertain. Chronic non-cancer health hazards associated with the LAWA Staff-Recommended Alternative should only be used to provide a relative comparison to basin-wide conditions. These hazards should not be viewed as absolute estimates of potential health impacts. Moreover, USEPA's estimates are based on data that are now several years old. Emissions from some important sources may have been reduced as a result of continuing efforts by SCAQMD and other agencies to improve air quality in the South Coast Air Basin. Finally, the estimates do not consider degradation of TAC in the atmosphere. Degradation may be very important for relatively reactive chemicals such as acrolein.

2.4.7.1.3 Cumulative Acute Non-Cancer Health Hazards

Predicted concentrations of TAC released from operational activities for the LAWA Staff-Recommended Alternative suggest that slight impacts to human health may occur associated with acute non-cancer health hazards. The assessment of cumulative acute non-cancer health hazards follows the methods used to evaluate cumulative acute non-cancer health hazards presented in the LAX Master Plan Final EIR[94] (Section 4.24.1.7 and Technical Report S-9a, Section 6.3), incorporating updated National-Scale Air Toxics Assessment (NATA) tables from 2005. USEPA-modeled emission estimates by census tract were used to estimate annual average ambient air concentrations. These census tract emission estimates are subject to high uncertainty, and USEPA warns against using them to predict local concentrations. Thus, for the analysis of cumulative acute non-cancer health hazards, estimates for each census tract within the HHRA study area were identified, and the range of concentrations was used as an estimate of the possible range of annual average concentrations in the general vicinity of the airport. This range of concentrations was used to estimate a range of acute non-cancer hazard indices using the same methods as described in the LAX Master Plan Final EIR[95] (Section 4.24.1.7 and Technical Report S-9a, Section 6.1). This range of hazard indices was then used as a basis for comparison with estimated maximum acute non-cancer health hazards for the LAWA Staff-Recommended Alternative. The relative magnitude of acute non-cancer health hazards calculated on the basis of the USEPA estimates and maximum hazards estimated for the LAWA Staff-Recommended Alternative were taken as a general measure of relative cumulative impacts. Emphasis must be placed on the relative nature of these estimates. Uncertainties in the analysis preclude estimation of absolute impacts; uncertainties in the methods are further discussed in Appendix G1, *Human Health Risk Assessment*, of the SPAS Draft EIR.

When USEPA annual average estimates are converted to possible 1-hour maximum concentrations, acute hazard indices associated with total acrolein concentrations are estimated to range from 0.03 to 1.5, with an average of 0.4, for locations within the HHRA study area. The predicted overall maximum incremental acute non-cancer health hazard associated with acrolein for the LAWA Staff-Recommended Alternative is 3.0. USEPA modeled acute hazard indices associated with formaldehyde exposure are estimated to range from 0.1 to 2.2, with an average of 1.0, for locations within the HHRA study area. The predicted maximum acute non-cancer health hazard associated with formaldehyde for the operation of the LAWA Staff-Recommended Alternative is 0.64. Results suggest that the LAWA Staff-Recommended Alternative would add to total 1-hour maximum acrolein concentrations at some locations in the HHRA study area and, therefore, to cumulative acute non-cancer health hazards associated with exposure to acrolein.

94 City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004.

95 City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004.

2.4.7.1.4 Conclusions

Although no defined thresholds for cumulative health risk impacts are available, it is the policy of the SCAQMD to use the same significance thresholds for cumulative impacts as for the project-specific impacts analyzed in the EIR.[96] If cumulative health risks are evaluated following this SCAQMD policy, the project's contribution to the cumulative cancer risk would not be cumulatively considerable since the incremental cancer risk impacts of the LAWA Staff-Recommended Alternative are all negative (i.e., beneficial) and thus below the individual cancer risk significance thresholds of 10 in one million.

However, the SCAQMD policy does have different significance thresholds for project-specific and cumulative impacts for hazard indices for TAC emissions. A project-specific significance threshold is 1.0 while the cumulative threshold is 3.0. Based on this SCAQMD policy, the relatively small chronic non-cancer hazard indices associated with airport emissions under the LAWA Staff-Recommended Alternative would not be cumulatively considerable. Acute non-cancer hazard indices would be at the cumulative threshold of 3.0 for the LAWA Staff-Recommended Alternative, and, therefore, also would likely be cumulatively considerable if it assumed that other planned regional projects would contribute positively to the total regional acute hazards.

2.4.7.2 Safety

The cumulative impacts analysis for safety addresses whether and how related projects at or near LAX in combination with the LAWA Staff-Preferred Alternative may affect the potential for aviation incidents and accidents, including birdstrikes, at LAX. The geographic scope of analysis includes areas in proximity to the north airfield, particularly as related to FAA safety areas for airfield operations. This area of analysis was defined in light of the nature and locations of the SPAS improvements and the projects shown in Figure 5-2 of the SPAS Draft EIR.

Cumulative projects near the north airfield include the LAX Northside development, as well as projects located in or near the CTA, including the North Terminals Improvements, the Central Utility Plant (CUP) Replacement Project, the Bradley West Project and associated taxiways, Taxiway R, and the Midfield Satellite Concourse (MSC) and associated taxiway improvements and passenger processor. Such improvements are generally located away from the north airfield operations area and/or are designed and operated in accordance with FAA safety requirements. In some cases, such as the taxiway improvements associated with Bradley West, MSC, and Taxiway R, the improvements are intended and designed to improve the safety and efficiency of large aircraft (i.e., Aircraft Design Group (ADG) VI) operations.

Cumulative projects would not increase the potential for the occurrence of birdstrikes. The likelihood of birdstrikes mainly depends on the presence of bird attractants, such as undeveloped open space, on or very near the airfield. Cumulative projects nearby, such as the LAX Northside development, would reduce the amount of undeveloped open space in the airport vicinity. Additionally, no projects or other land uses that would attract birds, such as solid waste landfills, are planned in the area. Therefore, there would be no cumulative impacts related to birdstrikes.

None of the ongoing and reasonably foreseeable on-airport improvements identified in Section 5.3 of the SPAS Draft EIR would increase the potential for aviation incidents or accidents. Future development within LAX Northside would place new structures north of the north airfield complex. As described in Section 4.7.2.6.1 of the SPAS Draft EIR, the relocation of Runway 6L/24R 260 feet north and the 604-foot westerly shift of the displaced landing threshold for Runway 24L would shift the associated FAR Part 77 Airspace Surfaces accordingly, drawing them closer to LAX Northside. Depending on the location, design, height, and timing of future development in LAX Northside, there would be a potential cumulative impact on aviation safety due to structures penetrating the Part 77 Airspace Surfaces (i.e., the potential

[96] South Coast Air Quality Management District, White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution, August 2003, Appendix D, Available: http://www.aqmd.gov/hb/2003/030929a.html, accessed June 15, 2012.

for future development to penetrate existing Part 77 surfaces and, in combination with the shifting of the surfaces, increase the amount of penetration). As described in Section 4.7.2.3 of the SPAS Draft EIR, FAR Part 77 imaginary surfaces are primarily intended to serve as a means of identifying objects that require more detailed analyses specific to the types of airspace operations and related safety requirements that occur within those surfaces. A determination of whether such penetrations of a Part 77 surface pose an aviation safety hazard, and the identification of the appropriate measure(s) to address any such hazard, occur through the more detailed analysis, which is completed by, or in coordination with, the FAA. Options to address potential aviation safety hazards can range from doing nothing (i.e., for low-risk objects), to placing high-visibility markings and lighting on structures to make them highly visible to pilots and indicating such objects on avigation maps, to identifying the need for proposed structures to be lower in height or removed. The combination of moving a runway and associated safety surfaces, and developing new uses directly north of the airport, would normally be a significant cumulative impact, and the contribution of the LAWA Staff-Preferred Alternative to this impact would be cumulatively considerable. However, both the northward relocation of Runway 6L/24R and the future development within LAX Northside are directly controlled by LAWA and are subject to FAA approval. As such, both LAWA and the FAA will plan, evaluate, and closely regulate future development within LAX Northside to address potential safety concerns, understanding that the safe and efficient operation of aircraft is the first priority. Such review, coordination, and requirement of FAA approval relative to the runway relocation would automatically occur through the airport layout plan (ALP) amendment process. While it is anticipated that such Part 77 review and approval by FAA relative to development in LAX Northside would occur through the normal course of ongoing coordination between LAWA and the FAA, Mitigation Measure MM-SAF (SPAS)-1, FAR Part 77 Review, presented in Section 5.5.7.2.10 of the SPAS Draft EIR, is recommended to provide additional certainty that potential aviation safety hazards are addressed through the Part 77 review process for LAX Northside development. With implementation of this mitigation measure, no cumulative impacts to aviation safety would occur.

2.4.7.3 Hazardous Materials

Impacts associated with hazardous materials include the potential exposure of construction workers to contamination, interference with ongoing remediation efforts, the potential for SPAS-related activities to result in soil or groundwater contamination, and the potential for impairment to the implementation of emergency response activities.

The exposure of construction workers to contaminated substances is not subject to cumulative effects, as this impact is site-specific and limited to particular construction workers that are employed at a construction site where contaminated materials may be uncovered. With respect to interference with ongoing remediation efforts, as noted in Section 4.7.3, *Hazardous Materials*, of the SPAS Draft EIR, there are a number of sites within the hazardous materials study area that contain contaminated soil and/or groundwater and are undergoing remediation. The LAWA Staff-Recommended Alternative has a potential to interfere with the remediation activities at some or all of these sites. However, contamination and remediation at these sites is limited geographically, and there are no other cumulative projects that would affect these ongoing remediation activities. Therefore, there would be no cumulative impacts related to ongoing remediation efforts.

Cumulative increases in the use of hazardous materials can result in an increased potential for a spill or release that, in turn, may result in soil or groundwater contamination. The potential for cumulative impacts focuses on cumulative development at LAX, as releases at LAX have the potential to affect the same soil or groundwater media. Such cumulative development includes construction of other projects at LAX, as well as operation of LAX improvements such as the Central Utility Plant (CUP) Replacement Project, the West Maintenance Area, and LAX Northside. The potential for cumulative impacts associated with these projects is addressed below.

There is a potential for cumulative impacts relating to the impairment of the implementation of emergency response activities. Within the airport, there are several substantial cumulative projects within the Central Terminal Area (CTA), including the passenger processor component of the Midfield Satellite Concourse (MSC) Program, CUP Replacement Project, and North Terminals Improvements. As indicated in the

introduction to this chapter, there are also a number of cumulative projects within the local area that would result in increased traffic on local roadways. The potential for cumulative impacts associated with these projects is addressed below.

As described in Section 2.3.7.3, *Hazardous Materials*, of this chapter, hazardous materials use and storage would increase under the LAWA Staff-Recommended Alternative compared to baseline conditions, which could increase the chances of a spill or release of these substances. Compliance with existing regulations and operating procedures, such as LAWA's *Procedure for the Management of Contaminated Materials Encountered During Construction*, would reduce the potential for releases to occur and would minimize the impact of a release were one to occur. Therefore, this impact would be less than significant. Cumulative projects at LAX would be subject to the same regulations and operating procedures. Therefore, cumulative impacts would also be less than significant.

The analysis of on-airport traffic conditions in the CTA provided in Section 2.3.12.1, *On-Airport Transportation*, of this chapter, includes roadway modifications associated with the LAWA Staff-Recommended Alternative as well as changes from the North Terminals Improvements, the MSC passenger processor, and CUP Replacement Project. As indicated in Section 2.3.7.3, *Hazardous Materials*, of this chapter, with implementation of the LAWA Staff-Recommended Alternative and these cumulative projects, traffic within the CTA would operate at acceptable levels of service, and the implementation of emergency response activities would not be impaired. Similarly, the analysis of off-airport traffic in Section 2.3.12.2, *Off-Airport Transportation*, of this chapter, accounts for traffic associated with the LAWA Staff-Recommended Alternative as well as regional growth. Although traffic would increase on off-airport roadways, conditions would by typical of the region. Moreover, there are three fire stations located on the airfield that have direct access to the airport without using off-airport roadways. For those emergency response providers located off-airport, there are multiple alternative routes to reach the airport and the roadway system would continue to operate such that emergency access would continue to be available. Therefore, cumulative impacts associated with emergency response activities would be less than significant.

2.4.8 Hydrology/Water Quality

This section considers the cumulative impacts relative to hydrology/water quality from past, present, and reasonably foreseeable future development projects in combination with the LAWA Staff-Recommended Alternative. The analysis focuses on development projects located in the watersheds within which the SPAS improvements are located (i.e., those projects with the greatest potential to have impacts to hydrology and water quality that could combine with impacts of the LAWA Staff-Recommended Alternative). In particular, the two projects at LAX with the potential to contribute to significant cumulative hydrology impacts are LAX Northside and the West Aircraft Maintenance Area, both of which would convert existing largely vacant land to future urban/airport development. LAX Northside is proposed to include a mix of retail uses, hotels, offices, educational and community facilities, and open space. The development of LAX Northside would result in conversion of largely vacant property to other land uses, such as commercial uses and roads. The West Aircraft Maintenance Area is proposed to be located on a 60-acre site on the west end of the airport. Development of the site would result in a land use conversion from airport open space to airport operations. Other development projects at/adjacent to LAX, as delineated in Figure 5-2 of the SPAS Draft EIR, that occur within the same sub-basins as the SPAS improvements, generally involve smaller improvements on areas that are already developed (i.e., surfaces are already impervious with surface water quality typical of developed/urbanized areas and, therefore, unlikely to change existing hydrology and water quality).

The vast majority of the LAX Northside area is vacant. The future development of urban uses on the site would increase the volumes and velocity of surface runoff due to the addition of impervious surfaces and would change the water quality characteristics within the runoff due to urban activities (e.g., traffic, parking, landscape maintenance, washing of surfaces) and building surfaces (i.e., roof/siding materials). Additionally, construction activities associated with future development within this area would pose the potential for temporary increases in erosion and sedimentation. The hydrology and water quality impacts

from development of LAX Northside would occur within the Argo sub-basin, which drains to the Santa Monica Bay.

The site proposed for the West Aircraft Maintenance Area is generally undeveloped, although portions of the site are paved and used for construction trailers/offices related to various improvement projects at LAX. Development of the West Aircraft Maintenance Area would increase the volumes and velocity of surface runoff due to the addition of impervious surfaces and would change the water quality characteristics within runoff. The change in water quality would occur from the replacement of existing vacant/disturbed ground, which generates mostly sediments and suspended solids within runoff, to aircraft apron/ramp area where aircraft would be parked or taxiing, introducing a source of pollutants such as oils and grease, metals, and particulate matter (e.g., tire particles). The hydrology and water quality impacts associated with implementation of the West Aircraft Maintenance Area project would occur within the Pershing sub-basin which drains to the Santa Monica Bay.

As discussed in Section 2.3.8, *Hydrology/Water Quality*, of this chapter, and shown in Table SRA-2.3.8-1 of this chapter, implementation of the LAWA Staff-Recommended Alternative would result in an increase in impervious surface area and an increase in several types of water quality pollutants, although there would be reductions in total suspended solids, 5-day Biochemical Oxygen Demand (BOD_5), and fecal enterococcus bacteria. Implementation of the LAWA Staff-Recommended Alternative would also result in short-term construction-related water quality impacts such as erosion and sedimentation. The impacts of the LAWA Staff-Recommended Alternative would include both the Argo sub-basin and the Pershing sub-basin. As such, there would be cumulative drainage impacts within the Argo sub-basin area from the combination of LAX Northside development and the LAWA Staff-Recommended Alternative, and cumulative drainage impacts within the Pershing sub-basin area from the combination of the West Aircraft Maintenance Area project and the LAWA Staff-Recommended Alternative (the two sub-basins do not share a common storm drain system, consequently cumulative drainage impacts would only be from the combination of the LAWA Staff-Recommended Alternative and each of the other projects within their respective sub-basins). Cumulative water quality impacts would occur from the combination of all three of the projects given that both affected sub-basins drain to Santa Monica Bay. The combination of these projects would not result in cumulative hydrology or water quality impacts related to the Dominguez Channel because neither LAX Northside or the West Aircraft Maintenance Area project drain to the Dominguez Channel sub-basin.

The LAX Master Plan Final EIR includes LAX Master Plan Commitment HWQ-1, which required preparation of the LAX Conceptual Drainage Plan (CDP) to identify the drainage system improvements and Best Management Practices (BMPs) necessary to avoid significant hydrology and water quality impacts from LAX Master Plan projects. While implementation of the current CDP would serve to mitigate hydrology and water quality impacts from future development within the LAX Master Plan area, within which all three projects - LAX Northside, West Aircraft Maintenance Area, and the LAWA Staff-Recommended Alternative - are located, the overall development characteristics of the combined projects would not be the same as the LAX Master Plan assumed during preparation of the CDP. As such, the cumulative hydrology and water quality impacts of the combined projects are considered to only be partially mitigated through implementation of LAX Master Plan Commitment HWQ-1, Conceptual Drainage Plan, and the remaining impact would be significant without additional mitigation. The contribution of the LAWA Staff-Recommended Alternative to this cumulatively significant impact would be cumulatively considerable.

As discussed in Section 2.3.8.2 of this chapter, Mitigation Measure MM-HWQ (SPAS)-1, Conceptual Drainage Plan Revision and Update, is recommended to revise and update the current CDP to account for changes in the development assumptions of SPAS alternatives, as compared to those of the LAX Master Plan, as well as other existing or proposed improvement projects at LAX. That revision and update of the CDP would serve to achieve the same level of mitigation intended by LAX Master Plan Commitment HWQ-1, that is, to reduce hydrology and water quality impacts to a level that is less than significant. Given that LAX Northside, the West Aircraft Maintenance Area project, and the LAWA Staff-Recommended Alternative would be accounted for through implementation of Mitigation Measure MM-HWQ (SPAS)-1, the cumulative hydrology and water quality impacts of these projects would be less than

significant, and the LAWA Staff-Recommended Alternative would no longer have a cumulatively considerable contribution.

2.4.9 Land Use and Planning

The cumulative analysis for land use and planning incorporates the same significance thresholds presented in Section 4.9, *Land Use and Planning*, of the SPAS Draft EIR, and also considers aircraft noise impacts on future noise-sensitive uses that could be introduced through cumulative project development. Therefore, a significant land use impact would occur if the SPAS alternatives, including the LAWA Staff-Recommended Alternative, in combination with the relevant cumulative projects would: 1) conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect and/or 2) create physical incompatibility with existing and future land uses through increased aircraft noise exposure.

Cumulative projects that are located at or adjacent to LAX are shown in Figure 5-2 of the SPAS Draft EIR. The cumulative projects that are evaluated in this analysis are those that have the potential for combined effects associated with the LAWA Staff-Recommended Alternative where this alternative includes proposed amendments to plans that have the potential for adverse environmental impacts. The LAWA Staff-Recommended Alternative includes changes to the following on-airport and off-airport land use plans/areas: the LAX Plan, LAX Specific Plan, Los Angeles Airport/El Segundo Dunes Specific Plan, City of Los Angeles Transportation Element, and City of Los Angeles 2010 Bicycle Plan. Cumulative projects that are not expected to conflict with these plans or are not expected to have combined physical effects in association with the SPAS land use plan impacts are not evaluated in this analysis. The cumulative projects evaluated in this analysis include the Coastal Dunes Improvement Project, LAX Northside, Metro Crenshaw/LAX Transit Corridor and Station, Airport Metro Connector Project, and the Coastal Dunes Improvement Project.

As described in Section 2.3.9, *Land Use and Planning*, of this chapter, the LAWA Staff-Recommended Alternative is consistent with the Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), SCAG 2012-2012 RTP/SCS Aviation and Ground Access Appendix, and SCAG 2004 Compass Blueprint Growth Vision, in large part because no changes are proposed to the practical capacity of LAX of 78.9 million annual passengers (MAP) and the LAWA Staff-Recommended Alternative otherwise support regional transportation policies. Furthermore, changes proposed under the LAWA Staff-Recommended Alternative are primarily within the existing airport boundary and would not result in changes to land use and development patterns on a regional scale. Therefore, cumulative impacts associated with the LAWA Staff-Recommended Alternative and potential conflicts with SCAG plans are not evaluated further in this analysis.

In addition to evaluation of cumulative impacts associated with consistency with plans, cumulative land use impacts were considered where cumulative projects with noise-sensitive uses are proposed in areas subject to significant aircraft noise exposure due to the LAWA Staff-Recommended Alternative, where incompatible land use could result with development of proposed projects. Cumulative noise impacts on noise-sensitive receptors associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration are analyzed in Section 2.3.10, *Noise*, of this chapter.

Plan Consistency

LAX Plan/LAX Specific Plan

As discussed in Section 2.3.9.1 of this chapter, the LAWA Staff-Recommended Alternative includes proposed amendments to the LAX Plan and LAX Specific Plan to ensure precise consistency with these plans. These amendments include the realignment of Lincoln Boulevard and related conversion of a small portion of LAX Northside (Areas 8 and 9) to Airport Airside rather than the areas' current commercial designation. However, the potential for commercial use on these areas is limited due to the close proximity to the LAX north airfield, and associated noise impacts, safety requirements, and height restrictions. Under the LAX Northside Plan Update, these areas are proposed for Airport Support. The

slight reduction of commercial or airport support uses could be accommodated within other areas of LAX Northside. Also under the LAWA Staff-Recommended Alternative, the relocation of Runway 6L/24R would require changes to navigational aids within the Dunes Specific Plan Area, which is designated as Open Space in the LAX Plan. Since the planned navigational aids would be similar in function and number to the existing facilities, and impacts to biological resources would be fully mitigated through restoration and enhancement of state-designated sensitive habitat (see Section 2.3.3, *Biological Resources*, of this chapter), this use would be consistent with the Open Space designation of the LAX Plan and physical impacts associated with the plan change would be less than significant. Therefore, no conflicts with land use designations would occur, with precise consistency supported through the amendments to the LAX Plan and LAX Specific Plan. As a result, impacts associated with the LAWA Staff-Recommended Alternative would be less than significant.

A cumulative project that would also affect development within the LAX Plan and LAX Specific Plan is LAX Northside. LAX Northside is an approved plan that includes future development of 4.5 million square feet of development consisting of a mix of employment, retail, restaurant, office, hotel, research and development, education, civic, airport support, recreation, and buffer uses that support the needs of surrounding communities and LAWA. Formulation of a new reduced land use development program for the subject area is currently in process as part of the LAX Northside Plan Update, which will be followed by completion of environmental review studies. The LAX Northside area serves as an airport buffer zone (comprised of compatible development and landscape) for the Westchester community and is subject to use restrictions, height restrictions, setback requirements, and landscape requirements to avoid or reduce land use conflicts. The LAX Northside Plan Update currently in process, would include landscaped buffer areas, updated Design Guidelines, and other measures to avoid or reduce land use conflicts. The LAX Northside Plan Update would not affect areas within the Dunes Specific Plan Area.

Improvements proposed under the LAWA Staff-Recommended Alternative would generally not affect the LAX Northside area with the exception of the realignment of Lincoln Boulevard. The roadway realignment would be compatible with both the existing LAX Northside commercial designation and the proposed LAX Northside Plan Update designation of Airport Support. Furthermore, the slight reduction of commercial or airport support uses could be accommodated within other areas of LAX Northside. Therefore, cumulative impacts associated with consistency with the LAX Plan and LAX Specific Plan would be less than significant.

Los Angeles Airport/El Segundo Dunes Specific Plan

As previously described in Section 2.3.9.1 of this chapter, the LAWA Staff-Recommended Alternative would require changes to navigational aids within the Dunes Habitat Preserve, as designated in the Los Angeles Airport/El Segundo Dunes Specific Plan. However, with conditions that would be required for approval of a Coastal Development Permit, and implementation of LAX Master Plan and proposed SPAS mitigation measures described in Section 2.3.3, *Biological Resources*, of this chapter, the LAWA Staff-Recommended Alternative would be consistent with the Los Angeles Airport/El Segundo Dunes Specific Plan, and physical impacts associated with the plan change would be less than significant.

A cumulative project that would also affect development within the Los Angeles Airport/El Segundo Dunes Specific Plan is the Coastal Dunes Improvement Project. However, this project consists of the restoration and improvement of coastal dune habitat located in a 47-acre site in the northern portion of the Dunes. Accordingly, this project would have a beneficial effect on the Dunes.

Based on the above, the LAWA Staff-Recommended Alternative in combination with the Coastal Dunes Improvement Project would not result in significant cumulative impacts on the Dunes due to inconsistencies with the Los Angeles Airport/El Segundo Dunes Specific Plan.

City of Los Angeles Transportation Element

The LAWA Staff-Recommended Alternative would involve ground access improvements, including alterations to the existing circulation system. These improvements would be consistent with Policy 5.4 of the Transportation Element to establish ground access plans to guide future development of LAX. With

amendments to the City of Los Angeles Transportation Element to ensure precise consistency, impacts related to conflicts with plans and regulations would be less than significant.

Two cumulative projects that would also affect access to LAX are the Metro Crenshaw/LAX Transit Corridor and Station and the Airport Metro Connector Project. The Metro Crenshaw/LAX Transit Corridor and Station project includes an 8.5-mile light-rail transit line that would connect the existing Metro Green Line and the Metro Expo Line. Near LAX, the alignment would be located along Aviation Boulevard and a station is proposed near the intersection of Century Boulevard and Aviation Boulevard. The Metro Crenshaw/LAX Transit Corridor and Station would be consistent with policies of the City of Los Angeles Transportation Element to provide high capacity transit service and extend transit service along priority corridors.[97] The Airport Metro Connector Project would connect the Metro Rail System to LAX. Options under consideration include Light Rail Transit, APM, and Bus Rapid Transit along a number of different alignments. The Airport Metro Connector Project would also be consistent with the same policies of the City of Los Angeles Transportation Element as described above for the Metro Crenshaw/LAX Transit Corridor and Station.

Ground access improvements proposed under the LAWA Staff-Recommended Alternative in combination with the Metro Crenshaw/LAX Transit Corridor and Station and Airport Metro Connector Project would involve coordination between Metro and LAWA and would result in overall improved access to LAX. Furthermore, amendments to the Transportation Element in association with the LAWA Staff-Recommended Alternative and the cumulative projects would ensure precise consistency with the plan. Therefore, cumulative impacts associated with the City of Los Angeles Transportation Element would be less than significant.

City of Los Angeles 2010 Bicycle Plan

The LAWA Staff-Recommended Alternative, would include the realignment of Lincoln Boulevard, identified as a future Backbone Bikeway Network, and therefore would include proposed amendments to the 2010 Bicycle Plan to ensure precise consistency. With implementation of LAX Master Plan Commitment LU-5, Comply with City of Los Angeles Transportation Element Bicycle Plan, and an amendment to the City of Los Angeles 2010 Bicycle Plan, the LAWA Staff-Recommended Alternative would be consistent with the 2010 Bicycle Plan and impacts related to conflicts with plans and regulations would be less than significant.

Various cumulative projects shown in Figure 5-2 and listed in Table 5-2 of the SPAS Draft EIR have the potential to affect existing and proposed bicycle networks. Cumulative projects requiring discretionary review would be reviewed at a project-specific level for compliance with the 2010 Bicycle Plan and mitigation measures would be imposed, as needed, to ensure that adequate bicycle facilities are provided. Therefore, changes to the bicycle networks that could occur with the development of cumulative projects would be less than significant.

In light of cumulative project requirements for consistency with the 2010 Bicycle Plan and the potential for associated mitigation requirements, and with implementation of LAX Master Plan Commitment LU-5 under the LAWA Staff-Recommended Alternative, cumulative impacts associated with the City of Los Angeles Bicycle Plan would be less than significant.

Aircraft Noise Exposure

Cumulative noise impacts on noise-sensitive uses associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration are analyzed in Section 2.3.10, *Noise*, of this chapter. As described in Section 2.3.10.1 of this chapter, the aircraft noise impacts analysis completed for the SPAS EIR accounts for present aircraft operations at LAX (i.e., baseline [2009] conditions) and reasonably foreseeable future aircraft operations at LAX (i.e., future [2025] conditions).

[97] U.S. Department of Transportation, Federal Transit Administration and Los Angeles County Metropolitan Transportation Authority (Metro), Crenshaw/LAX Transit Corridor Project Final Environmental Impact Report/Environmental Impact Statement, August 2011.

As also indicated in that discussion, implementation of the LAWA Staff-Recommended Alternative would result in significant aircraft noise impacts to noise-sensitive uses around the airport. These impacts can be reduced through implementation of LAX Master Plan commitments and mitigation measures, compliance with Title 24 requirements, and review of certain projects located within the airport influence area by the Airport Land Use Commission (ALUC) for compliance with the Los Angeles County Airport Land Use Plan (ALUP) but interim impacts prior to implementation of mitigation measures or certain residential uses with outdoor private habitable areas or parks that are newly exposed to outdoor noise levels of 75 CNEL or higher would be significant and unavoidable. In light of such impacts, implementation of the LAWA Staff-Recommended Alternative would have a cumulatively considerable contribution to significant future aircraft noise impacts on existing and potential future noise-sensitive uses within the 65 CNEL and higher noise contours.

2.4.10 Noise

The following addresses the potential for cumulative impacts associated with aircraft noise, road traffic noise, construction traffic and equipment noise, and transit noise and vibration. The cumulative impacts analysis also takes into consideration past, present, and reasonably foreseeable future projects specific to each of those four types of noise sources and also addresses the project's contribution to potential cumulative impacts from those four types of noise sources combined (i.e., the potential for noise-sensitive receptors to be impacted from project-related increases in aircraft noise, road traffic noise, transit noise, and the possibility of project-related construction equipment and traffic noise overlapping with project-related increases in operational noise). Some of the individual resource sections have already provided cumulative analyses. See Section 4.10.1.2 of the SPAS Draft EIR and Section 2.3.10.1 of this chapter (Aircraft Noise) and Section 4.10.2.2 of the SPAS Draft EIR and Section 2.3.10.2 of this chapter (Road Traffic Noise) for additional discussion of cumulative methodology and conclusions, respectively. Cumulative construction traffic and equipment noise impacts are evaluated separately for the LAWA Staff-Recommended Alternative, taking into consideration the construction activities and locations associated with the LAWA Staff-Recommended Alternative.

2.4.10.1 Aircraft Noise

The potential for cumulative aircraft noise impacts is defined primarily by past, present, and reasonably foreseeable future operations at LAX. Although there are other airports in the nearby area, such as Hawthorne Municipal Airport approximately five miles southeast of LAX and Compton Airport approximately ten miles southeast of LAX, they are primarily small municipal airports with relatively few daily operations compared to LAX and flight paths separate from the primary arrivals and departure routes for LAX. Commercial airports, such as Bob Hope International Airport approximately 20 miles northeast of LAX and Long Beach International Airport approximately 15 miles southeast of LAX, have higher daily operations than the aforementioned local airports and may share some of the same regulated air space routes as operations at LAX; however, such common use of regulated air space would occur at higher altitudes that would not contribute appreciably to cumulative noise levels on the ground in the vicinity of LAX.

The aircraft noise impacts analysis presented in Section 2.3.10.1, *Aircraft Noise*, of this chapter, accounts for present operations at LAX (i.e., baseline [2009] conditions) and reasonably foreseeable future operations at LAX (i.e., future [2025] conditions). In general, aircraft noise conditions have improved over the past two decades at most major airports in the U.S. with the federally-mandated phase-out of older noisier (FAR Part 36 Stage 2) aircraft.

As indicated in Section 2.3.10.1.3 of this chapter, implementation of the LAWA Staff-Recommended Alternative would result in significant aircraft noise impacts at buildout in 2025, compared to baseline conditions. Although LAX Master Plan Commitment N-1 and LAX Master Plan Mitigation Measure MM-N-4 would reduce aircraft noise impacts, they cannot fully mitigate the noise impacts associated with implementation of the LAWA Staff-Recommended Alternative. Further, no other operational noise abatement measures are available to fully mitigate the noise impacts of the LAWA Staff-Recommended

Alternative. Based on the above, implementation of the LAWA Staff-Recommended Alternative would have a cumulatively considerable contribution to significant future aircraft noise impacts.

Regarding classroom disruption impacts, as described in Section 2.3.10.1.3 of this chapter, LAX Master Plan Mitigation Measure MM-LU-1, Implement Revised Aircraft Noise Mitigation Program, would incorporate all eligible dwellings and non-residential noise-sensitive facilities, including schools, that are newly exposed to noise levels 65 CNEL or higher into the Aircraft Noise Mitigation Program (ANMP) to mitigate the significant noise impacts associated with the LAWA Staff-Recommended Alternative. Further, LAX Master Plan Mitigation Measures MM-LU-3, Conduct Study of the Relationship Between Aircraft Noise Levels and the Ability of Children to Learn, and MM-LU-4, Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise, would ultimately serve to mitigate adverse noise impacts on schools as a result of the LAWA Staff-Recommended Alternative. Because the noise-related land use mitigation measures would take several years to fully implement, it is possible that significant noise impacts related to classroom disruption would be experienced in the area after implementation of the LAWA Staff-Recommended Alternative but before the mitigation measures are fully implemented. Based on the above, implementation of the LAWA Staff-Recommended Alternative would have an interim cumulatively considerable contribution to significant future classroom disruption.

Regarding nighttime awakenings, as discussed in Section 2.3.10.1, *Aircraft Noise*, of this chapter, the LAWA Staff-Recommended Alternative would not result in a substantial increase in the probability of nighttime awakenings under the project level and cumulative analyses; therefore, the impact would be less than significant and the project's contribution to cumulative impacts would not be cumulatively considerable (i.e., less than significant).

2.4.10.2 Road Traffic Noise

The analysis of road traffic noise impacts presented in Section 2.3.10.2, *Road Traffic Noise*, of this chapter, includes traffic from past, present, and reasonably foreseeable future projects in the region under future (2025) conditions, including regional growth projections from the Southern California Association of Governments (SCAG). As indicated below in **Table SRA-2.4.10.2-1** the contribution of SPAS-related traffic impacts to future cumulative road traffic noise levels at each noise-sensitive receptor location would be less than 3 dBA. As such, the LAWA Staff-Recommended Alternative would not result in a cumulatively considerable contribution to future cumulative road traffic noise.

Table SRA-2.4.10.2-1

Contribution of the LAWA Staff-Recommended Alternative to Future (2025) Road Traffic Noise Levels

	dBA CNEL Future (2025)

2.4.10.3 Construction Traffic and Equipment Noise

The following analysis of cumulative impacts focuses on construction equipment noise associated with development projects at/adjacent to LAX and the LAWA Staff-Recommended Alternative. There is not sufficient information at this conceptual level of planning to estimate the construction schedules, construction traffic trip generation, or trip distribution associated with the various development projects, including the LAWA Staff-Recommended Alternative. Notwithstanding, it is considered unlikely that the nature, location, and timing of the various construction projects would coincide such that traffic volumes on the nearby arterial roadways and highways would double or triple resulting in significant construction traffic noise impacts. As described in Section 2.3.10.3.1 of this chapter, even using very conservative assumptions regarding construction-related traffic generation and distribution for a recent major development project at LAX (i.e., the Bradley West Project), the traffic volumes on nearby arterial roadways and freeways would not double or triple. It would be speculative at this conceptual level of planning to estimate the nature, timing, and construction traffic characteristics of major improvements projects particular to the LAWA Staff-Recommended Alternative along with the nature, timing, and construction traffic characteristics of other development projects that may occur between now and 2025, such that a specific combination of projects would result in a doubling or tripling of traffic on specific roadways in the airport vicinity. Regarding increases in road traffic noise associated with regional growth anticipated to occur by 2025, please see Section 4.10.2, *Road Traffic Noise*, of the SPAS Draft EIR.

The geographic scope of analysis for cumulative construction equipment noise impacts generally encompasses the land uses immediately north, east, and south of the airport; specifically, the southern edges of Playa del Rey and Westchester, the northeastern edges of Inglewood and Lennox, and the northern edges of Del Aire and El Segundo. Such areas contain noise-sensitive uses that could be exposed to combined construction equipment noise from local development projects and from improvements proposed under the LAWA Staff-Recommended Alternative. The nature and location of specific noise-sensitive uses within these areas, as well as existing exterior ambient noise levels in those areas, are described in Section 4.10.3.3 of the SPAS Draft EIR (construction noise - existing conditions). Section 4.10.3.2 of the SPAS Draft EIR, (construction noise analysis methodology) describes the

assumptions and approach used to estimate a daily CNEL noise level of 89 dBA at 50 feet for overall construction activity, which, in turn, was used to estimate construction-related increases in existing exterior ambient noise levels at the nearest noise-sensitive use. An increase of 5 dBA in the existing exterior ambient noise level from construction traffic and equipment noise is defined as being a significant impact.[98]

The local development projects considered in the cumulative construction equipment noise analysis are shown in Figure 5-2, of the SPAS Draft EIR. Although the general characteristics of these projects are known, specifics regarding the proposed construction program for each project have not yet been defined. That is also the case for the LAWA Staff-Recommended Alternative. As such, the cumulative construction equipment noise analysis presented below is based on the general location of each project, the aforementioned 89 dBA CNEL at 50 feet assumed for all projects unless otherwise stated, a sound attenuation rate of -4.5 dBA per doubling of distance, no intervening topography or noise barriers unless specifically stated, and an existing exterior ambient noise level of approximately 65 dBA CNEL for all of the nearby noise-sensitive area, except for Playa del Rey, which is estimated to be approximately 68 dBA CNEL. Additionally, in evaluating combined construction equipment noise levels, the analysis below includes a conservative assumption that construction timing of future development projects coincides with that of the LAWA Staff-Recommended Alternative improvements in the nearby area. Local development projects that have been completed, such as the South Airfield Improvement Project, Crossfield Taxiway Project, and Westchester Golf Course Three-Hole Restoration Project, would not contribute to cumulative construction equipment noise impacts with the LAWA Staff-Recommended Alternative and are therefore not further addressed below.

Cumulative projects with the potential to affect noise-sensitive uses in Playa del Rey and Westchester include the Coastal Dunes Improvement Project, the City of Los Angeles Bureau of Sanitation Stormwater Infiltration and Treatment Facility, and LAX Northside, along with the airfield improvements proposed under the LAWA Staff-Recommended Alternative. Other future projects at LAX, such as the completion of the Bradley West Project, the Midfield Satellite Concourse and associated taxiways, and North Terminals Improvements, would occur over 3,000 feet away from noise-sensitive uses in Westchester and are unlikely to contribute to cumulatively significant construction equipment noise impacts in conjunction with the LAWA Staff-Recommended Alternative.

The combined construction equipment noise levels associated with the Coastal Dunes Improvement Project and the LAWA Staff-Recommended Alternative airfield improvements nearby, specifically, the relocation of runway navigational aids, would not result in significant cumulative construction equipment noise impacts to residences in Playa del Rey, based on the distances between source and receptor and the nature of construction equipment likely to be used for both projects. Based on an estimated 86 dBA at 50 feet for construction equipment noise for both projects (i.e., neither project would require a full mix of heavy construction equipment that might otherwise produce an overall noise level of 89 dBA at 50 feet), the combined noise level at the nearest residential uses in Playa del Rey from the relocation of navigational aids under the LAWA Staff-Recommended Alternative (approximately 1,300 feet away) and the Coastal Dunes Improvement Project (approximately 750 feet away) would increase the existing exterior ambient noise level by 4.1 dBA CNEL, which would be less than significant. Additional noise contribution from the development and use of Construction Staging Area A could also occur; however, based on its distance and location (i.e., is not in direct line-of-sight from the nearest residences in Playa del Rey due to an intervening hill on the northwest corner of Pershing Drive and Westchester Parkway), the combined noise level with the other two projects described above would still result in the increase in existing exterior ambient noise level being less than 5 dBA CNEL (i.e., estimated to be approximately 4.8 dBA increase).

[98] As explained in Section 2.3.10.3.1, the construction equipment noise impacts analysis focuses on the potential for a 5 dBA increase in the existing ambient exterior noise level measured in terms of CNEL. Although the threshold of significance for construction noise also recognizes a 5 dBA increase in ambient noise levels during certain evening and nighttime hours as being significant, the analysis of the impacts to 24-hour CNEL values is considered more conservative.

Relative to cumulative construction noise impacts to Saint Bernard High School, residential uses along the southern edge of Westchester, and the Park West Apartments northwest of Lincoln Boulevard south of La Tijera, all three areas would be significantly impacted by airfield-related improvements and construction staging area use under the LAWA Staff-Recommended Alternative. Construction equipment noise from other nearby projects, such as the Stormwater Infiltration and Treatment Facility and LAX Northside, would add to that significant impact. The contribution of the LAWA Staff-Recommended Alternative to the impact would be cumulatively considerable.

With regard to the residential uses along 88th Street between Liberator Avenue and Sepulveda Westway, these uses are not expected to be significantly impacted by airfield-related improvements and construction staging area use under the LAWA Staff-Recommended Alternative, based on the nature and location of activities occurring under the LAWA Staff-Recommended Alternative and the presence of an existing noise wall along the north side of 88th Street. Construction activities associated with LAX Northside would result in temporary significant noise impacts to those residences, particularly if multi-story structures are developed nearby (i.e., construction activities could occur above the heights of the existing noise wall). The contribution of the LAWA Staff-Recommended Alternative to such an impact would not exceed the significance threshold and would not be cumulatively considerable.

Within Belford and Manchester Square, potential cumulative construction equipment noise impacts would occur from construction of the Metro Crenshaw/LAX Transit Corridor and Station and the Airport Metro Connector Project (depending on the selected alignment) in combination with ground access improvements associated with the LAWA Staff-Recommended Alternative including the Intermodal Transportation Facility (ITF) and the APM system. Additionally, use of Belford and Manchester Square as construction staging sites and also future development of new uses within those two areas would further contribute to cumulative impacts. Existing noise-sensitive uses in Belford and Manchester Square, if still present when the LAWA Staff-Recommended Alternative is implemented, would be significantly impacted by ground access improvements proposed under the LAWA Staff-Recommended Alternative and by construction staging area use. Construction equipment noise from the other local development projects described above would add to that significant impact. The contribution of the LAWA Staff-Recommended Alternative to the impact would be cumulatively considerable.

The Animo Leadership Charter High School located near the northeast corner of Arbor Vitae Street and Aviation Boulevard[99] would be subject to significant cumulative construction equipment noise impacts from development of ground access improvements associated with the LAWA Staff-Recommended Alternative, specifically, the CONRAC and parking within Manchester Square, the use of Manchester Square for construction staging, and the development of the Metro Crenshaw/LAX Transit Corridor. Given the proximity of Manchester Square to the subject school site and the fact that the LAWA Staff-Recommended Alternative would alone result in a significant construction equipment noise impact at the school site, the contribution of the LAWA Staff-Recommended Alternative to the overall combined significant construction noise impact would be cumulatively considerable.

With regard to construction equipment noise impacts to residential uses in Inglewood, development of the CONRAC and parking in Manchester Square, as well as construction staging activities associated with the LAWA Staff-Recommended Alternative would generate noise; however, based on the presence of the I-405 Freeway and associated noise wall between the two subject areas, no significant construction equipment noise impacts to Inglewood are expected to occur. For that same reason, plus the fact that the nearest other local development projects - the Metro Crenshaw/LAX Transit Corridor and Station and the Airport Metro Connector Project - are located approximately 3,000 feet away from that residential area

[99] At the publication time of the Notice of Preparation for the SPAS Draft EIR, October 2010 (i.e., the baseline year for the EIR impacts analysis), the Animo Leadership Charter High School was located at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square. This school, however, has subsequently moved to a new location in Lennox, approximately 2.5 miles from the current site (see http://www.dailybreeze.com/news/ci_21358340/animo-leadership-has-new-lennox-campus-and-new, accessed on December 10, 2012). In order to provide a consistent basis of comparison, the impacts discussion for the LAWA Staff-Recommended Alternative contained herein assumes the location of the Animo Leadership Charter High School to be at its former location at the northeast corner of Aviation Boulevard and Arbor Vitae Street, across from Manchester Square.

of Inglewood (i.e., 89 dBA at 50 feet would attenuate to 62.3 dBA over that distance), a significant cumulative construction equipment noise impact to Inglewood is not expected to occur.

With regard to residential uses within Del Aire, the development and use of Continental City for construction staging under the LAWA Staff-Recommended Alternative, and development of the Metro Crenshaw/LAX Transit Corridor and Station would result in cumulative construction equipment noise impacts to that community. The cumulative noise impact is anticipated to increase existing exterior ambient noise levels in the residential area by more than 5 dBA, consequently resulting in a significant cumulative impact. The contribution of the LAWA Staff-Recommended Alternative to that impact is not anticipated to be cumulatively considerable, based on the relative distance of Continental City from the community compared to the proximity of the Metro Crenshaw/LAX Transit Corridor (i.e., approximately 800 feet for the former and approximately 250 feet for the latter) and the differences in work area elevations (i.e., portions of the Metro Crenshaw/LAX Transit Corridor and Station improvements would occur at elevations above, and near to, the residences, which Continental City would be at-grade with residences, consequently enabling the intervening noise wall to provide some level of noise attenuation between the construction staging area and the residences).

2.4.10.4 Transit Noise and Vibration

The only past, present, or reasonably foreseeable future projects posing the potential to result in a cumulative transit noise and vibration impact would be the combination of the transit improvements proposed under the LAWA Staff-Recommended Alternative (specifically, the APM system), the recently approved Metro Crenshaw/LAX Transit Corridor and Station, and the proposed Airport Metro Connector Project (depending on the selected alignment). The geographic scope of the cumulative transit noise and vibration impacts analysis is based on the impact screening distances set forth by the Federal Transit Administration's (FTA's) *Transit Noise and Vibration Impact Assessment*[100] relative to Category 2 land uses, which, in this case, are the hotel uses in the general vicinity of Century Boulevard and 98th Street. For light rail transit projects in the vicinity of Category 2 uses, the FTA screening distance for transit noise impacts is 175 feet and for transit vibration impacts is 150 feet.

The approved Metro Crenshaw/LAX Transit Corridor will extend south from the existing Metro Exposition Line at Crenshaw and Exposition Boulevards approximately 8.5 miles to a proposed station near Century Boulevard and Aviation Boulevard. In the vicinity of LAX, the alignment of the proposed line will extend along the east side of Aviation Boulevard north of Century Boulevard. Based on Table 4-15 in the Final EIS/EIR for the Metro Crenshaw/LAX Transit Corridor,[101] the operational noise level associated with the system near Century Boulevard and Aviation Boulevard would be 60 dBA L_{dn} at a distance of 123 feet from the line trackwork.

Overall, there would be no cumulative transit noise and vibration impacts from the combination of the Metro Crenshaw/LAX Transit Corridor and the LAWA Staff-Recommended Alternative.

The Airport Metro Connector Project is proposed to extend into the LAX Central Terminal Area (CTA). The Airport Metro Connector Project is still in the early stages of conceptual planning and the range of alternatives, including system design choices (i.e., bus rapid transit, APM, light-rail) and route alignments, to be further investigated and advanced to the EIS and EIR has not been determined. It would be speculative at this time to attempt to quantify potential noise and vibration impacts from the Airport Metro Connector Project, as they may combine with the noise and vibration impacts of the LAWA Staff-Recommended Alternative addressed in Section 4.10.4, *Transit Noise and Vibration*, of the SPAS Draft EIR. Additionally, it would be speculative to estimate and account for how the SPAS transit options, addressed in Section 4.10.4, *Transit Noise and Vibration*, of the SPAS Draft EIR, might change in design and operation if the Airport Metro Connector Project is operating on a shared or parallel corridor. As

---

101 Los Angeles County Metropolitan Transportation Authority, Crenshaw/LAX Transit Corridor Final Environmental Impact Statement/Final Environmental Impact Report, August 2011.

such, it is considered too speculative to draw conclusions at this time regarding cumulative noise and vibration impacts from the combination of the Airport Metro Connector Project and the LAWA Staff-Recommended Alternative.

2.4.11 Public Services

2.4.11.1 Fire Protection

The types of development projects at or adjacent to LAX that have the potential to result in cumulative impacts on fire protection include various airside, terminal, land development, infrastructure, security, and transportation projects. These types of projects are further described below. The geographic area of analysis includes nearby areas that may be served by the same fire response resources that serve LAX, including the communities of Playa del Rey, Loyola Village, and Vista del Mar, the Manchester Square area, and portions of Westchester and Dockweiler State Beach.

The LAWA Staff-Recommended Alternative would alter demands for fire protection services. Many of the components of the LAWA Staff-Recommended Alternative, such as airfield and ground access improvements, would enhance safety and efficiency at the airport, thereby decreasing the potential need for fire and emergency response. However, development of new terminal areas and new ground access facilities would increase demand for fire protection services. Implementation of LAX Master Plan Commitments FP-1, PS-1, PS-2, C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 and ongoing regulatory compliance would ensure that impacts relative to fire and emergency services would be less than significant.

Cumulative on-airport projects that are independent from SPAS include airfield safety and terminal improvements, installation of security fencing and lighting, construction of the Airport Response Coordination Center (ARCC) and the LAX Public Safety Building and Supporting Facilities, LAX Northside, and various fire system, infrastructure, electrical, and Americans with Disabilities Act (ADA) upgrades. Many of the cumulative projects, including those related to maintenance, signage, and infrastructure upgrades, would have no impact on fire protection. Other projects, such as the Airfield Operating Area (AOA) Perimeter Fence Enhancements and the ARCC, would improve overall safety at the airport and reduce the potential demand for fire and emergency response. On-airport cumulative projects that would increase passenger-serving areas, provide new maintenance or cargo facilities, or add new development, such as the Bradley West Project, Midfield Satellite Concourse (MSC), North and South Terminals Improvements, West Maintenance Area, and LAX Northside, in combination with the LAWA Staff-Recommended Alternative, have the potential to increase demand for fire and emergency services. The majority of projects that would contribute to this cumulative impact are related to the LAX Master Plan, and would be subject to LAX Master Plan commitments and regulatory requirements that would ensure that cumulative impacts from airport-related development would be less than significant. The LAX Northside project would also add new development that would have the potential to increase demand for fire and emergency services. The LAX Northside project would be reviewed through standard City processes to ensure compliance with the Uniform Fire Code, Los Angeles Fire Code, City of Los Angeles General Plan Fire Prevention Plan, and other applicable Los Angeles Fire Department (LAFD) requirements. In addition, measures that address fire protection are incorporated in the development requirements for the LAX Northside Sub-Area in the LAX Specific Plan. With implementation of these conditions, fulfillment of LAX Master Plan commitments, and the recent relocation and expansion of Station 5, the potential impacts of the LAX Northside project on levels of fire protection services would be less than significant. With implementation of LAX Master Plan commitments, regulatory requirements, past improvements in fire protection facilities, and planned upgrades such as the LAX Public Safety Building and Supporting Facilities, cumulative impacts associated with airport-related development would be less than significant.

Regarding cumulative off-airport projects, the development of the Metro Crenshaw/LAX Transit Corridor Project and the Airport Metro Connector would introduce new rail systems in the airport vicinity and within the CTA, with a corresponding potential increase in demand for fire and emergency services. However, Metro would be responsible for implementing System Safety Program Plans and System Security Plans

for Metro projects, which would address the safety and security of transit commuter operations, mitigate accidents, and support compliance with state regulations.[102] These safety measures have been established to provide employee and passenger safety, crime prevention, adequate emergency response, and emergency procedures. In addition, the proposed stations would be designed to promote pedestrian safety and would be adequately lit and monitored by security personnel.

The Metro Crenshaw/LAX Transit Corridor would have a beneficial effect on the regional transportation network compared to existing conditions.[103] Although the Airport Metro Connector Project is currently being studied with various alternatives under consideration, it is also expected to have a beneficial effect on the regional transportation network. This reduced traffic congestion would reduce the potential for degradation of response times adjacent to LAX. In addition, the removal of remaining residences within the Manchester Square and Belford areas through implementation of LAWA's residential acquisition program would reduce the overall demand for fire protection services in the LAX area.

In light of past and planned improvements to airport-related fire protection facilities, LAX Master Plan commitments, project-specific mitigation measures, design features, and regulatory compliance, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not restrict emergency access, increase response times, or extend station response distances beyond the standards maintained by the agencies serving LAX and the surrounding communities. Moreover, cumulative development would not result in the need for a new fire station or the expansion, consolidation, or relocation of an existing facility to maintain adequate service levels. Therefore, cumulative impacts on fire protection services under the LAWA Staff-Recommended Alternative would be less than significant.

2.4.11.2 Law Enforcement

The types of development projects at or adjacent to LAX that have the potential to result in cumulative impacts on law enforcement include various airside, terminal, land development, infrastructure, security, and transportation projects. These types of projects are further described below.

The LAWA Staff-Recommended Alternative would alter demand for law enforcement services. Many of the components of the LAWA Staff-Recommended Alternative, such as airfield and ground access improvements, would enhance safety at the airport and improve response times, thereby reducing demand for law enforcement services. However, development of new terminal areas and new ground access facilities would increase demand for law enforcement services. Implementation of LAX Master Plan Commitments LE-1, LE-2, PS-1, PS-2, C-1, ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would ensure that impacts to law enforcement services, facilities, and response times would be less than significant in most instances. The removal of the Los Angeles World Airports Police Division (LAWAPD) station and associated facilities on West 96th Street would result in a significant impact to law enforcement if the planned LAX Public Safety Building and Supporting Facilities is not completed prior to removal of these facilities. SPAS Mitigation Measure MM-LE (SPAS)-1, LAWAPD Replacement Facilities, would ensure that adequate law enforcement facilities are maintained. Therefore, impacts to law enforcement services and facilities would be less than significant.

Cumulative on-airport projects that are independent from SPAS include airfield and terminal safety improvements, installation of security fencing and lighting, construction of the Airport Response Coordination Center (ARCC) and the LAX Public Safety Building and Supporting Facilities, LAX Northside, and various other safety, infrastructure, and security upgrades. Many of the cumulative projects, including those related to maintenance, signage, and infrastructure upgrades, would have no impact on law enforcement. Other projects, such as the Airfield Operating Area (AOA) Perimeter Fence

---

102 U.S. Department of Transportation, Federal Transit Administration and Los Angeles County Metropolitan Transportation Authority (Metro), Crenshaw/LAX Transit Corridor Project Final Environmental Impact Report/Environmental Impact Statement, August 2011, p. 4-267 and p. F-65.

103 U.S. Department of Transportation, Federal Transit Administration and Los Angeles County Metropolitan Transportation Authority (Metro), Crenshaw/LAX Transit Corridor Project Final Environmental Impact Report/Environmental Impact Statement, August 2011, p. 3-37.

Enhancements and the ARCC, would improve overall safety at the airport and reduce the potential demand for law enforcement services and facilities. In particular, the LAX Public Safety Building and Supporting Facilities would consolidate existing facilities and personnel under one roof, creating a larger, more modern and efficient facility that would result in an improvement and expansion of LAWAPD facilities. The new facility would be sited to ensure that adequate response times are maintained. On-airport cumulative projects that would increase passenger-serving areas, provide new maintenance or cargo facilities, or add new development, such as the Bradley West Project, Midfield Satellite Concourse (MSC), North and South Terminals Improvements, West Maintenance Area, and LAX Northside, in combination with the LAWA Staff-Recommended Alternative, have the potential to increase demands for law enforcement services. The majority of projects that would contribute to this cumulative impact are related to the LAX Master Plan, and would be subject to LAX Master Plan commitments and regulatory requirements that would ensure that cumulative impacts from airport-related development would be less than significant. The LAX Northside project would also add new development that would have the potential to increase demand for law enforcement services. With review of project plans by LAWAPD and Los Angeles Police Department (LAPD), implementation of the security features referenced in the development requirements for the LAX Northside Sub-Area in the LAX Specific Plan, provision of a police station within the area, and fulfillment of LAX Master Plan commitments, impacts on law enforcement services associated with LAX Northside would be less than significant. With implementation of LAX Master Plan commitments, regulatory requirements, and planned upgrades such as the LAX Public Safety Building and Supporting Facilities, cumulative impacts associated with airport-related development would be less than significant.

Regarding cumulative off-airport projects, the development of the Metro Crenshaw/LAX Transit Corridor Project and Airport Metro Connector Project would introduce new rail systems in the airport vicinity and within the CTA, with a corresponding potential increase in demand for law enforcement services. However, Metro would be responsible for implementing System Safety Program Plans and System Security Plans for Metro projects, which would address the safety and security of transit commuter operations, mitigate accidents, and support compliance with state regulations.[104] These safety measures have been established to provide employee and passenger safety, crime prevention, adequate emergency response, and emergency procedures. In addition, the proposed stations would be designed to avoid obstructions to visibility or observation and would be adequately lit and monitored by security personnel.

The Metro Crenshaw/LAX Transit Corridor would have a beneficial effect on the regional transportation network compared to existing conditions.[105] Although the Airport Metro Connector Project is currently being studied with various alternatives under consideration, it is also expected to have a beneficial effect on the regional transportation network. This reduced traffic congestion would reduce the potential for degradation of response times adjacent to LAX. In addition, the removal of remaining residences within the Manchester Square and Belford areas through implementation of LAWA's residential acquisition program would reduce the overall demand for law enforcement services in the LAX area.

In light of planned improvements to law enforcement facilities, LAX Master Plan commitments, SPAS and project-specific mitigation measures, design features, and regulatory compliance, improvements under the LAWA Staff-Recommended Alternative in combination with cumulative projects would not require a substantial increase in law enforcement services to maintain adequate services or require new or expanded facilities without providing adequate mechanisms for addressing these additional needs. Moreover, cumulative development would not increase emergency response times beyond the limits required by applicable jurisdictions. Therefore, cumulative impacts on law enforcement services under the LAWA Staff-Recommended Alternative would be less than significant.

2.4.12 Transportation

2.4.12.1 On-Airport Transportation

Cumulative impacts to on-airport transportation are incorporated into the analysis provided in Section 2.3.12.1, *On-Airport Transportation*, of this chapter. More specifically, the contributions of the LAWA Staff-Recommended Alternative to cumulative impacts were determined based on a comparison between Future (2025) With Alternative traffic conditions and Future (2025) Without Alternative traffic conditions. Please see Section 4.12.1 of the SPAS Draft EIR for a discussion of the methodology used in the analysis of cumulative on-airport transportation impacts, determination as to whether the contribution of each SPAS alternative, including the LAWA Staff-Recommended Alternative, to significant cumulative impacts would be considerable, and mitigation proposed to address cumulatively considerable contributions.

2.4.12.2 Off-Airport Transportation

Cumulative impacts to off-airport transportation are incorporated into the analysis provided in Section 2.3.12.2, *Off-airport Transportation*, of this chapter. More specifically, the contributions of the LAWA Staff-Recommended Alternative to cumulative impacts were determined based on a comparison between Future (2025) With Alternative traffic conditions and Future (2025) Without Alternative traffic conditions. Please see Section 4.12.2 of the SPAS Draft EIR for a discussion of the methodology used in the analysis of cumulative off-airport transportation impacts, determination as to whether the contribution of each SPAS alternative, including the LAWA Staff-Recommended Alternative, to significant cumulative impacts would be considerable, and mitigation proposed to address cumulatively considerable contributions.

2.4.13 Utilities

2.4.13.1 Energy

This section addresses potential cumulative impacts to energy supply associated with the LAWA Staff-Recommended Alternative, in combination with other past, present, and probable future projects. As discussed in Section 4.13.1.3 of the SPAS Draft EIR, electricity and natural gas consumption at LAX results from a number of activities, including space heating and cooling, airfield and terminal lighting, food preparation, and office functions. Energy is also used indirectly in the delivery, treatment, and distribution of water used at LAX and the treatment of wastewater generated by airport-related activities. Transportation-related fuel consumption includes aviation fuel (i.e., Jet A) for aircraft, as well as gasoline, diesel, and alternative fuels for on- and off-airport vehicles, construction, and ground support equipment (GSE).

Within LAX, the projects that would contribute to cumulative energy use are the Midfield Satellite Concourse (MSC) Program, LAX Northside, Bradley West Project, North Terminals Improvements, and the LAX Public Safety Building and Supporting Facilities. The regional analysis for electricity is based on future projections of electricity demand and supply from the City of Los Angeles' *Power Integrated Resource Plan*.[106] The regional analysis for natural gas is based on future projections of natural gas demand and supply from the annual *California Gas Report*, prepared by the state's natural gas utilities.[107] Cumulative impacts pertaining to petroleum fuel products consider Southern California Association of Governments (SCAG) regional projections, national demands, and the world's projected oil supply.[108,109]

---

106 City of Los Angeles, Department of Water and Power, Power Integrated Resource Plan, December 11, 2011, Available: http://www.lapowerplan.org/.

107 The California Gas and Electric Utilities, 2010 California Gas Report, 2010, Available: http://www.socalgas.com/regulatory/cgr.shtml.

108 Southern California Association of Governments, 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy, April 2012.

City and regional electricity and natural gas supply planning programs would ensure adequate energy supply for projected cumulative growth within the City of Los Angeles through the year 2025. As indicated in Section 2.3.13.1, *Energy*, of this chapter, existing energy supplies of electricity, natural gas, and transportation-related fuels are considered to be adequate, with sufficient supplies to meet the future energy needs of LAX.[110,111,112]

Electricity and Natural Gas

Under the LAWA Staff-Recommended Alternative, demand for electricity and natural gas would increase due to new passenger-related facilities and energy use associated with water supply and wastewater treatment. Implementation of LAX Master Plan commitments, adherence to LAWA's *Sustainability Plan*, and compliance with federal policies and state requirements pertaining to energy efficiency would increase the energy efficiency of the proposed buildings. Measures aimed at increasing water conservation would decrease indirect consumption of electricity. As indicated in Section 2.3.13.1, *Energy*, of this chapter, existing and projected supplies of electricity and natural gas are expected to be sufficient to accommodate demand, including demand associated with the LAWA Staff-Recommended Alternative.

As indicated above, the projects at LAX that would contribute to cumulative electricity and natural gas use are the MSC, LAX Northside, Bradley West Project, North Terminals Improvements, and LAX Public Safety Building and Supporting Facilities. Cumulative development in the region would also increase electricity and natural gas demand. New buildings would be required to meet energy consumption standards prescribed for new structures in Title 24. New development at LAX would have the added requirement to comply with LAWA's *Sustainability Plan*, including the goal that all new buildings at LAX meet Leadership in Energy and Environmental Design (LEED®) Silver or higher standards. With compliance with these standards, cumulative development would be more energy efficient than buildings built previously. As a result, cumulative projects would not result in a wasteful, inefficient, or unnecessary consumption of electricity or natural gas.

As noted in Section 2.3.13.1, *Energy*, of this chapter, electricity consumption within the City of Los Angeles Department of Water and Power's (LADWP) service area is projected to increase marginally through 2030, with an annual growth rate of approximately 1.1 percent.[113] Regional natural gas demand is projected to contract at an average annual rate of approximately 0.2 percent through 2030.[114] LADWP and the Southern California Gas Company have sufficient supplies of electricity and natural gas, respectively, to meet existing and future demands. Therefore, cumulative impacts related to electricity and natural gas consumption would be less than significant.

Transportation-Related Fuel

Passenger activity levels at LAX are forecasted to be 78.9 million annual passengers (MAP) by 2025 as a result of projected natural growth. The increase in passenger activity, and related aircraft operations, is expected to occur with or without implementation of this alternative. Projected increased passenger demand and aircraft operations at LAX would result in increased consumption of transportation-related fuels associated with aircraft, on- and off-airport vehicle trips, and GSE. The increased fuel demand

114 The California Gas and Electric Utilities, 2010 California Gas Report, 2010, Available: http://www.socalgas.com/regulatory/cgr.shtml.

would be partially offset by increasingly higher vehicle fleet fuel efficiency. Construction activities associated with the LAWA Staff-Recommended Alternative would also increase fuel consumption. As indicated in Section 2.3.13.1, *Energy*, of this chapter, petroleum product supplies, including all forms of transportation-related fuels, are anticipated to be adequate well beyond 2025.[115] Therefore, the impact associated with an increase in fuel consumption under the LAWA Staff-Recommended Alternative would be less than significant.

Cumulative development at LAX and in the region would also contribute to increased demand for transportation-related fuels. As indicated above, since adequate supplies of these fuels are anticipated to be available well beyond 2025, the cumulative impact of increased fuel consumption would be less than significant.

2.4.13.2 Solid Waste

Current projections indicate that, under current conditions, existing solid waste disposal facilities will not be able to accommodate daily disposal demands in 2025.[116] Many landfills in the urbanized portions of the County of Los Angeles are at or near capacity, resulting in a need to transport waste to less urban areas of the region, or outside the region. Pursuant to Assembly Bill 939, the *2010 Annual Report on the Countywide Summary Plan and Countywide Siting Element* provided an analysis of nine scenarios to assist the County in meeting projected future disposal demands. These scenarios range from maintaining the status quo (i.e., no new landfills or expansions of existing landfills in the County) to scenarios in which the County successfully permits and develops all in-County landfill expansions; expands transfer and processing infrastructure; studies, promotes, and develops conversion technologies; develops a waste-by-rail system; and maximizes waste reduction and recycling.[117] The report concludes that six of the scenarios have the potential to meet the projected future daily disposal demand through the 15-year planning period (through 2025). Currently, extensions are being sought at several landfills, and the County of Los Angeles is pursuing development of a waste-by-rail system outside the County. Notwithstanding these plans, the ability of the County to meet future disposal demands is uncertain.

The following LAX Master Plan mitigation measure has been adopted by LAWA to reduce cumulative solid waste impacts:

- **MM-SW-1. Provide Landfill Capacity.**

  Additional landfill capacity in the Los Angeles region should be provided through the siting of new landfills, the expansion of existing landfills, or the extension of permits for existing facilities. As an alternative, or to augment regional landfill capacity, landfill capacity outside the region could be accessed by developing the necessary rail haul infrastructure. The responsibility for implementing this mitigation measure lies with state, county, and local solid waste planning authorities. The costs for implementing this mitigation measure will be passed on to LAX and other solid waste generators through increase solid waste disposal costs.

Passenger activity levels at LAX are forecasted to be 78.9 million annual passengers (MAP) by 2025 as a result of natural growth. The increase in passenger activity is expected to occur with or without implementation of the LAWA Staff-Recommended Alternative. Projected increased passenger demand at LAX, in conjunction with other regional projects and population growth, would result in cumulative increases to municipal solid waste generation within the Los Angeles region. Although the Sunshine Canyon Landfill has the existing physical and permitted capacity to accept solid waste beyond the SPAS planning horizon, and several landfills are scheduled to remain open during this timeframe, future regional

---

115 California Energy Commission, Transportation Energy Forecasts and Analysis for the 2009 Integrated Energy Policy Report, May 2010.

116 County of Los Angeles, Department of Public Works, 2010 Annual Report on the Countywide Summary Plan and Countywide Siting Element, October 2011.

117 County of Los Angeles, Department of Public Works, 2010 Annual Report on the Countywide Summary Plan and Countywide Siting Element, October 2011.

solid waste disposal capacity to meet projected demand in Los Angeles County is not assured. As a result, impacts associated with cumulative increases in municipal solid waste generation would be significant and LAX's contribution to these impacts would be cumulatively considerable.

Cumulative impacts from population growth could be mitigated though implementation of LAX Master Plan Mitigation Measure MM-SW-1, Provide Landfill Capacity. Implementation of this mitigation measure is the responsibility of another agency (or agencies). If this mitigation measure is not fully implemented, cumulative impacts associated with solid waste generation and disposal would remain significant, and LAX's contribution would remain cumulatively considerable.

2.4.13.3 Wastewater Generation

The cumulative impacts analysis pertaining to wastewater generation considers the entire Hyperion Service Area (HSA), which includes the Hyperion Treatment Plant (HTP), Donald C. Tillman Water Reclamation Plant (DCTWRP), and Los Angeles-Glendale Water Reclamation Plant (LAGWRP). Within LAX, the projects that would contribute to cumulative wastewater generation are the Midfield Satellite Concourse (MSC) Program, LAX Northside, Bradley West Project, North Terminals Improvements, and the LAX Public Safety Building and Supporting Facilities. Building areas associated with these projects are consistent with the LAX Master Plan and, therefore, with the 2012 SCAG projections, which are considered by the Los Angeles Department of Water and Power (LADWP) in their wastewater planning, including their *Integrated Resources Plan* (IRP)[118] updates. The regional analysis is based on future projections of wastewater generation associated with the IRP as well as trendlines based on the Southern California Association of Governments (SCAG) 2008 *Regional Transportation Plan* (RTP), which projects the same future passenger activity level at LAX as SCAG's Draft 2012-2035 RTP/Sustainable Communities Strategy.[119]

The City's planning horizon for wastewater facilities is 2020. Projections of future flows within this horizon are provided in Figure 4.13.3-1 of the SPAS Draft EIR. As indicated in the *IRP 5-Year Review Draft Documents for Stakeholder Review* (5-Year Review) and illustrated in the figure, with implementation of the IRP, the City expects to have sufficient capacity to treat wastewater flows within the HSA through 2020 and beyond.[120] The IRP also anticipates sufficient future capacity at HTP. The plant, with a design capacity of 450 million gallons per day (mgd), had wastewater flows of 299 mgd[121] in 2010, leaving an available capacity of 151 mgd. Currently there are no plans to expand the design capacity of HTP before 2025.[122]

Under the LAWA Staff-Recommended Alternative, wastewater generation from passenger-related facilities would be 0.12 mgd in 2025. This would represent less than 0.03 percent of HTP's wastewater design capacity (450 mgd), which would not be significant compared to the existing available capacity at HTP. Moreover, as discussed in Section 2.3.13.3, *Wastewater Generation*, of this chapter, SCAG and HSA flow trendlines indicate that the HSA would have sufficient capacity to handle projected wastewater flows in 2025, including flows associated with the LAWA Staff-Recommended Alternative.

As noted in Section 2.3.13.3, *Wastewater Generation*, of this chapter, implementation of the IRP would provide sufficient capacity to treat projected wastewater flows within the HSA, including flows from

118 City of Los Angeles, Department of Public Works, Bureau of Sanitation and Department of Water and Power, IRP 5-Year Review Draft Documents for Stakeholder Review, January 2012, Available: http://www.lacitysan.org/irp/documents/I5R_DRAFT_Documents-v2.pdf, accessed March 7, 2012.

119 SCAG recently adopted the 2012-2035 RTP/SCS, however, the 2012-2035 RTP/SCS does not include projections of wastewater generation. The 2012-2035 RTP/SCS projects a lower future regional population than did the 2008 RTP; therefore, the trendline based on the 2008 RTP is likely conservative.

120 City of Los Angeles, Department of Public Works, Bureau of Sanitation and Department of Water and Power, IRP 5-Year Review Draft Documents for Stakeholder Review, January 2012, Available: http://www.lacitysan.org/irp/documents/I5R_DRAFT_Documents-v2.pdf, accessed March 7, 2012.

121 Patel, Dipak, Process Engineer, Hyperion Service Plant, Personal Communication, April 23, 2012.

122 City of Los Angeles, Department of Public Works, Bureau of Sanitation and Department of Water and Power, IRP 5-Year Review Draft Documents for Stakeholder Review, January 2012, Available: http://www.lacitysan.org/irp/documents/I5R_DRAFT_Documents-v2.pdf, accessed March 7, 2012.

cumulative growth, through the City's 2020 planning horizon for wastewater facilities. As shown in Figure 4.13.3-1 of the SPAS Draft EIR, if the SCAG and HSA wastewater flow trendlines continue beyond 2020, the HSA would have sufficient capacity to handle projected wastewater flows in 2025, including flows associated with the LAWA Staff-Recommended Alternative, other cumulative projects at LAX, and cumulative growth in the service area. As it is reasonably foreseeable that wastewater treatment capacity would be sufficient to handle cumulative wastewater flows, the cumulative impacts of wastewater generation would be less than significant.

2.4.13.4 Water Supply

The cumulative impacts analysis pertaining to water demand and supply considers the entire Los Angeles Department of Water and Power (LADWP) service area. Within LAX, the projects that would contribute to cumulative water use are the Midfield Satellite Concourse (MSC) Program, LAX Northside, Bradley West Project, North Terminals Improvements, and the LAX Public Safety Building and Supporting Facilities. The regional analysis is based on future projections of demand and supply in LADWP's 2010 Urban Water Management Plan (UWMP)[123] and the projected growth in urbanization (i.e., population, households, and employment) within the region contained in the Southern California Association of Governments' (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).[124]

As described in Section 2.3.13.4, *Water Supply*, of this chapter, water demand from passenger-related facilities under the LAWA Staff-Recommended Alternative would be 134.06 acre-feet per year (AF/yr) in 2025. This would represent less than 0.02 percent of anticipated LADWP water demand in 2025 (675,600 AF).[125] The UWMP accounts for future activity levels that are consistent with activity levels under the LAWA Staff-Recommended Alternative. In addition, and as indicated in Section 2.3.13.4, *Water Supply*, of this chapter, the conclusions of a Water Supply Assessment (WSA) prepared for the LAX Master Plan, which found that adequate water supplies will be available for the project, are still valid because passenger activity at LAX in 2025 would be 78.9 million annual passengers (MAP), the same activity level assumed in the WSA.

As indicated above, projects at LAX with the potential for cumulative impacts include the MSC, LAX Northside, Bradley West Project, North Terminals Improvements, and the LAX Public Safety Building and Supporting Facilities. Building areas associated with these improvements, and projected LAX activity level of 78.9 MAP, were included in the WSA prepared for the LAX Master Plan; hence, cumulative water demand at LAX has been considered by LADWP and is accounted for in the 2010 UWMP. As indicated in Section 4.13.4, *Water Supply*, of the SPAS Draft EIR, according to the 2010 UWMP, citywide water supply planning programs will ensure adequate water supply for projected cumulative growth within the City of Los Angeles through the year 2035. The 2010 UWMP water supply projections are based on the 2008 RTP population projections. Subsequent to adoption of the 2010 UWMP, SCAG adopted the 2012-2035 RTP/SCS, which projects a decrease in population growth compared to the SCAG 2008 RTP projections. Therefore, the 2010 UWMP water supply projections remain valid and the City will have sufficient water supplies through 2035. As a result, impacts associated with cumulative increases in water demand would be less significant.

2.5 Summary of Impacts and Mitigation Measures Related to the LAWA Staff-Recommended Alternative

Table SRA-2.5-1 summarizes the environmental impacts after mitigation of the LAWA Staff-Recommended Alternative as identified in Section 2.3 of this chapter. Impacts associated with implementation of the LAWA Staff-Recommended Alternative include those directly associated with proposed physical improvements (e.g., impacts to biological resources that would occur from grading activities, impacts to aesthetics, views, light, and glare that would occur from development of new structures or modification of existing structures). Impacts associated with implementation of the LAWA Staff-Recommended Alternative also include those associated with proposed or anticipated changes in airport operations (e.g., noise impacts, air pollutant emissions from aircraft operations, traffic impacts from vehicles traveling to and from the airport). The majority of the operations-related impacts summarized in this section, and more fully addressed in Sections 2.3 and 2.4 of this chapter, are primarily attributable to future growth in aircraft and passenger activity levels at LAX that are projected to occur independent of the LAWA Staff-Recommended Alternative. The SPAS Draft EIR analyzes and identifies mitigation for such impacts even though they are attributable to future growth not related to the proposed project.

Specifically, the impacts analyses completed for the SPAS project include an evaluation of conditions projected to occur upon completion (buildout) of the LAWA Staff-Recommended Alternative compared to conditions that existed at the time the Notice of Preparation (NOP) for the Draft EIR was published (i.e., existing baseline conditions). The analyses of operations-related impacts, such as those pertaining to air quality, noise, and traffic, account for the growth in activity projected to occur between 2009 (56.5 MAP and 1,493 average daily aircraft operations [landings and takeoffs combined]) and 2025 (78.9 MAP and 1,937 average daily aircraft operations).[126] This 30 to 40 percent increase in aircraft and passenger activity at LAX is projected to occur regardless of SPAS (i.e., would occur even if none of the SPAS alternatives were implemented). The SPAS Draft EIR analysis evaluates how the improvements specific to each alternative would interact with that projected growth and delineates the differences, or the similarities, in impacts between alternatives.

As indicated in **Table SRA-2.5-1**, impacts are anticipated to be less than significant after mitigation for the LAWA Staff-Recommended Alternative relative to most environmental topics. Unavoidable significant impacts are expected to occur for the LAWA Staff-Recommended Alternative relative to air quality, greenhouse gas emissions, human health risk, aircraft noise, construction equipment noise, on-airport surface transportation, and off-airport surface transportation. With the exception of construction equipment noise impacts, the vast majority of the unavoidable significant impacts that occur under the LAWA Staff-Recommended Alternative are primarily attributable to the projected growth in airport activity. **Table SRA-2.5-2** provides additional summary information regarding the nature and extent of the unavoidable significant impacts associated with the LAWA Staff-Recommended Alternative, including as related to the projected growth in airport activity.

Table SRA-2.5-3 provides specific references to the applicable LAX Master Plan Commitments and mitigation measures, as well as new mitigation measures that are proposed to reduce or avoid environmental impacts associated with the LAWA Staff-Recommended Alternative, including mitigation measures that address cumulative impacts. The full text of such measures and commitments are

[126] The future passenger activity for LAX that is addressed within this SPAS Final EIR for buildout of the LAWA Staff-Recommended Alternative in 2025 is 78.9 MAP, which is consistent with the regional growth projections in the adopted 2012 SCAG Regional Transportation Plan and the fact that all of the SPAS alternatives, including the LAWA Staff-Recommended Alternative, include (i) no more than 153 gates and (ii) the amendment of LAX Specific Plan Section 7.H requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. The passenger activity level for LAX under baseline (2009) conditions within this EIR is 56.5 MAP.

provided in the respective environmental topic sections in Chapter 4 of the SPAS Draft EIR and Section 2.3 of this chapter.[127]

[127] Please see Section 5.5.7.2.10 of the SPAS Draft EIR for the full text of SPAS Mitigation Measure MM-SAF (SPAS)-1, FAR Part 77 Review, which addresses the cumulatively considerable contribution of the LAWA Staff-Recommended Alternative to impacts to aviation safety from building/structural penetrations of FAR Part 77 imaginary surfaces.

Table SRA-2.5-2

Summary Comparison of Unavoidable Significant Impacts - LAWA Staff-Recommended Alternative

Topic	Basis of Comparison	Impacts Associated With the SRA Value
Air Quality		
Construction-Related Emissions	CO (Threshold = 550 lbs/day)	1,514
	VOC (Threshold = 75 lbs/day)	313
	NO_x (Threshold = 100 lbs/day)	3,683
	PM10 (Threshold = 150 lbs/day)	1,711
	PM2.5 (Threshold = 55 lbs/day)	263
Construction-Related Concentrations	NO_2 - 1-Hour CAAQS (Threshold = 339 µg/m^3)	1,192
	NO_2 - 1-Hour NAAQS (Threshold = 188 µg/m^3)	964
	PM10 - 24-Hour (Threshold = 10.4 µg/m^3)	41
	PM10 - Annual (Threshold = 1.0 µg/m^3)	4
Operations-Related Emissions[2]	SO_2 (Threshold = 150 lbs day)	**893 to 1,036**
	PM10 (Threshold = 150 lbs/day)	**2,510 to 2,519**
	PM2.5 (Threshold = 55 lbs/day)	**149 to 157**
Operations-Related Concentrations[2]	NO_2 - 1-Hour CAAQS (Threshold = 339 µg/m^3)	**553 to 863[3]**
	NO_2 - 1-Hour NAAQS (Threshold = 188 µg/m^3)	**279 to 313[3]**
	PM10 - 24-Hour (Threshold = 2.5 µg/m^3)	**2.3 to 2.4[3]**
	PM10 - Annual (Threshold = 1.0 µg/m^3)	**1.2[3]**
Greenhouse Gas Emissions	Reduction in per capita GHG emissions at project buildout compared to baseline conditions (Threshold = Minimum of 16% reduction)	14.73%
Human Health Risk	Acute Non-Cancer Hazard Index for Overall Off-Airport Receptors Relative to Acrolein From Aircraft Compared to Baseline (2009) Conditions (Threshold = 1.0)	3.0
Aircraft Noise Exposure	Population Newly Exposed to 65≥ CNEL in 2025 Compared to Baseline (2009) Conditions	**13,160**
	Homes Newly Exposed to 65≥ CNEL in 2025 Compared to Baseline (2009) Conditions	**4,370**
Construction Noise	Types of construction activities posing potential for temporary significant noise impacts to sensitive receptors nearby, including airfield improvements (AI), ground access improvements (GAI), and use of construction staging areas (CSA)	AI, GAI, CSA
On-Airport Transportation	Number of on-airport facilities (i.e., CTA curbsides, intersections, or roadway links) significantly impacted in 2025 with no feasible mitigation available	**1 (Intersection of World Way South and Center Way)**
Off-Airport Transportation	Number of off-airport facilities (i.e., intersections and CMP facilities) significantly impacted relative to Baseline (2010 and no airport growth) conditions with no feasible mitigation available	2 (Intersections)

Table SRA-2.5-2

Summary Comparison of Unavoidable Significant Impacts - LAWA Staff-Recommended Alternative

Topic	Basis of Comparison	Impacts Associated With the SRA Value
	Number of off-airport facilities (i.e., intersections and CMP facilities) significantly impacted relative to Future (2025 with airport growth) conditions with no feasible mitigation available	**46 (42 Intersections and 4 CMP Facilities)**

[1] Impacts identified in **Bold** type are primarily attributable to future growth in airport activity that will occur regardless of the LAWA Staff-Recommended Alternative. Also, relative to off-airport transportation, significant impacts are primarily the result of the combination of increased airport activity levels and increased regional background traffic projected to occur by 2025.

[2] The ranges of emissions and concentrations shown for each alternative are based on the analysis of aircraft-related emissions and concentrations that accounted for differences in airfield activities under different weather/visibility conditions. The low end of the range typically represents good visibility with less spacing required between aircraft, and the high end of the emission range typically represents poor weather conditions with greater spacing between aircraft and more ground delay time - see Tables SRA-2.3.2-4, SRA-2.3.2-6, and SRA-2.3.2-7 in Section 2.3.2, *Air Quality*.

[3] The project increment for the LAWA Staff-Recommended Alternative is just under the significance threshold. Given that the peak daily concentrations for all other alternatives are higher than the threshold, and that there is a very small margin between the peak daily concentration for the LAWA Staff-Recommended Alternative and the threshold, the lead agency is identifying the PM2.5 project concentration as significant.

[1] LAWA and the LAX Coalition for Economic, Environmental and Educational Justice (LAX Coalition) have developed and entered into an agreement, the Community Benefits Agreement (CBA), to ensure that communities adversely affected by the LAX Master Plan Program also receive benefits as a result of implementation of the Program. The benefits and mitigations included in the CBA were negotiated independently from, and are not a part of, the LAX Master Plan Mitigation Monitoring and Reporting Program. The CBA contains a number of air quality mitigation measures, of which Sections X.A., X.F., X.K., X.L., X.M., and X.N. are applicable to SPAS.

[2] This measure would reduce the cumulatively considerable contribution to impacts to aviation safety from building/structural penetrations of FAR Part 77 imaginary surfaces.

[3] This measure would address cumulatively significant impacts associated with solid waste generation and disposal.

3. PROPOSED AMENDMENTS TO RELATED PLANNING DOCUMENTS

Section 6.1 of the SPAS Draft EIR included a preliminary identification of the potential LAX Specific Plan amendments associated with the SPAS alternatives. Section 6.2 of the SPAS Draft EIR provided an evaluation of potential environmental impacts associated with those amendments. Section 6.2 also included a discussion of potential impacts associated with the combination of the potential amendments to LAX Specific Plan Section 7.H and the physical improvements proposed under the SPAS alternatives. That analysis considers, in particular, whether the impacts associated with the SPAS alternatives, as addressed in detail in Chapters 4 and 5 of the SPAS Draft EIR, would be materially different in light of the potential shift in aircraft and passenger activity from LAX to other airports in the region. Provided below in Section 3.1 is a reiteration of those proposed amendments to the LAX Specific Plan, including minor updates and clarifications identified during preparation of the SPAS Final EIR. Those minor modifications do not affect the environmental evaluation presented in Section 6.2 of the SPAS Draft EIR.

Section 3.2, below, provides amendments to the LAX Plan, a component of the City of Los Angeles General Plan, that would be proposed to achieve consistency with the LAX Specific Plan, as amended. Included within the description of the LAX Plan amendments is an environmental evaluation explaining that the amendments are largely administrative in nature and either would not result in any environmental impacts or would not result in environmental impacts beyond those already described in the SPAS Draft EIR.

3.1 Proposed LAX Specific Plan Amendments

3.1.1 Revision of LAX Specific Plan Section 7.H.

Proposed Amendments

In conjunction with potential LAX Specific Plan amendments arising from the physical and operational configurations of SPAS Alternatives 1 through 9, described in Section 3.1.2 below, the following amendments, applicable to all SPAS alternatives, would revise existing LAX Specific Plan Section 7.H to (a) delete Specific Plan Amendment Study requirements satisfied by this LAX Specific Plan Amendment Study and (b) add a Passenger and Airline Market survey and study requirement when the annual aviation activity analysis required in LAX Specific Plan Subsection 7.G(1) forecasts that passengers at LAX for that year are anticipated to exceed 75 million.

LAX Specific Plan Section 7.H (as previously amended by Ordinance No. 179,148) currently requires LAWA to initiate an LAX Specific Plan Amendment Study in three circumstances. It states:

> "H. Specific Plan Amendment Study. LAWA shall initiate a complete LAX Specific Plan Amendment Study comprehensively addressing security, traffic, aviation activity and corresponding environmental analysis consistent with CEQA, in the following three circumstances:
>
> 1. Prior to seeking an LAX Plan Compliance determination for any one of the following projects:
>
> (a) Development of the Ground Transportation Center, including baggage tunnel, associated structures and equipment;
>
> (b) APM 2 from GTC to CTA, including its stations and related facilities and equipment;
>
> (c) Demolition of CTA Terminals 1, 2 and 3;
>
> (d) North Runway re-configuration as contemplated in the Master Plan, including center taxiways; and
>
> (e) On-site road improvements associated only with (a) and (b) above.

2. If the annual traffic generation report required in Subsection G.1 above, and/or the annual traffic generation report considered together with any project-specific traffic study, shows that any Master Plan Projects will be generating net new airport peak hour Trips in excess of 8,236 (unless the total Trips for that year are related to construction or phasing impacts).

3. If the annual aviation activity analysis required in Subsection G.1 above forecasts that the annual passengers for that year are anticipated to exceed 78.9 million."

LAWA's current Specific Plan Amendment Study satisfies Subsection 7.H(1). Subsection 7.H(1) and related text would, therefore, be deleted. The remaining triggers to conduct a specific plan amendment study (currently contained in Subsections 7.H(2) and 7.H(3)) would be renumbered and the introductory text correspondingly revised and folded into a newly formatted Subsection 7.H(1) titled "Specific Plan Amendment Study." A new subsection -- 7.H(2) -- would be inserted requiring LAWA to initiate a Domestic Passenger and Airline Market Survey and Study triggered upon LAX reaching 75 million annual passengers (MAP).[128]

The revised Section 7.H would state:

"H. Additional Study Requirements.

1. Specific Plan Amendment Study. LAWA shall initiate a Specific Plan Amendment Study with corresponding environmental analysis in compliance with CEQA, in the following two circumstances:

   (a) If the annual traffic generation report required in Section G.1 above, and/or the annual traffic generation report considered together with any project-specific traffic study, shows that any Master Plan Projects will be generating net new airport peak hour Trips in excess of 8,236 (unless the total Trips for that year are related to construction or phasing impacts).

   (b) If the annual aviation activity analysis required in Section G.1 above forecasts that the annual passengers for that year are anticipated to exceed 78.9 million.

2. LAX Domestic Passenger and Airline Market Survey/Study. LAWA shall initiate an LAX Domestic Passenger Survey/Study and corresponding Airline Survey/Study, if the annual aviation activity analysis required in Section G.1 above forecasts that the annual passengers for that year are anticipated to exceed 75 million.

   (a) LAX Domestic Passenger Survey and Study. LAWA shall conduct a survey and study of LAX domestic passengers (those passengers not flying internationally or connecting to international flights) designed to identify, at a minimum, (i) those LAX domestic passengers with origination or destination locations closer to other commercial airports in the region, (ii) why those domestic passengers chose to fly out of, or into, LAX rather than another commercial airport closer to their location of origin or destination, and (iii) what actions, consistent with federal, state and local laws, LAWA could take to encourage those domestic passengers to use an airport closer to their location of origin or destination for domestic flights.

   (b) Airline Survey and Study. Upon completion of the LAX Domestic Passenger Survey and Study described in 2(a) above, LAWA shall conduct a survey and study of Airlines then serving the Southern California commercial air travel market designed to identify what action(s), consistent with federal, state and local laws, LAWA could take to encourage

[128] This 75 million annual passenger trigger reflects the Passenger Gate Reduction trigger set forth in Stipulated Settlement Section IV. C. It states, "LAWA need not reduce the number of passenger gates at LAX down to 153 by 2015 if either (1) the total passenger operations at LAX are below 75 million annual passengers or (2) the LAX Master Plan Program is substantially revised pursuant to the LAX Specific Plan Amendment Process such that the total number of gates is reduced to 153 or less." As discussed herein, all SPAS alternatives currently contemplate a total of no more than 153 gates.

those airlines to provide increased Domestic service at other airports in the region, particularly those owned or operated by LAWA."

3.1.2 Other LAX Specific Plan Amendments

Development of any of the potential SPAS alternatives would require various administrative amendments to the LAX Specific Plan. These amendments would be necessary to ensure precise consistency from a land use and zoning perspective. Following is a summary of the potential amendments organized by sections within the LAX Specific Plan. The exact language of the amendments would be determined during the land use entitlement process for SPAS, and reviewed and approved by various decision-making bodies, including the Los Angeles City Council.

Section 1. Establishment of the LAX Specific Plan

No amendments are anticipated to be required to this section.

Section 2. Purposes

No amendments are anticipated to be required to this section.

Section 3. Relationship to the Los Angeles Municipal Code and Other Ordinances

This section would be revised, as necessary, to ensure that the Los Angeles Municipal Code references are consistent with the current Municipal Code. Any outdated references would be corrected accordingly. Also, any new Municipal Code requirements that have become effective since the LAX Specific Plan was adopted in December of 2004, but which are not applicable to airport use or development, would be included and acknowledged as such. These amendments would occur under all nine SPAS alternatives.

Section 4. Application of Specific Plan to Development in Specific Plan Area

No amendments are anticipated to be required to this section.

Section 5. Definitions

This section would be revised to remove definitions for those facilities and improvements that are no longer planned as part of the various SPAS alternatives and add definitions for new facilities and improvements proposed under the various SPAS alternatives. The nature and extent of improvements associated with each alternative would determine the precise amendments that are required. The definitions of the Ground Transportation Center (GTC) and Intermodal Transportation Center (ITC), as well as all references to these facilities in other definitions, would be deleted under all SPAS alternatives except Alternative 3. The Automated People Mover (APM) System would be redefined under all alternatives except Alternative 3. The APM would be redefined under Alternative 9 to accurately describe the route to and from the affected facilities. The APM would be redefined under Alternatives 1, 2, 4, 5, 6, 7, and 8 to include only that segment of the APM planned between the Central Terminal Area (CTA), the Tom Bradley International Terminal, and West Satellite Concourse,[129] as other segments would no longer be implemented under these alternatives. The CTA would be redefined under all SPAS alternatives except Alternative 3, as it would no longer be a true transition point to and from landside facilities as envisioned under the approved LAX Master Plan. The Consolidated Rental Car Facility (CONRAC) would also be redefined under all SPAS alternatives except Alternative 3, as it may no longer include security screening. A new definition would be added for the Intermodal Transportation Facility (ITF) under Alternatives 1, 2, 8, and 9. A definition for the dedicated busway may be added, if determined necessary, under Alternatives 1, 2, and 8. Lastly, the West Satellite Concourse would be re-named the Midfield Satellite Concourse.

Section 6. Safety of Airport Operations

No amendments are anticipated to be required to this section.

[129] The West Satellite Concourse was subsequently renamed the Midfield Satellite Concourse.

Section 7. LAX Plan Compliance Review

This section would be revised, as necessary, to ensure that the Los Angeles Municipal Code references are consistent with the current Municipal Code. Subsections 7.F(2)(d), 7.F(4), and 7.F(5) would be revised to incorporate references to any applicable mitigation measures identified in any subsequent environmental review. Subsection 7.F(5) would be revised to delete the reference to Subsection 7.H(1), as this section would be revised as noted above. Subsection 7.G(3) would be deleted, as this requirement will have been completed as part of the LAX Specific Plan Amendment Study. Subsection 7.H(1), which outlines the requirement for initiation of a Specific Plan Amendment Study prior to seeking approval for any Yellow Light project, would be revised as discussed above. Section 7.I would be deleted due to the fact that LAWA already has in place a Design and Construction Handbook, dated May 2012, which establishes broad design and construction guidelines for all infrastructure, terminal buildings, renovations, and other facilities. These amendments would occur under all nine SPAS alternatives.

Subsection 7.F(3)(b) would also be revised to delete the references to the GTC and ITC under all SPAS alternatives except Alternative 3.

Section 8. Land Use

No amendments are anticipated to be required to this section.

Section 9. Airport Airside Sub-Area

This section would be revised, as necessary, to incorporate any uses currently relevant to the airport or anticipated under the SPAS alternatives, but which are not already included in the list of permitted uses. These amendments would occur under all SPAS alternatives except for Alternative 3.

Section 10. Airport Landside Sub-Area

This section would be revised, as necessary, to incorporate any uses currently relevant to the airport or anticipated under the SPAS alternatives, but which are not already included in the list of permitted uses. These amendments would occur under all SPAS alternatives except for Alternative 3.

Section 11. LAX Northside Sub-Area

No amendments are anticipated to be required to this section.

Section 12. Transportation Regulations

Subsection 12.A(1) would be revised, as necessary, to ensure that the list of major and secondary highways in the LAX Specific Plan area are consistent with the current street designations in the City of Los Angeles General Plan. Any streets no longer designated as major or secondary highways would be deleted from the list and any streets within the LAX Specific Plan area that have been designated as major or secondary highways since the LAX Specific Plan was originally adopted would be added to the list. These amendments would occur under all nine SPAS alternatives.

The first paragraph of Section 12.D would also be deleted under Alternatives 1, 2, 4, 5, 6, 7, and 8, as it pertains to the interface between the APM and public roadways, and this condition no longer exists under these alternatives. Alternatively, under Alternatives 1, 2, and 8, language regarding the APM may be substituted with that appropriate to the dedicated busway in order to address the interface of the dedicated busway with public roadways.

Section 13. Parking Regulations

Subsection 13.A(1) would be revised to state the maximum number of off-street parking spaces that would be provided under the various SPAS alternatives. The exact number stated would depend on the alternative, however, it is anticipated that this amendment would be required under all alternatives except Alternative 3.

Section 14. Sign Regulations

This section would be revised, as necessary, to ensure that the Los Angeles Municipal Code references are consistent with the current Municipal Code.

Section 15. Severability

No amendments are anticipated to be required to this section.

Appendix A

No amendments are anticipated to be required to this appendix.

Map 1

This map would be revised to reflect the current boundary of the airport, as well as any changes to the boundary that may occur as a result of a SPAS alternative, including any property proposed for acquisition under that alternative. It is the intent that the LAX Specific Plan boundary include all property owned by Los Angeles World Airports with the exception of the Los Angeles Airport/El Segundo Dunes Specific Plan Area and the Belford Special Study Area. No amendment to this map would be required under Alternative 3. Amendments to this map under Alternatives 1, 2, 8, and 9 would include, but are not limited to, the removal of a portion of the property currently within the LAX Specific Plan area between 96th and 98th Streets and between Sepulveda Boulevard and east of Vicksburg Avenue; the southeast corner of Sepulveda Boulevard and 98th Street; the northwest and southwest corners of Manchester Square; between Century Boulevard and approximately 104th Street east of Aviation Boulevard; and north of Imperial Highway between Aviation Boulevard and Hindry Avenue. Under Alternative 4, property at the southeast corner of Sepulveda Boulevard and 98th Street; within Manchester Square; between Century Boulevard and approximately 104th Street east of Aviation Boulevard; and north of Imperial Highway between Aviation Boulevard and Hindry Avenue would be removed. This map would also be amended under Alternatives 1, 5, and 6 to reflect the realignment of Lincoln Boulevard (including the connector streets between Lincoln Boulevard and Westchester Parkway).

Map 2

This map would be revised to be consistent with the LAX Specific Plan boundary shown on Map 1, as may be amended as described above. This map would also be amended under Alternatives 1, 5, and 6 to reflect the realignment of Lincoln Boulevard (including the connector streets between Lincoln Boulevard and Westchester Parkway).

Map 3

No amendments are anticipated to be required to this map.

3.2 Proposed LAX Plan Amendments

Should the potential LAX Specific Plan amendments identified above in Section 3.1 be adopted by the City of Los Angeles, various administrative amendments would also be required to the LAX Plan, the City's General Plan element for LAX. These amendments would be necessary to ensure precise consistency from a land use and policy perspective. Following is a summary of the potential amendments organized by sections within the LAX Plan. The exact language of the amendments would be determined during the land use entitlement process for SPAS, and reviewed and approved by various decision-making bodies, including the Los Angeles City Council. No amendments are anticipated to be required under Alternative 3, as this alternative represents the improvements originally envisioned under the LAX Master Plan and that Master Plan formed the basis of the existing LAX Plan. Also provided below, following the description of potential amendments to each section of the LAX Plan, is an explanation of how the subject amendments are administrative in nature and either would not result in any environmental impacts or would result in impacts that are addressed in the SPAS Draft EIR.

Section 1. Purpose of the Plan

Subsection 1.2 of the LAX Plan would be revised to reflect more current passenger and air cargo statistics for LAX, as well as passenger demand projections for both LAX and the region. This subsection may also be revised to acknowledge that the SPAS process was undertaken by the City to identify potential alternative designs, technologies, and configurations for the Master Plan program, with the focus continuing to be on the modernization and improvement of LAX in a manner that limits capacity, enhances safety and security, minimizes environmental impacts on the surrounding communities, and creates conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA. These amendments would occur under all SPAS alternatives except Alternative 3.

Environmental Evaluation

The updating of airport activity statistics from 2004 to reflect current data and projections is for general informational purposes only and does not result in any environmental impacts. The SPAS Draft EIR included an updated baseline for the purposes of evaluating impacts associated with the SPAS alternatives. The added description of the SPAS process simply reflects LAWA's current effort to identify amendments to the LAX Specific Plan as required by the LAX Master Plan Stipulated Settlement. No environmental impacts would occur from the potential amendments to Section 1 of the LAX Plan.

Section 2. Goals and Objectives

The objectives under Goal 1 of the LAX Plan would be revised, as necessary, under Alternative 2 to reflect that there would be limited upgrades to the facilities to accommodate current and next-generation larger aircraft. These objectives would also be revised under Alternative 4 to reflect that there would not be any upgrade to the facilities to accommodate current and next-generation larger aircraft, and to acknowledge the lesser extent to which "superior facilities" and "world class service" could be provided under this alternative. Goal 2 would be revised under Alternative 2 to account for the fact that this alternative would result in higher, but not the "highest," standards of air traffic safety as compared to current conditions. Goal 2 and the objectives thereunder would also be revised under Alternative 4 to account for the fact that this alternative would not result in the "highest" standards of air traffic safety or reduce the possibility of runway incursions. Under all SPAS alternatives except Alternative 3, Objective 3 of Goal 4 would be revised to delete references to the LAX Master Plan, thus broadening the intent of the objective to encompass all applicable environmental analyses.

Environmental Evaluation

The potential amendments to the LAX Plan Goals and Objectives would reflect the specific characteristics of the approved SPAS alternative, if any, that were taken into account in the SPAS Draft EIR analysis of all the SPAS alternatives. No environmental impacts different from those already presented and analyzed in the SPAS Draft EIR, as amended by corrections and additions identified in Chapter 5 of Part II of this Final EIR, would occur as a result of the potential amendments to Section 2 of the LAX Plan.

Section 3. Policies and Programs

Subsection 3.1.1 of the LAX Plan would be revised under Alternative 2 to reflect that the runways would not be reconfigured to accommodate new larger aircraft; rather, runway extension and taxiway modifications would serve this purpose. This subsection would also be revised, as necessary, to reflect the extent to which taxiway reconfiguration, taxiway separation, and queue space would be provided under this alternative. Under Alternative 4, this subsection would be revised to reflect that the runways would not be reconfigured to accommodate new larger aircraft, nor would the taxiways be improved, other than federally-mandated Runway Safety Area (RSA) improvements. Under all SPAS alternatives except Alternative 3, Policy P8 would be revised to more appropriately encompass all FAA-designated runway safety areas, not just runway protection zones.

Subsection 3.1.2 would be revised to reflect that the concept of restricted access for non-secure private, public, and commercial vehicles into the CTA would be eliminated under all SPAS alternatives except

Alternative 3. The reference to the ITC would be deleted under all SPAS alternatives except Alternative 3, as this facility would no longer be planned. A reference to the new ITF may be added, if determined necessary, under Alternatives 1, 2, 8, and 9.

Subsection 3.2.1 would be revised under Alternative 4 to reflect that a balanced airfield is not achieved under this alternative, nor is employee parking expanded and improved.

Subsection 3.2.2 would be revised under all SPAS alternatives except Alternative 3 to reflect that restricted access to and from the CTA would not be implemented nor would secure linkages between major Landside facilities and Airport Airside facilities be developed. References to the GTC and ITC would be deleted under all SPAS alternatives except Alternative 3. References to the CONRAC would be deleted under Alternatives 1 and 2, as this facility would no longer be planned under these alternatives. References to, and general descriptions of, the proposed ITF and surface parking at Manchester Square and/or the Avis facility (east of Parking Lot C) may be added, if determined necessary, under Alternatives 1, 2, 8, and 9. The function of the APM would be redefined under Alternatives 1, 2, 4, 5, 6, 7, and 8 to acknowledge only that segment planned between the CTA, the Tom Bradley International Terminal, and the Midfield Satellite Concourse, as the other segments would no longer be implemented under these alternatives. The APM description would be revised under Alternative 9 to accurately reflect the route proposed under this alternative, as well as the facilities it is intended to serve. A description of the dedicated busway may also be added, if determined necessary, under Alternatives 1, 2, and 8. In addition, the reference to the Los Angeles County Metropolitan Transportation Authority (Metro) Green Line Station would be expanded under Alternatives 1, 2, 5, 6, 7, 8, and 9 to include any other future Metro rail facilities, thereby acknowledging that there is a planned Metro station at Century and Aviation Boulevards, to which there would be an integrated connection to LAX. Under Alternative 4, this section would be revised to reflect that there would not be an integrated connection between the Landside facilities and the Metro Green Line Station.

Subsection 3.4 would be revised under all SPAS alternatives except Alternative 3 to reflect that the development of secure linkages between major Airport Landside facilities and Airport Airside facilities would no longer be implemented under these alternatives. This subsection would be revised under Alternatives 1 and 2 to reflect that the consolidation of rental car facilities would no longer be planned under these alternatives. The reference to the Metro Green Line Station would be expanded under Alternatives 1, 2, 5, 6, 7, 8, and 9 to include any other future Metro facilities. This subsection would also be revised under Alternative 4 to reflect that an integrated connection between the airport and Metro Green Line station would no longer be developed and the provision of facilities for the regional bus system would not be implemented.

Subsection 3.5 would be revised under all SPAS alternatives except Alternative 3 to reflect more current job generation and economic output statistics for LAX.

Under Alternative 4, Subsection 3.6 would be revised to reflect that the runways would not be updated to accommodate new larger aircraft and the next generation of quieter jets. Subsection 3.7 would also be revised to reflect that the runways and taxiways would not be modified under Alternative 4 to the extent necessary to lessen air emissions through reduced aircraft idle time.

In Subsection 3.9, references to the development of an LAX Conceptual Plan and/or Design Guidelines would be deleted under all SPAS alternatives except Alternative 3 to reflect the fact that LAWA now has in place a Design and Construction Handbook, dated May 2012, which establishes broad design and construction guidelines for all infrastructure, terminal buildings, renovations, and other facilities.

Environmental Evaluation

The potential amendments to the LAX Policies and Programs would reflect the specific characteristics of the approved SPAS alternative, if any, that were taken into account in the SPAS Draft EIR analysis of all the SPAS alternatives. No environmental impacts different from those already presented and analyzed in the SPAS Draft EIR, as amended by corrections and additions identified in Chapter 5 of Part II of this Final EIR, would occur as a result of the potential amendments to Section 3 of the LAX Plan.

Section 4. Implementation

This section of the LAX Plan would be revised to acknowledge that the LAX Specific Plan has been adopted.

Environmental Evaluation

This potential amendment to the Implementation section of the LAX Plan is an administrative amendment and has no environmental impacts.

Section 5. LAX Specific Plan

This section of the LAX Plan would be updated to reference the prior amendment to the LAX Specific Plan under Ordinance No. 179,148 and any amendment adopted following the SPAS.

Environmental Evaluation

Similar to above, this potential amendment to Section 5 of the LAX Plan is an administrative amendment and has no environmental impacts. Potential environmental impacts associated with the LAX Specific Plan amendments themselves are described in Section 6.2 of the SPAS Draft EIR.

Section 6. Los Angeles Airport/El Segundo Dunes Specific Plan

No amendments are anticipated to be required to this section of the LAX Plan; hence, no environmental impacts are anticipated to occur.

Section 7. Coastal Transportation Corridor Specific Plan

No amendments are anticipated to be required to this section of the LAX Plan; hence, no environmental impacts are anticipated to occur.

Figure 1. Plan Areas

This figure in the LAX Plan would be revised to reflect the current boundary of the airport, as well as any modifications to the boundary associated with the smaller acquisition areas of all SPAS alternatives except Alternative 3, as compared to the approved LAX Master Plan. In particular, under Alternatives 1, 2, 8, and 9, portions of property between 96th and 98th Streets and between Sepulveda Boulevard and east of Vicksburg Avenue; the southeast corner of Sepulveda Boulevard and 98th Street; the northwest and southwest corners of Manchester Square; between Century Boulevard and approximately 104th Street east of Aviation Boulevard; and north of Imperial Highway between Aviation Boulevard and Hindry Avenue would be removed from the plan area. Under Alternative 4, property at the southeast corner of Sepulveda Boulevard and 98th Street; within Manchester Square; between Century Boulevard and approximately 104th Street east of Aviation Boulevard; and north of Imperial Highway between Aviation Boulevard and Hindry Avenue would be removed from the plan area. This figure would also be amended under Alternatives 1, 2, 4, 5, 6, and 7 to reflect the relocation and/or extension of the runways. This figure would be amended under Alternatives 1, 5, and 6 to reflect the realignment of Lincoln Boulevard (including the connector streets between Lincoln Boulevard and Westchester Parkway).

Environmental Evaluation

The aforementioned revisions to Figure 1 of the LAX Plan would be an administrative amendment to conform the map in Figure 1 to the specific characteristics of the approved SPAS alternative, if any, which were taken into account in the SPAS Draft EIR analysis of all the SPAS alternatives. No environmental impacts different from those already presented and analyzed in the SPAS Draft EIR, as amended by corrections and additions identified in Chapter 5 of Part II of this Final EIR, would occur as a result of the potential amendments to Figure 1 of the LAX Plan.

Figure 2. Transportation Element - Regional Highways and Freeways

This figure in the LAX Plan would be revised to be consistent with the LAX Plan boundary shown in Figure 1, as may be amended as described above. This figure would also be amended under Alternatives 1, 2, 4, 5, 6, and 7 to reflect the relocation and/or extension of the runways. This figure would be amended under Alternatives 1, 5, and 6 to reflect the realignment of Lincoln Boulevard (including the connector streets between Lincoln Boulevard and Westchester Parkway).

Environmental Evaluation

The aforementioned revisions to Figure 2 of the LAX Plan would be an administrative amendment to conform the map in Figure 2 to the specific characteristics of the approved SPAS alternative, if any, which were taken into account in the SPAS Draft EIR analysis of all the SPAS alternatives. No environmental impacts different from those already presented and analyzed in the SPAS Draft EIR, as amended by corrections and additions identified in Chapter 5 of Part II of this Final EIR, would occur as a result of the potential amendments to Figure 2 of the LAX Plan.

4. COMMENTS AND RESPONSES ON THE SPAS DRAFT EIR

4.1 Introduction

In accordance with Section 15088 of the State CEQA Guidelines, LAWA prepared responses to all comments received on the SPAS Draft EIR. As required by the State CEQA Guidelines, the focus of the responses to comments is on "the disposition of significant environmental issues raised." Detailed responses are not provided to comments on the merits of SPAS or on other topics that do not relate to environmental issues.

This chapter of the SPAS Final EIR presents LAWA's written responses to comments received on the SPAS Draft EIR. The format for the responses to SPAS Draft EIR comments presents, on a letter-by-letter basis, each comment, which is then followed immediately by a response. The comments and responses are organized and grouped into categories based on the affiliation of the commentor. The comments are presented in the following order: federal agencies, state agencies, regional agencies, local agencies, public comments (i.e., letters from private citizens, organizations, etc.), form letters, and public meeting testimony.

An alphanumeric index system is used to identify each comment and response, and is keyed to each letter and the individual comments therein. For example, the first letter within the group of federal agencies submitting comments on the SPAS Draft EIR is from the United States Department of Homeland Security, and the text of the letter is considered to have one individual comment. The subject letter was assigned the alphanumeric label "SPAS-AF00001," representing "Specific Plan Amendment Study-Agency-Federal-Letter No. 1." The individual comment within the letter is labeled as SPAS-AF00001-1. The same basic format and approach is used for the comment letters from state agencies ("AS"), regional agencies ("AR"), local agencies ("AL"), public comments ("PC"), form letters (PF) and the public hearings ("PH").

The following are the prefix codes used for categorizing the comment letter types:

Letter ID Prefix	Description
AF	Federal Agency
AS	State Agency
AR	Regional Agency
AL	Local Agency
PC	Public Comment
PF	Form Letter
PH	Public Hearing

To assist the reader's review and use of the responses to comments, three indices are provided. These indices provide the alphanumeric label number, commentor name, affiliation (i.e., name of agency or organization that the author represents), and date (if provided) of each comment letter. The first index lists all of the comment letters by alphanumeric label number, the second index lists all of the comment letters by the commentor's last name, and the third index lists all of the comment letters by the affiliation, if any, of the commentor.

The responses to comments consist of both topical responses and individual responses. Within the individual comments submitted on the SPAS Draft EIR, many of the same issues were raised by multiple commentors, and many comments pertained to a general theme that was common to multiple commentors. To respond to these comments, topical responses were prepared that provide a single comprehensive discussion of the issue of concern. A total of three topical responses are provided. Each topical response ("TR") has an alphanumeric designation related to its general subject matter. For example, the topical response pertaining to the proposed realignment of Lincoln Boulevard, which would

occur under certain SPAS alternatives, is designated "TR-SPAS-LR-1." Individual comments are cross-referenced to these topical responses. The topical responses are provided later in this chapter.

This chapter also provides individual comments and responses, presented on a letter-by-letter basis. Each comment is typed exactly as it appears in the original comment letter. No corrections to typographical errors or other edits to the original comments were made. A copy of each original comment letter is provided in Attachment 5 of Part II of this Final EIR. Videotaped comments were transcribed; this transcription is provided in Attachment 5.

Immediately following each typed comment is a written response developed by LAWA. In many instances, the response to a particular comment may refer to the response(s) to another comment(s) that expressed the same concern or is otherwise related. Cross-referencing of responses uses the alphanumeric index system described above. For example, a response may indicate "Please see Response to Comment SPAS-AL00001-2" if that response addresses the same concern expressed in a different comment.

4.2 Indices of Comment Letters

Following are three indices that organize the comment letters by letter identification number, commentor, and affiliation.

Index by Letter Identification (ID) Number

Letter ID	Commentor	Affiliation/Agency/Department	Date
SPAS-AF00001	Blackburn, Gregor	U.S. Department of Homeland Security, FEMA Region IX	8/9/2012
SPAS-AF00002	Goebel, Karen A.	U.S. Department of the Interior Fish and Wildlife Service	10/10/2012
SPAS-AF00002	Moskus, Brittni	U.S. Department of the Interior Fish and Wildlife Service	10/10/2012
SPAS-AS00001	Morgan, Scott	State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit	8/6/2012
SPAS-AS00002	Singleton, Dave	State of California, Native American Heritage Commission	8/13/2012
SPAS-AS00003	Morgan, Scott	State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit	9/11/2012
SPAS-AR00001	Lee, Pamela K.	Southern California Association of Governments	10/9/2012
SPAS-AR00001	Nadler, Jonathan	Southern California Association of Governments	10/9/2012
SPAS-AR00002	MacMillan, Ian V.	South Coast Air Quality Management District	10/25/2012
SPAS-AL00001	Kurtz, Barry	County of Los Angeles Department of Beaches and Harbors	10/3/2012
SPAS-AL00002	Poosti, Ali	City of Los Angeles Bureau of Sanitation	9/24/2012
SPAS-AL00003	Hartwell, Scott	Metropolitan Transportation Authority	10/9/2012
SPAS-AL00003	Welborne, Martha	Metropolitan Transportation Authority	10/9/2012

4.3 Comments and Responses

The following provides the Topical Responses and individual responses to comments on the SPAS Draft EIR.

4.3.1 Topical Responses

TR-SPAS-LR-1 Lincoln Boulevard Realignment

Introduction

This topical response responds to comments on the SPAS Draft EIR regarding the realignment of Lincoln Boulevard that would occur under SPAS Alternatives 1, 5, and 6. As explained below, the SPAS Draft EIR analyzes the Lincoln Boulevard realignment at a program-level of detail appropriate for this stage of the SPAS process.

Description of the Lincoln Boulevard Realignment

Lincoln Boulevard is a State highway that runs generally parallel to, and north of, the eastern portion of Runway 6L/24R before turning northwest through the community of Westchester. Under the SPAS alternatives that would relocate Runway 6L/24R to the north (i.e., Alternatives 1, 5, and 6), a portion of Lincoln Boulevard would also be realigned to the north in order to move the roadway out of the footprint of the runway and outside of the Runway Safety Area (RSA) and Object Free Area (OFA), to the extent possible. A small portion of the realigned roadway could remain within the RSA and/or the OFA under each of the SPAS alternatives. The portion of the roadway within the RSA and/or OFA would be required to be below grade (i.e., in a trench) or covered (i.e., in a covered trench or tunnel) to meet FAA runway safety requirements.

The need to relocate Lincoln Boulevard under Alternatives 1, 5, and 6 is clearly identified in the SPAS Draft EIR. Specifically, this project component is identified and accurately described on pages 2-10, 2-29, 2-33, and 2-55, listed in Table 2-3, and illustrated in Figures 2-1, 2-5, 2-6, and 2-10 in Chapter 2 of the SPAS Draft EIR. As described in Chapter 2, under Alternative 1, approximately 540 linear feet of the road segment would need to be covered; under Alternative 5, approximately 765 linear feet would need to be covered; and under Alternative 6, approximately 252 linear feet would need to be covered.

The portion of the roadway to be realigned starts northwest of the intersection of Lincoln Boulevard and Sepulveda Boulevard and extends to just past the Westchester Parkway underpass. The intersection of Lincoln Boulevard and Sepulveda Boulevard itself would remain in its current configuration; a minor modification to the right turn movement from southbound Sepulveda Boulevard to westbound Lincoln Boulevard may be required. At its greatest distance, the roadway would be moved approximately 500 feet to the north. For the portion of the roadway that would need to be below grade, the depth of the depression would not exceed approximately 30 feet.

The road would be realigned south of Westchester Parkway and north of the existing alignment of Lincoln Boulevard. This area is almost entirely vacant, with the exception of a roadway that accommodates movements from westbound Lincoln Boulevard to Westchester Parkway and from Westchester Parkway to westbound Lincoln Boulevard, and a radar facility located immediately east of this roadway. The area is entirely within airport property. The airport perimeter fence is located along the south side of Lincoln Boulevard between El Manor Avenue and Northside Parkway. If Lincoln Boulevard were realigned, this portion of the perimeter fence would also be relocated, remaining on the south side of the realigned roadway. The relocation of the perimeter fence would not affect any homes or businesses and would not alter the airport property line. No acquisition would be required to realign Lincoln Boulevard and there was, therefore, no need for Section 2.3.1.1 of the SPAS Draft EIR to list the Lincoln Boulevard and Sepulveda Boulevard intersection as a potential acquisition.

Required Level of Detail in SPAS Draft Program EIR

As discussed on page 4-3 of the SPAS Draft EIR, the Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4)).

Section 15146(b) of the State CEQA Guidelines states that "An EIR on a project such as the… amendment of… a local general plan should focus on the secondary effects that can be expected to follow from the… amendment, but the EIR need not be as detailed as an EIR on the specific construction projects that might follow."[130]

Program EIRs are commonly used in conjunction with the tiering process, which is "the coverage of general matters in broader EIRs (such as general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs…concentrating solely on the issues specific to the EIR subsequently prepared." (State CEQA Guidelines Section 15385.) Under CEQA's tiering principles, it is proper for a lead agency to focus a first-tier EIR on only the program's general impacts, "leaving project-level details to subsequent EIRs when specific projects are being considered." (State CEQA Guidelines Section 15152(c); *In re Bay-Delta* (2008) 43 Cal.4th 1143, 1174-1175.)

The State CEQA Guidelines establish several additional principles related to the level of detail appropriate for a first-tier program EIR. For example, an EIR project description should be "general" and "not supply extensive detail beyond that needed for an evaluation and review of the environmental impacts." (State CEQA Guidelines Section 15124.) Also, the degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated. (State CEQA Guidelines Section 15146(b).) An EIR's sufficiency is reviewed in the light of what is "reasonably feasible." (State CEQA Guidelines Section 15151.)

The requirements and principles for first-tier program EIRs reviewed above apply directly to the SPAS Draft EIR. As stated on page 1-10 in Section 1.2.1 of the SPAS Draft EIR, "[t]he project is to complete a Specific Plan Amendment Study (SPAS) that fulfills Section 7.H of the LAX Specific Plan consistent with the definition of the SPAS set forth in the LAX Master Plan Stipulated Settlement." The outcome of SPAS is the possible amendment of the LAX Specific Plan, which is an element of the City's General Plan. Therefore, the SPAS Draft EIR is appropriately a program EIR that focuses on program-wide impacts, and is not a project-level EIR. Because it is a program EIR, the SPAS Draft EIR is not required to analyze the impacts of specific construction projects included in the program at a project-specific level of detail.

As indicated on page 2-74 in Section 2.4 of the SPAS Draft EIR, "Certification of the SPAS EIR would complete the program-level CEQA compliance review for the SPAS process. Depending on the outcome of the SPAS process, additional project-level CEQA review may be required for implementation of the improvements associated with the selected SPAS alternative." LAWA's approach to preparing second-tier project-level CEQA documents is exemplified by project-specific EIRs prepared for major elements of the LAX Master Plan implemented to date, such as the South Airfield Improvement Project EIR, the Bradley West Project EIR, and the Crossfield Taxiway Project EIR.

During the SPAS process, LAWA has evaluated a wide range of options that would fulfill the requirements of the LAX Specific Plan, the Stipulated Settlement, and the project objectives. Detailed project-specific planning, phasing, and design for individual components in the SPAS alternatives are not included in this

[130] Contrary to Comment SPAS-PC00130-637, Section 15146(b) of the State CEQA Guidelines does not state that a program-level EIR may be used to adopt a general plan for the conceptual planning of a district or area, or that a program-level EIR applies to "future and unspecified" projects.

phase of the SPAS process. Therefore, not only is project-level analysis of the Lincoln Boulevard realignment not required by CEQA, but it also would be technically infeasible and speculative.

Responsibility for Preparation and Scope of Second-Tier Project-Specific EIR

Lincoln Boulevard is a State highway (State Route 1) under the jurisdiction of Caltrans. Responsibility for the realignment of Lincoln Boulevard, if required due to selection of SPAS Alternatives 1, 5, or 6, was not known at the time of SPAS Draft EIR and Final EIR preparation. Should the Board of Airport Commissioners and the Los Angeles City Council ultimately approve an alternative that includes realignment of Lincoln Boulevard, the realignment may go through the Caltrans design and approval process, including preparation of a Project Study Report and completion of CEQA review. Alternatively, in the event that ownership and/or control of this portion of the road is transferred to the City of Los Angeles, the City may be responsible for implementing the realignment, including preparation of detailed design plans and completion of required CEQA review. In either case, LAWA would have a prominent role in the project and would provide the funding for its design, environmental review, and implementation.

For the project-specific Lincoln Boulevard realignment CEQA review, construction details would be developed during the detailed engineering phase, and included in the document's project description. Detailed project-specific impact analysis would then be conducted, including impacts during construction on adjacent residences and businesses. Construction details would include construction plans and phasing; specifications for the portion of the roadway that would be covered, including vehicle restrictions, hazardous materials restrictions, ventilation, emergency exits, emergency response, traffic controls, security issues, and maintenance; an evaluation of utilities beneath the site and relocation plans for these utilities; the nature and duration of roadway closures and related detours; and relocation or preservation plans for the memorial marker for LAWA Police Officer Tommy Scott, if required. Under either of the options for review identified above, LAWA would consult with all relevant agencies during detailed engineering and project-specific CEQA review, including Caltrans (as noted on page 2-75 of the SPAS Draft EIR), the Bureau of Sanitation, Department of Water and Power, and other agencies.

Approach to Lincoln Boulevard Realignment in SPAS Draft EIR, Including Rough-Order-of-Magnitude Cost Estimates

LAWA developed conceptual plans for the Lincoln Boulevard realignment as part of SPAS in order to enable this project component to be evaluated at a program level of detail. These plans included conceptual engineering to define the Lincoln Boulevard realignment associated with Alternatives 1, 5, and 6.

Rough-order-of-magnitude (ROM) cost estimates were prepared for all of the components of all of the SPAS alternatives (see Appendix G of the Preliminary LAX SPAS Report). In addition to providing an equal basis of cost comparison between the SPAS alternatives, as presented in Chapter 8 of the Preliminary LAX SPAS Report, these cost estimates were used as a basis for the program-level air quality construction analysis. In order to complete the ROM cost estimates, assumptions were made as to the characteristics of the various improvements. For the Lincoln Boulevard ROM cost estimate, these assumptions included the quantities of materials that would be used during construction, which were determined based on assumptions that included the depth of the subbase, base, and asphalt, as well as many other factors.

The SPAS ROM cost estimates, prepared by professionals experienced in the development of construction cost estimates and familiar with the construction programs at LAX, were detailed and thorough estimates for this level of planning and, as the name states, provide a rough-order-of-magnitude of the costs associated with constructing the improvements associated with the various SPAS alternatives. The cost estimates consider a wide range of factors, and provide assumptions and allowances for those factors that are not known at this time. For example, the ROM cost estimates for the Lincoln Boulevard realignment include allowances related to utilities (e.g., electrical, sewer, and water

lines). There are no known cost considerations that were intentionally omitted from the ROM cost estimates, as asserted in Comment SPAS-PC00130-637.

The fact that specific assumptions were made in the development of ROM cost estimates does not mean that detailed engineering design has been completed or that detailed studies of soil conditions and subsurface utilities have been or should be conducted at this level of planning. In fact, detailed engineering design has not yet been conducted and will not be conducted unless (1) a SPAS alternative is approved that includes the realignment of Lincoln Boulevard and (2) the Lincoln Boulevard project is proposed for implementation, at which time detailed planning, engineering design, and environmental review will be undertaken. Nevertheless, the level of detail that was developed as part of the SPAS process was appropriate and sufficient, for this level of planning and evaluation, to determine the general location of the realigned roadway, its approximate depth, the approximate length of the roadway that would need to be depressed, and other general characteristics. This level of specificity was sufficient to determine the distance of the realigned roadway to off-airport land uses, and the impacts of the realignment at a program-level of detail, including impacts to aesthetics and visual resources, biological resources, air quality, and other environmental topics.

The SPAS Draft EIR treats the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6 as an integral component of these alternatives, as evidenced by the specific evaluation of the realignment throughout the environmental analysis (as described below), and the level of detail in the ROM cost estimates. As indicated in the cost estimates, the realignment of Lincoln Boulevard is estimated to cost between $45 million and $90 million, depending upon the alternative (not $1 billion as stated in Comment SPAS-PC00130-637, which provides no supporting documentation or discussion to support that estimate). LAWA recognizes that this is a substantial expenditure. The reference to the realignment of Lincoln Boulevard as an "improvement" or "modification" in the SPAS Draft EIR does not imply that LAWA is not evaluating this project component at the same level of detail as all other components of the various SPAS alternatives.

Environmental Analysis of Lincoln Boulevard Realignment in SPAS Draft EIR

Comment SPAS-PC00130-637 presents a large number of comments and questions on the SPAS Draft EIR's description and environmental assessment of the Lincoln Boulevard realignment. For the most part, these comments and questions do not point out any specific deficiencies in the substantial evidence supporting the EIR's impact analysis conclusions. Further, these comments and questions present personal opinions that are not supported by facts or evidence.

The following discussion addresses the environmental topics raised in Comment SPAS-PC00130-637.

Aesthetics - The light and glare impacts of the proposed SPAS alternatives, including the potential light and glare impacts associated with the realignment of Lincoln Boulevard northward under Alternatives 1, 5, and 6, are evaluated in Section 4.1 of the SPAS Draft EIR. The analysis does not "discount the significance of possible light and glare problems" associated with moving Lincoln Boulevard northward. Rather, the potential light and glare impacts associated with the realignment of Lincoln Boulevard under SPAS Alternatives 1, 5, and 6, have been fully evaluated in the SPAS Draft EIR at a program level of detail.

As indicated on page 4-44 in Section 4.1 of the SPAS Draft EIR, under the impact analysis of Alternative 1, which also applies to Alternatives 5 and 6 as stated through cross-references, light and glare impacts associated with operation of the realignment of Lincoln Boulevard would be less than significant due to several factors, including: (1) the several hundred foot distance between the proposed roadway alignment and the existing light-sensitive receptors to the north; (2) the presence of intervening features between the roadway and the sensitive receptors, including the Westchester Golf Course (lit at night) and a 12-foot-high noise wall atop an 8-foot high berm located south of W. 88th Street; (3) a portion of the realigned roadway would be developed below grade, thereby reducing the height of the required light poles; and (4) the realignment would represent the realignment of an existing lit roadway rather than the introduction of new lighting in a currently unlit environment. Furthermore, the realigned roadway and light

poles would be subject to existing requirements formulated to ensure that airport development does not result in light spillover onto adjacent properties or substantial glare, including LAX Master Plan Commitments DA-1 (Provide and Maintain Airport Buffer Areas), LI-2 (Use of Non-Glare Generating Building Materials), and LI-3 (Lighting Controls); Los Angeles Municipal Code Section 93.0117, which prohibits light spillover and requires that light sources be shielded and directed downward; the light and glare standards of the LAX Northside Plan and Development Guidelines; and the light standards and objectives of the Los Angeles Transportation Element. Based on the above, the analysis concludes that the realignment of Lincoln Boulevard under SPAS Alternatives 1, 5, and 6 would not result in light spillover onto light-sensitive receptors or substantial glare, and thus would result in a less than significant light and glare impact.

The light and glare impacts associated with the construction of the proposed Lincoln Boulevard realignment under SPAS Alternatives 1, 5, and 6 are also addressed in Section 4.1 of the SPAS Draft EIR. As indicated on page 4-45 in Section 4.1 of the SPAS Draft EIR, the impact analysis for Alternative 1, which also applies to Alternatives 5 and 6, acknowledges that construction lighting would be required at both the construction site itself and within the proposed construction staging areas (including within proposed Construction Staging Areas B, C, and D proposed along the north and south sides of Westchester Parkway, as identified in Figure 2-15 in Chapter 2 of the SPAS Draft EIR). As indicated, sound walls currently separate some of the residential uses from the proposed construction sites and construction staging areas (including, in the case of Construction Staging Areas B, C and D, the 12-foot nigh noise wall atop an 8-foot high berm noted above). As further indicated, construction fencing would be installed in accordance with LAX Master Plan Mitigation Measure MM-DA-1 (Construction Fencing), to block and/or buffer views of the construction sites and construction staging areas; some of the construction staging areas (including Construction Staging Area D) are already the sites of airport-related construction staging activities, and thus are already sources of construction light and glare; and the construction sites and construction staging areas are already located in a well-lit urban environment. Furthermore, the construction activities and associated construction lighting for the proposed Lincoln Boulevard realignment would be temporary. Therefore, while the analysis acknowledges on page 4-45 of Section 4.1 of the SPAS Draft EIR that there would be greater levels of ambient lighting during construction of the Lincoln Boulevard realignment, the analysis also determines that this light and any associated glare would not result in a change in lighting or lighting intensity such that light would spill off and affect light-sensitive uses, and that the realignment construction would not result in substantial new sources of glare which would adversely affect nighttime views. Hence, the construction-related light and glare impacts associated with the realignment of Lincoln Boulevard would be less than significant.

As demonstrated above, the SPAS Draft EIR's analysis of the light and glare impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate light and glare impacts in greater detail, based on detailed project engineering and design.

Air Quality - As mentioned previously, the ROM cost estimates were used as a basis for calculating construction-related air quality impacts, which included both emissions and concentrations. The ROM cost estimates included costs associated with the realignment of Lincoln Boulevard (see Tables AF-3 through AF-5 of Appendix G of the Preliminary LAX SPAS Report). Therefore, the Lincoln Boulevard realignment was accounted for in the construction air quality analysis. As described on page 4-88 in Section 4.2.2.1 of the SPAS Draft EIR, construction activities were grouped geographically by source. The Lincoln Boulevard realignment was grouped with the north airfield construction activity, due to the proximity of Lincoln Boulevard to the north airfield. Therefore, the impacts of routing Lincoln Boulevard closer to off-airport land uses under some of the SPAS alternatives were analyzed; in addition, the impacts of using heavy construction equipment were included in the analysis. Based on existing information and analysis, pollutant emissions and concentrations from construction of the SPAS improvements, which include the Lincoln Boulevard realignment, are expected to be significant; however, if the realignment is proposed for implementation, additional detailed air quality analysis would occur in conjunction with project-level CEQA review.

The SPAS Draft EIR's air quality analysis evaluated the impacts associated with construction of all of the construction projects associated with each of the SPAS alternatives at a program level of detail. The fact that the results reported in Sections 4.2.6.1 and 4.2.6.2 of the SPAS Draft EIR do not specifically mention air quality impacts associated with the Lincoln Boulevard realignment does not mean that these impacts were not evaluated. As noted above, the construction air quality analysis did include the Lincoln Boulevard realignment.

As demonstrated above, the SPAS Draft EIR's analysis of the air quality impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate air quality impacts in greater detail, based on detailed project engineering and design.

Biological Resources - The SPAS Draft EIR biological resources analysis considered the impacts of the realignment of Lincoln Boulevard. The area between Lincoln Boulevard and Westchester Parkway where the realignment would occur was included in the habitat surveys and vegetation maps (see Figure 4.3-1 of the SPAS Draft EIR). The relationship between the Lincoln Boulevard realignment and existing habitat is shown in Figures 4.3-6, 4.3-14, and 4.3-16 of the SPAS Draft EIR. Moreover, the habitat area that would be affected by the Lincoln Boulevard alignment under Alternatives 1, 5, and 6 is included in the calculations of impacts to habitat areas and habitat units for each alternative (see Tables 4.3-3 and 4.3-5 of the SPAS Draft EIR, respectively). Page 4-207 of the SPAS Draft EIR specifically states that the analysis of habitats and vegetation associations included roadway modifications. Mitigation for impacts associated with the loss of habitat units is provided in MM-BIO (SPAS)-14 (Replacement of Habitat Units), and includes mitigation for habitat losses caused by the Lincoln Boulevard realignment. The biological resources analysis also identified impacts to mature trees associated with the Lincoln Boulevard realignment under Alternatives 1, 5, and 6 (pages 4-212, 4-254, and 4-265, respectively), which would be less than significant with implementation of LAX Master Plan Mitigation Measure MM-BC-3 (Conservation of Floral Resources: Mature Tree Replacement).

As demonstrated above, the SPAS Draft EIR's analysis of the biological resources impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate biological impacts in greater detail, based on detailed project engineering and design.

Coastal Resources - The analysis of impacts to coastal resources in Section 4.4 of the SPAS Draft EIR focused on resources within the coastal zone. The Lincoln Boulevard realignment would not be located within, or in proximity to, the coastal zone, and thus would not affect coastal resources.

Cultural Resources - Similar to the analysis of biological resources, the cultural resources analysis considered the realignment of Lincoln Boulevard. Relative to archaeological resources, a pedestrian survey for archaeological resources was conducted that consisted of surveyed areas and areas that were only spot-checked due to poor ground surface area visibility. The area that was subject to the pedestrian survey is illustrated in Figure 4.5-2 of the SPAS Draft EIR and clearly includes the area in which the realignment of Lincoln Boulevard would occur. The only components of the SPAS alternatives that would be located in proximity to recorded archaeological resources are the airfield improvements and Construction Staging Area A; the Lincoln Boulevard realignment would not be located in proximity to any such resources. Nevertheless, the SPAS Draft EIR acknowledges that previously unrecorded resources could be encountered during construction of any of the SPAS project components. This impact would be mitigated by Mitigation Measure MM-HA (SPAS)-4 (Conformance with LAX Master Plan Archaeological Treatment Plan).

The Lincoln Boulevard realignment was also included within the SPAS study area for historical resources, as were buildings located along Sepulveda Boulevard. As described on page 4-355 of the SPAS Draft EIR, properties over 45 years of age that could be affected by the proposed SPAS alternatives due to demolition, alteration, or adjacent new construction were surveyed and evaluated, including properties along Sepulveda Boulevard such as the Union Savings and Loan Building. The Lincoln Boulevard realignment would be located on vacant land; there are no eligible or designated historical resources

adjacent to the portion of the roadway that would be relocated under Alternatives 1, 5, and 6. The Union Savings and Loan Building at 9800 S. Sepulveda Boulevard is the only historical resource along Sepulveda Boulevard that would be impacted by the SPAS alternatives, but it would not be affected by the roadway realignment. In fact, page 4-367 of the SPAS Draft EIR specifically states that the realignment of Lincoln Boulevard would have no impact on identified eligible and listed historical resources.

As demonstrated above, the SPAS Draft EIR's analysis of the cultural resources impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence.

Greenhouse Gas Emissions - As with the air quality analysis, the evaluation of greenhouse gas emissions associated with construction of the SPAS alternatives was based on the ROM cost estimates that were prepared for the SPAS alternatives. As noted above, these cost estimates accounted for the realignment of Lincoln Boulevard under Alternatives 1, 5, and 6; therefore, the analysis of greenhouse gas emissions considers emissions related to construction of the roadway realignment.

Therefore, the SPAS Draft EIR's analysis of the greenhouse gas impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate project-level greenhouse gas impacts in greater detail, based on detailed project engineering and design.

With respect to the potential for greenhouse gas emissions associated with disturbance of old petroleum lines and major sewer lines, as described in the discussion of utilities below, disturbance of major sewer lines by the Lincoln Boulevard realignment is unlikely. Nevertheless, in the event that disturbance of major sewer lines or old petroleum lines were to occur, the potential for "significant" greenhouse gas emissions would be low based on several considerations: (1) Petroleum transmission lines that are no longer in service typically undergo procedures by the operator in order to reduce potential liability concerns, maintain proper product management (i.e., avoid having to deal with old unusable product), and meet regulatory requirements.[131,132] Such procedures typically include draining/evacuating the affected pipeline segment of all bulk product and filling it with a concrete slurry or grout if that segment of the line segment is being permanently taken out of service or, if the line segment may be reused in the future, cleaning the line segment by using compressed air to force one or more "pigs" (i.e., plugs) that scrape the walls of the pipeline, and possibly running nitrogen gas through the line to purge it of petrochemical vapors; (2) GHG emissions from petroleum products come primarily from the refinement and combustion processes, and are relatively minor from product transmission;[133] and (3) Most sewer lines, such as the major conveyance lines running to the Hyperion Treatment Plant, are gravity-flow systems that maintain normal atmospheric pressure within the pipeline through the use of venting stations located along the pipeline route.[134]

Human Health Risk Assessment - Contrary to the statement in Comment SPAS-PC00130-637 that the analysis of toxic air contaminants (TAC) focuses primarily on cancer, as stated in the introduction to Section 4.7.1 of the SPAS Draft EIR (page 4-423), the analysis of impacts to human health associated with releases of TAC includes increased cancer risks, chronic (long-term) non-cancer health hazards, and

134 City of Los Angeles Department of Public Works, Bureau of Sanitation, Bureau of Contract Administration, Bureau of Engineering, Joint Board Report No. 1, July 18, 2007, Available: http://www.lasewers.org/ssmp/pdfs/WDR_Signed.pdf, accessed January 2, 2013.

acute (short-term) non-cancer health hazards. Impacts to on-airport workers are also evaluated. Each of these areas is uniformly assessed in the SPAS Draft EIR.

Comment SPAS-PC00130-637 states that the SPAS Draft EIR "conceal[s] and explain[s] away the impact of locating, opening and relocating major petroleum, sewer and other underground facilities despite the apparent risk of release of toxic substances including explosive gases." However, as described in the discussion of utilities below, disturbance of major sewers by the Lincoln Boulevard realignment is unlikely.

Further, it is important to note that the human health risk assessment (HHRA) deals, appropriately, with emissions that cannot be effectively controlled. For example, during construction, some diesel emissions are anticipated at LAX regardless of any control measures implemented. It is these uncontrolled emissions that present unavoidable exposure to people in areas surrounding LAX. The types of risk cited in the comment do not fall under the category of long-term emissions and each can be effectively controlled. Accidental releases of vapors or gases as a result of breaks in sewer lines, petroleum or gas pipelines, or other utility lines (1) fall under the category of acute releases and risks, and (2) are issues that are typical to most major construction projects. People most at risk from these types of releases are construction workers themselves, and safety of these workers falls under Occupational Safety and Health Administration (OSHA) requirements and guidelines. Moreover, regulations governing safe work practices have been developed and are routinely implemented for the situations that may be encountered during LAX construction activities.[135] All construction at LAX has and would continue to follow OSHA safety requirements and best construction practices to maintain worker safety. These measures would also protect people living, working, or going to school around a construction site. Therefore, health risks associated with potential accidental releases of vapors or gases from utility lines during construction of Lincoln Boulevard realignment (as well as construction of other SPAS components) would be less than significant.

The analysis of construction-related human health risks was done at a program level of detail, which is appropriate for this level of planning, as described previously in this Topical Response. No attempt to conceal the limitations of the analysis was made. The text cited in Comment SPAS-PC00130-637, which is from the introduction to Section 4.7.1 of the SPAS Draft EIR (page 4-424), is clear in describing the limits that this level of analysis imposes and explains how the analysis that was provided was developed. It should be noted that HHRA efforts associated with the LAX Master Plan have been ongoing for many years. During this time, project-level health risks from construction have been evaluated for several projects that have gone on to implementation/completion. Experience with these projects, for which detailed construction schedules were developed, provides a strong background for evaluating possible impacts of construction of the similar projects evaluated in the SPAS Draft EIR. Risk estimates in the SPAS Draft EIR provide a sound basis for assessing the SPAS alternatives and proceeding with more detailed health risk assessments in the future, as appropriate.

As with the air quality analysis and the analysis of greenhouse gas emissions, the SPAS Draft EIR's program-level evaluation of construction-related human health risks in Section 4.7.1 was based on the ROM cost estimates that were prepared for the SPAS alternatives. A discussion of the ROM cost estimates, which include construction of the Lincoln Boulevard realignment, is provided previously in this Topical Response.

Contrary to Comment SPAS-PC00130-637, the analysis on page 4-452 of the SPAS Draft EIR does not indicate that health risks associated with operation of a realigned Lincoln Boulevard would be outweighed by efficiencies in airfield operation and transit facilities. Rather, the discussion on page 4-452 states that adverse impacts associated with increases in aircraft operations and changes in airfield and terminal

---

[135] U.S. Department of Labor, Occupational Safety and Health Administration, 29 CFR Part 1910: Occupational Safety and Health Standards; U.S. Department of Labor, Occupational Safety and Health Administration, 29 CFR Part 1926: Safety and Health Regulations for Construction; U.S. Department of Labor, Occupational Safety and Health Administration, 29 CFR Part 1952: Approved State Plans for Enforcement of State Standards; State of California Department of Industrial Relations, Division of Occupational Safety and Health (Cal/OSHA), Title 8 California Code of Regulations, Subchapter 4, Sections 1500-1938: Construction Safety Orders.

facilities would be offset by the ongoing implementation of more stringent motor vehicle emission standards, cleaner future fleet mixes, and the decrease in stationary source emissions attributable to the replacement Central Utility Plant. Moreover, the cleaner future fleet mixes referred to on page 4-452 are not unfunded or related to the construction of SPAS facilities; rather, these are changes in the future vehicle fleet mix that will occur over time and are based on California Air Resources Board (CARB) and South Coast Air Quality Management District (SCAQMD) default assumptions.

As demonstrated above, the SPAS Draft EIR's analysis of the human health risks associated with Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level health risk assessment would evaluate health risks in greater detail, based on detailed project engineering and design.

Hazardous Materials - As indicated on page 4-573 in Section 4.7.3 of the SPAS Draft EIR, the analysis of hazardous materials was based on a records search performed by Environmental Data Resources, Inc. (EDR) of all sites with known contamination (including both soil and groundwater contamination) within the airport property and SPAS alternatives acquisition areas. As the area to which Lincoln Boulevard would be relocated under SPAS Alternatives 1, 5, and 6 is airport property, the records search included that area. The EDR Report, which is provided in Appendix G3 of the SPAS Draft EIR, identifies the sites with known contamination throughout the airport property, as well as known contamination in some areas adjacent to the airport. As illustrated in the EDR DataMap in Appendix G3, there are no sites with known contamination within the Lincoln Boulevard realignment area. The results of the EDR Report were supplemented by LAWA's existing records and knowledge of known contamination, which do not identify any known contamination within the Lincoln Boulevard realignment area. The complete listing of sites with known contamination within the airport property and SPAS alternatives acquisition area is provided in Table 4.7.3-1 of the SPAS Draft EIR; the locations of the sites are illustrated in Figure 4.7.3-1.

As stated on page 4-573 of the SPAS Draft EIR, the analysis of the potential to interfere with current or planned remediation activities was conducted by mapping areas of known contamination and comparing those locations to areas of planned excavation under the SPAS alternatives. For this reason, the analysis of such impacts associated with Alternative 5 on page 4-592 of the SPAS Draft EIR, and noted in Comment SPAS-PC00130-637, addresses impacts from construction activities associated with Terminal 0, the realignment of Taxilane D, and modifications to the Terminal 1 concourse. Because there is no current or planned remediation in the vicinity of the Lincoln Boulevard realignment area, this area is not addressed in this portion of the analysis.

Notwithstanding the fact no contamination is known to exist within the Lincoln Boulevard realignment area, the SPAS Draft EIR acknowledges that previously unknown contamination may be encountered during construction of any of the project components. With compliance with existing laws and regulations, including LAWA's *Procedure for the Management of Contaminated Materials Encountered During Construction*, which was prepared in accordance with LAX Master Plan Commitment HM-2 (Handling of Contaminated Materials Encountered During Construction), this impact was found to be less than significant.

Analysis of soil conditions, including the presence of contaminated soils, associated with the Lincoln Boulevard realignment would be undertaken during detailed engineering and project-level CEQA review of that project, were the alternative that is ultimately approved by the Board of Airport Commissioners and Los Angeles City Council to require the realignment of the roadway.

As demonstrated above, the SPAS Draft EIR's analysis of the hazardous materials impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. The EIR is not "fatally flawed" for not having conducted a project-specific analysis.

Hydrology and Water Quality - As stated on page 4-599 of the SPAS Draft EIR, and noted in Comment SPAS-PC00130-637, the hydrology and water quality study area (HWQSA) includes the existing LAX property, the Manchester Square area, and SPAS acquisition areas. The realignment of Lincoln Boulevard would occur entirely within existing LAX property and is therefore included in the analysis of

hydrology and water quality impacts. (As noted in the discussion of Hazardous Materials above, the evaluation of worker safety and groundwater contamination similarly included the entire airport property, including the Lincoln Boulevard realignment area.) The hydrology analysis evaluated the change in impervious areas and the associated increase in storm water peak flows within the entire HWQSA. The water quality analysis estimated annual total pollutant loads that would be generated within the HWQSA with implementation of the SPAS alternatives. Both program-level analyses concluded that associated impacts would be significant but could be mitigated with Mitigation Measure MM-HWQ (SPAS)-1 (Conceptual Drainage Plan Revision and Update), which would tailor the LAX Conceptual Drainage Plan recommendations to the specific characteristics of the selected SPAS alternative, including Alternatives 1, 5, and 6.

As demonstrated above, the SPAS Draft EIR's analysis of the hydrology and water quality impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate hydrology and water quality impacts in greater detail, based on detailed project engineering and design.

Land Use and Planning - Comment SPAS-PC00130-637 does not raise any new significant environmental issues pertaining to land use and planning or address the adequacy of the land use and planning analysis included in the SPAS Draft EIR.

Noise - As indicated in the discussion of road traffic noise on page 4-935 in Section 4.10.2 of the SPAS Draft EIR, project-related impacts to traffic conditions on roadways around the airport are influenced primarily by the ground access improvements proposed under SPAS Alternatives 1, 2, 3, 4, 8, and 9. As further noted in that discussion, Alternatives 5, 6, and 7 focus on airfield improvements, but would be paired with the ground access improvements associated with Alternatives 1, 2, 8, or 9. Therefore, potential traffic noise impacts associated with Alternatives 5 through 7 are addressed through those other alternatives.

As discussed in Section 4.10.2.2 of the SPAS Draft EIR, the analysis evaluated the program-level change in ambient noise levels at sensitive noise receptors resulting from changes in traffic levels and traffic distribution on affected roadways. As illustrated in Figure 4.10.2-1 of the SPAS Draft EIR, noise-sensitive receptors were identified in a number of locations surrounding the airport. Receptor RD2, located adjacent to Lincoln Boulevard just north of the airport, provides the most representative indication of future changes in noise levels along Lincoln Boulevard. As indicated in Tables 4.10.2-3 and 4.10.2-4, noise levels at Receptor RD2 with implementation of Alternatives 1, 2, 8, and 9 would be slightly less (i.e., -0.1 dBA to -0.7 dBA CNEL) than those of baseline conditions or future (2025) conditions without any of the SPAS alternatives. These conclusions would also apply to Alternatives 5, 6, and 7, given that the airfield improvement of these alternatives would be paired with the ground access improvements of Alternatives 1, 2, 8, or 9, as noted above.

The residential development immediately north of the subject area (i.e., homes located on the north side of West 88th Street between Liberator Avenue and Sepulveda Westway) would be shielded from roadway noise by existing noise barriers/walls, which range in height from approximately 8 feet to approximately 20 feet, as identified on pages 4-29 and 4-956 of the SPAS Draft EIR. Additionally, the intervening area between the proposed realigned roadway and existing residential development to the north is anticipated to be developed as part of LAX Northside. The structures, landforms, and landscaping associated with that future development would provide additional shielding of roadway noise relative to existing residential development to the north, as noted on page 4-654 of the SPAS Draft EIR. Please also see Responses to Comments SPAS-PC00130-428 and SPAS-PC00130-737 regarding attenuation of ground-level noise impacts to areas north of the airport. Based on existing information and analysis, no significant traffic noise impacts to noise-sensitive receptors would result from the SPAS alternatives that include realignment of Lincoln Boulevard. If the Lincoln Boulevard realignment is proposed for implementation, the project-specific CEQA document would present a detailed evaluation of project-level traffic noise impacts, based on detailed project engineering and design.

As noted in Comment SPAS-PC00130-637, the analysis of construction traffic and equipment noise in Section 4.10.3 of the SPAS Draft EIR identified a significant, unavoidable construction equipment noise impact at the Park West Apartments from the realignment of Lincoln Boulevard. However, as documented throughout this Topical Response, this is not the sole area where the impacts of the Lincoln Boulevard realignment are considered in the SPAS Draft EIR. To the contrary, as shown in this Topical Response, impacts of the Lincoln Boulevard realignment were evaluated throughout the SPAS Draft EIR.

The transit noise and vibration analysis in Section 4.10.4 of the SPAS Draft EIR evaluated the impacts of the transit systems proposed under certain SPAS alternatives, specifically the elevated/dedicated busway system proposed under Alternatives 1, 2, and 8 and the APM system proposed under Alternatives 3 and 9. As further noted in that discussion, Alternatives 5, 6, and 7 do not include an elevated/dedicated busway or an APM, and are therefore not further addressed in the analysis. However, as stated elsewhere throughout the SPAS Draft EIR, these alternatives would be paired with the ground access improvements associated with Alternatives 1, 2, 8, or 9. Therefore, potential transit noise and vibration impacts associated with Alternatives 5 through 7 are addressed through those other alternatives. It should be noted that the analysis of transit noise and vibration is not associated with the realignment of Lincoln Boulevard, as no airport transit system is proposed along this roadway as a part of SPAS.

As demonstrated above, the SPAS Draft EIR's analysis of the noise and vibration impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate traffic noise in greater detail, based on detailed project engineering.

Public Services - Sections 4.11.1 and 4.11.2 of the SPAS Draft EIR address impacts to fire protection and law enforcement services from construction of the proposed SPAS improvements at a program level, and acknowledge that construction may hamper or delay emergency response. The SPAS Draft EIR does not dismiss adverse impacts from implementation of the SPAS alternatives, nor does the analysis rely solely on LAX Master Plan Commitment C-1 (Establishment of a Ground Transportation/Construction Coordination Office), as stated in Comment SPAS-PC00130-637. Rather, as noted in Sections 4.11.1 and 4.11.2, LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22 would also serve to further reduce potential traffic congestion during construction and, as a result, delays in emergency response. The SPAS Draft EIR further states that, in the event construction activities were to result in deterioration of traffic conditions even with these LAX Master Plan commitments, use of emergency sirens, alternate response routes, and multiple station responses when necessary would help facilitate emergency access and response as occurs under current congested conditions. Therefore, the analysis concludes that impacts to emergency response times related to construction of the SPAS improvements, including Lincoln Boulevard realignment, would be less than significant.

As demonstrated above, the SPAS Draft EIR's analysis of the public services impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If the realignment is later proposed for implementation, a project-level CEQA document would evaluate public services impacts in greater detail, based on detailed project engineering and design.

Off-Airport Transportation - The SPAS Draft EIR does not minimize the impacts to off-airport transportation that may result from construction of SPAS improvements. Rather, Section 4.12.2.6.3 of the SPAS Draft EIR presents a program-level analysis of off-airport transportation impacts, and acknowledges that there is the potential for traffic delays due to SPAS improvements, including closures of key roadways and intersections, closures of sidewalks that could affect pedestrian access or bicycle lanes, and impacts to transit service due to the need to temporarily relocate bus stops.

Nowhere does the SPAS Draft EIR state that the realignment of Lincoln Boulevard could be accomplished by single-lane closures in off-peak hours, as stated in Comment SPAS-PC00130-637. The reference to that language in the comment is misleading. The actual text of the SPAS Draft EIR states, on page 4-1282, "[T]here is the potential for additional disruption in the event a project-related improvement requires temporary closure of at least one lane adjacent to its site. Closures of key roadways and intersections could cause delays, except if done for short durations during periods of very

low vehicular volumes" (emphasis added). In fact, the analysis concludes that, even with implementation of LAX Master Plan commitments and mitigation measures that are specifically designed to reduce such impacts, construction-related impacts associated with project components, such as Lincoln Boulevard realignment, could result in temporary significant and unavoidable impacts on the streets surrounding LAX.

As demonstrated above, the SPAS Draft EIR's analysis of the off-airport transportation impacts of Lincoln Boulevard realignment meets CEQA requirements for a program EIR, and is supported by substantial evidence. If Lincoln Boulevard realignment is proposed for implementation, the project-specific CEQA document would present a detailed evaluation of project-level off-airport transportation impacts, based on project-specific construction details such as construction plans and phasing; specifications for the portion of the roadway that would be covered; an evaluation of utilities beneath the site and relocation plans for these utilities; and the nature and duration of roadway closures and related detours.

Utilities - A number of comments were received concerning the presence of utilities beneath Lincoln Boulevard that would be disrupted as a result of the roadway realignment under Alternatives 1, 5, and 6. As stated previously in this Topical Response, detailed project-level planning and design have not occurred at this stage in the SPAS process, including detailed engineering design for the Lincoln Boulevard realignment. Detailed information on soil conditions, geotechnical concerns, and subsurface utilities can feasibly be developed during construction-level planning. As such, these issues would be evaluated during engineering design and project-level CEQA review for the Lincoln Boulevard realignment, if it is proposed for implementation.

Two major outfall sewers lie beneath the portion of Lincoln Boulevard that would be realigned under Alternatives 1, 5, and 6. The North Central Outfall Sewer (NCOS) runs diagonally from northeast to southwest across the Westchester Golf Course and directly beneath the intersection of Lincoln Boulevard and Westchester Parkway, continuing beneath the north airfield and the LAXFUEL fuel farm to the Hyperion Treatment Plant. The NCOS has a maximum diameter of 114 inches, or 9½ feet,[136] and is located at an approximate depth of over 65 feet below the surface in the area of the Lincoln Boulevard realignment.[137] The North Outfall Replacement Sewer (NORS) lies to the east of NCOS and also runs diagonally from northeast to southwest through the intersection of Sepulveda Boulevard and La Tijera Boulevard, crossing Lincoln Boulevard east of Emerson Avenue, and turning southerly west of Tom Bradley International Terminal towards the Hyperion Treatment Plant. The NORS ranges in diameter from 96 to 150 inches (8 to 12½ feet).[138] This outfall sewer is also at least 65 feet below the surface in the vicinity of the Lincoln Boulevard realignment. At these depths, the Lincoln Boulevard realignment, whose depression would not exceed approximately 30 feet, would not interfere with these outfall sewers, as acknowledged by the City of Los Angeles Bureau of Sanitation, Wastewater Engineering Services Division.[139]

As noted above, detailed project-level planning and design have not occurred at this stage in the SPAS process. Therefore, specific impacts on individual subsurface utilities cannot be determined. LAWA has not identified other major utilities, including oil pipelines, in the vicinity of the Lincoln Boulevard realignment. Nevertheless, it is expected that numerous utilities could require relocation, which could include smaller sewers, water lines, storm drains, electrical lines, fiber optic cables, oil pipelines, and other utilities. (There are no known plugged or abandoned oil or gas wells in the vicinity of the Lincoln Boulevard realignment. See Figure F4.17.2-1 in Section 4.17.2 of the LAX Master Plan Final EIR.) Such

137 City of Los Angeles, Bureau of Sanitation, Wastewater Engineering Services Division, Letter from Mr. Ali Poosti, Division Manager, to Mr. Denny Schneider, September 14, 2012.

138 City of Los Angeles Bureau of Sanitation, Wastewater Engineering Services Division, City of Los Angeles Sewer Odor Control Master Plan, August 2010.

139 City of Los Angeles, Bureau of Sanitation, Wastewater Engineering Services Division, Letter from Mr. Ali Poosti, Division Manager, to Mr. Denny Schneider, September 14, 2012.

impacts would be identified during project-level engineering and environmental review. Construction of SPAS-related improvements, such as Lincoln Boulevard, that have the potential to interfere with existing subsurface utilities would be subject to LAX Master Plan Commitment PU-1, which requires that a utility relocation program be implemented during construction to minimize potential impacts to existing subsurface utilities, including service disruptions, and to ensure that potential impacts to such utilities would be less than significant. Developing and implementing a utility relocation program would ensure that impacts on existing utility services and distribution facilities would be less than significant. As noted previously in this Topical Response, allowances for the realignment of utilities were included in the ROM cost estimates for the Lincoln Boulevard realignment (see Table AF-4 in Appendix G of the Preliminary LAX SPAS Report).

It should be noted that scoping under CEQA allows agencies to obtain input regarding the significant effects to be addressed in a Draft EIR (State CEQA Guidelines Section 15083(a)). However, a lead agency is not obligated to conduct a project-level analysis in a program EIR merely because comments concerning this issue were raised during scoping. Rather, as discussed previously, a program-level EIR "need not be as detailed as an EIR on the specific construction projects that might follow" (State CEQA Guidelines Section 15146(b)). Therefore, despite the fact that members of the public may have requested a project-level evaluation of the Lincoln Boulevard realignment's impacts on subsurface utilities in their comments on the SPAS Draft EIR Notice of Preparation (NOP) or SPAS Draft EIR Revised NOP, LAWA is not required to perform such an evaluation due to the program-level nature of the SPAS Draft EIR.

Conclusions

As demonstrated in this Topical Response, the SPAS Draft EIR analyzes the Lincoln Boulevard realignment at a program level of detail appropriate for this stage of the SPAS process. The level of detail in the ROM cost estimates demonstrates that LAWA considers the Lincoln Boulevard realignment to be a substantial undertaking. Impacts of the roadway realignment are evaluated at a program level throughout the SPAS Draft EIR environmental analysis.

If Lincoln Boulevard realignment is proposed for implementation, a project-specific EIR would be required and would present a detailed evaluation of project-specific impacts, based on detailed project engineering and design. Project-level analysis of Lincoln Boulevard realignment is neither required nor appropriate for the SPAS Draft EIR since it is a program EIR, and recirculation of the SPAS Draft EIR to include such analysis is not warranted.

TR-SPAS-REG-1 Regionalization

Introduction

Numerous comments on the SPAS Draft EIR claim that other airports in Southern California should be used instead of LAX to accommodate regional air travel demands. In particular, several commentors suggested there is a greater need to improve and/or use other airports such as LA/Ontario International Airport (ONT) and Palmdale Regional Airport (PMD) as a means to avoid or lessen increased aviation activity at LAX and the associated impacts on surrounding communities. The following response addresses the comments on these issues, collectively referred to as "regionalization."

The Relationship of SPAS to Regionalization of Air Travel

As indicated in Chapter 1 of the SPAS Draft EIR and further explained in Chapter 2, the proposed project under consideration is the LAX SPAS. The SPAS process involves the identification and evaluation of potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address. The SPAS process also includes identification of potential amendments to the LAX Specific Plan that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP, which is the same future passenger activity level of the LAX Master Plan that was incorporated into

the SCAG RTP relative to regionalization of commercial air travel. All of the SPAS alternatives maintain the basic design parameters of the LAX Master Plan in planning for a future activity level of 78.9 MAP and allowing for no more than 153 passenger gates.

Several comments received on the SPAS Draft EIR suggested that regionalization of air travel demand in Southern California should have been included, and addressed, as a SPAS alternative in the Draft EIR. Under the Airport Noise and Capacity Act of 1990 (commonly called "ANCA"), and its implementing regulations,[140] LAWA cannot force passengers or airlines to utilize one airport over the other. More specifically, federal law prohibits an airport proprietor from unilaterally imposing any restrictions on "access" to an airport by Stage 3 aircraft. Following the phase-out of most noisy Stage 2 aircraft during the 1990s, Stage 3 aircraft comprise essentially all commercial aircraft landing at any U.S. airport. Any Stage 3 restriction is subject to review and approval by the FAA based on strict regulatory criteria that limit the ability to implement any such measures. The FAA strongly discourages any operational limits imposed under Part 161 and prefers and promotes permanent solutions to operational concerns and inefficiencies through capacity improvements. Further, the federal Airline Deregulation Act of 1978 expressly preempted the ability of airport proprietors to control the "price, route or service of an air carrier."[141] The United States Supreme Court has interpreted this prohibition broadly to mean that airports "may not seek to impose their own public policies or theories of ... regulation on the operations of an air carrier."[142] For this reason, an alternative that would have required passengers or airlines to utilize another airport, even one managed by LAWA, is legally infeasible.

Other commentors have suggested that the further development of ONT or PMD would lead to a redistribution of air traffic to those airports and away from LAX. However, the facilities at ONT are already operating below capacity and could support additional activity level even utilizing the existing facilities.[143] Furthermore, as documented below in the discussion of efforts to market and develop air services at PMD, when PMD had an operating certificate and capacity was available, airlines were unable to sustain air service without subsidies provided by the FAA. As a result, LAWA can conclude that the development of new passenger facilities would not induce airlines to relocate air service at either of these airports.

Also, several comments received on the SPAS Draft EIR suggested that regionalization of air travel demand in Southern California should have been included as a project objective for SPAS. Regionalization was not included as a project objective because it is built into the SPAS project description itself. As indicated in Chapter 1 of the SPAS Draft EIR, the SPAS process includes identification of potential amendments to the LAX Specific Plan that, among other things, create conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA.

As discussed in Section 6.2 of the Preliminary LAX SPAS Report, all of the SPAS alternatives have been designed with 153 gates and analyzed at a practical capacity of 78.9 MAP, which is consistent with the planning framework of the LAX Master Plan that was taken into account in the SCAG regional aviation plan (i.e., air aviation element of the RTP). LAWA acknowledges that while the passenger activity projections are based upon the best available evidence and expert opinion, history demonstrates it is possible that over the next ten years, currently unexpected fluctuations in the economy, aviation industry practices, passenger demand, and other known and unknown factors may result in LAX annual passengers increasing (or decreasing) at a different rate than expected. Therefore, in addition to alternatives with physical configurations of no more than 153 gates, the SPAS considers a potential amendment to Section 7.H. of the LAX Specific Plan. The LAX Specific Plan Section 7.H amendment (applicable to all alternatives, including the existing LAX Master Plan) would provide opportunities for adjustments if LAX reaches 75 or 78.9 MAP earlier than expected. This amendment, set forth in detail in

---

140 14 C.F.R. Part 161.

141 49 USC Section 41713(b)(1).

142 Morales v. Trans World Airlines, Inc. (1992) 504 US 374, 384.

143 ONT served 7.2 million passengers in 2005 and 2007, 2.7 million more passengers than were served in 2011.

Chapter 7 of the Preliminary LAX SPAS Report, would address potential variations over time, first by requiring action (where feasible and lawful) to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, second, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 79.9 MAP. This amendment is intended to enhance LAWA's ability to anticipate and plan for the potential for aviation activities at LAX to reach 78.9 and identify appropriate actions to help shift additional growth to other airports in the region, including, in particular, ONT. As discussed in Section 6.2 of the SPAS Draft EIR, to the extent that implementation of the above measure is successful in shifting aviation activity from LAX to other airports such as ONT, the resultant reduction or avoidance of impacts to communities surrounding LAX would be accompanied by the creation or increase of aviation-related impacts to communities around those other affected airports. The nature and extent of such secondary impacts would depend on the type and amount of aviation activity that is shifted and the environmental setting specific to each affected airport. Section 6.2 describes, in general, the types of environmental impacts that could occur; however, any attempt at this time to provide a detailed analysis of changes in impacts at LAX and other affected airports due to a shift in aviation activity would be purely speculative.

LAWA's Participation in Efforts for the Regionalization of Air Travel in Southern California

Certain commentors have inferred that LAWA has not worked to encourage the regionalization of air travel. In fact, LAWA has continuously encouraged the regionalization of aviation traffic by supporting the reconstitution of the Southern California Regional Airport Authority (SCRAA), efforts to initiate air service at Palmdale Regional Airport, and through the development and implementation of market studies, analyses, and strategic plans.

The SCRAA was created in 1984 through a joint powers agreement between the City and County of Los Angeles, and the Counties of Orange, Riverside, and San Bernardino. However, the panel became inactive in 2003. Following the adoption of the LAX Master Plan in 2004, LAWA provided staffing and financial support to the SCRAA as it attempted to reconstitute. In October of 2006, LAWA supported the Chair of the SCRAA, Los Angeles Councilman Bill Rosendahl, with organizational support as SCRAA attempted to develop new governance and membership plans. Following that initial coordination effort, LAWA staff assisted by developing reports for the SCRAA Board of Directors, hosting workshops, and performing outreach to potential SCRAA members. LAWA also supported the hiring of a consultant to assist in the development of governance strategies informed by the potential SCRAA members, decision-makers, and the public. Despite these efforts, with an absence of a consensus on governance and the lack of participation by other regional airport sponsors, the SCRAA has been inactive since 2009.

Furthermore, LAWA has presented and implemented a series of market studies, analyses, and plans on the issue of regionalization since 2006. These reports have been provided to the BOAC, the Los Angeles City Council, and the public, starting on February 5, 2007. The reports contain summaries of aviation industry trends, marketing efforts, and recommendations for policy changes related to the management of LAWA airports. Most recently, reports were given to the Board of Airport Commissioners on this topic on December 11, 2011, May 7, 2012, and September 17, 2012.

LAWA Efforts to Market and Develop Air Service at LA/Ontario International Airport

Certain commentors suggested that LAWA has made insufficient progress in expanding air service at ONT. LAWA has sought to utilize the facilities at Ontario to better distribute aviation activity in the Southern California region. The City of Los Angeles is the owner of ONT, with LAWA being the airport operator. ONT covers approximately 1,700 acres, has two runways, and three terminals with 38 passenger gates (http://lawa.org/welcome_ont.aspx?id=808 accessed on December 16, 2012).

Since becoming part of the City of Los Angeles' regional airport system in 1967, ONT experienced gradual increases in passenger activity levels, from when it first passed the 1 MAP level in 1971 up to a peak of 7.2 MAP in 2007. During that time, LAWA implemented numerous measures to expand and improve airport facilities and operations and encourage airlines and airline passengers to choose ONT for air travel. Such measures include, but are not limited to, the opening of a new runway in 1981 to accommodate wide-body jets, the completion of a $244 million terminal expansion project in 1998, the development of a new ground transportation center in 1999, and the completion of several other improvement projects such as taxiway improvements, parking lot expansions, and airfield security access point improvements. In 2005, LAWA launched the "Fly Ontario" ad campaign aimed at increasing passenger volume at ONT. In 2006, LAWA changed the airport's name to LA/Ontario International Airport in order to increase the airport's visibility and recognition as being part of the Los Angeles regional airport system, particularly as related to travelers seeking to book flights to the Los Angeles area (http://lawa.org/welcome_ont.aspx?id=1364 - Accessed on December 16, 2012).

In 2008, ONT experienced a sharp decline in passenger volume, as did LAX, John Wayne Airport, Bob Hope Airport, and many other airports throughout the state and country, due primarily to the nationwide economic recession and increased fuel prices ("ONT and LAWA Regionalization" Presentation to LAWA Board of Airport Commissioners (BOAC), December 15, 2011). Passenger activity levels at ONT continued to decline over the next several years, dropping to a low of 4.5 MAP in 2011.

In response, LAWA has for several years continued to formulate and implement various initiatives to address issues and concerns regarding activity levels at ONT. The objectives of such initiatives are specifically targeted towards reducing expenses, increasing passenger traffic, and increasing airline activity at ONT. On September 17, 2012, the LAWA BOAC was provided a status update by LAWA staff on the management initiatives and marketing efforts that were outlined for ONT in May 2012. Table 1 summarizes the nature and status of those initiatives and efforts.

Table 1

Summary of 2012 Management Initiatives and Marketing Efforts for ONT

Initiative/Effort	Status
Management Initiative	
1. Reduce Terminal Rates and Freeze Landing Fees	Completed in June as part of FY 2013 budget approval process. Terminal rents reduced by 6%.
2. Reduce Passenger Facility Charge (PFC) Level	Application filed with FAA. PFC to be reduced from $4.50 to $2.00 on January 1, 2013 if approved.
3. Initiate Airline Consortium	Agreement with airlines reached and airlines are drafting documents. Obtain Board approval by first quarter of 2013.
4. Improve Parking Performance	Request for Proposal (RFP) issued for new manager and revenue control system. Proposals due September 27.
5. Rationalize Bus Services	RFP for dedicated rationalized services to be issued in October.
6. Redevelop Concessions Through Single Manager/Operator	ONT-wide concessionaire Draft RFP to be issued for industry comment and input in next 10 days.
7. Further Reduce Headcount and Costs	Since April, a total of 26 additional staff reductions have been implemented.
Marketing Effort	
8. Define New Air Service Incentive Plan	Issued letter to airlines on Aug. 2 proposing to wave terminal rent associated with new air service. Results to Date: Airlines responded that incentive programs do not result in sustained increased service.
9. Develop Cooperative Marketing Plan with Airlines	Issued letter to airlines on Aug. 2 proposing $500,000 for marketing for new routes with a maximum of $5 million to be rate based. Results to Date: Airlines responded with concerns that such an amount would increase the Cost Per Enplanement. Airlines acknowledged need for this but

Table 1

Summary of 2012 Management Initiatives and Marketing Efforts for ONT

Initiative/Effort	Status
	questioned extent and source of funding.
10. Restart Direct Marketing Efforts with Airlines Regarding Air Service	Had meetings with 7 airlines currently serving ONT and with the following airlines: PeopleExpress, jetBlue and Westjet. Results to Date: Non-incumbent airlines expressed interest in air service incentive plan; incumbent airlines expressed little interest in expanding service.
11. Establish Factual Market Research Basis for Future Initiatives	Completed the following: Market capture analysis; Comparative air fare analysis; Focus group interviews; Direct survey of passengers to occur during first two weeks of October. Findings to Date: ONT's fares are consistently lower than Bob Hope Airport and John Wayne Airport but higher than Long Beach Airport; All secondary airports face significant fare competition from LAX; ONT retains a higher percentage of its primary service area passengers than its peers; ONT's primary service area has significantly fewer target households than its peers do; Airlines provide more service to areas with higher incomes;ONT's service area has fewer households with higher income levels; and, to grow ONT traffic, need to draw passengers from outside of ONT's primary service area.

Source: LAWA 2012.

As summarized above, given the actual passenger activity levels at airports throughout the region, LAWA and executive management of the City of Los Angeles have implemented, and will continue to evaluate appropriate measures relative to increased stability and growth of ONT. Such measures are intended to enhance the viability and attractiveness of ONT as a preferred airport for passengers and airlines within the Southern California regional airport system.

LAWA Efforts to Market and Develop Air Service at LA/Palmdale Regional Airport

Some comments assert that LAWA has failed to support efforts to establish air service at LA/Palmdale Regional Airport. PMD is located in the Antelope Valley, in the northeast portion of the City of Palmdale, approximately 60 miles northeast of downtown Los Angeles. These assertions have no basis in fact.

Since the adoption of the LAX Master Plan, LAWA has supported efforts to develop air service at Palmdale Regional Airport (PMD). For example, LAWA worked cooperatively with the "Wheels-Up Palmdale Coalition" to apply for federal grants that would support the establishment of air service at PMD. In August of 2006, the FAA awarded a grant that provided operating subsidies to an air carrier that offered service from PMD, and subsequently to the launch of a new flight operated by United Airlines between PMD and SFO in June of 2007. Although efforts by the U.S. Department of Transportation, LAWA, and the City of Palmdale resulted in more than $238 per passenger subsidy for air service at PMD, United Airlines discontinued flights to PMD after 18 months. ("ONT and LAWA Regionalization" Presentation to LAWA BOAC, December 15, 2011).

TR-SPAS-T-1 Transit/Rail

Introduction

Many comments were received containing questions regarding various modes of mass transportation to the airport, including both rail and bus. This topical response provides a detailed discussion of the assumed roles and background assumptions pertaining to mass transportation modes used in the LAX SPAS Draft EIR and the current state of transit planning relative to LAX.

The SPAS analysis assumed a modest increase in the percentage of airline passengers who would use transit with the improved access provided by the planned passenger conveyance system linking the planned Metro Aviation/Century station to the CTA. While actual ridership may be higher, this assumption resulted in a conservative assessment of the impacts of passenger activity increases on transit systems between 2009 and 2025. Please refer to Response to Comment SPAS-PC00130-329 for additional information on transit trip assumptions.

Background

The Los Angeles County Metropolitan Transportation Authority (Metro) has been actively engaged in planning an expansion of its light rail network throughout the County. Within the vicinity of LAX, Metro is undertaking two key projects: the Metro Crenshaw/LAX Transit Corridor Project, which was approved in 2012 and is now starting construction, and the Airport Metro Connector Project, which is in the conceptual planning stage. The Metro Crenshaw/LAX Transit Corridor Project will extend from Metro's existing Exposition Line at the intersection of Crenshaw Boulevard and Exposition Boulevard to the existing Green Line Aviation/LAX station. This line will include a station at Aviation and Century Boulevards (Aviation/Century station), serving as a stop for both the Green Line and Crenshaw/LAX Transit Corridor Line. With the Airport Metro Connector Project, Metro is considering various alignments to connect the Metro rail system to LAX.[144]

Relationship of SPAS to Metro Crenshaw/LAX Transit Corridor Project

When LAWA's current SPAS planning efforts began, Metro had not yet developed definitive concept plans for projects in the LAX vicinity. Absent definitive plans, the SPAS analysis assumed that the new Crenshaw/LAX Transit Corridor would be constructed east of the airport along the Aviation Boulevard corridor, and that this line would also serve as an extension of the Green Line, which is currently located along the I-105 corridor and turns south just west of Aviation Boulevard. (Currently, transit passengers who wish to access the airport can transfer for free to a LAWA-operated shuttle at the Green Line Aviation/LAX station.) It was assumed that the co-located lines would include a new light rail station to be located north of Century and Aviation Boulevards on the west side of Aviation Boulevard. The new light rail station was assumed to be elevated above the surrounding roadways to accommodate the crossing of Century Boulevard, with the passenger platform oriented in the north-south direction.

As discussed and depicted in Chapter 2 of the SPAS Draft EIR, each of the SPAS alternatives, with the exception of Alternative 4, includes a connection to the planned Metro Aviation/Century station that would provide improved passenger connectivity as compared to the existing service. The SPAS alternatives that include connectivity to regional transit are Alternatives 1, 2, 3, 8 and 9. (Alternatives 5 through 7, which focus on airfield improvements, would only be approved in conjunction with the ground access components associated with Alternatives 1, 2, 8, or 9.) Each of these SPAS alternatives includes one or more new ground access facilities that are intended to offer passengers convenient alternative locations outside of the CTA to be picked up, dropped off, or to park their vehicle before boarding a passenger conveyance system that would provide a direct and more time-certain mode of travel for accessing the CTA as compared with driving the local area roadways.

Alternatives 1, 2, 8, and 9 would all include ground access facilities at Century and Aviation Boulevards in Manchester Square, as well as a new Intermodal Transportation Facility (ITF) between 96th and 98th Streets, and between approximately Vicksburg Avenue and Airport Boulevard. Under Alternatives 1 and 2, parking would be provided in Manchester Square. Under Alternatives 8 and 9, Manchester Square would be developed with a Consolidated Rent-A-Car (CONRAC) facility as well as parking. The passenger conveyance system proposed in Alternatives 1, 2, and 8 would employ a busing operation on a dedicated, elevated busway to transport passengers between these facilities and the CTA. Within the CTA, the buses would travel in mixed flow traffic. Under Alternative 9, an Automated People Mover

[144] Los Angeles County Metropolitan Transportation Authority, Revised Planning and Programming Committee Report, Metro Green Line to LAX, April 18, 2012.

(APM) would be used instead of a busway. Alternative 3 includes a Ground Transportation Center (GTC) in Manchester Square, an Intermodal Transportation Center (ITC) in the area known as Continental City at Aviation Boulevard and Imperial Highway, and a CONRAC in the Lot C area. Alternative 3 includes two separate APM systems: one APM would convey passengers between the ITC, CONRAC, and CTA, while a second APM would transport passengers between the GTC and the CTA. Under Alternative 3 as originally planned as part of the approved LAX Master Plan (i.e., Alternative D), an elevated pedestrian bridge would link the ITC to the Metro Green Line Aviation/LAX station, which at the time was the closest existing or planned transit station to LAX. With the now-planned transit station at Century and Aviation Boulevards, Alternative 3 would provide connectivity with the new transit station as well.

Both passenger conveyance systems defined in SPAS Alternatives 1, 2, 3, 8, and 9 assume a pedestrian connection would be provided for passengers between LAWA's APM or busway and the planned Metro Aviation/Century station. Additionally, SPAS Alternatives 1, 2, 8, and 9 assume that LAWA's future conveyance system connecting Manchester Square and the planned Metro Aviation/Century station to the CTA would include a stop at the proposed ITF, while Alternative 3 would include a stop at the proposed CONRAC, which in this alternative would be located along 98th Street. These stops could serve as a connection point between the airport conveyance system and Metro's current transit bus depot located at Lot C, as well as a possible future Metro rail line serving the Lincoln or Sepulveda Boulevard corridors.

Recent coordination between LAWA and Metro indicates that Metro's current concept planning is consistent with the transit-related assumptions included in the SPAS Draft EIR with the exception of the location of the planned light rail station. Metro's current plans, which have evolved as the agency continues to move forward, shift the new light rail station to the south and locate it above Century Boulevard.[145] This location differs slightly from the location depicted in the figures provided for each alternative in Chapter 2 of the SPAS Draft EIR, in which the station was depicted as being slightly north of Century Boulevard on the west side of Aviation Boulevard. While the location of the light rail station has changed, the transit line remains planned within the existing right-of-way along the west side of Aviation Boulevard. The new light rail transit line was included in the study area travel mode. Because the connectivity with the planned Metro light rail station was evaluated at a program level in the SPAS Draft EIR, the slight modification to the planned station location does not result in new or substantially more severe significant environmental impacts, or change the conclusions of the impact analyses completed for the SPAS Draft EIR.

Relationship of SPAS to Airport Metro Connector Project

Metro is currently examining ways to connect the regional rail system to LAX in order to provide its customers with improved connectivity to the airport. Metro has completed an Alternatives Analysis Report for the Airport Metro Connector Project[146] and has narrowed the number of alternatives to four build alternatives. These alternatives are depicted in Figure 1 and described below.

- Direct Light Rail Transit (LRT) Branch (extension of the Metro Green Line and/or Metro Crenshaw/LAX Transit Corridor) into the CTA, providing Metro Green Line passengers with a direct connection to the CTA without requiring a transfer. Passengers on the Crenshaw/LAX Transit Corridor line would be required to transfer at the Aviation/Century Station before being transported to the CTA. The Airport Connector alternative would branch off the Crenshaw/LAX Transit Corridor just south of Metro's planned maintenance yard at W. Arbor Vitae Street and Bellanca Avenue, with a stop at the proposed ITF before continuing into the CTA. This Airport Metro Connector alternative is not included in any of the SPAS alternatives.

---

145 Los Angeles County Metropolitan Transportation Authority, Crenshaw/LAX Transit Corridor, Volume 7: Project Definition Drawings, Part 7.1 - Harbor Subdivision Segment Fixed Facilities, June 1, 2012.

146 Los Angeles County Metropolitan Transportation Authority, Metro Green Line to LAX Alternatives Analysis Report, April 2012, Available: http://www.metro.net/projects_studies/green_line_lax/images/mgllax_aa_report__3preliminary_definition_of_alternatives.pdf, accessed November 14, 2012.

- Modified Light Rail Transit Trunk (Through LAX), which would connect to the Crenshaw/LAX Transit Corridor south of the planned maintenance yard, with a stop at the ITC, following a similar alignment to the CTA as described above for the Direct LRT Branch. West of Sepulveda Boulevard, this trunk line would pass through the CTA underground with a single station serving LAX. The line would continue south, remaining underground until passing Imperial Highway where the line would connect with the Green Line near E. Maple Avenue, north of the Mariposa Station. This Airport Metro Connector alternative is not included in any of the SPAS alternatives.
- An airport circulator using an APM system (similar to the proposed APM system in SPAS Alternative 9) connecting to Metro's service at the planned Aviation/Century station. The alignment for this system would be on a dedicated, elevated guideway along 98th Street, and would include a stop at the proposed ITF prior to entering the CTA. This system is conceptually similar to the proposed APM system under SPAS Alternative 9.
- An airport circulator using a Bus Rapid Transit (BRT) system on a dedicated, elevated busway to transport passengers between the airport's facilities outside of the CTA (conceptually similar to the proposed busway system in SPAS Alternatives 1, 2, and 8), including the planned Metro Aviation/Century station, with the CTA. As with the busing operation proposed in SPAS Alternatives 1, 2, and 8, buses would mix with other vehicles to circulate around the CTA, with a stop at each terminal.

As noted above, when LAWA's planning efforts for SPAS began, and when preparation of the SPAS Draft EIR was initiated, Metro had not yet developed definitive concept plans for projects in the LAX vicinity. Therefore, only two of the alternatives identified above, the airport circulator using an APM system and the airport circulator using a BRT, were considered in the SPAS Draft EIR as project elements. The Airport Metro Connector Project, including all four alternatives, is considered in the SPAS Draft EIR as a cumulative project. Metro is currently performing technical studies of the four alternatives identified above as well as additional alternatives analysis,[147] with the aim of initiating environmental analysis following the completion of SPAS. The relationship of each of the Metro alternatives to the SPAS alternative, should one be selected, will be evaluated in project planning and environmental studies prepared by Metro for the Airport Metro Connector Project. These studies will address modifications to airport facilities, including SPAS-related facilities, that would be required, if any, to accommodate each of the Metro alternatives being evaluated. Should a SPAS alternative be selected, further project-level review of ground transportation and terminal elements would be conducted by LAWA for individual improvements and modifications. This level of review would include environmental analysis that incorporates all details about the Airport Metro Connector Project known at that time.

Collaboration between LAWA and Metro

LAWA and Metro will be coordinating throughout the planning of the Airport Metro Connector Project and implementation of the Metro Crenshaw/LAX Transit Corridor Project. As stated in the Metro Planning and Programming Committee Report on the Regional Airport Connectivity Plan, dated November 14, 2012,[148] in support of the Airport Metro Connector Project, Metro and LAWA have "formed a joint task force to develop a mutually agreeable solution to providing rail access at LAX. This task force could eventually work on joint funding strategies to implement the mutually agreed upon solution."

LAWA is committed to working collaboratively with Metro to create a robust connection between LAX and the Metro rail system. As stated in a letter from LAWA to Metro dated October 12, 2012 (Attachment B of the November 2012 Metro Planning and Programming Committee Report: Regional Airport Connectivity Plan), LAWA is dedicated to accommodating all existing and future airport-related traffic and delivering an

147 Los Angeles County Metropolitan Transportation Authority, Report to Board of Directors: Airport Metro Connector Project, July 20, 2012.

appropriate level of service for all transportation modes at LAX. In response to Metro's plans, LAWA has accelerated its work to ensure the best interface and connection to the planned Metro Aviation/Century light rail station. LAWA is convening a series of workshops designed to facilitate collaboration between Metro staff, LAWA staff, and technical experts to define real and achievable outcomes for consideration by Metro and LAWA decision-makers with the goal of designing public transit systems that work for LAX, for Metro, and for the traveling public. To the extent that these efforts further refine connectivity between LAX and the Metro transit system as identified in the SPAS Draft EIR, this collaboration will inform project-level planning, design, and environmental analysis for individual SPAS projects. To the extent that such efforts represent changes in the connectivity between LAX and the Metro transit system from that evaluated in the SPAS Draft EIR, as noted above, the relationship of such solutions to LAX in general, and to the SPAS alternatives in particular, would be addressed in the Metro planning process and related environmental analyses.

Comment:

This is in response to your request for comments on the Public Review and Comment document, Draft Environmental Impact Report (EIR) Review for the Los Angeles International Airport (LAX) Specific Plan Amendment Study (SPAS).

Please review the current effective countywide Flood Insurance Rate Maps (FIRMs) for the County of Los Angeles (Community Number 065043) and City of Los Angeles (Community Number 060137), Maps revised September 26, 2008. Please note that the City of Los Angeles, Los Angeles County, California is a participant in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.

A summary of these NFIP floodplain management building requirements are as follows:

- All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and Al through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.

- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any development must not increase base flood elevation levels. The term development means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials. A hydrologic and hydraulic analysis must be performed prior to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.

- All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.

- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA

for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at http://www.fema.gov/business/nfip/forms.shtm.

Please Note:

Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community's floodplain manager for more information on local floodplain management building requirements. The City of Los Angeles floodplain manager can be reached by calling Gary L. Moore, City Engineer, at (213) 485-4935. The Los Angeles County floodplain manager can be reached by calling George De La O, Senior Civil Engineer, at (626) 458-7155.

Response:

None of the project components associated with any of the SPAS alternatives are located within a floodplain, as mapped and identified under the National Flood Insurance Program of the Federal Emergency Management Agency.1 For additional details regarding flooding, please see Section 4.8 of the SPAS Draft EIR.

1. Flood Insurance Rate Map (FIRM) Panels 06037C1754F, 06037C1760F, 06037C1770F, and 06037C1780F. Available: https://msc.fema.gov/webapp/wcs/stores/servlet/FemaWelcomeView?storeId=10001&catalogId=10001&langId=-1.

SPAS-AF00002 Goebel, Karen A U.S. Department of the Interior Fish and Wildlife Service 10/10/2012

SPAS-AF00002-1

Comment:

The U.S. Fish and Wildlife Service (Service) has reviewed the Draft Environmental Impact Report (DEIR) for the above-referenced project, dated July 2012. In 2004, we issued a biological opinion addressing impacts to the federally endangered Riverside fairy shrimp (Streptocephalus woottoni, "RFS") and El Segundo blue butterfly (Euphilotes battoides allyni "ESB") in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.), based on our review of Alternative D of the Draft Environmental Impact Statement/Environmental Impact Report (EIR/EIS) for the Los Angeles World Airports Master Plan for LAX. The Specific Plan Amendment Study has been prepared to satisfy a lawsuit settlement regarding approval of the LAX Master Plan, and the study involves the identification and evaluation of potential alternative designs, technologies, and configurations that could be implemented consistent with the LAX Master Plan Program.

The primary mission of the Service is to "work with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people." Specifically, the Service administers the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), and provides support to other Federal agencies in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).

As indicated above, our prior biological opinion addressed proposed impacts to RFS and ESB anticipated under one of four primary alternatives considered for the LAX Master Plan. The current DEIR is tiered off of the prior EIR/EIS (i.e., impacts and mitigation measures proposed under the prior impact analysis are discussed as part of the baseline) and addresses impacts associated with approximately nine different proposed alternatives that include various airfield, terminal, and ground access improvements. Components of these alternatives are interchangeable such that airfield and terminal improvements from one alternative could be implemented in association with the ground access improvements proposed under another alternative. Due to the inter-relationship of the Specific

Plan Amendment Study with implementation of programmatic alternatives identified in the LAX Master Plan and our prior biological opinion, we have the following specific comments and concerns:

Response:

The comment is noted. It should be noted that the SPAS Draft EIR is not tiered off of the LAX Master Plan EIS/EIR, although the LAX Master Plan Final EIR is incorporated by reference (see page 1-105 in Section 1.7 of the SPAS Draft EIR). Please see Responses to Comments SPAS-AF00002-2 and SPAS-AF00002-3 below.

SPAS-AF00002-2

Comment:

1. The DEIR indicates that 2.69 acres of disturbed southern dune scrub occur on the northerly edge of the north airfield, an area that is proposed to be permanently removed in association with construction staging areas and airfield improvements from most, if not all, of the alternatives. This area is noted to be degraded and surrounded by urban development but is also characterized as supporting various indicator species of this plant community, including coast buckwheat (Eriogonum parvifolium), the known host plant of the endangered ESB. Although the DEIR discusses recent survey efforts for ESB within the El Segundo Dunes and ESB Preserve west of Pershing Drive, we were not able to determine what survey efforts have been performed within the 2.69 acres of disturbed southern dune scrub in the vicinity of the airfield. Because ESB is vagile with potential to colonize suitable habitat adjoining the ESB Preserve, we request that the DEIR identify what survey efforts have been performed at this location. If no recent survey efforts (i.e., within the last year) have been performed at this location, then we recommend that appropriately timed updated surveys for ESB be performed so that the potential impacts to ESB from removal of this habitat area can be properly disclosed and addressed.

Response:

The description of the 2.69-acre Disturbed Southern Dune Scrub on page 4-179 of the SPAS Draft EIR inadvertently included coast buckwheat (Eriogonum parviflorum), which is the larval host plant for the El Segundo blue butterfly (Euphilotes battoides allyni), and bush lupine (Lupinus chamissonis) in the list of species observed; however, neither of these species is present. Additionally, several native and non-native species were inadvertently omitted, none of which are larvel host plants for the El Segundo blue butterfly. Native species inadvertently omitted, but which occur within the subject 2.69-acre area of disturbed southern dune scrub, include deerweed (Acmispon glaber), beach evening primrose (Camissonia cheiranthifolia), annual bur-sage (Ambrosia acanthicarpa), and white everlasting (Pseudognaphalium canescens). Non-native species inadvertently omitted, but which occur within the subject area, include wavy sea lavender (Limonium perezii), filaree (Erodium spp.), pampas grass (Cortadaria selloana), fountain grass (Pennisetum setaceum), veldt grass (Ehrharta spp.), hottentot fig (Carpobrotus edulis), English plantain (Plantago lanceolata), and wild oats (Avena fatua). These findings were confirmed in a general biological survey of the 2.69-acre parcel by Glenn Lukos Associates, conducted on November 7, 2012. Accordingly, page 4-179 of the SPAS Draft EIR has been revised. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. The revisions to page 4-179 of the SPAS Draft EIR do not change the classification of the 2.69-acre area as Disturbed Southern Dune Scrub because these species are consistent with this classification.

No surveys for the federally endangered El Segundo blue butterfly have been conducted within the 2.69 acres of disturbed southern dune scrub identified by the SPAS Draft EIR, either as part of the SPAS Draft EIR survey efforts or any other survey program. No surveys are necessary as coast buckwheat, the larval host plant for the El Segundo blue butterfly, does not occur.

SPAS-AF00002-3

Comment:

2. The DEIR indicates that the relocation of navigational aids proposed in association with implementation of Alternatives 1 through 7 will result in impacts to undeveloped areas within the Los Angeles/El Segundo Dunes, including impacts ranging between 0.33 to 1.03 acres of disturbed southern foredune vegetation, depending on the alternative. Because ESB is anticipated to be impacted in association with impacts to the disturbed southern foredune plant community, the DEIR proposes to

implement LAX Master Plan Mitigation Measures MM-BC-1, MM-ET-3, and MM-ET-4 to reduce the anticipated impacts to this species to a level below significance. Mitigation Measure MM-ET-4 makes specific reference to the Service's April 2004 biological opinion addressing the LAX Master Plan and references a number of conservation measures that were committed to in association with that biological opinion.

Among the conservation measures that were included as the basis for our biological opinion was the commitment to limit activities associated with navigational aid development to the existing roads and proposed impact areas depicted in Figure S4.14-1 and F4.14-1, Location of Proposed Navigational Aids-Alternative D, in Section 4.14, Coastal Zone Management and Coastal Barriers, of the Supplement to the Draft EIS/EIR and Final EIS/EIR, respectively. Based on this commitment we anticipated that construction of the proposed navigational aids would permanently convert 0.25 acre of the El Segundo sand dune complex to structures supporting the navigational lighting system in an area where there are very few coast buckwheat plants. Therefore, we anticipated that construction of the navigational lighting system would result in the removal and translocation of two coast buckwheat plants, causing a small but unquantifiable number of ESB pupae being killed as a result of ground disturbance and the loss of the food source from these plants. Because the DEIR suggests that implementation of any of Alternatives 1 through 7 will impact more disturbed southern foredune vegetation than was addressed in our biological opinion, it appears that the amount or extent of take that was anticipated in association with the removal of two coast buckwheat plants could be exceeded.

As provided for in 50 CFR § 402.16, reinitiation of formal consultation is required when an action proposed by a Federal agency is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in the original biological opinion. Because there appears to be a discrepancy between the extent of habitat impact that was anticipated to be removed in association with construction of navigational lighting in our biological opinion and implementation of the various alternatives presented in the DEIR, we request that the DEIR be revised to include a discussion of consistency of each of the potential alternatives with the analysis of the biological opinion. For those alternatives anticipated to exceed the loss or removal of two coast buckwheat plants, the DEIR should identify the need for further consultation with the Service prior to implementation of those alternatives.

Response:

As discussed in Sections 1.4 and 4.3 of the SPAS Draft EIR, relocation of navigational aids in the Los Angeles/El Segundo Dunes associated with SPAS Alternatives 1 through 7 would not result in significant impacts to the federally endangered El Segundo blue butterfly (Euphilotes battoides allyni). Impacts to Disturbed Southern Foredune (which provides habitat for El Segundo blue butterfly) associated with relocation of navigational aids would be significant but mitigable to a level that is less than significant (see Table 4.3.6 of the SPAS Draft EIR). As noted on page 4-170 of the SPAS Draft EIR, the project alternatives are conceptual in nature, and the full scope of the impacts cannot be ascertained at this level of planning. Impacts to El Segundo blue butterfly habitat in the Los Angeles/El Segundo Dunes for each alternative were estimated based upon the sizes of the pads, roads, localizer antennae, and ancillary facilities associated with LAX Master Plan Alternative D. These estimated impacts were refined based upon the updated impact calculations provided by Appendix A-3a, Coastal Zone Management Act Consistency Determination, of the LAX Master Plan Final EIR. Nevertheless, the impact calculations for El Segundo blue butterfly habitat (disturbed southern foredune vegetation) remain conceptual at this level of planning, and final engineering analysis may determine impacts to be greater or lesser. As explained on page 1-18 in the SPAS Draft EIR, Alternative 3 represents what would reasonably be expected to occur in the foreseeable future if the LAX Master Plan (i.e., "Alternative D") and all of the LAX Master Plan improvements were implemented. Please note that, as indicated on page 4-289 of the SPAS Draft EIR, LAX Master Plan Mitigation Measures MM-BC-1, MM-ET-3, and MM-ET-4 are relevant to the impact analysis for biological resources for SPAS Alternatives 1 through 7 and would ensure that impacts to the El Segundo blue butterfly and the Habitat Restoration Area would be less than significant.

The commentor requests that the SPAS Draft EIR be revised to discuss the consistency of each of the individual alternatives with the analysis in the U.S. Fish and Wildlife Service's (USFWS) April 2004 biological opinion. However, for the reasons stated above, additional analysis would be speculative prior to completion of final project engineering design.

The commentor additionally states that "reinitiation of formal consultation is required when an action proposed by a Federal agency is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in the original biological opinion." However, the SPAS Draft EIR was released by the City of Los Angeles, and no action is being proposed by a Federal agency at this time. If the City of Los Angeles certifies the Final EIR and approves a SPAS alternative other than Alternative 3, the Federal Aviation Administration (FAA), in connection with review under NEPA, would determine whether previously authorized incidental take would exceed the incidental take authorized by the April 2004 biological opinion, and whether consultation must be reinitiated.

SPAS-AS00001 Morgan, Scott State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit 8/6/2012

SPAS-AS00001-1

Comment:

The Lead Agency has corrected some information regarding the above-mentioned project. Please see the attached materials for more specific information. All other project information remains the same.

SUBJECT: Printable Files for the Draft Environmental Impact Report (DEIR) for the Los Angeles International Airport (LAX) Specific Plan Amendment Study (SPAS)

To Whom It May Concern:

You recently received a DVD containing the Draft EIR for the LAX Specific Plan Amendment Study. The DVD included a file named "LAX SPAS DEIR Appendix A NOP-Scoping Part 1 of 2." While the subject file is viewable on a computer screen, the file on the disk was inadvertently encrypted in a manner that does not enable it to print.

Should you desire a printable version of the file, one is available on the project website, laxspas.org, at the following link:

http://laxspas.org/Draft_EIR.aspx

If you prefer to receive a replacement DVD, please contact me at 424/646-5179 or dalvarez@lawa.org.

Response:

The comment is noted. A printable version of Appendix A NOP-Scoping Part 1 of 2 was posted at laxspas.org on July 30, 2012.

SPAS-AS00002 Singleton, Dave State of California, Native American Heritage Commission 8/13/2012

SPAS-AS00002-1

Comment:

The Native American Heritage Commission (NAHC), the State of California 'Trustee Agency' for the protection and preservation of Native American cultural resources pursuant to California Public Resources Code §21070 and affirmed by the Third Appellate Court in the case of EPIC v. Johnson (1985: 170 Cal App. 3rd 604).

This letter includes state and federal statutes relating to Native American historic properties or resources of religious and cultural significance to American Indian tribes and interested Native

American individuals as 'consulting parties' under both state and federal law. State law also addresses the freedom of Native American Religious Expression in Public Resources Code §5097.9. This project is also subject to California Government Code Section 65352.3 et seq. This project is also subject to California Government Code Section 65352.3 et seq. This project is also subject to California Government Code Section 65352.3 et seq.

The California Environmental Quality Act (CEQA - CA Public Resources Code 21000-21177, amendments effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the CEQA Guidelines defines a significant impact on the environment as 'a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ... objects of historic or aesthetic significance." In order to comply with this provision, the lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. The NAHC recommends that the lead agency request that the NAHC do a Sacred Lands File search as part of the careful planning for the proposed project.

The NAHC "Sacred Sites,' as defined by the Native American Heritage Commission and the California Legislature in California Public Resources Code §§5097.94(a) and 5097.96. Items in the NAHC Sacred Lands Inventory are confidential and exempt from the Public Records Act pursuant to California Government Code §6254 (r).

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries of cultural resources or burial sites once a project is underway. Culturally affiliated tribes and individuals may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). We strongly urge that you make contact with the list of Native American Contacts on the attached list of Native American contacts, to see if your proposed project might impact Native American cultural resources and to obtain their recommendations concerning the proposed project. Pursuant to CA Public Resources Code § 5097.95, the NAHC requests cooperation from other public agencies in order that the Native American consulting parties be provided pertinent project information. Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e). Pursuant to CA Public Resources Code §5097.95, the NAHC requests that pertinent project information be provided consulting tribal parties, including archaeological studies. The NAHC recommends avoidance as defined by CEQA Guidelines §15370(a) to pursuing a project that would damage or destroy Native American cultural resources and Section 2183.2 that requires documentation, data recovery of cultural resources.

Furthermore, the NAHC if the proposed project is under the jurisdiction of the statutes and regulations of the National Environmental Policy Act (e.g. NEPA; 42 U.S.C. 4321-43351). Consultation with tribes and interested Native American consulting parties, on the NAHC list, should be conducted in compliance with the requirements of federal NEPA and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 et seq), 36 CFR Part 800.3 (f) (2) & .5, the President's Council on Environmental Quality (CSQ, 42 U.S.C 4371 et seq. and NAGPRA (25 U.S.C. 3001-3013) as appropriate. The 1992 Secretary of the Interiors Standards for the Treatment of Historic Properties were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The aforementioned Secretary of the Interior's Standards include recommendations for all 'lead agencies' to consider the historic context of proposed projects and to ''research" the cultural landscape that might include the area of potential effect.'

Confidentiality of "historic properties of religious and cultural significance" should also be considered as protected by California Government Code §6254(r) and may also be protected under Section 304 of he NHPA or at the Secretary of the Interior discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C., 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APEs and possibility threatened by proposed project activity.

Furthermore, Public Resources Code Section 5097.98, California Government Code §27491 and Health & Safety Code Section 7050.5 provide for provisions for inadvertent discovery of human remains mandate the processes to be followed in the event of a discovery of human remains in a project location other than a 'dedicated cemetery'.

To be effective, consultation on specific projects must be the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors, in the opinion of the NAHC. Regarding tribal consultation, a relationship built around regular meetings and informal involvement with local tribes will lead to more qualitative consultation tribal input on specific projects.

Finally, when Native American cultural sites and/or Native American burial sites are prevalent within the project site, the NAHC recommends 'avoidance' of the site as referenced by CEQA Guidelines Section 15370(a).

Response:

As stated on page 4-363 in Section 4.5.3.3 of the SPAS Draft EIR, LAWA initiated Senate Bill (SB) 18 consultation with local Native American groups and individuals in December 2011 in coordination with the California Native American Heritage Commission (NAHC) seeking their assistance in the identification of traditional tribal "cultural places." As part of this effort, LAWA also requested a Sacred Lands File (SLF) search of the project site. The NAHC provided an SB 18 Contact List and the results of the SLF search in a letter to PCR Services Corporation dated December 7, 2011. The letter indicated that "Native American cultural resources were identified in the project site" and included the contact information of five individuals for consultation purposes.

On December 19, 2011 PCR Services Corporation, on behalf of LAWA, submitted "request to consult" letters to the five Native American contacts on the SB 18 Contact List. LAWA received responses from Mr. Sam Dunlap (Chairperson of the Gabrielino Tongva Nation) and Mr. Andy Salas (Chairman of the Gabrielino Band of Mission Indians) that highlighted the potential for the project site to contain Native American cultural resources. Both Mr. Dunlap and Mr. Salas recommended the presence of a Native American monitor during construction excavations associated with the project given the potential to encounter Native American cultural resources. LAWA submitted responses to Mr. Dunlap and Mr. Salas on May 15, 2012. In the letters, LAWA summarized recent archaeological construction monitoring efforts and highlighted LAWA's conformance to the Archaeological Treatment Plan document, which stipulates the requirement for Native American construction monitoring after Native American cultural resources are encountered.

The Native American consultation documentation is provided in Appendix B and Appendix E-1 of the SPAS Draft EIR.

SPAS-AS00003 — Morgan, Scott — State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit — 9/11/2012

SPAS-AS00003-1

Comment:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on September 10, 2012, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Response:

The comment is noted. It is further noted that this letter included as an attachment a copy of the comment letter on the SPAS Draft EIR that was submitted separately by the Native American Heritage Commission (SPAS-AS00002); please refer to the response to comment letter SPAS-AS00002.

SPAS-AR00001 Nadler, Jonathan Southern California Association of Governments 10/9/2012

SPAS-AR00001-1

Comment:

Thank you for submitting the Draft Environmental Impact Report for the Los Angeles International Airport Specific Plan Amendment Study (SPAS) to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and as such is responsible for preparation of the Regional Transportation Plan including its Sustainable Communities Strategy component pursuant to SB 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.1 Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of the regional goals and policies in the RTP/SCS.

SCAG staff has determined that the proposed project is regionally significant per CEQA Guidelines, Sections 15125 and 15206 and evaluated this project based on the goals of SCAG's 2012-2035 Regional Transportation Plan/Sustainable Community Strategy.

When available, please send a copy of the Final Environmental Impact Report to the attention of Pamela Lee at SCAG, 818 West 7th Street, 12th floor, Los Angeles, California, 90017. If you have any questions regarding the attached comments, please contact Pamela Lee at (213) 236-1895 or leep@scag.ca.gov. Thank you.

1 SB 375 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows for certain CEQA streamlining for projects consistent with the RTP/SCS. Lead agencies (including local jurisdictions) maintain the discretion and will be solely responsible for determining "consistency" of any future project with the SCS. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a finding of consistency under SB 375 for purposes of CEQA streamlining.

Response:

The comment is noted. Please see Responses to Comments SPAS-AR00001-2 through SPAS-AR00001-4 below. A copy of the Final EIR will be sent to the Southern California Association of Governments at least 10 days prior to certification of the Final EIR. The Final EIR will also be available at www.laxspas.org.

SPAS-AR00001-2

Comment:

COMMENTS ON THE ENVIRONMENTAL IMPACT REPORT FOR THE LOS ANGELES INTERNATIONAL AIRPORT SPECIFIC PLAN AMENDMENT STUDY
[SCAG NO.I20120136]

SUMMARY

Based on SCAG staff review, the proposed project supports the SCAG 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), where applicable.

2012-2035 RTP/SCS

The 2012-20135 RTP/SCS links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitations (see http://rtpscs.scag.ca.gov). The goals included in the 2012 RTP/SCS, listed below, may be pertinent to the proposed project.

2012-2035 RTP/SCS GOALS

RTP/SCS G1: Align the plan investments and policies with improving regional economic development and competitiveness

RTP/SCS G2: Maximize mobility and accessibility for all people and goods in the region

RTP/SCS G3: Ensure travel safety and reliability for all people and goods in the region

RTP/SCS G4: Preserve and ensure a sustainable regional transportation system

RTP/SCS G5: Maximize the productivity of our transportation system

RTP/SCS G6: Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking)

RTP/SCS G7: Actively encourage and create incentives for energy efficiency, where possible

RTP/SCS G8: Encourage land use and growth patterns that facilitate transit and non-motorized transportation

RTP/SCS G9: Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies

The 2012-2035 RTP/SCS also contains regional aviation policies (http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_Aviation.pdf), including Airport and Land Use Compatibility and Environmental Impacts policies.

2012-2035 RTP/SCS Regional Aviation Policies
III.A. Airport and Land Use Compatibility and Environmental Impacts Regional Aviation Policies

- Increased coordination between airport planning and land use planning on both regional and local levels should be promoted
- Regional support and coordination should be extended to the region's Airport Land Use Commissions
- Information on aviation environmental "best practices" should be shared and disseminated on a regional level
- Mechanisms for promoting cleaner and quieter aircraft at the region's airports should be identified and supported

The proposed project is listed in SCAG's 2012-2035 RTP/SCS, Aviation and Airport Ground Access Report Appendix, as the LAX Specific Plan 'Yellow Light Projects'.

The adopted 2012-2035 RTP/SCS's includes total regional and LAX air passenger demand forecasts for 2035 of 145.9 million of annual passengers (MAP) and 78.9 MAP, respectively.

SCAG Staff Comments
The proposed Los Angeles International Airport Specific Plan Amendment is consistent with SCAG's 2012-2035 RTP/SCS air passenger demand forecast of 78.9 MAP.

Chapter 4.9 (Land Use and Planning) and Appendix I (Land Use and Planning) of the proposed project Draft EIR analyze, where applicable, each project alternative's consistency with SCAG's 2012-2035 RTP/SCS Airport Land Use Compatibility and Environmental Impacts regional aviation policies, as well as SCAG's 2004 Compass Blueprint principles (which are precursors to the mobility and sustainability goals in the 2012-2035 RTP/SCS). The proposed project's Final EIR should clarify the information in Chapter 4.9 and Appendix I to also specifically address the 2012-2035 RTP/SCS goals listed above, where applicable.

Response:

The comment regarding the project supporting the 2012-2035 RTP/SCS is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

Section 4.9.3 of the SPAS Draft EIR discusses the goals of the Southern California Association of Governments (SCAG) 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which were also considered in relation to each of the nine proposed SPAS alternatives, in Section 4.9.6. A consistency evaluation of RTP/SCS Aviation and Ground Access Appendix (AAGA Appendix) aviation-specific policies was also conducted for each alternative and included in Appendix I-1 of the SPAS Draft EIR.

To address SCAG's request to specifically address Goals 1 through 9 of the RTP/SCS in the Final EIR, an addition to the SPAS Draft EIR, Table 1 analyzes the consistency of the SPAS alternatives with the nine goals of the RTP/SCS.

Table 1

Comparison of the LAX SPAS Alternatives to the SCAG 2012-2035 RTP/SCS Goals

Goal	Comparison
Goal 1. Align the plan investments and policies with improving regional economic development and competitiveness.	Consistent: SPAS would support the goal of promoting the alignment of plan investments with the improvement of regional and economic development and competitiveness, as development of SPAS would include major airfield, terminal, and ground access improvements which would upgrade the regional air transportation system. Construction of major airfield, terminal and ground access improvements would foster economic development associated with LAX, which plays an important role in the Southern California economy through employment, generation of taxes and other revenue, and by facilitating the movement of people, goods, and services.

Table 1

Comparison of the LAX SPAS Alternatives to the SCAG 2012-2035 RTP/SCS Goals

Goal	Comparison
Goal 2. **Maximize the mobility and accessibility for all people and goods in the region.**	Consistent: SPAS would maximize the mobility and accessibility for all people and goods in the region, as it would improve mobility for residents by constructing major ground access improvements and by providing transit connectivity. Such improvements include the modification of Sky Way, parking within Manchester Square, and development of an elevated/dedicated busway providing connectivity to the CTA, the ITF, the future Metro LAX/Crenshaw Light Rail Transit Station, and other public transit. New airfield and terminal improvements, including redesigned airport entry roadways, would provide more convenient access to air transportation services, as well as increase the efficiency of the region's air transportation system. These and other improvements, as described within each of the SPAS alternatives, would encourage transportation investments, transit-oriented development, and the promotion of a variety of travel choices.
Goal 3. **Ensure travel safety and reliability for all people and goods in the region.**	Consistent: This goal would be supported as SPAS includes enhancements in the safety and efficiency of the airfield that promote greater travel safety. The reliability of travel for people and movement of goods would also be supported by the proposed major airfield, terminal, and ground access improvements.
Goal 4. **Preserve and ensure a sustainable regional transportation system.**	Consistent: SPAS would be consistent with Goal 4, as it would preserve and ensure a sustainable regional transportation system by developing airfield, terminal, and ground access improvements, such as redesigned airport entry roadways, the modification of Sky Way, parking within Manchester Square, and development of an elevated/dedicated busway providing connectivity to the CTA, the ITF, the future Metro LAX/Crenshaw Light Rail Transit Station, and other public transit. Development of major ground access improvements would be focused in an existing urban center, as the ground access improvements would offer alternative means of travel to and from LAX and other areas, thereby reducing vehicle miles traveled. Furthermore, airfield, terminal, and other facility improvements would be designed in compliance with LAWA's Sustainability Plan, thereby implementing strategies which use resources efficiently and utilize "green" development techniques, as further described in Section 4.6, of the SPAS Draft EIR. In addition, development of the proposed airfield, terminal and ground access improvements would be undertaken following other environmental best practices such as those required through implementation of LAX Master Plan commitments, LAX Master Plan mitigation measures, and the Community Benefits Agreement, further demonstrating consistency with Goal 4.
Goal 5. **Maximize the productivity of our transportation system.**	Consistent: SPAS would be consistent with Goal 5, as it would maximize the productivity of our transportation system by developing major airfield, terminal, and ground access improvements. Productivity would be achieved under Goal 5 for many of the same reasons described in the above-discussed RTP/SCS Goals, since the major airfield, terminal, and ground access improvements would improve the current transportation and transit systems around and within LAX. New airfield and terminal improvements, including redesigned airport entry roadways, would provide more convenient access to air transportation services, as well as increase the efficiency of the region's air transportation system. These improvements would encourage transportation investments, transit-oriented development and the promotion of a variety of travel choices.
Goal 6. **Protect the environment and health of our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking).**	Consistent: SPAS would be consistent with Goal 6, as it would protect the environment and the health of residents by developing major airfield, terminal, and ground access improvements, such as the development of an elevated/dedicated busway providing connectivity to the CTA, the ITF, the future Metro LAX/Crenshaw Light Rail Transit Station, and other public transit. Development of major ground access improvements would be focused in an existing urban center, as the ground access improvements would offer alternative means of travel to and from LAX and other areas, thereby reducing vehicle miles traveled. Furthermore, airfield, terminal, and other facility improvements would be designed in compliance with LAWA's Sustainability Plan, thereby implementing strategies which use resources efficiently and utilize "green" development techniques, as further described in Section 4.6 of the SPAS Draft EIR.

Table 1

Comparison of the LAX SPAS Alternatives to the SCAG 2012-2035 RTP/SCS Goals

Goal	Comparison
Goal 7. Actively encourage and create incentives for energy efficiency, where possible.	Consistent: SPAS would be consistent with Goal 7, as it would encourage and create incentives for energy efficiency, where feasible. Development of major ground access improvements would be designed in compliance with LAWA's Sustainability Plan, thereby implementing strategies which use resources efficiently and utilize "green" development techniques, as further described in Section 4.6, *Greenhouse Gases*, of the SPAS Draft EIR. LAWA would also incorporate energy conserving measures into the design of new buildings and airport facilities, including the use of energy-efficient building materials, energy-saving lighting systems, energy-efficient water heating systems, and designed-in access for alternative means of surface transportation, including the Green Line and the APM, as further described in Section 4.13.1 of the SPAS Draft EIR. Development of the SPAS improvements would also be undertaken pursuant to other environmental best practices required through implementation of LAX Master Plan commitments, LAX mitigation measures, and the Community Benefits Agreement, further demonstrating consistency with Goal 7.
Goal 8. Encourage land use and growth patterns that facilitate transit and non-motorized transportation.	Consistent: SPAS would be consistent with Goal 8, as it would encourage land use and growth patterns that facilitate transit and non-motorized transportation, such as the development of an elevated/dedicated busway providing connectivity to the CTA, the ITF, the future Metro LAX/Crenshaw Light Rail Transit Station, and other public transit. Development of major ground access improvements would be focused in an existing urban center, as the ground access improvements would offer alternative means of travel to and from LAX and other areas, thereby reducing vehicle miles traveled. In addition, provisions for bicycle access and amenities, such as bicycle parking, lockers and showers, will be provided, where feasible.
Goal 9. Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.	Consistent: Security compliance for SPAS would be assured through various design features and security measures such as access control systems, employee I.D. requirements, and other current TSA requirements included in the Airport Security Program. Continued upgrades to security systems, review of future plans for compliance with current and future TSA and other applicable security related requirements, and continued coordination with and between the multiple agencies involved in security at LAX would help maximize the security of the regional transportation system. Also see Appendix I, SPAS Security Assessment, and Section 4.11.2, *Law Enforcement*, for detailed discussions of security and law enforcement.

Source: PCR Services Corporation, 2012.

SPAS-AR00001-3

Comment:

The Draft EIR includes some of alternatives that do not propose ground access improvements. SCAG encourages selection of a preferred alternative that maximizes implementation of the economic, mobility, and sustainability goals of the 2012-2035 RTP/SCS, which would include ground access improvements and close collaboration with Los Angeles County Metropolitan Transportation Authority on the proposed Crenshaw/LAX Transit Corridor.

Response:

As provided in Section 1.2.1 of the SPAS Draft EIR, one of the project objectives is to improve the ground access system at LAX. More specific goals associated with improving the ground access system, including integrating the ground access system improvements with regional transit facilities nearby, such as the recently approved Metro Crenshaw/LAX Transit Corridor and Station, are described in detail on page 1-12 of the SPAS Draft EIR. The ground access improvements associated with the alternatives are discussed on page 1-17 of the SPAS Draft EIR.

The SPAS Draft EIR evaluated nine alternatives. Of these, four alternatives, Alternatives 1 through 4, are "fully integrated" alternatives that include specific airfield, terminal, and ground access improvements. Alternatives 5 through 7 focus on variations to the airfield improvements which, in turn,

would affect terminal improvements. Alternatives 8 and 9 focus on variations to the ground access improvements. However, as stated on page 1-17 of the SPAS Draft EIR, there is a certain amount of compatibility or "interchangeability" between the SPAS alternatives. Specifically, the airfield and terminal improvements in Alternatives 5 through 7 are equally compatible with the ground access improvements in Alternatives 1, 2, 8, and 9. Alternatives 5 through 7 would only address all of the problems that the Yellow Light Projects were designed to address in conjunction with the ground access improvements associated with Alternatives 1, 2, 8, or 9.

As to the commentor's suggestion, the comment is noted and is hereby part of the Final EIR. It will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS Project.

SPAS-AR00001-4

Comment:

MITIGATION

SCAG Staff Comments
SCAG staff recommends that you review the SCAG 2012-2035 RTP/SCS Final Program EIR List of Mitigation Measures Appendix for additional guidance, as appropriate. The SCAG List of Mitigation Measures may be found here: http://scag.ca.gov/igr/pdf/SCAG_IGRMMRP_2012.pdf

Response:

The commentor recommends that LAWA review the 2012-2035 RTP/SCS Final Program EIR list of example mitigation measures for additional guidance, which is provided in Appendix G, Examples of Measures that Could Reduce Impacts from Planning, Development and Transportation Projects. LAWA has reviewed these measures and confirmed that the applicable LAX Master Plan mitigation measures, LAX Master Plan commitments, and new mitigation measures included in the SPAS Draft EIR (refer to Table 1-6 in Chapter 1) address the potentially significant impacts associated with the project in a manner that is comprehensive and that supports the general intent and expected benefits reflected in the 2012-2035 RTP/SCS Final Program EIR list of example mitigation measures.

There are multiple examples of applicable LAX Master Plan commitments and mitigation measures or SPAS mitigation measures which fulfill the intent of Appendix G, several of which are described below. For instance, SCAG Appendix G construction-related air quality impact mitigation measures AQ3, AQ4, and AQ6 would be implemented through LAX Master Plan Mitigation Measure MM-AQ-2, which includes mitigation measures to minimize fugitive dust emissions during construction of the SPAS alternatives. Components of SCAG Appendix G Greenhouse Gas Emissions mitigation measure GHG2 would be implemented through LAX Master Plan Mitigation Measure MM-AQ-3, which encourages the use of low emission vehicles for LAX operations, including those associated with the SPAS alternatives. Components of SCAG Appendix G Land Use mitigation measure LU2 would be implemented through LAX Master Plan Commitment RBR-1 and LAX Master Plan Mitigation Measure MM-RBR-1, which provide for the relocation of businesses which may be acquired as a result of the development of SPAS alternatives. SCAG Appendix G Noise mitigation measure NO9 would be implemented through corresponding LAX Master Plan Commitment N-1 and LAX Master Plan Mitigation Measures MM-N-4 and MM-N-5, which would reduce aircraft noise resulting from the development of SPAS alternatives. Components of SCAG Appendix G Traffic mitigation measure TR13 would be implemented through corresponding LAX Master Plan Commitments ST-9, ST-12, ST-14, ST-17, ST-18, ST-19, ST-21, and ST-22, which would minimize traffic congestion during construction of the LAX SPAS alternatives. These are but a few examples of the SPAS Draft EIR fulfilling the general intent of the SCAG Appendix G mitigation guidance document.

SPAS-AR00002 MacMillan, Ian V — South Coast Air Quality Management District — 10/25/2012

SPAS-AR00002-1

Comment:

The South Coast Air Quality Management District (AQMD) staff appreciates the opportunity to comment on the above-mentioned document and the lead agency's consideration of the enclosed comments beyond the comment period. The following comments are intended to provide guidance to the lead agency and should be incorporated into the Final Environmental Impact Report (EIR) as appropriate.

Response:

The comment is noted. Please see Responses to Comments SPAS-AR00002-2 through SPAS-AR00002-53 below. LAWA has incorporated SCAQMD's comments pertaining to mitigation into the Final EIR. Please see Responses to Comments AR00002-27, AR00002-28, AR00002-31, AR00002-32, AR00002-35, and AR00002-36.

SPAS-AR00002-2

Comment:

Based on a review of the Draft EIR the proposed project will generate significant regional and local air quality impacts during operations. The project's significant air quality impacts are predominantly from aircraft emissions generated by a significant increase of air passenger capacity at the project site. For example, the project could result in an additional 11,000 lbs/day of NOx emissions from future aircraft activity, resulting in significant localized impacts. Therefore, it is imperative that the lead agency provide additional mitigation measures that address these significant project emissions pursuant to CEQA Guidelines Section 15126.4. Because of the high baseline and future emissions from the project site, the lead agency should also ensure that any approved build alternatives minimize exposures wherever feasible, including through providing the largest possible buffer between emission sources (such as runways) and sensitive receptors.

Response:

Implementation of the proposed project, specifically, airfield improvements associated with certain SPAS alternatives (i.e., Alternatives 1, 2, 3, 5, 6, and 7) would reduce local and regional air quality impacts compared to future conditions if no airfield improvements are made. As explained in Section 4.2 of the SPAS Draft EIR, the increase in air pollutant emissions from aircraft, which are the predominant source daily emissions, over baseline (2009) levels is due to the growth in airport activity projected to occur by the future horizon year (2025). Such growth would occur regardless of SPAS. The airfield improvements proposed under the SPAS alternatives are intended to improve the safety and efficiency of airfield operations at LAX compared to what would otherwise occur in the future if no improvements are made. Alternative 4 represents a scenario whereby no airfield improvements are implemented, other than federally mandated runway safety area improvement, which do not affect normal daily operations. As evident in Tables 4.2-13, 4.2-14, 4.2-15, and 4.2-16, airfield-related emissions and concentrations associated with alternatives that include airfield improvements (Alternatives 1, 2, 3, 5, 6, and 7) would, in general, be less than those that would occur if no improvements were made (Alternative 4), with the most notable exception being Alternative 3, which would have greater impacts for some pollutants due to a greater amount of aircraft taxiing required under this scenario.

Note that Alternative 3 would provide the largest buffer between the northernmost runway and the north fence-line. However, by leaving Runway 24R where it is today and moving Runway 24L farther south, the emissions actually increase above those alternatives where Runway 24R is moved north. This can be seen be looking at the aircraft NOx emissions in Table 4.2-13 (page 4-123) of the SPAS Draft EIR. Alternative 3 would have the highest range of emissions of any of the airfield improvement alternatives

(Alternatives 1, 2, 3, 5, 6, and 7). Even Alternative 7, which leaves Runway 24R where it is today and moves Runway 24L farther south, has a higher emissions range than the alternatives that move Runway 24R north (Alternatives 1, 5, and 6). The attempts to provide a buffer between the northern runway and north fence-line actually increase air emissions in the airport area.

The SPAS Draft EIR identifies numerous LAX Master Plan commitments and mitigation measures that will reduce air quality impacts associated with airport operations. LAWA has carefully reviewed and considered the mitigation measures proposed elsewhere in this comment letter and has provided responses as to the necessity, effectiveness, and/or feasibility of each. In addition, this is a programmatic EIR. Appropriate project-level mitigation would be implemented as necessary when individual projects are considered. As discussed on page 4-3 of the SPAS Draft EIR, the Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4)).

Please see Responses to Comments SPAS-AR00002-7 through SPAS-AR00002-41, and SPAS-AR00002-44 for specific responses addressing the mitigation measures proposed in this comment letter.

SPAS-AR00002-3

Comment:

Further, the Draft EIR lacks necessary specificity in several areas, including how mitigation will be implemented, what other air quality work has been recently completed for LAX and the surrounding community, and in many of the air quality analysis methodologies. Without presenting the details of the analysis, AQMD staff is unable to confirm whether the air quality analysis is consistent with our guidance. Further, by omitting this information, the decision makers and the public are not afforded the opportunity to review all of the pertinent information prior to determining the environmental impacts of this project. As a result, AQMD staff has suggested revisions to this analysis (included in the attachment).

Response:

Please see the responses to specific comments in Responses to Comments SPAS-AR00002-7 through SPAS-AR00002-53.

SPAS-AR00002-4

Comment:

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Staff is available to work with the lead agency to address these issues and recommends that the lead agency coordinate with our staff prior to releasing the Final EIR.

Response:

The comment is noted. Written responses to all comments contained in the letter from SCAQMD will be sent to SCAQMD at least 10 days prior to certification of the Final EIR. As suggested in this comment, LAWA held a follow-up meeting with SCAQMD staff on November 29, 2012 to review and discuss the SPAS EIR air quality analysis.

SPAS-AR00002-5

Comment:

Operational Emissions Mitigation

1. Given that the lead agency's operational air quality analysis demonstrates significant regional air quality impacts from PM10 and PM2.5 and localized air quality impacts from NO2, SO2, PM10, and PM2.5 emissions the AQMD staff recommends that the lead agency provide additional mitigation measures pursuant to CEQA Guidelines Section 15126.4. Because of these significant current and future air quality impacts, the lead agency should ensure that any approved build alternative looks to minimize exposures wherever possible. This can include providing the maximum buffer between emission sources (such as runways, major travel routes, parking lot entrances, etc.) and sensitive receptors.

Response:

The airport is now accommodating the arrival and departure of Aircraft Design Group (ADG) VI aircraft, including the Airbus 380. One of the major objectives of the proposed program is the development of an airport layout that is safe and more efficient than the current airfield. The lead agency will be balancing the numerous environmental impacts of each alternative with the safety requirements of the Federal Aviation Administration as well as other objectives in the stated project purpose when selecting a preferred alternative. LAWA has carefully reviewed and considered the mitigation measures proposed elsewhere in this comment letter. In addition, this is a programmatic EIR. Appropriate project-level mitigation would be implemented as necessary when individual projects are considered. Please see Responses to Comments SPAS-AR00002-7 through SPAS-AR00002-41, and SPAS-AR00002-44.

SPAS-AR00002-6

Comment:

2. In addition, the AQMD staff recommends that the lead agency minimize or eliminate significant adverse air quality impacts by adding the mitigation measures provided below.

Response:

Please refer to Responses to Comments SPAS-AR00002-7 through SPAS-AR00002-41, and SPAS-AR00002-44 for discussions of the individual mitigation measures proposed in this comment letter.

SPAS-AR00002-7

Comment:

Aircraft Emissions.
a) Encourage or incentivize airlines to route the cleanest aircraft engines to serve the South Coast Air Basin.

Response:

As noted in Appendix IV-B of the Revised Draft 2012 Air Quality Management Plan developed by the South Coast Air Quality Management District 1, state and local aircraft emission regulation is preempted by the Clean Air Act which gives that authority to the U.S. Environmental Protection Agency (USEPA) in consultation with the Federal Aviation Administration (FAA). New engine emission standards for nitrogen oxides (NOx) were recently adopted by the USEPA 2, making the federal standards consistent with international aircraft engine emission standards. The new, Tier 6 NOx standard applies to newly certified engines after July 18, 2012, and represents a 12 percent reduction compared to the current, Tier 4 NOx standard. In addition, the future Tier 8 NOx standard will apply to newly certified engines in 2014. The Tier 8 standard is approximately 15 percent lower (more stringent) than the Tier 6 standard.

The airline industry balances a number of constraints when routing aircraft to various cities across the country. The industry's biggest cost today is that of fuel. Because fuel cost is such a driver in aircraft routing decisions, it is unlikely that the lead agency could develop an incentive policy that would change routing decisions to bring cleaner aircraft to LAX. However, LAWA will continue to encourage the routing of newer aircraft to LAX and other Southern California airports through its ongoing coordination with its tenants.

1. South Coast Air Quality Management District. 2012. Revised Draft 2012 Air Quality Management Plan, Appendix IV-B, Control Measure No. ADV-07 (September).
2. U.S. Environmental Protection Agency. 2012. Control of Air Pollution from Aircraft and Aircraft Engines; Emission Standards and Test Procedures. Final Rule. 77 FR 36341 (June 18).

SPAS-AR00002-8

Comment:

Energy Efficiency Mitigation Measures
b) Maximize use of solar energy including solar panels; specifically, the lead agency should review, estimate and commit to a minimum installation based on the total available space at the project site. The lead agency should provide a brief justification for any areas found to be infeasible for solar panel installation.

Response:

As a general note, LAWA must now comply with the Los Angeles Green Building Code 2, approved in 2010. As part of LAWA's new Sustainability Guidelines, a Standard of Tier 1 has been set for all building projects with a Los Angeles Department of Building and Safety permit-valuation over $200,000. This requirement will address a number of the suggested mitigation measures listed in Comments SPAS-AR00002-9, 10, 11, 12, 13, and 14.

LAWA will consider solar energy options in the project planning and design phases of any approved SPAS alternative. However, space at LAX is limited for construction of solar energy systems in a manner that does not conflict with airport operations. The general design of any solar energy systems would be addressed in the project-level CEQA documents that will be developed to implement the programmatic SPAS alternatives. Please refer to Responses to Comments SPAS-PC00130-225 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

Solar energy includes both passive (solar lighting) and active (solar panels) systems and designs. Typically, large areas are needed to install solar panels in sufficient quantity to offset the cost of installation in a reasonable time. One of the largest airports in the U.S. that operates a solar system is Denver International, which has large areas within its property line that can accommodate large solar panel arrays. Space for a solar energy system at LAX, which is in the middle of urban Los Angeles, is substantially more limited than at Denver International Airport and the effectiveness of a such system on a smaller scale is uncertain. Approximately 30 acres of space is required for solar photovoltaic panels to generate 9 MW of power. Additionally, solar energy systems at airports have been known to result in operational issues. For example, a recent solar panel installation at the Manchester-Boston Regional Airport in New Hampshire had approximately 25 percent of its panels covered with tarps to eliminate the glare in the air traffic control tower 1.

LAWA will also consider passive solar design, the use of sunlight to light rooms in the daytime, in the project planning and design phases of any approved SPAS alternative. As noted above, LAWA must now comply with the Los Angeles Green Building Code 2, approved in 2010. As part of LAWA's new Sustainability Guidelines, a Standard of Tier 1 has been set for all on-airport building projects with a Los Angeles Department of Building and Safety permit-valuation over $200,000. The design criteria for passive solar lighting is located in Section A5.507.2. In summary, building designs should incorporate daylit spaces for toplighting and sidelighting indicated in the California Energy Code.

1. Hayward, M., Airport controllers complain of solar panels' glare, New Hampshire Union Leader, 2012.
2. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), approved December 15, 2010.

SPAS-AR00002-9

Comment:

c) Require all lighting fixtures, including signage, to be energy efficient, and require that new traffic signals have light-emitting diode (LED) bulbs and require that light fixtures be energy efficient compact fluorescent and/or LED light bulbs. Where feasible use solar powered lighting.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. The LAGBC contains voluntary Tier 1 and Tier 2 goals for energy reduction. As part of LAWA's Sustainability Guidelines, a Standard of meeting Tier 1 has been set for all on-airport LAWA building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

Under LAWA's Sustainability Program, energy efficient lighting fixtures, ballasts, and bulbs have been retrofitted at LAX (and LA/Ontario International Airport, ONT) over the last several years. LAWA has successfully completed the replacement of incandescent light bulbs with compact florescent light (CFL) bulbs at LAX and ONT. CFL bulbs use less electricity and have a longer life span than incandescent bulbs. For outside facilities such as runways, signage, outdoor lighting, etc., light-emitting diodes (LED) have been installed wherever feasible 2. When specific projects are approved, appropriate energy efficient measures, including LED lights, will be incorporated. See Tables 4.6-7 and 4.6-8 of the SPAS Draft EIR which present a comprehensive list of suggested mitigation measures for new development projects throughout the state of California. As explained on page 4-414 of the SPAS Draft EIR, the use of energy efficient lighting, systems and equipment in new facilities and in the renovation/modification of existing facilities is standard practice by LAWA and is generally reflected in the Green Building Ordinance. No emission reduction credit is taken for these measures.

1. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), Approved December 15, 2010.
2. City of Los Angeles, Los Angeles World Airports, Los Angeles World Airports Sustainability Report 2010, June 30, 2011.

SPAS-AR00002-10

Comment:

d) Use light colored paving and roofing materials.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. It should be noted that the LAGBC contains voluntary Tier 1 and Tier 2 goals for energy reduction. As part of LAWA's Sustainability Guideline, a Standard of meeting Tier 1 has been set for all on-airport LAWA building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

LAWA will address the use of light colored paving and roofing materials during project design according the LAGBC A5.106.11, which includes use of light colored/high albedo materials, and cool roof

materials. Note that much of the airport's existing surfaces designed for aircraft movement are made of concrete or asphaltic concrete which tends to be lighter in color than standard asphalt. Many of the existing roof structures are also light gray (concrete) colored as well. Light colored paving and roofing materials are included in LAWA Sustainability Guidelines (adopted). They include provisions for "heat island' reduction, including the use of cool roofs as an option under all the SPAS alternatives as set forth in Table 4.6-7 (page 4-414) of the SPAS Draft EIR.

1. City of Los Angeles. 2010. Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code). (Approved December 15).

SPAS-AR00002-11

Comment:

e) Use passive heating, natural cooling, and solar hot water systems for buildings, and reduced pavement for non-roadway areas where possible.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. It should be noted that the LAGBC contains voluntary Tier 1 and Tier 2 goals for energy reduction. As part of LAWA's Sustainability Guidelines, a Standard of meeting Tier 1 has been set for all on-airport LAWA building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

LAWA will consider adopting reduced pavement for non-roadway areas where possible and feasible, i.e., where it will not impact airport and runway safety and security).

In response to the comment regarding heating and cooling systems, LAWA has adopted and implemented energy efficient cooling and heating systems at LAX. The Central Utility Plant (CUP) Replacement Project elements include (1) new facility and plant equipment, combustion gas turbine, heat-recovery steam generators, cooling tower, water refrigeration/heating equipment; (2) replacement cooling/heating for buildings; (3) 1.6 million-gallon thermal energy storage tanks. LAWA, therefore, has already adopted and implemented reduced energy heating and cooling. The new CUP was built in accordance with LAWA's Sustainable Design and Construction Guidelines, and systems and their components for the new CUP are designed to achieve LEED® Silver certification from the U.S. Green Building Council. The new design will be approximately 25 percent more energy-efficient than the current facility and will meet all current air-quality regulations. No emission reduction credit is taken for these measures.

1. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), Approved December 15, 2010.

SPAS-AR00002-12

Comment:

f) Utilize only Energy Star heating, cooling, and lighting devices, and appliances.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. It should be noted that the LAGBC contains voluntary Tier 1 and Tier 2

goals for energy reduction. As part of LAWA's Sustainability Guidelines, a Standard of meeting Tier 1 has been set for all LAWA on-airport building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

LAWA will use Energy Star heating and cooling units, lighting devices, and appliances where appropriate and feasible, as this is a requirement under LAGBC. See Tables 4.6-7 and 4.6-8 of the SPAS Draft EIR for a discussion of adoption of these measures. Note that LAWA continuously upgrades and performs preventative maintenance on its air-handling equipment. As LAWA upgrades and replaces its air-handling equipment, new units with variable frequency drives and soft-start controls that are more energy efficient are installed. Because these drives do not operate at full load at all times, the energy savings can be substantial. As of May 2010, LAWA's Maintenance Service Division (MSD) had converted 80 percent of fan drives to these newer, more efficient units 2.

Please also see Responses to Comments SPAS-AR00002-9 regarding lighting fixtures at LAX and SPAS-AR00002-10 and SPAS-AR00002-11 regarding heating and cooling. No emission reduction credit is taken for these measures.

1. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), Approved December 15, 2010.
2. City of Los Angeles, Los Angeles World Airports, Los Angeles World Airports Sustainability Report 2010, June 30, 2011.

SPAS-AR00002-13

Comment:

g) Limit the hours of operation of outdoor lighting where possible.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. It should be noted that the LAGBC contains voluntary Tier 1 and Tier 2 goals for energy reduction. As part of LAWA's Sustainability Guideline, a Standard of meeting Tier 1 has been set for all on-airport LAWA building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

LAWA currently limits the use of outdoor lighting where appropriate and feasible, giving priority, however, to maintaining proper illumination for airport security purposes.

See Table 4.6-7 of the SPAS Draft EIR for a discussion of adoption of the feasible outdoor lighting measures.

1. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), Approved December 15, 2010.

SPAS-AR00002-14

Comment:

h) Install energy efficient heating and cooling systems, appliances and equipment, and control systems.

Response:

The City of Los Angeles and LAWA have incorporated energy efficiency measures into the municipal building code and LAWA Design and Construction Handbook (DCH). The City adopted the Los

Angeles Green Building Code (LAGBC) in 2010 1, and the energy efficiency measures in this code are incorporated into the DCH. It should be noted that the LAGBC contains voluntary Tier 1 and Tier 2 goals for energy reduction. As part of LAWA's Sustainability Guidelines, a Standard of meeting Tier 1 has been set for all on-airport LAWA building projects. The Tier 1 goal is to reduce energy consumption by 15 percent below 2008 California Energy Code requirements.

Please see Responses to Comments SPAS-AR00002-8 and SPAS-AR00002-11 regarding use of passive lighting, Response to Comment SPAS-AR00002-9 regarding use of efficient lighting, and Response to Comment SPAS-AR00002-12 regarding use of energy efficient heating/cooling systems and appliances at LAX.

See Table 4.6-7 of the SPAS Draft EIR for a discussion of adoption of the feasible energy efficient measures

1. City of Los Angeles, Ordinance No. 181480 An ordinance amending Chapter IX of the Los Angeles Municipal Code by adding a new Article 9 to incorporate various provisions of the 2010 California Green Building Standards Code (CALGreen Code), Approved December 15, 2010.

SPAS-AR00002-15

Comment:

Transportation Mitigation Measures
i) Set specific goals for service levels applicable to LAX Flyaway Service that will provide direct shuttle service between the site and off-site locations.

Response:

LAWA provides detailed information on the LAWA website about the FlyAway program and other alternative modes of transportation to and from LAX (lawa.org/welcome_LAX.aspx?id=132), and also provides FlyAway information brochures at transit centers, such as Union Station, and to major employers upon request as part of their transportation demand management/trip reduction programs.

The LAX FlyAway program was expanded since development of the LAX Master Plan to include FlyAway connections at Union Station in downtown Los Angeles, in Westwood/UCLA, as well as continued use of the original FlyAway station in Van Nuys. Although LAWA also initiated FlyAway service to and from the Irvine Transit Center in Orange County, that service was terminated on August 31, 2012 due to low ridership. LAWA staff continues to work on establishing additional FlyAway sites. The next FlyAway service, connecting LAX with the Metro Exposition light rail line at its Expo/LaBrea station, was approved by the LAWA Board of Airport Commissioners in October 2012 and is expected to begin service in spring 2013. Other potential LAX FlyAway locations which LAWA staff is currently evaluating for service include Santa Monica, Long Beach, Torrance, Hollywood, and Glendale.

The percentage of passengers using the FlyAway service during the peak arrival and peak departure periods in the 2009 baseline is included in Table 4.12.1-5 (page 4-1073) in Section 4.12.1.3.11 of the SPAS Draft EIR. The percentage of passengers assumed to use FlyAway service during the peak arrival and peak departure periods in the 2025 alternatives are included in Table 4.12.1-15 (page 4-1103) in Section 4.12.1.7.2 of the SPAS Draft EIR. FlyAway use by passengers was between 1.49 and 1.90 percent for the 2009 baseline during peak arrival and departure periods, and is estimated to be up to 3.1 percent in 2025. While the existing FlyAway routes demonstrate a consistent and mature level of passenger demand, this change does not substantially alter the number of private vehicles driving to or from LAX; thus, the FlyAway impact on the emissions for each alternative were not specifically quantified, and the analysis did not assume any reduction in emissions as a result of the FlyAway service. However, LAWA remains committed to developing and providing FlyAway service.

The commentor is also referred to Response to Comment SPAS-PC00130-231.

SPAS-AR00002-16

Comment:

j) Set goals for the introduction of zero/near zero emission shuttles serving LAX.

Response:

LAWA continues to make progress towards meeting the requirements of the Community Benefits Agreement (CBA), paragraphs X.J.2.b and c, which requires conversion of on-road commercial vehicles operating at LAX to convert to alternative fuels or clean engine technology within 10 years of the effective date of the CBA. LAWA's fleet is the largest Alternative Fuel Vehicle (AFV) airport fleet in the nation and includes over 590 AFVs. Currently, over 63 percent of LAWA's fleet vehicles and equipment at LAX are AFV's. Additionally, 100 percent of the LAX courtesy shuttle fleet is powered by natural gas.1 LAWA has designed and built a state-of-the-art, high-technology LNG/CNG fueling station at LAX and acquired over $5 million in grant funding to offset the differential cost of AFVs. LAWA also has adopted an "Alternative Fuel Vehicle Requirement Program" that applies to all on-road vehicles weighing 8,500 pounds or larger.2 The program ensures the alternative fuel conversion of car rental shuttles, trucks, and other large vehicles or heavy equipment at LAX. The overall compliance rate of the program was close to 90 percent in 2010 and LAWA intends to expand the program to include more off-airport parking lot shuttles.3 Based on the above, there is substantial evidence that goals related to the introduction of zero/near zero emission shuttles serving LAX already exist.

1. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP), 2011 Annual Progress Report, October 2012.
2. City of Los Angeles, Los Angeles World Airports, Alternative Fuel Vehicle Requirement Program, Available: http://www.lawa.org/uploadedfiles/AirOps/pdf/Exh%20C%20-%20Alt%20Fuel%20Program .pdf, accessed January 1, 2013.
3. City of Los Angeles, Los Angeles World Airports, Los Angeles World Airports Sustainability Report 2010, June 30, 2011.

SPAS-AR00002-17

Comment:

k) Ensure that LAX Flyaway Services provide adequate seating capacity for employees.

Response:

LAWA policy states that the FlyAway contractor will provide an additional bus to a FlyAway route if demand for seats on that route is not being met. Please also refer to Response to Comment SPAS-AR00002-15 for additional discussion regarding the LAX FlyAway service. Also, with regard to employees using the LAX FlyAway service, LAWA encourages such use by providing a $110 per month allotment to its employees choosing to use public transit, including the FlyAway, for commuting to and from work at LAX. A monthly pass for the FlyAway is $120 per month, meaning that the "out of pocket" expense for LAWA employees using the FlyAway is only $10, which is substantially less than the cost of gas, insurance, maintenance/repairs, and other expenses otherwise associated with commuting in a private vehicle.

SPAS-AR00002-18

Comment:

l) Implement a home dispatching system where employees receive routing schedules by phone.

Response:

It is not clear if the comment refers to incident management or general traffic congestion at LAX. LAWA operates an incident reporting and response system, Everbridge, to alert employees, via e-mail, of

incidents at the airport and specify appropriate responses. For general traffic congestion, employees have access to the same internet-based traffic reporting website available to the general public (such as "SigAlert.com" for regional highway/freeway traffic conditions and "trafficinfo.lacity.org" for local roadway traffic conditions). In addition, LAX utilizes portable and fixed electronic message boards to provide real-time information so that motorists can make knowledgeable driving decisions. Eight portable changeable message signs are available at LAX during peak travel times or for special occurrences. The quantity of traffic information on www.lawa.org has increased to traffic alerts, a link to LADOT real-time traffic maps, and airport-specific maps showing the current lane closures and detours in the LAX area.1

Notwithstanding the above, LAWA will develop, as a SPAS mitigation measure, an information technology system that LAWA employees and the general public can utilize with consumer electronics that will provide links, such as to the sources mentioned above, for real-time information regarding local and regional traffic conditions for travel to and from LAX. As such, Section 4.2.7 of the SPAS Draft EIR has been revised to add this new mitigation measure for air quality. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

1. City of Los Angeles, Los Angeles World Airports, Los Angeles World Airports Sustainability Report 2010, June 30, 2011.

SPAS-AR00002-19

Comment:

m) Provide incentives to encourage public transportation and carpooling (e.g., through internal retail and restaurant discounts).

Response:

As discussed in Table 4.6-8 of the SPAS Draft EIR, LAWA has a comprehensive rideshare and vanpool program available to all employees, which offers financial incentives and discounts to participating employees. As noted in the annual Sustainability Report,1 LAWA's Rideshare Program has eliminated eight billion pounds of air pollutants and over seven million vehicle miles traveled since its inception, which has led to reduced congestion during peak morning and evening commuting hours at the LAWA airports. Additionally the U.S. Environmental Protection Agency (EPA) considers the LAWA program to be one of the most comprehensive programs offered by an employer in Southern California. It is part of the EPA's Best Workplaces for Commuters Program that distinguishes and provides national recognition to employers offering outstanding commuter benefits. In order to participate in this program, employers must meet the EPA's National Standard of Excellence in commuter benefits. This program would continue agency-wide and is not particular to any SPAS alternative.

LAWA's multi-faceted Rideshare Program includes 66 vanpools, 88 carpool program participants, 320 free monthly transit passes, and numerous marketing and advocacy activities to recruit and retain program participants. Currently, about 26 percent of LAWA's employees are participating in the Rideshare Program, saving over 1,000 vehicle trips to LAWA facilities every day.2

LAWA also provides a transit subsidy for LAWA employees, which can be used to purchase Metrorail/Metrobus or FlyAway tickets or passes, so long as the participating employees make a specified number of commutes using the transit service over the course of a month.

Additionally, as discussed in Section 4.6 of the SPAS Draft EIR, the City of Los Angeles' Green Building Code includes measures to provide designated parking for any combination of low emitting, fuel-efficient, and carpool/vanpool vehicles.

1. City of Los Angeles, Los Angeles World Airports, Los Angeles World Airports Sustainability Report 2010, June 30, 2011.
2. City of Los Angeles, Los Angeles World Airports, LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP), 2011 Annual Progress Report, October 2012.

SPAS-AR00002-20

Comment:

n) Provide incentives for employees and the public to use public transportation such as discounted transit passes, reduced ticket prices, and/or other incentives.

Response:

Please see Response to Comment SPAS-AR00002-19 regarding discount transit passes for employees. As noted in that response, LAWA has an aggressive ridership program. All of the SPAS alternatives, except for Alternative 4, include ground transportation systems improvements that will be integrated with the recently-approved Metro Crenshaw/LAX Transit Corridor and Station, which is specifically intended to encourage and improve the use of transit by the public, and employees, traveling to and from LAX.

SPAS-AR00002-21

Comment:

o) Implement and/or enhance a rideshare program for employees.

Response:

Please see Response to Comment SPAS-AR00002-19 regarding LAWA's Ridershare Program.

SPAS-AR00002-22

Comment:

p) Require the use of 2010 diesel, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) as soon as feasible and prior to the 2023 CARB compliance deadline.

Response:

Please see Response to Comment SPAS-AR00002-16 regarding LAWA's Alternative Fuel Vehicle Requirement Program.

SPAS-AR00002-23

Comment:

q) Provide electric infrastructure (wiring, panel upgrades, etc.) for truck loading areas to allow future charging station installation.

Response:

The SPAS project does not alter air cargo handling at LAX. However, LAWA will provide the appropriate electrical infrastructure for those cargo handling tenants that have a need for such facilities and request it from LAWA. In general, LAWA intends to monitor the development of electric truck engines and the design standards for these engines and associated charging infrastructure. The selection of appropriate infrastructure for installation at LAX would be made when air cargo facilities are updated. Electrical infrastructure upgrade goals have been incorporated into the SPAS Final EIR mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for measure.

SPAS-AR00002-24

Comment:

r) Provide a direct connection between the MTA Green Line/Crenshaw Line and any constructed Automated People Mover (APM).

Response:

As described in Section 2.3.1.3 of the SPAS Draft EIR, Alternative 3 includes a Ground Transportation Center (GTC) in Manchester Square, an Intermodal Transportation Center (ITC) in the area known as Continental City at Aviation Boulevard and Imperial Highway, and a CONRAC in the Lot C area. Alternative 3 includes two separate APM systems: one APM would convey passengers between the ITC, CONRAC, and CTA, while a second APM would transport passengers between the GTC and the CTA. Under Alternative 3 as originally planned as part of the LAX Master Plan (i.e., Alternative D), an elevated pedestrian bridge would link the ITC to the Metro Green Line Aviation/LAX station, which at the time was the closest existing or planned transit station to LAX. With the now-planned transit station at Century and Aviation Boulevards, Alternative 3 would also provide connectivity with the new transit station as well.

An automated people mover (APM) would be incorporated into the SPAS program if LAWA selects the ground access design under Alternative 9. As described in Section 2.3.1.9.3 of the SPAS Draft EIR, the Alternative 9 ground access facilities would include an APM with "stops at the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards…" The Alternative 9 ground access design can be incorporated into the overall SPAS design under Alternatives 1, 2, 5, 6, and 7. In addition, even if the APM is not selected, the dedicated busway that is part of the SPAS Alternatives 1, 2, 5, 6, and 7 would also have connect with the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards as described in Sections 2.3.1.1.3 (page 2-13), 2.3.1.2.3 (page 2-17), 2.3.1.5.3 (page 2-30), 2.3.1.6.3 (page 2-33), and 2.3.1.7.3 (page 2-37) of the SPAS Draft EIR). Finally, Alternative 8 would also include a dedicated busway that connects to the Metro LAX/Crenshaw station (see Section 2.3.1.8.2 on page 2-38 of the SPAS Draft EIR).

Please also see Topical Response TR-SPAS-T-1 regarding SPAS connectivity to transit.

SPAS-AR00002-25

Comment:

s) Require the APM to operate with zero emissions technology.

Response:

The automated people mover (APM) included under Alternatives 3 and 9 would be an electric-powered system with zero local emissions from the motors.

SPAS-AR00002-26

Comment:

t) Provide zero/near-zero emissions and alternative fueled technologies to transport passengers from nearby locations such as rental car centers.

Response:

Please see Response to Comment SPAS-AR00002-16 regarding LAWA's Alternative Fuel Vehicle Requirement Program that applies to all on-road vehicles weighing 8,500 pounds or more. Note that this program applies to rental car shuttles.

SPAS-AR00002-27

Comment:

Parking Mitigation Measures
u) Provide parking system for quick entry and exit that will reduce vehicle idling time. A system should also be installed that provides sufficient signage or communication for available parking, parking locations, and parking fee.

Response:

LAWA will incorporate quick entry and exit parking systems in the project level design of future parking structures associated with the SPAS project. Signage will be included in the design to assist passengers in finding available parking locations. These design goals have been incorporated into the SPAS Final EIR mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

SPAS-AR00002-28

Comment:

v) Provide real time information on parking availability in the parking structures to minimize the time it takes to find available parking.

Response:

LAWA will include advanced signage in the design of future parking structures that could advise airport users of available parking spaces within that facility. This design goal has been included in the SPAS Final EIR list of mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

SPAS-AR00002-29

Comment:

w) Install electrical hookups at docks for any TRU's.

Response:

The LAX SPAS project does not alter Transportation Refrigeration Unit (TRU) facilities or operations at LAX. However, LAWA will provide the appropriate TRU electrical infrastructure for those tenants that have a need for such facilities and request it from LAWA. Such electrical infrastructure upgrades for TRU facilities would be provided in conjunction with the mitigation measures added in Response to Comment SPAS-AR00002-23. In general, LAWA intends to monitor the development of electric TRU docking design standards for such infrastructure. The selection of appropriate infrastructure for installation at LAX would be made when TRU facilities are updated. No emission reduction credit is taken for this measure.

SPAS-AR00002-30

Comment:

Other Mitigation Measures
x) Require diesel particulate filters on all diesel-fueled emergency generators.

Response:

The installation of diesel particulate filters on emergency power generators is not feasible. The cost effectiveness of such a measure is likely to be high given the minimal amount of emissions associated with emergency generators. However, because these generators are stationary sources, subject to

SCAQMD rules and regulations, any regulations requiring the installation of filters on emergency power generators will be complied with by LAWA.

SPAS-AR00002-31

Comment:

y) Require use of electric lawn mowers and leaf blowers.

Response:

LAWA will require the use of electric lawn mowers and leaf blowers for landscape maintenance, as these units become available for commercial use, associated with the SPAS project. This requirement has been incorporated into the SPAS Final EIR mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

SPAS-AR00002-32

Comment:

z) Require use of electric or alternatively fueled sweepers with HEPA filters.

Response:

LAWA will require the conversion of sweepers to alternative fuels or electric power for ongoing airfield and roadway maintenance. In the 2006 GSE inventory, two (2) of 10 sweepers were electric powered and one (1) was either CNG or LPG fueled. HEPA files will be installed on airport sweepers where the use of HEPA filters is technologically and financially feasible and does not pose a safety hazard to airport operations. This requirement has been included in the SPAS Final EIR mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

SPAS-AR00002-33

Comment:

Further, given that the lead agency incorporates MMAQ-4 from the Final EIR for the LAX Master Plan in the proposed project the AQMD staff recommends that the lead agency provide an updated inventory in the Final EIR that demonstrates the lead agency's progress toward achieving a zero/near zero (low emission) fleet of ground support equipment. The aforementioned inventory should provide an overview of the existing ground support equipment fleet and near future milestones toward achieving a low emission fleet.

Response:

Progress towards compliance with MM-AQ-4, as with all LAX Master Plan commitments and mitigation measures, is reported annually in the LAX Master Plan Mitigation Monitoring and Reporting Program (MMRP) Annual Progress Report found at: http://ourlax.org/publications.aspx.

The survey of GSE conducted in 2006 indicated that approximately 3,050 pieces of ground support equipment (GSE) were operating at LAX. Of these, 27 percent were diesel, 32 percent were gasoline, 24 percent were electric, and 17 percent were natural gas or LPG fueled.

LAWA is continuing to pursue the expansion of electronic GSE (EGSE) use at LAX and is currently reevaluating the overall electrical power infrastructure around the airport for the planning of future EGSE charging stations at the airport. In conjunction with that effort, and in response to the commentor's suggestion, LAWA will conduct a comprehensive GSE inventory update to identify and assess the current fuel type composition of GSE operating at LAX, as will help to guide next steps in supporting and encouraging the use of alternative fuel GSE at LAX. As such, Section 4.2.7 of the SPAS Draft EIR has been revised to add this new mitigation measure for air quality. Please see

Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. No emission reduction credit is taken for this measure.

SPAS-AR00002-34

Comment:

Construction Emissions Mitigation

3. The lead agency determined that the proposed project will exceed the CEQA regional construction significance thresholds for NOx, VOC, CO, PM10, and PM2.5; therefore, beyond MMAQ-1 and MMAQ-2 and the requirements of the applicable settlement agreement the AQMD staff recommends that the lead agency provide the following additional mitigation measures pursuant to CEQA Guidelines Section 15126.4.

Response:

The comment provides an introduction to the commentor's suggestions for additional mitigation measures. Those additional measures are described in subsequent comments, which LAWA has addressed as follows: Please see Response to Comment SPAS-AR00002-35 regarding mitigation for on-road trucks used during SPAS construction; and, please see Response to Comment SPAS-AR00002-36 regarding mitigation for off-road equipment used during SPAS construction.

SPAS-AR00002-35

Comment:

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx emissions requirements,

Response:

LAWA agrees that construction on-road truck measures can be incorporated into project construction specifications. For future on-road trucks used on SPAS-related projects, LAWA has incorporated the following mitigation action as part of MM-AQ-2:

On-road trucks with a gross vehicle weight rating of at least 19,500 pounds must, at a minimum, comply with USEPA 2007 on-road emission standards for PM10 and NOx.

No emission reduction credit is taken for these measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-AR00002-36

Comment:

- Consistent with measures that other lead agencies in the region (including Port of Los Angeles, Port of Long Beach, Metro and City of Los Angeles)1 have enacted, require all on-site construction equipment to meet EPA Tier 3 or higher emissions standards according to the following:

- Project start, to December 31, 2014: All offroad diesel-powered construction equipment greater than 50 hp shall meet Tier 3 offroad emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- Post-January 1, 2015: All offroad diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be

outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit‟s certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Encourage construction contractors to apply for AQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for AQMD "SOON" funds. The "SOON" program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/tao/Implementation/SOONProgram.htm

Additional measures to reduce off-road construction equipment can be found at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM intro.html.

1 For example see the Metro Green Construction Policy at: http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

Response:

LAWA agrees that construction off-road equipment measures can be incorporated into project construction specifications. For future off-road equipment used on SPAS-related projects, LAWA has incorporated the following mitigation action as part of MM-AQ-2:

Prior to January 1, 2015, all off-road diesel-powered construction equipment greater than 50 HP will meet USEPA Tier 3 off-road emission standards. After December 31, 2014, all off-road diesel-powered construction equipment greater than 50 HP will meet Tier 4 off-road emissions standards. Tier 4 equipment shall be considered based on availability at the time the construction bid is issued. LAWA will encourage construction contractors to apply for SCAQMD "SOON" funds to accelerate clean up of off-road diesel engine emissions.

No emission reduction credit is taken for this measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-AR00002-37

Comment:

Specificity of Mitigation Measures

4. Many of the mitigation measures from the LAX Master Plan that are carried forward into the LAX SPAS Draft EIR are vague and need further clarification in the Final EIR. Without this added specificity, it is unclear how effectively the proposed measures from Table 4.2-9 of the Draft EIR may mitigate air quality impacts. The Final EIR should include additional discussion of the following items:

Response:

As discussed on page 4-3 of the SPAS Draft EIR, the Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4)). Section 15146(b) of the State CEQA Guidelines states that "An EIR on a project such as the… amendment of… a local general plan should focus on the secondary effects that can be expected to follow from the… amendment, but the EIR need not be as detailed as an EIR on the specific construction projects that might follow."

Program EIRs are commonly used in conjunction with the tiering process, which is "the coverage of general matters in broader EIRs (such as general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs…concentrating solely on the issues specific to the EIR subsequently prepared." (State CEQA Guidelines Section 15385.) Under CEQA's tiering principles, it is proper for a lead agency to focus a first-tier EIR on only the program's general impacts, "leaving project-level details to subsequent EIRs when specific projects are being considered." (State CEQA Guidelines Section 15152(c); In re Bay-Delta (2008) 43 Cal.4th 1143, 1174-1175.)

The CEQA Guidelines establish several additional principles related to the level of detail appropriate for a first-tier program EIR. For example, an EIR project description should be "general" and "not supply extensive detail beyond that needed for an evaluation and review of the environmental impacts." (CEQA Guidelines Section 15124.) Also, the degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated. (CEQA Guidelines Section 15146(b).) An EIR's sufficiency is reviewed in the light of what is "reasonably feasible." (CEQA Guidelines Section 15151.)

The requirements and principles for first-tier program EIRs reviewed above apply directly to the SPAS Draft EIR. As stated on page 1-10 in Section 1.2.1 of the SPAS Draft EIR, "The project is to complete a Specific Plan Amendment Study (SPAS) that fulfills Section 7.H of the LAX Specific Plan consistent with the definition of the SPAS set forth in the LAX Master Plan Stipulated Settlement." The outcome of SPAS is the possible amendment of the LAX Specific Plan, which is an element of the City's General Plan. Therefore, the SPAS Draft EIR is appropriately a program EIR that focuses on program-wide impacts, and is not a project-level EIR. Because it is a program EIR, the SPAS Draft EIR is not required to analyze the impacts of specific construction projects included in the program at a project-specific level of detail.

As with the analysis in the EIR, the level of detail in mitigation measures can only be as specific as the program that they are designed to address. Where, as here, the project is at the general planning-level, it is appropriate to consider broad policy alternatives and program-wide mitigation measures rather than develop project-level, specific mitigation measures in the absence of specific project details. (State CEQA Guidelines Section 15168(b)(4).) Specific, project-level mitigation measures would be identified in connection with the environmental analysis of future projects.

Please see Response to Comment SPAS-AR00002-38 regarding electric charging stations in parking structures. Please see Responses to Comment SPAS-AR00002-39 regarding rental car fleets. Please see Response to Comment SPAS-AR00002-16 regarding LAWA's Alternative Fuel Vehicle Requirement Program that is applicable to all commercial vehicles using the terminal areas.

SPAS-AR00002-38

Comment:

- It is unclear how many charging stations will be provided by implementing this project. The currently installed electric vehicle charging stations are commonly overcrowded, thus not allowing electric vehicles the ability to charge while onsite. At a minimum, enough Level 1 charging capacity should be added to accommodate demand.

Response:

LAWA has partnered with the Department of Water and Power to install over 30 public access Level 2 electric vehicle charging stations at LAX. These stations are located in Parking Structures P1 and P6. LAWA's recent replacement of old style chargers and the provision of additional chargers was in response to increased usage. LAWA will continue to evaluate the charging station use to determine when additional charging stations are warranted. Charging stations will also be installed in the new parking facilities constructed under SPAS.

SPAS-AR00002-39

Comment:

- It is unclear how promoting "best engine" technologies at rental car fleets will be implemented. The types of technologies that will be promoted and the incentives provided should be detailed in the Final EIR.

Response:

LAWA has a number of existing programs in place to promote the use of alternative fuel vehicles at LAX, such as the extensive amount of CNG vehicles within LAWA's current fleet mix and the alternative fuel conversion program for trucks, shuttles, passenger vans, and buses over 8,500 pounds gross vehicle weight ratings that was developed through the LAX Master Plan Community Benefits Agreement. The increased use of such vehicles, particularly CNG/LNG-fueled vehicles, at and around LAX can provide a greater demand for CNG/LNG-fueling stations around LAX, which, in-turn, can support a greater use of CNG rental cars, such as those available through Hertz Green Traveler Program.

SPAS-AR00002-40

Comment:

- It is unclear how the lead agency will promote SULEV/ZEV technology for commercial vehicles using terminal areas. The Final EIR should specify the types of incentives that will be offered, as well as the applicability of these incentives (e.g., how will it apply to heavy duty delivery trucks, shuttle buses, etc?)

Response:

Please see Response to Comment SPAS-AR00002-16 regarding LAWA's Alternative Fuel Vehicle Requirement Program that is applicable to all commercial vehicles using the terminal areas.

SPAS-AR00002-41

Comment:

Electrification of Passenger Gates

5. Page 4-107 of the Draft EIR states that newly constructed passenger gates will be electrified (Measure X.A). Because of the significant air quality impacts of this project, the lead agency should investigate the feasibility of electrifying all gates at LAX. The Final EIR should include a discussion of the feasibility of this additional mitigation, as well as the time frame that would be needed to implement it.

Response:

All existing passenger gates (terminal and regional boarding ramp gates) at LAX have been retrofitted with 400 Hz gate power.1

SPAS-AR00002-42

Comment:

CEQA Baseline

6. Establishing a proper baseline is fundamental to accurately assessing a project's impacts. The function of the baseline is to set conditions against which project impacts are compared to determine whether an environmental impact is significant. As such, the baseline should not be established in a way that understates project impacts. The baseline emissions in this Draft EIR are from 2010. While conditions at the time the NOP is released normally constitutes the baseline for analysis of project impacts, a future conditions baseline is the more appropriate baseline to evaluate the impacts from this proposed project. This is because use of a current conditions baseline underestimates project impacts by taking credit for projected improvements to air quality that are unrelated to the proposed project. These improvements include the future air quality benefits from currently adopted and enforceable vehicle emission standards. Crediting the project with such benefits does not disclose the impacts of the project. Therefore, in order to ensure that the impacts of this project are accurately described, the AQMD staff believes the impacts of the proposed Project should be measured against future conditions without the proposed Project. In other words, a baseline should be presented that includes current activity levels along with project build-out emission standards.

Response:

The baseline analysis was conducted pursuant to, and complies with, the requirements of CEQA. (State CEQA Guidelines Section 15125(a).) The operational emissions comparison using the standard CEQA approach (i.e., baseline as existing conditions at time of the Notice of Preparation (NOP)), was presented in Table 4.2-13 (pages 4-122 through 4-125) of the SPAS Draft EIR. The results of this analysis indicated that aircraft and on-board auxiliary power unit (APU) emissions would be substantially higher in the future under all SPAS alternatives compared to existing aircraft and APU emissions. The results also indicate that despite anticipated growth in activity levels of traffic and ground handling support, emissions would decrease relative to existing emission inventories for parking lots, roadways, and airport ground support equipment (GSE). The emission reductions would mostly be due to existing regulations that substantially lower future motor vehicle and offroad equipment emission rates. The only exception to this finding is for PM10 and PM2.5, which are driven by fugitive road dust. Because the dust emission factors do not decline over time, the roadway emissions of PM10 and PM2.5 increase over time with the increased activity. Removing regulations from analysis is inconsistent with CEQA case law and the reality of air emissions modeling. New regulations are part of the reasons the EMFAC and OFFROAD emissions models are updated. In addition, CEQA case law provides for the use of regulations in analyzing impacts. See for example, Oakland Heritage Alliance v. City of Oakland (2011) 195 Cal.App.4th 884, 904, where petitioners argued that the lead agency could not rely on existing regulations and codes to support its conclusion that the project's impact would be less than significant. The Court rejected this argument, holding that "compliance with the Building Code, and other regulatory provisions . . . provided substantial evidence that the mitigation measures would reduce seismic impact to a less than significant level." See also, Sundstrom v. County of Mendocino (1988) 202 Cal.App.3d 296, 308, where the Court noted "(a) condition requiring compliance with environmental regulations is a common and reasonable mitigating measure."

The anticipated growth at LAX assumed in the SPAS Draft EIR, which is consistent with growth projections in the SCAG 2012-2035 RTP, would occur with or without construction of any of the SPAS alternatives. The airport satisfies a demand for air travel, and the SPAS alternatives are proposed to improve the ability to handle the anticipated passenger and cargo activity levels. Since all future alternatives are assumed to handle the same level of activity, useful information about the relative emissions of each of the SPAS alternatives is obtained by comparing each build alternative to a future no-build alternative. Alternative 4 in the SPAS Draft EIR represents what would reasonably be expected to occur if all ongoing and reasonably foreseeble non-Yellow Light improvements identified in the LAX Master Plan were implemented, and none of the Yellow Light Projects or any of the SPAS alternatives were constructed or implemented. (See Section 2.3.1.4 of the SPAS Draft EIR.) In this sense, it is almost a no-build alternative in that it would include no changes to terminal facilities, minimal airfield improvements, and only the installation of a consolidated rental car facility in a current parking lot (Lot C) and development of additional parking on the southeast corner of the airport. As explained on page 4-121 of the SPAS Draft EIR, using Alternative 4 as a basis of comparison between alternatives better respresents the differences in aircraft emissions that are directly attributable to the different airfield configurations under consideration. For informational purposes, Table 4.2-14 (pages 4-126 through 4-129) of the SPAS Draft EIR provides a comparison of criteria pollutant emissions from each build alternative (Alternatives 1 through 3, and 5 through 9) in 2025 to Alternative 4's 2025

emissions. The results of this comparison indicate that SPAS Alternatives 1, 2, and 5 through 9 would have lower aircraft and APU emissions than Alternative 4, indicating that each possible SPAS alternative (except Alternative 3, the previously approved LAX Master Plan including all Yellow Light Projects) would reduce aircraft time in mode (e.g., approach, taxi/idle-in, taxi/idle-out, takeoff, and climbout) relative to Alternative 4. The results of this comparison are discussed in detail on pages 4-130 through 4-136 of the SPAS Draft EIR. GSE would be approximately the same for all alternatives, and traffic is dependent on the specific alternative with Alternatives 8 and 9 having the lowest traffic emissions.

SPAS-AR00002-43

Comment:

Air Quality Analysis Interim Milestone Years Needed in Air Quality Analysis

7. The analysis years for the Draft EIR includes only two analysis years: baseline year 2009/2010 and build out year 2025. It is not clear that 2025 captures the peak daily emissions. By 2025, the project will be at full build and vehicle and truck fleets will meet the most stringent emission standards currently required. Although the proposed project may not be at peak capacity in earlier years, it is possible that due to higher emission rates of vehicles and trucks in earlier years that peak daily emissions may occur before 2025. The overall emission rates of vehicles and trucks are higher in earlier years as more stringent emission standards have not been fully implemented and fleets have not fully turned over. The Final EIR must provide additional information to demonstrate that 2025 is the peak year, and if it is found that an earlier year is the peak year, that year should be presented in the air quality analysis.

Response:

The SPAS Draft EIR analyzed impacts at a programmatic level; thus, it is reasonable to assess the baseline and build-out year as was done because specific details about individual project construction schedules are not available at this time. Interim year evaluations would be conducted for the project level EIRs as each specific project is undertaken. Notwithstanding, LAWA has completed a review of the SPAS air quality mobile source emission calculations in light of EMFAC emissions factors for years earlier than 2025 to confirm, on a preliminary basis, that such "interim year" emissions would be less than the baseline emissions was conducted, as is summarized below.

Operational emissions of SO2, PM10, and PM2.5 would peak in 2025 since these pollutants are driven by either aircraft operations (SO2) or fugitive road dust (PM10 and PM2.5) and are thus highest at the highest activity levels. The emissions of CO, VOC, and NOx would be expected to remain less than significant during interim years as follows:

- The forecasted growth in activity between 2009/2010 and 2025 is expected to be roughly linear, based on passenger forecasts between 2009 and 2025 presented in Table 4 in Appendix F-1 of the Preliminary LAX SPAS Report. Please also see Attachment 2 of this Final EIR for a plot of the LAX passenger forecast between 2009 and 2025. Therefore, if the on-road vehicle emission factors decline at least linearly between the baseline and build-out year, then it would be expected that SPAS-related emissions in interim years would be no higher than the baseline emissions, and would probably be lower. If the on-road vehicle emission factors decline more rapidly in the earlier years than later years during this period, the interim year emissions would be lower than the baseline year emissions, and impacts would remain less than significant.

- The EMFAC 2011 emission factors for LDA, LDT1, and LDT2 categories (representing passenger vehicular traffic) for 2010, 2015, 2020, and 2025 were reviewed.1 During the first 1/3rd of the period, between 2010 and 2015, emission factors for criteria pollutants dropped between 42 percent and 53 percent. Reviewing heavy duty diesel truck (EMFAC T7 category) emission factors indicates that between 2010 and 2015, these factors dropped between 41 percent and 53 percent. Since this five year period represents only 33 percent growth in activity, it is clear that the vehicular emissions would be lower by 2015 than during the baseline period. The emissions from on-road vehicles are substantially higher than those from airside equipment (aircraft, auxiliary power units, and ground support equipment). Therefore, the program level emissions in the interim years would still be less than the baseline period emissions, and would be less than significant for operational emissions of CO, VOC,

and NOx. The results of this evaluation are provided in Table 1 for passenger cars and Table 2 for heavy duty diesel trucks. EMFAC emission factor files are provided in Attachment 2.

SPAS-AR00002-44

Comment:

Diesel Idling

8. Page 4-108 of the Draft EIR describes a ten minute idling limitation for vehicles onsite (Measure X.M). This measure should be revisited and made consistent with the most recent CARB rule on diesel idling, including no more than five minutes of idling for trucks.

Response:

The Community Benefits Agreement, Section X.M, Limits on Diesel Idling, listed on page 4-108 of the SPAS Draft EIR currently states, "LAWA shall prohibit diesel-powered vehicles from idling or queuing for more than ten consecutive minutes On-Site, unless CARB adopts a stricter standard, in which case LAWA shall enforce that standard. Exemptions to this rule may be granted for safety-related and operational reasons, as defined in CARB regulations."1 The limitation on idling time will be revised to five (5) minutes per current CARB regulations. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-AR00002-45

Comment:

Monitoring Studies Evaluating Black Carbon and Ultrafine Particles

9. LAX is currently undertaking a monitoring study to evaluate the community impacts of air pollution from the existing facility.2 According to the LAWA website, the study will be complete by Spring of 2013. This study will evaluate a diverse suite of pollutants, including two pollutants commonly associated with health impacts, ultrafine particles and black carbon. Another recent study that investigated pollutant concentrations near LAX found that black carbon and ultrafine particles are substantially elevated during aircraft takeoffs and landings.3 However AQMD staff was unable to identify any discussion of either study in the Draft EIR. As both of these studies were conducted to help the public and decision makers for this project evaluate potential air quality impacts from this facility, a robust description should be included in the Final EIR.

2 http://www.lawa.org/welcome_LAX.aspx?id=1066
3 http://arb.ca.gov/research/apr/past/04-325.pdf

Response:

LAWA has committed to conduct a study to determine and quantify LAX's contribution to air pollutant impacts on neighborhoods surrounding the airport by conducting the LAX Air Quality and Source Apportionment Study (AQSAS), pursuant to the LAX Master Plan Community Benefits Agreement, Section VII and Section E of Exhibit A of the LAX Master Plan Stipulated Settlement. The study is not tied to any specific LAX project, since the timing of the study could be affected by events outside of LAWA's control (such as the events of 9/11 which delayed the original study implementation). The LAX AQSAS uses methodologies and techniques that are research oriented, state-of-the-art, and sometimes different than USEPA-approved methods for analyzing pollutant concentrations for comparison to ambient air quality standards.

The LAX AQSAS is overseen by the study's Technical Working Group. The Technical Working Group provides oversight of the technical quality of the AQSAS and is comprised of air quality scientists, researchers, and engineers from the U.S. Environmental Protection Agency (U.S. EPA), California Air Resources Board (CARB), South Coast Air Quality Management District (SCAQMD), State of California Office of Environmental Health Hazard Assessment (OEHHA), Federal Aviation Administration (FAA), and community organizations.

The LAX AQSAS is currently in its third and final phase, including monitoring at numerous locations in the communities around the airport, conducting laboratory analyses, applying receptor modeling techniques to the monitored data, interpreting the results, and preparing the final report. LAWA has committed to publish the study final report in the spring of 2013. The project status can be viewed at: http://www.lawa.org/welcome_LAX.aspx?id=1066.

SPAS-AR00002-46

Comment:

Receptors Used in Dispersion Modeling

10. The dispersion modeling used to determine criteria and toxic air pollutant concentrations uses a set of receptors along the boundary of the project site. As shown in Table 4.2-15 of the Draft EIR, most of the pollutants exceed significance thresholds, some by a large margin. However, because receptors were not included farther out in the community, it is impossible to determine the extent of these impacts. While knowing whether predicted concentrations exceed the Ambient Air Quality Standards (AAQS) is important, the public and decision makers also need to know if this impact is strictly at the fenceline or if it impacts a substantial number of people in the surrounding community. The Final EIR should include results of the dispersion model, including contour maps, showing the extent of criteria pollutant impacts

offsite. Guidance regarding receptor placement for dispersion modeling can be found at the website below:
http://www.aqmd.gov/smog/metdata/AERMOD ModelingGuidance.html.

Response:

The peak impact locations for each pollutant and averaging period are presented for Alternatives 1 through 7 in Figures 4.2-2 through 4.2-8 of the SPAS Draft EIR (pages 4-137, 145, 147, 149, 151, 153, and 157). While not plotted specifically, the range of impacts above the thresholds for 1-hour NO2, PM10, and PM2.5 are confined to well under 1 kilometer (0.62 mile) beyond the fence-line to the east and no more than 100 meters (328 feet) to the north. The PM2.5 impacts at the fence-line are just at or below the significance threshold for Alternatives 1, 2, 5, 6, 7, 8, and 9. The PM10 impacts at the fence-line are slightly above the threshold for these same alternatives. Under Alternative 5, which would relocate Runway 6L/24R 350 feet northward, the extent of the threshold of significance exceedance for 1-hour NO2 beyond the fence-line would only reach the southernmost portion of the residential area located between Westchester Parkway, Kittyhawk Avenue, and Will Rogers Avenue. Specifically, the area in which the threshold would be exceeded includes fewer than five residences. The area in which there would be PM2.5 and PM10 exceedances would be even smaller. For alternatives that do not move Runway 6L/24R as far north, or do not move the runway north at all, there may be no exceedances in the surrounding community.

Impacts east of the southern runways would not be significant beyond La Cienega Boulevard. That is, peak impacts for 1-hour NO2, PM10, and PM2.5 drop below the significance threshold between the eastern LAX fence-line and La Cienega Boulevard, which is primarily an industrial area. As noted above, impacts to the north do not extend more than 100 meters beyond the northern LAX fence-line.

The peak impact locations for acute non-cancer risk from exposure to acrolein are presented for Alternatives 1 through 7 in Figures 4.7.1-6 and 4.7.1-7 of the SPAS Draft EIR (pages 4-469 and 4-471). The extent which acrolein impacts would exceed the acute hazard index of 1 is limited to the area bounded by Westchester Parkway to the south, Manchester Parkway to the north, Lincoln Boulevard to the east (between Westchester and Manchester), and Stanmoor Drive to the west.

As requested in comment SPAS-AR00002-4, LAWA met with SCAQMD on November 29, 2012, at which two CDs with the detailed calculations and model input and output files were provided to SCAQMD. These files are available, upon request, in electronic format and are also available for public review in hard copy form at LAWA's Capital Programming and Planning Division, Room 208, One World Way, Los Angeles, California. Technical working files that delineate raw EDMS input/output data would be approximately 60,000 to 80,000 pages long if printed. Because of the sheer volume and the lack of added value they provide, the technical working files were not included within the SPAS Draft EIR air quality technical appendix. Instead, the summary EDMS output results for each alternative was included in the 400+ page Appendix C of the SPAS Draft EIR. The detailed input/output EDMS data were available upon request to LAWA (SPAS Contact Person: Diego Alvarez as indicated on SPAS public notices and SPAS website) during the 75-day public review period of the SPAS Draft EIR.

SPAS-AR00002-47

Comment:

Dispersion Modeling Source Treatment

11. The Draft EIR does not contain any description of how emission sources were treated in the dispersion model. Without this key description of the modeling exercise, neither AQMD staff, nor the public, is able to confirm the validity of the dispersion modeling analysis. Key parameters that require additional clarification include source type, placement, strength, dispersion parameters, etc. The Final EIR should include a copy of the dispersion modeling input and output files as a separate appendix. AQMD staff also requests that the input and output files be provided to us in their native format (consistent with our request from our comment letter on the project"s NOP) when available.

Response:

The EDMS and AERMOD input and output files in native formats were provided by LAWA to SCAQMD on CDs during a meeting scheduled to discuss the LAX SPAS project with SCAQMD on November 29, 2012. Also included on the disks were the emission calculation spreadsheets for construction and operational sources. Producing a hard copy of this information would generate 60,000 to 80,000 pages of material; therefore, LAWA has chosen not to create hard copies, since most of this material is only useful in electronic format as used in the modeling programs. The SPAS Draft EIR provided all required and necessary information from the air quality impact analysis for decision making, including construction and operational emissions and concentrations by alternative, in Section 4.2 and Appendix C of the SPAS Draft EIR. The emissions were developed from standard sanctioned regulatory models (EMFAC2011, OFFROAD2007, CalEEMod, and EDMS v.5.1.3) for the sources considered in the analysis.

Much of the treatment of aviation sources in the FAA EDMS program is hardwired in the program and the modeler is not allowed to modify those components of the analysis. The selection of aircraft types was based on the fleet mixes presented in Appendix J1-1, Aircraft Noise Technical Analysis of the SPAS Draft EIR. Table 3 in Appendix J1-1 presents the fleet mix used for the Baseline (2009) conditions, while Table 8 presents the fleet mix used for all alternatives in 2025. Please also see Response to Comment SPAS-PC00130-770 for more detail on the fleet mixes and aircraft equipment included in the air quality analysis. Once the aircraft/engine combination is selected, EDMS calculates emissions, develops the aviation source parameters from runway, taxiway, and terminal coordinates and assigns emissions to each source it generates.

SPAS-AR00002-48

Comment:

Meteorological Data Used in Dispersion Model

12. Page 4-88 of the Draft EIR states that one year of meteorological data was used to complete the dispersion modeling analysis. While one year of meteorological data is appropriate if collected onsite for most modeling purposes, it is not clear how the NO2 and SO2 modeling analysis comparing against the federal standards were completed. The federal NO2 and SO2 standards are based on the three year average of the 98th and 99th percentile (respectively) of the daily maximum hourly concentration. Three years of meteorological data is available from the LAX met station4 and should be used to determine these potential impacts.

4 http://www.aqmd.gov/smog/metdata/AERMOD.html

Response:

Prior to conducting the air dispersion modeling for all SPAS alternatives and all pollutants, a screening study was conducted to evaluate the potential impacts from each of the three years of meteorological data obtained from the LAX station (2005, 2006, and 2007). This analysis was conducted using the 2009 baseline source dataset, and the results indicated that peak hourly NOx and 8th high NOx would occur with the 2007 meteorological data. The variation in other pollutants was never more than 20 percent, and was typically less than 10 percent between the years. Therefore, 2007 meteorological data was chosen to analyze all alternatives. The concentration results shown in Tables 4.2-15 and 4.2-16 on pages 4-139 through 4-142 of the SPAS Draft EIR, were either so far below (better than) the threshold that an increase of 20 percent would not change the significance finding, or the impacts were already identified as significant. No change in the significance findings would occur if additional modeling were conducted with two more years of meteorological data. In addition, the ranking between the alternatives would not change.

SPAS-AR00002-49

Comment:

Emissions Inventory Calculations for Vehicles

13. It is unclear how the emission inventories were calculated for vehicles accessing the project site. For example, Table 56 of Attachment 2 of Appendix of the Draft EIR presents estimates of Vehicle Miles Travelled (VMT) for different speed bins and different vehicle types for the baseline scenario. This VMT estimate is then presumably multiplied by the emission factors from Table 61 of the same appendix to determine the total emission inventory from this source. However, there are several parameters that are not clear from Table 56 including 1) how the VMT was apportioned to each speed bin (it does not correlate with EMFAC 2011 for example); 2) how the different vehicles classes (at least 6 classes of vehicles likely travel to LAX) were weighted down to the two classes presented in Table 56; 3) how the VMT per trip value was determined; and 4) how the number of trips presented in Table 56 correlates with Tables 4.12.1-2 and 4.12.1-5 from the transportation analysis in the Draft EIR. The Final EIR should include a more thorough explanation of how the emission calculations were performed, including providing additional calculation sheets if necessary.

Response:

The emission factors for on-road motor vehicles were obtained from the EMFAC2011 model,1 as noted on page 4-93 in Section 4.2.2.2 of the SPAS Draft EIR. The passenger automobiles, including taxis and limousines, were based on a composite emission factor for EMFAC vehicle categories LDA, LDT1, and LDT2. The composite weighting factor is the vehicle miles traveled (VMT) for Los Angeles County for the year of analysis. Emission factors for trucks (cargo trucks) calling at LAX were based on heavy-heavy duty truck (EMFAC vehicle category T7) factors.2 For the on-airport roadways with substantial bus and large shuttle vehicles, the EMFAC factors for medium heavy duty truck (EMFAC vehicle category T6) were used 2 for these vehicles.2

The number of trips and VMT by speed bin presented in Tables 56 through 60 in Attachment 2 of Appendix C of the SPAS Draft EIR were developed by the transportation consultants analyzing traffic impacts. Please refer to Response to Comment SPAS-AR00002-51 for a brief summary of traffic models used in the SPAS analysis. Note that these values are only for trips associated with LAX (i.e., trips that begin or end at LAX), not for all trips in Los Angeles County. Therefore, these VMT values will not be found in EMFAC 2011 output because they are SPAS program-specific values only.

A check of the calculation for NOx emissions for the 40 to 45 mph speed bin is presented here (table numbers are for tables in Attachment 2 of Appendix C): The car NOx emission factor for cars traveling at 45 mph from Table 61 is 0.2867 grams/VMT (rounded). The VMT for cars in the 40 to 45 mph bin from Table 56 is 943,157. The truck NOx emission factor for truck traveling at 45 mph from Table 62 is 14.09 grams/VMT (rounded). The VMT for trucks in the 40 to 45 mph speed bin from Table 56 is 50,997. The result is calculated from [(0.2867 x 943157)+(14.09 x 50997)]/453.59 = 2180 lbs/day ~ 2179 lbs/day in Table 56.

1. California Air Resources Board. 2011. EMFAC2011 Web Based Data Access. Available at http:// www.arb.ca.gov/jpub/webapp//EMFAC2011WebApp/rateSelectionPage_1.jsp. Accessed November 24, 2012.
2. The truck emission factors in EMFAC2011 were obtained for the EMFAC2007 categories (T6 and T7) instead of the EMFAC2011 categories which had numerous T6 and T7 subcategories. Note that the emission factors are from EMFAC2011. Since the traffic analysis data did not have detailed evaluations of bus and truck sizes (gross vehicle weights), the simplified categories were appropriate for use.

SPAS-AR00002-50

Comment:

Emissions Inventory Calculations for Aircraft

14. The Draft EIR and its appendices only contain summary results for the emission inventory for aircraft emissions. AQMD staff could not find any backup calculations, including spreadsheets or EDMS input or output files in any of the project files. Without these emission calculations, neither AQMD staff, nor the public, is able to confirm the validity of the aircraft emission calculations. The Final EIR should include all of the calculation sheets and model files used to determine air quality impacts from aircraft emissions.

Response:

The aircraft fleet mix used in the air quality impact analysis is the same fleet mix used in the aircraft noise impact analysis. Please refer to Response to Comment SPAS-PC00130-110 regarding the aircraft fleet mix and emission model used to develop aircraft emissions for each alternative.

In addition, as requested in comment SPAS-AR00002-4, LAWA held a follow-up meeting with SCAQMD staff on November 29, 2012, to review and discuss the air quality analysis, impacts, and mitigation. Detailed aircraft emission calculation spreadsheets and modeling input and output files associated with the SPAS Draft EIR air quality analysis were provided to SCAQMD on two CDs at this meeting. These file are available, upon request, in electronic format and are also available for public review in hard-copy form at LAWA's Capital Programming and Planning Division, Room 208, One World Way, Los Angeles, California. Please also see Response to Comment SPAS-AR00002-46 regarding these files.

However, the data and information in the SPAS Draft EIR is more than sufficient for the decision-makers and public to understand aircraft emissions and the air quality impacts of the SPAS alternatives.

SPAS-AR00002-51

Comment:

Consistency with the AQMP

15. The Draft EIR does not address how the project is consistent with the AQMP. Although the capped number of passengers (78.9 million annually) appears to be consistent with assumptions in the Regional Transportation Plan / Sustainable Community Strategy (RTP/SCS), it is not clear if the assumptions about on-road vehicular travel are consistent with the RTP. The AQMP relies on the assumptions contained within the RTP/SCS. Given the volume of vehicles travelling to LAX, it is important to understand if the analysis contained within this EIR is consistent with regional planning assumptions. The Final EIR should include a discussion of the consistency between this project's traffic analysis and the RTP/SCS and the AQMP in general.

Response:

As noted in the comment, the future passenger activity for LAX evaluated in the SPAS Draft EIR in 2025 is 78.9 million annual passengers (MAP), which is consistent with the regional growth projections in the adopted 2012-2035 SCAG Regional Transportation Plan/Sustainable Communities Strategies. This level of activity was also consistent with the previous 2008 Regional Transportation Plan, which is part of the mobile emissions strategy for the AQMP. In addition, all of the SPAS alternatives include no more than 153 gates, and an amendment to the LAX Specific Plan Section 7.H requiring action to encourage further shifts in passenger and airline activity to other regional airports when and if forecasts for LAX exceed 75 MAP.

The description of the traffic model used is summarized in Section 4.12.2.2.2 (beginning on page 4-1202) of the SPAS Draft EIR. The description notes that the traffic volume forecasts for SPAS were developed from a version of the City of Los Angeles TDF Model, which was originally developed from the SCAG regional travel forecasting model and was calibrated and validated for conditions in the City of Los Angeles. The LAX SPAS Traffic Model utilizes TransCAD Version 4.8 Build 500 modeling

software consistent with the SCAG and City of Los Angeles TDF models. The traffic projections are consistent with the 2012 RTP/SCS. Thus, the SPAS Draft EIR traffic analysis is consistent with the SCAG RTP/SCS and the AQMP. See 2012 AQMP, Appendix IV-C. http://www.aqmd.gov/aqmp/2012 aqmp/DraftFinal/index.html.

SPAS-AR00002-52

Comment:

Greenhouse Gas Calculations for Aircraft

16. Page 4-389 of the Draft EIR describes how the GHG emissions were calculated from aircraft. Consistent with the criteria pollutant analysis, emissions were only included below the average mixing height of 1,806 feet above sea level. While using the mixing height is an appropriate method for a criteria pollutant analysis, it is not clear why this is appropriate for a GHG analysis. Aircraft travel the vast majority of their trip above the mixing height, and hence emit the bulk of their GHG's above this level. The Final EIR should include further clarification about why this is an appropriate method. The lead agency should also describe why other methods are not more appropriate (e.g., calculating aircraft GHG's based on the amount of fuel dispensed from LAX).

Response:

Section 4.6.2 of the SPAS Draft EIR describes the methodology and basis for the SPAS greenhouse gas (GHG) analysis and Section 4.6.4 provides additional discussion of the analytical framework and basis for determining significant GHG impacts associated with the SPAS alternatives. The approach described therein is considered reasonable and appropriate for disclosing GHG impacts associated with the SPAS project and provides the basis for a meaningful comparison of impacts between the SPAS alternatives for the public and decision-makers to review and consider. The commentor questions LAWA's use of the 1,806 feet above sea level mixing height as the basis for estimating aircraft-related GHG emissions, notwithstanding that specific elevation level is set forth by the South Coast Air Quality Management District for the purposes of air quality modeling, and instead suggests that calculating aircraft GHG emissions based on the amount of fuel dispensed from LAX. That alternative approach would, however, simply provide an estimate of the inherent GHG emission potential of a specific quantity of fuel that would be consumed (burned) somewhere in the world while the aircraft are operating. While it is understood (and is acknowledged in Section 4.6.1.1 of the SPAS Draft EIR) that GHG emissions contribute to global climate change, and that consequently, the sale and subsequent combustion of aircraft fuel dispensed at LAX would arguably contribute to global climate change, the dispensing of aircraft fuel at LAX is based on market forces (i.e., fuel prices that can vary across the globe and can change within a short amount of time), fuel contracts, and airline carrier policies, practices, and preferences regarding where their aircraft take on fuel, and how much fuel, between the various airports at which they operate. All of those factors are completely independent of SPAS; hence, the development of aircraft GHG emissions based on the amount of aircraft fuel dispensed at LAX on an annual basis would be: (1) speculative as to estimating the amount to be dispersed in 2025; and, (2), meaningless relative to the impacts of SPAS. The approach used in the SPAS Draft EIR analysis for estimating aircraft GHG focuses on the operational characteristics of aircraft at LAX, including aircraft engine time-in-mode for landing, taxiing/idling, and taking-off from LAX, as would vary between the SPAS alternatives. The different airfield improvement configurations reflected in SPAS Alternatives 1 through 7 would affect aircraft operations at LAX, especially relative to time-in-mode for aircraft that are taxiing and idling. Those differences in the estimated aircraft GHG emissions for the SPAS alternatives are evident in the Table 4.6-6 of the SPAS Draft EIR, providing a meaningful basis for the public and decision-makers to compare among and consider the impacts of the SPAS alternatives. Had the aircraft GHG emissions estimates been based on the amount of fuel dispensed at LAX, there would be no difference among the alternatives. In summary, the approach described therein is considered reasonable and appropriate for disclosing GHG impacts associated with the SPAS project and, moreover, provides the basis for a meaningful comparison of impacts among the SPAS alternatives for the public and decision-makers to review and consider.

SPAS-AR00002-53

Comment:

Greenhouse Gas Emissions Mitigation

17. Based on a review of the Draft EIR the lead agency has determined that the proposed project will not achieve a greenhouse gas (GHG) reduction target of 16% per passenger below 2009 levels by 2025. However, the lead agency indicates that, at a minimum, the project will achieve a 13.05% reduction in GHG emissions per capita. Therefore, the AQMD staff recommends that the lead agency provide the following additional mitigation measures pursuant to CEQA Guidelines Section 15126.4.

- Incorporate mitigation measures (b) through (x) in comment #2 and all mitigation measures in comment #3 identified above.

- Develop a monitoring and reporting plan that ensures the implementation of the applicable mitigation measures and requires future updates of the project's GHG emissions inventory. At a minimum, the inventory should demonstrate that the project achieves 13.05% reduction per capita consistent with the lead agency's GHG emissions analysis in the Draft EIR.

Response:

Please see Responses to Comments SPAS-AR00002-8 through SPAS-AR00002-30 and SPAS-AR00002-34 through SPAS-AR00002-36 regarding the mitigation measures suggested by the commentor. In accordance with State CEQA Guidelines Section 15097, should a SPAS alternative be selected for implementation, a mitigation monitoring and reporting program (MMRP) will be adopted to document and ensure implementation of the EIR GHG mitigation measures.

SPAS-AL00001 Kurtz, Barry — County of Los Angeles Department of Beaches and Harbors — 10/3/2012

SPAS-AL00001-1

Comment:

The Los Angeles County Department of Beaches and Harbors has the following comments on the Draft Environmental Impact Report (Draft EIR) for the Los Angeles International Airport (LAX) Specific Plan Amendment Study (SPAS):

The Off-Airport Transportation traffic study on Page 4-1301 indicates the project would have a significant impact at the intersection of Lincoln Boulevard and Washington Boulevard. The report states, "The addition of a southbound through lane would fully mitigate the project at this location. However, adding a southbound through lane would require widening of the southbound approach and departure...is considered infeasible...No other feasible improvements has been identified to fully mitigate the project impact...Therefore, this impact would remain significant and unavoidable..." We disagree that there are no other feasible mitigation measures. Costco also had an impact on the Lincoln/Washington intersection and was required to pay Culver City $1.5million towards the SR90 Connector Road to Admiralty Way project to mitigate their impact. Similarly, this project should contribute towards the SR90 Connector Road to Admiralty Way project to mitigate this project's impact or contribute to Admiralty Way improvements, since Admiralty Way serves as a "relief valve" to Lincoln Boulevard when it reaches capacity.

Response:

The comment correctly notes that the SPAS Draft EIR identifies a significant and unavoidable impact at the intersection of Washington Boulevard and Lincoln Boulevard under Alternatives 1-2, 4, 8, and 9. A mitigation measure was considered based on the projected future volumes at the intersection (addition of a southbound through lane) but it was found to be infeasible (see page 4-1301 in Section 4.12.2. of the SPAS Draft EIR). The comment claims that this significant impact can be mitigated through

monetary contributions to the Los Angeles County Department of Beaches and Harbors for: (a) an SR-90 connector road to Admiralty Way; and, (b) unspecified improvements to Admiralty Way. The comment also cites a monetary contribution made by Costco toward improvement (a) above.

While the traffic impact analysis was being prepared for the SPAS Draft EIR, Los Angeles County Department of Beaches and Harbors was contacted to determine the status of the extension of SR-90 and whether it was a reasonably foreseeable project that should be included in the cumulative 2025 without alternative scenario (page 4-1208 of the SPAS Draft EIR). The extension of SR-90 has been discussed for many years but has been controversial due to the need for property acquisition and other issues. The necessary approvals from Caltrans and the City of Los Angeles have not been obtained, and it is not included in the RTP, STIP or Metro's LRDP. Thus, after consultation with Los Angeles County, the project was determined not to be reasonably foreseeable within the 2025 timeframe of the SPAS project and was not included in the cumulative scenario or as a feasible mitigation measure. It would therefore be inappropriate to offer a contribution toward its implementation, particularly in light of the additional complications and restrictions that LAWA is subject to under federal law regarding the use of airport funds. Simply contributing funds toward an unspecified future improvement would not constitute mitigation under CEQA, since there is currently no mechanism to ensure that any specific improvements addressing the specific impacts are made. As discussed in Anderson First Coalition v. City of Anderson (2005) 130 Cal.App. 4th 1173and Carson Coalition for Healthy Families v. City of Carson (2007) 2007 WL 3408624 at page 18 [unpublished], without an actual plan and a commitment, a fair-share fee is not an adequate mitigation measure. The statement that the Costco project paid Culver City for this improvement to mitigate its traffic impact, and the fact that the Costco store has been in operation for well over a decade, suggests that its traffic impacts remain unmitigated.

Regarding the improvements to Admiralty Way, Los Angeles County is currently reconstructing a major section of Admiralty Way. On October 9, 2012 the Los Angeles County Board of Supervisors approved an addendum to a Mitigated Negative Declaration for the Admiralty Way Settlement Repair Project. The staff report posted on-line1 states that the project is fully funded. A review of the original Mitigated Negative Declaration, which was approved on August 14, 2012, shows that the future lane configuration of Admiralty Way at Bali Way, at Mindinao Way and at Palawan Way will be changed from the existing conditions.2 These three locations are study intersections #1, #3, and #4 in the SPAS Draft EIR. No significant traffic impacts were identified at those intersections in the SPAS Draft EIR, but because improvements currently being constructed were unknown during the preparation of the SPAS Draft EIR, LAWA has further evaluated the subject intersections to account for these new improvements and assess whether the conclusions of the SPAS Draft EIR analysis would be affected.

In response to this comment, Table 4.12.2-19 on pages 4-1255 and 4-1256 and Tables 4.12.2-21 through 4.12.2-25 on pages 4-1261 through 4-1280 of the SPAS Draft EIR have been revised for three study intersections: Admiralty Way at Bali Way (#1), Admiralty Way at Mindinao Way (#3) and Admiralty Way at Palawan Way (#4). Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. The refined analysis presented in the revised Tables 4.12.2-19 and 4.12.2-21 through 4.12.2-25 in Chapter 5, Corrections and Additions Related to the SPAS Draft EIR, is substantially the same as what is presented in the SPAS Draft EIR, did not identify any significant impacts at these three intersections, and the improvements identified in the Mitigated Negative Declaration for the Admiralty Way Settlement Repair Project would not worsen traffic conditions; therefore, the SPAS Draft EIR conclusions of no significant impacts at these three intersections are still valid.

1. County of Los Angeles, Department of Public Works, Admiralty Way Settlement Repair Project Staff Report, October 9, 2012, Available: http://file.lacounty.gov/bos/supdocs/71703.pdf.
2. County of Los Angeles, Department of Public Works, Draft Mitigated Negative Declaration and Initial Study for Admiralty Way Street Improvement Project, August 2012, Available: http://file.lacounty.gov/dbh/docs/cms1_181869.pdf.

SPAS-AL00001-2

Comment:

Table 4.12.2-25 shows in the PM peak hour Admiralty/Fiji LOS A, Admiralty/Mindanao LOS B and Admiralty/Palawan LOS B. These levels of service show less congestion than the levels of service shown in recent previous traffic studies. Provide the backup data to verify these levels of service.

Response:

The comment requests that backup up information be provided for the projected future levels of service at Admiralty Way and Fiji Way (study intersection 2), Admiralty Way and Mindanao Way (study intersection 3) and Admiralty Way and Palawan Way (study intersection 4) in Table 4.12.2-25 of the SPAS Draft EIR. The baseline traffic count data for these intersections is provided on page 1 through 3 of the PDF file of Appendix K2-4 of the SPAS Draft EIR. Detailed level of service calculations for the intersections are provided on page 1579 and 2135 of the PDF file of Appendix K2-6 of the SPAS Draft EIR. Appendices K2-4 and K2-6 of the SPAS Draft EIR are available for review at laxspas.org.

While the vast majority of base traffic count data for the SPAS off-airport traffic impacts analysis were collected in July and August 2010, it was not possible to collect valid traffic count data for several intersections in the Marina del Rey area due to construction activity occurring at that time (i.e., normal traffic patterns in that area were disrupted and detoured at times due to construction). Due to construction occurring in 2010, baseline counts collected in July 2008 were used at Study Intersections 4, 5, 119 and 122. In order to confirm that the 2008 data represents 2010 conditions, a comparison of "existing" levels of service was made between the SPAS Draft EIR and a traffic study prepared for the Marina Del Rey Local Coastal Program Amendment.1 The Marina del Rey study states that it is based on traffic counts collected in May 2009 and January 2010 and reports "Existing Conditions" as 2009. The levels of service for the three intersections that are the subject of this comment, as reported in the Marina del Rey study, are very similar to the "Baseline (2010) Without Alternative" levels of service. Both studies show that those three intersections are operating at good level of service under existing conditions. A review of the incremental differences in V/C or delay that would result from the SPAS alternatives shows that these minor differences in the baseline levels of service would not alter the conclusions of the traffic impact analysis presented in the SPAS Draft EIR. Based on the above, the analysis presented in the SPAS Draft EIR is considered to be valid and the traffic impact significance conclusions in the SPAS Draft EIR are unchanged.

1. Los Angeles County, Department of Beaches and Harbors, Draft Traffic Study for the Marine Del Rey Local Coastal Program Amendment, prepared by Raju Associates, April 29, 2010, Available: http://file.lacounty.gov/dbh/docs/cms1_148597.pdf, accessed December 11, 2012.

SPAS-AL00001-3

Comment:

All the intersections of Lincoln Boulevard near Marina del Rey show worse levels of service after the project, except the intersection of Lincoln/Mindanao shows no change in the PM peak hour. This appears to be an error. Provide the backup data to verify these levels of service.

Response:

The comment requests that backup up information be provided to verify the projected levels of service at Lincoln Boulevard and Mindanao Way (study intersection 107). The baseline traffic count data for this intersection is provided on pages 80 and 81 of the PDF file of Technical Appendix K2-4 of the SPAS Draft EIR. Detailed level of service calculations for the analyzed Existing and Future scenarios are provided on pages 45, 185, 264, 343, 422, 501, 1537, 1677, 1756, 1835, 1914, and 1993 of the PDF file of Appendix K2-6 of the SPAS Draft EIR. Appendices K2-4 and K2-6 of the SPAS Draft EIR are available for review at laxspas.org. As shown, while the level of service would not worsen, the v/c ratio and intersection volumes would not increase under all of the SPAS alternatives. For additional details regarding development and verification of the traffic model please see Draft EIR Section 4.12.2.2.2, and for discussion of methodology please see Section 4.12.2.2.3 of the SPAS Draft EIR.

SPAS-AL00001-4

Comment:

We will follow up with a letter with these comments.

Response:

The subject comment letter was submitted via email on October 3, 2012. It is noted that the Los Angeles County Department of Beaches and Harbors submitted a letter, dated October 10, 2012, via mail, which consists of identical comments to those included in this comment letter (SPAS-AL00001). The October 10, 2012 comment letter is designated as comment letter SPAS-AL00009.

SPAS-AL00002 Poosti, Ali City of Los Angeles Bureau of Sanitation 9/24/2012

SPAS-AL00002-1

Comment:

Los Angeles International Airport (LAX) Specific Plan Amendment Study - Draft EIR

This is in response to your letter requesting a review of your proposed Specific Plan Amendment Study project. The Bureau of Sanitation has conducted a preliminary study of the wastewater and stormwater systems of the proposed project.

WASTEWATER REQUIREMENT

The Bureau of Sanitation, Wastewater Engineering Services Division (WESD) has reviewed the request and found the project to be related to enhancing safety and security, minimizing environmental impacts on surrounding communities, and designing for a practical capacity only.

Based on the project description, we have determined the project is unrelated to sewer capacity availability and therefore do not have sufficient detail to offer an analysis at this time. Should the project description change, please continue to send us information so that we may determine if a sewer assessment is required in the future.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

Response:

The fact that the Bureau of Sanitation, Wastewater Engineering Services Division (WESD) has no comments on the Draft EIR is noted. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00002-2

Comment:

STORMWATER REQUIREMENTS

The Bureau of Sanitation, Watershed Protection Division (WPD) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

The project requires implementation of stormwater mitigation measures. These requirements are based on the Standard Urban Stormwater Mitigation Plan (SUSMP) and the recently adopted Low Impact Development (LID) requirements. The projects that are subject to SUSMP/LID are required to incorporate measures to mitigate the impact of stormwater runoff. The requirements are outlined in the guidance manual titled"Development Best Management Practices Handbook - Part B: Planning Activities". Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lastormwater.org. It is advised that input regarding SUSMP requirements be received in the early phases of the project from WPD's plan-checking staff.

Response:

This comment is noted. As indicated on page 4-620 of the SPAS Draft EIR, the update to the CDP required by Mitigation Measure MM-HWQ (SPAS)-1 would integrate applicable BMP requirements related to SUSMP and the City's LID Ordinance.

SPAS-AL00002-3

Comment:

GREEN STREETS

The City is developing a Green Street initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the SUSMP/LID requirements.

Response:

This comment is noted. As noted in Section 4.8 of the SPAS Draft EIR, the CDP would be updated in conjunction with all of the SPAS alternatives except for Alternative 3, for which a CDP has already been prepared. As noted in Mitigation Measure MM-HWQ (SPAS)-1 on page 4-638 of the SPAS Draft EIR, the updated CDP would take into account current regulatory programs related to water quality, such as the application of SUSMP and LID requirements by the City Bureau of Sanitation - Watershed Protection Division. In accordance with the updated CDP, measures that are consistent with the City's Green Street initiative, which is another current regulatory program, would be incorporated into project design, to the extent feasible and applicable.

SPAS-AL00002-4

Comment:

CONSTRUCTION REQUIREMENTS

The project is required to implement stormwater control measures during its construction phase. All projects are subject to a set of minimum control measures to lessen the impact of stormwater pollution.
In addition for projects that involve construction during the rainy season that is between October 1 and April 15, a Wet Weather Erosion Control Plan is required to be prepared. Also projects that disturbed more than one-acre of land are subject to the California General Construction Stormwater Permit. As part of this requirement a Notice of Intent (N01) needs to be filed with the State of California and a Storm Water Pollution Prevention Plan (SWPPP) needs to be prepared. The SWPPP must be maintained on-site during the duration of construction.

Response:

This comment is noted. The comment is consistent with the discussion of construction-related water quality requirements included in Section 4.8 of the SPAS Draft EIR.

SPAS-AL00002-5

Comment:

If there are questions regarding the stormwater requirements, please call Kosta Kaporis at (213) 485-0586, or WPD's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

Response:

The comment is noted.

SPAS-AL00003 Welborne, Martha Metropolitan Transportation Authority 10/9/2012

SPAS-AL00003-1

Comment:

Thank you for the opportunity to comment on the Draft Environmental Impact Report (EIR) for the LAX Specific Plan Amendment Study (SPAS). The Los Angeles County Metropolitan Transportation Authority (LACMTA) is responding in its capacity as a responsible agency with respect to the proposed project's potential impacts on existing and planned Metro and municipal transit services.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00003-2 through SPAS-AL00003-12 below.

SPAS-AL00003-2

Comment:

Valuable Analysis Tools to Clarify Differences in Benefits / Impacts among Alternatives

To support a better understanding of the benefits of various ground transportation solutions when comparing alternatives, please note the following suggestions for the traffic analysis:

1) Traffic Micro-simulation

The traffic analysis performed for the SPAS presents a significant level of rigor following the Critical Movement Analysis methodology using the TRAFFIX traffic modeling tool (as indicated on Page 4-1079). It may be helpful to complement the Critical Movement Analysis with more detailed micro-simulation to clarify differences in benefits and impacts to ground transportation among the various ground transportation and transit alternatives. Traffic flow micro-simulation is often able to capture interactions across many roadway segments (links) and intersections (nodes) and can simulate compounding downstream effects of traffic delay and queuing ("spill back") and bottlenecks ("lane blocking") that are common to airports, especially those with ring roads. Especially in the Central Terminal Area (CTA), there are complex interactions with different curb configurations, ramps, turn lanes, parking garage entrances and exits, weaving lanes, and drop off areas that create location-specific bottlenecks and weaving friction. Capturing these differences in performance of the roadway system will help to clarify the differences between the performance of transit buses operating in mixed flow traffic and other transit solutions that are not affected by roadway performance (elevated busway, automated people movers, and light rail).

Response:

Please see Response to Comment SPAS-PC00130-687 regarding the STV analysis of ground access conducted as part of SPAS.

As discussed on pages 4-1044 and 1045 in Section 4.12.1.2 of the SPAS Draft EIR, the SPAS on-airport transportation analysis methodology is consistent with that used in analysis in the LAX Master Plan Final EIS/EIR. Quantification of impacts is based on projected supply and demand, and takes into account projected availability of on-airport parking. These analytic methods provide a program-level impact analysis, which is appropriate at this stage of the planning process. Detailed project-specific planning, phasing, and design for individual components in the SPAS alternatives are not included in this phase of the SPAS process. Should a SPAS alternative be selected for implementation, detailed design-level data and traffic impact analyses would be developed as future projects are proposed, providing the basis to complete a more detailed project level CEQA analysis using micro-simulation. Please see Responses to Comments SPAS-PC00139-142 and SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic environmental review conducted for the SPAS project.

SPAS-AL00003-3

Comment:

2) Without Alternative Condition with Future Traffic Levels

The Without Alternative condition for 2025 is presented with air passenger traffic levels for 2009. As noted on Page 4-1048, this approach is conservative for determining the extent of impacts for each individual "With Alternative" condition. It may be worthwhile to compare some "With Alternative" conditions to a Without Alternative Condition at 2025 air passenger traffic levels, rather than 2009 traffic levels. Alternatively, it may be useful to compare them to the 2025 traffic levels and impacts that would be generated using either Alternative 5, 6, or 7 as a baseline (if this is pursued, Alternatives 5, 6, and 7 should include the proposed Metro station at Aviation and Century Boulevards as part of the baseline). Comparing these scenarios with 2025 traffic levels may help to clarify the benefits of transit investments and to test the robustness of the background roadway and transportation networks.

Response:

The comment correctly states that the cumulative traffic impact analysis in the SPAS Draft EIR was based on a comparison between the Future (2025) With Alternative scenario and the Future (2025) Without Alternative scenario. LAX is projected to grow naturally along with greater Los Angeles with or without implementation of any SPAS alternative. Passenger growth at LAX was not included in the Future (2025) Without Alternative scenario, although it was included in the Future (2025) With Alternative scenario. Therefore, the Future (2025) Without Alternative scenario was based upon a projection of 56.5 MAP, not the 78.9 MAP expected in 2025. This approach was utilized because it presents a very conservative delineation of the future off-airport traffic impacts of the SPAS alternatives since the vehicle trips associated with projected growth in aviation activity at LAX would occur regardless of whether the SPAS project is implemented. (See Section 4.12.2.2.3 of the SPAS Draft EIR.)

The comment states that it may be beneficial to compare the Future (2025) With Alternative scenario to a Future (2025) Without Alternative scenario that includes traffic associated with the projected growth at LAX or, alternatively, to Alternatives 5, 6, or 7. The comment also recommends including the future Metro station at Aviation and Century Boulevards as part of the future baseline.

The commentor's suggestion that the analysis use Alternative 5, 6, or 7 as a baseline, and that if one of those alternatives is pursued it should include the subject Metro station, does not reflect the fact that adoption of any one of those alternatives would be paired with the ground transportation system improvements proposed under either Alternative 1, 2, 8, or 9. Although Alternatives 5, 6, and 7 focus on airfield and terminal improvements, they are not "stand alone" alternatives, as explained on page 2-8 in Section 2.3.1 of the SPAS Draft EIR, and would therefore not be an appropriate comparison.

As discussed on page 4-1208 and shown in Appendix K2-1 of the SPAS Draft EIR, the Future (2025) Without Alternative conditions used in the SPAS Draft EIR do include the Metro station at Century and

Aviation Boulevards on the Metro Crenshaw/LAX Transit Corridor, as well as other committed future transportation improvements in the study area. As discussed on page 4-1208 of the SPAS Draft EIR, Future (2025) Without Alternative conditions were identified in a manner that provides a conservative analysis. It is agreed, however, that, while not required by CEQA or considered necessary to the decision-making process, additional analysis, specifically an analysis that includes a scenario that accounts for natural growth at LAX, may provide useful information to the public and to the decision-makers. Therefore, this response to comment, part of the SPAS Final EIR, presents below an analysis of a Future (2025) Without Alternative scenario that includes the natural growth at LAX but does not include the physical changes proposed under the analyzed SPAS alternatives ("Future (2025) Without Alternative With Future MAP Levels").

LAWA has prepared a Future (2025) Without Alternative With Future MAP Levels scenario and provided additional analysis using this scenario. The subject analysis provides a comparison of the Future (2025) With Alternative scenario to a Future (2025) Without Alternative scenario that includes the natural growth at LAX (i.e., future 78.9 MAP in 2025) and the Metro station at Century and Aviation Boulevards on the Metro Crenshaw/LAX Transit Corridor (as well as other reasonably foreseeable improvements as described on page 4-1208 of the SPAS Draft EIR), but does not include the physical changes proposed under the analyzed SPAS alternatives. Under this comparison, as identified below, impacts would be reduced relative to the impacts disclosed in the SPAS Draft EIR. Table 1 summarizes the results of the analysis, and is followed by a description of the analysis. Detailed tables delineating the specific impacts at all of the transportation facilities addressed in the SPAS traffic analysis (i.e., 200 intersections and CMP facilities) are provided in Attachment 4 of Part II of the Final EIR.

Summary

Table 1 below summarizes the off-airport intersection traffic analysis using the Future (2025) Without Alternative With Future MAP Levels (i.e., future 78.9 MAP in 2025) as the comparison scenario with each SPAS alternative. The table provides a comparison of traffic impacts when using the Future (2025) Without Alternative scenario, which does not include future MAP levels (i.e., baseline 56.5 MAP in 2009), previously identified in the SPAS Draft EIR, and the traffic impacts, as described above. The analysis in the SPAS Draft EIR (Future (2025) With Alternative scenario compared to Future (2025) Without Alternative scenario (56.5 MAP)), as amended by corrections and additions to the SPAS Draft EIR identified in Chapter 5 of this Part of the Final EIR, indicates that the number of impacted locations after mitigation ranged between 37 and 42 intersections, depending on the alternative.

When comparing the alternatives to the Future (2025) Without Alternative With Future MAP Levels scenario, impacts were reduced considerably both before and after mitigation. After mitigation, between 14 and 20 intersections would remain significantly impacted (all of which were already determined to be significant and unavoidable in the SPAS Draft EIR analysis). It should be noted that, although between 14 and 20 intersections within the total 200 intersections evaluated would have significant and unavoidable impacts, the redistribution of traffic associated with each SPAS alternative would have a corresponding improvement in the volume to capacity (v/c) ratios during one or more of the peak hours at the majority of the other intersections. As can be seen in review of Tables B-8 through B-12 in Attachment 3B, between 133 and 151 intersections within the total of 200 intersections would experience an improvement in v/c ratio under the different alternatives, with the improvements in v/c ratio generally ranging from 0.001 to 0.020.

Table 1

Summary Comparison of Intersection Impacts

	"Future (2025) With Alternative" Scenario compared to "Future (2025) Without Alternative" Scenario (56.5 MAP)[1]		"Future (2025) With Alternative" Scenario compared to "Future (2025) Without Alternative With Future MAP Levels" Scenario (78.9 MAP)

Future (2025) Without Alternative With Future Map Levels Trip Generation

The trip generation estimates for the Future (2025) Without Alternative With Future MAP Levels scenario prepared by Ricondo & Associates are provided in Attachment 3A. The Future (2025) Without Alternative With Future MAP Levels scenario is estimated to generate a total of 15,245 a.m. peak hour trips (7,830 inbound and 7,415 outbound), 20,163 midday peak hour trips (10,054 inbound, 10,109 outbound) and 17,660 p.m. peak hour trips (9,663 inbound and 7,997 outbound).

The airport-generated trips for each of the SPAS alternatives used in the Future (2025) Without Alternative With Future MAP Levels scenario analysis are consistent with the off-airport trip generation in Appendix K2-8 of the SPAS Draft EIR.

Table 2 below provides a comparison of the trip generation estimates for the Future (2025) Without Alternative With Future MAP Levels scenario against the trip generation estimates of each of the SPAS alternatives as well as the Future (2025) Without Alternative scenario from the SPAS Draft EIR.

Table 2

Comparison of Trip Generation Estimates

Alternative	AM Peak Hour Trips[1]			MD Peak Hour Trips[1]			PM Peak Hour Trips[1]		
	In	Out	Total	In	Out	Total	In	Out	Total
Future (2025) Without Alternative Scenario (56.5 MAP)	5,682	4,281	9,963	6,927	7,102	14,029	5,697	6,210	11,907
Future (2025) Without Alternative With Future MAP Levels Scenario (78.9 MAP)	7,830	7,415	15,245	10,054	10,109	20,163	9,663	7,997	17,660
Alt 1-2	7,899	7,446	15,345	10,078	10,123	20,201	9,718	8,066	17,784
Alt 3	7,571	7,124	14,695	9,767	9,824	19,591	9,368	7,727	17,095
Alt 4	7,763	7,329	15,092	9,976	10,029	20,005	9,639	7,966	17,605

Intersection Traffic Analysis

As discussed in greater detail in Section 4.12.2.2.3 of the SPAS Draft EIR (Future (2025) Comparison Methodology), the SPAS Draft EIR compared the Future (2025) With Alternative scenario against the Future (2025) Without Alternative scenario for each alternative to calculate the alternatives' contribution to cumulative impacts. The Future (2025) Without Alternative scenario included cumulative growth projections related to vehicle trips in the area surrounding LAX and traffic generated by reasonably foreseeable planned development, but held airport-related trip generation levels at Baseline (2010) Without Alternative MAP levels. This approach is considered to be very conservative in delineating the future off-airport traffic impacts of the SPAS alternatives because the vehicle trips associated with projected growth in aviation activity at LAX would occur regardless of whether the project is implemented.

The analysis presented below compares the Future (2025) With Alternative scenario provided in the SPAS Draft EIR against the Future (2025) Without Alternative With Future MAP Levels scenario. With the inclusion of projected natural growth at LAX in the new scenario, the alternatives' contribution to cumulative impacts would be reduced in comparison to the cumulative contribution disclosed in the SPAS Draft EIR (i.e., impacts would be reduced).

Criteria for Determination of Significant Traffic Impact

LAWA's off-airport traffic consultant, Fehr & Peers, assessed the alternatives' incremental contribution to cumulative traffic impacts at 200 intersections. The alternatives' traffic impact analysis was conducted for three traffic analysis periods (i.e., weekday a.m. peak hour, airport midday peak hour, and weekday afternoon p.m. peak hour). Each study intersection was evaluated for potential significant traffic impacts using the significant traffic impact criteria described in Section 4.12.2.4 of the SPAS Draft EIR.

Impacts Relative to Future (2025) Without Alternative With Future MAP Levels

The impact comparison for the SPAS alternatives is shown in Table B-1 of Attachment 3B. The associated level of service (LOS) worksheets used to calculate these impacts are provided in Attachment 3H for the Future (2025) Without Alternative With Future MAP Levels scenario and in Appendix K2-6 of the SPAS Draft EIR for the Future (2025) With Alternatives 1-2, 3, 4, 8, and 9 scenarios.

The following section summarizes the impacts associated with each alternative in comparison to Future (2025) Without Alternative With Future MAP Levels. In addition, Table 3 below shows the percentage change in the number of impacted intersections for the SPAS alternatives between the two Future Without Alternative scenarios, without and with MAP growth.

Table 3

Summary of Intersection Impact Analysis Before Mitigation

Alternatives	Impact Analysis using "Future (2025) Without Alternative" Conditions with 56.5 MAP (Number of Significantly Impacted Intersections)[1]	Impact Analysis using "Future (2025) Without Alternative With Future MAP Levels" Conditions with 78.9 MAP (Number of Significantly Impacted Intersections)	Change in Number of Significant Impacts	% Change
Alts 1-2	55	23	-32	-58%
Alt 3	50	23	-27	-54%
Alt 4	51	23	-28	-55%
Alt 8	57	28	-29	-51%
Alt 9	57	28	-29	-51%

Note:

For the purposes determining the 'Number of Significantly Impacted Intersections' in this table, an intersection was counted if it was impacted during the a.m., midday, or the p.m. peak hours.

[1] As amended by corrections and additions to the SPAS Draft EIR, presented in Chapter 5 of Part II of the Final EIR.

Source: Fehr & Peers, 2013.

Detailed intersection analysis showing LOS and v/c ratios are presented in Tables B-2 through Table B-6 of Attachment 3B.

Alternatives 1-2, Alternative 3, and Alternative 4

As indicated in Tables B-1 through B-4 of Attachment 3B, 23 of the 200 intersections would be significantly impacted, before mitigation, during one or more peak hours under the comparison utilizing the Future (2025) Without Alternative With Future MAP Levels scenario. The number of intersections that would be reduced to a less than significant level after implementation of mitigation is presented in Table 1, above.

Alternatives 8 and 9

As indicated in Tables B-1, B-5, and B-6 of Attachment 3B, 28 of the 200 intersections would be significantly impacted, before mitigation, during one or more peak hours under the comparison utilizing the Future (2025) Without Alternative With Future MAP Levels scenario. The number of intersections that would be reduced to a less than significant level after implementation of mitigation is presented in Table 1, above.

Intersection Mitigation Analysis

The identification of mitigation measures for significantly impacted intersections under the off-airport traffic impact analysis using the Future (2025) Without Alternative With Future MAP Levels scenario is consistent with the corresponding intersection improvements discussed in Sections 4.12.2.7.1 and 4.12.2.7.2 of the SPAS Draft EIR for those intersections, along with revisions made in the Final EIR to Section 4.12.2 (see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR). Table 4 below summarizes the intersection mitigation analysis in comparison to the SPAS Draft EIR results, as amended.

Table 4

Summary of Intersection Mitigation Analysis

	SPAS Draft EIR Impact Analysis using "Future (2025) Without Alternative" Conditions with 56.5 MAP[1]				Impact Analysis using "Future (2025) Without Alternative With Future MAP Levels" Conditions with 78.9 MAP			
		Number of Impacted Intersections After Mitigation				Number of Impacted Intersections After Mitigation		
Alternatives	Number of Non-Impacted Intersections	Fully Mitigated	Partially Mitigated	No Feasible Mitigation	Number of Non-Impacted Intersections	Fully Mitigated	Partially Mitigated	No Feasible Mitigation
Alts1-2	145	17	13	25	177	9	4	10
Alt 3	150	13	15	22	177	3	11	9
Alt 4	149	13	16	22	177	7	7	9
Alt 8	143	15	17	25	172	11	7	10
Alt 9	143	15	17	25	172	11	7	10

Note:

Non-impacted intersections include those with no change or change that is less than significant.

[1] As amended by corrections and additions to the SPAS Draft EIR, presented in Chapter 5 of Part II of the Final EIR.

Source: Fehr & Peers, 2013.

A summary of the mitigation effectiveness is presented in Table B-7 of Attachment 3B, with details for each alternative provided in Tables B-8 through B-12. Figures C-1 through C-5 in Attachment 3C illustrate the impacted locations and the effectiveness of the mitigation measures.

The analysis results indicated that there is a decrease in the number of intersections remaining significantly impacted after the implementation of recommended mitigation when utilizing the Future (2025) Without Alternative With Future MAP Levels conditions, compared to what was identified in the SPAS Draft EIR.

Regional Transportation System Analysis

Similar to the SPAS Draft EIR, this off-airport traffic analysis using the Future (2025) Without Alternative With Future MAP Levels scenario indicated alternative-related impacts at the same Congestion Management Plan (CMP) arterial and freeway monitoring stations, as well as the transit system. The methodologies used to conduct the Future (2025) Without Alternative With Future Map Levels scenario, such as the evaluation of intersection operating conditions and the assessment of impacts under the SPAS alternatives on CMP facilities, are consistent with the methodologies described in Section 4.12.2.2 of the SPAS Draft EIR, with the exception that the Future (2025) Without Alternative With Future MAP Levels scenario replaces the Future (2025) Without Alternative scenario.

CMP Freeway Analysis

Tables D-1 through D-4 (Attachment 3D) describe the traffic impacts on CMP freeway monitoring stations by comparing each SPAS alternative scenario to the Future (2025) Without Alternative With Future MAP Levels scenario. None of the CMP freeway monitoring stations that were identified as impacted in the SPAS Draft EIR would be significantly impacted in the comparative analysis against the Future (2025) Without Alternative With Future MAP Levels scenario. The conclusion that CMP freeway impacts would be less than significant applies to all alternatives when utilizing the Future (2025) Without Alternative With Future MAP Levels scenario. Please see Section 4.12.2.6.2 of the SPAS Draft EIR for a discussion of the impacts of the various alternatives to CMP freeway monitoring stations under the analysis utilizing the Future (2025) Without Alternative scenario.

CMP Arterial Intersection Analysis
Tables E-1 through Table E-5 (Attachment 3E) show the impacts of each SPAS alternative to the 15 CMP arterial monitoring stations by comparing the SPAS Future (2025) With Alternative scenarios against the Future (2025) Without Alternative With Future MAP Levels scenario.

None of the CMP arterial monitoring stations would be significantly impacted in the CMP arterial intersection analysis when utilizing the Future (2025) Without Alternative With Future MAP Levels scenario under Alternatives 1-2, 4, 8, and 9. However, under Alternative 3, the CMP arterial monitoring station at La Cienega Boulevard and Centinela Avenue (Intersection #26) would be significantly impacted. This impact was fully disclosed on page 4-1231 of the SPAS Draft EIR and was partially mitigated as stated on page 4-1309 of the SPAS Draft EIR. Please see Section 4.12.2.6.2 of the SPAS Draft EIR for a discussion of the impacts of the various alternatives to CMP arterial monitoring stations under the Future (2025) Without Alternative scenario.

Under this requested analysis, this CMP arterial impact at La Cienega Boulevard and Centinela Avenue under Alternative 3 can be fully mitigated to a level that is less than significant with implementation of Mitigation Measure MM-ST (SPAS)-10.

HCM Freeway Ramp Analysis
In evaluating freeway ramp impacts related to the Future (2025) Without Alternative With Future MAP Levels scenario, the analysis was conducted using the Highway Capacity Manual (HCM) methodology to comply with the requirements in Caltrans' Guide for the Preparation of Traffic Impact Studies and is included in Tables F-1 through F-4 of Attachment 3F. These tables provide side-by-side comparisons of the Future (2025) Without Alternative With Future MAP Levels and the Future (2025) With Alternative in terms of the average control delay per vehicle and operating conditions for key ramp intersections based on the average delay of all vehicles passing through the intersection. Tables F-5 through F-8 also provide the density (passenger cars per hour per lane) and operating conditions for the key freeway ramp terminals.

This requested HCM Freeway Ramp analysis indicated that the incremental changes in average vehicle delay between the SPAS alternatives and Future (2025) Without Alternative With Future MAP Levels conditions at the analyzed freeway ramps are all less than the incremental vehicle delay shown in the SPAS Draft EIR analysis in Appendix K2-9. Therefore, the requested HCM Freeway Ramp analysis indicated no new significant impacts or increase in the severity of impacts compared to the SPAS Draft EIR traffic analysis.

CMP Transit Analysis
With regard to CMP transit impacts, Table G-1 of Attachment 3G shows the total change in transit demand for each alternative by comparing Future (2025) With Alternative scenarios to the Future (2025) Without Alternative With Future MAP Levels scenario. Table G-2 indicates how the change in transit demand associated with each alternative would affect the utilization of the major north/south and east/west CMP transit corridors in the vicinity of LAX. Alternatives 1-2 would minimally increase transit system utilization and would not represent a significant impact in transit demand. Alternatives 3, 4, 8, and 9 would decrease transit system utilization and decrease transit demand. Consistent with the SPAS Draft EIR, the impacts of each analyzed alternative to the regional transit system would be considered less than significant when utilizing the Future (2025) Without Alternative With Future MAP Levels scenario.

Conclusion
The SPAS Draft EIR analyzed the impacts of the alternatives by comparing the Future (2025) With Alternative scenario with the Future (2025) Without Alternative scenario. The Future (2025) Without Alternative scenario did not include the projected natural growth at LAX, and thus relied, conservatively, on a usage of 56.6 MAP. The analysis presented here compares the Future (2025) With Alternative scenarios to the Future (2025) Without Alternative With Future MAP Levels scenario. The SPAS Draft EIR analysis concluded that the number of significant and unavoidable impacted intersections, as identified in the SPAS Draft EIR (after mitigation) and as modified by the SPAS Final EIR, would range between 37 and 42, depending on the alternative. These were reduced considerably to between 14 and 20 intersections in the comparative analysis using the Future (2025) Without Alternative With

Future MAP Levels scenario. This comparison confirms the conservative nature of the analysis in the SPAS Draft EIR, which identified many more significant impacts than would have been identified had the Future (2025) Without Alternative scenario included the projected natural growth at LAX that would occur with or without any of the SPAS alternatives.

The analysis related to the Future (2025) Without Alternative With Future MAP Levels scenario does not identify new significant impacts, does not result in an increase in the severity of impacts, and does not trigger recirculation under any of the criteria provided in Section 15088.5 of the State CEQA Guidelines. This conclusion is consistent with the recent decision Merced Alliance for Responsible Growth v. City of Merced (2012, 5th App. Dist., Case F062602) [Publication Request Pending]. In Merced, petitioners alleged that "…the city's late-submitted information on traffic impacts triggered the requirement that the EIR be recirculated." (Slip Opinion at 65.) "[The Lead Agency] prepared a response that explained in detail why the methodologies used in its traffic study were sound. In addition, to allay [Plaintiff's] concern, [the Lead Agencies' consultants] conducted an analysis of the study intersections using the baseline [Plaintiffs] suggested - the existing condition plus project-generated trips. This analysis showed that 'there would be no new findings compared to the DEIR traffic analysis.' The challengers argue that, because the respondents cited [the Lead Agency's] analysis to defend the EIR before the superior court, this must have been significant new information that required recirculation. Once again, their recirculation argument fails. The [lead agency's] response letter and new analysis did not disclose a new significant impact, increase the severity of an impact, identify a feasible project alternative or mitigation measure, or 'deprive the public of a meaningful opportunity to comment upon a substantial adverse environmental effect…'. [Laurel Heights II, supra, 6 Cal.4th at p. 1129.] The letter and analysis were prepared especially to respond to [Plaintiff's] concerns, not to change any aspect of the project, mitigation measures, or findings and conclusions in the EIR." (Slip Opinion at 77-78.)

SPAS-AL00003-4

Comment:

Connections to Metro's Light Rail Lines (Crenshaw/LAX Line and the Metro Green Line) and Aviation/Century Station

LACMTA notes that all of the Alternatives that involve Ground Transportation improvements, especially the elevated busway between Aviation and Sepulveda Boulevards (Alternatives 1, 2, 4, and 8) and the Automated People Mover (Alternatives 3 and 9) connect to both light rail lines that will operate in the area - the Metro Green Line and the Crenshaw/LAX Line and a new station to be developed by LACMTA at Aviation/Century (to be constructed and in service by 2018). LACMTA supports plans by LAWA to extend any transit connection to serve both lines, thereby minimizing the number of transfers for passengers on their journey to and from LAX. When LAWA considers how connections are made at Aviation and Century Boulevards (near Manchester Square), we request that the evaluation of alternatives should consider the impacts upon the design of the Metro Rail Station, on the proposed bus facility on the west side of Aviation Boulevard and upon long-term use of LACMTA's property (currently in process for purchase).

Response:

Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. As indicated in the topical response, LAWA is committed to working collaboratively with Metro to create a robust connection between LAX and the Metro rail system. The SPAS Draft EIR is a programmatic document. Details regarding the dedicated busway under Alternatives 1, 2, and 8, and the APM system under Alternatives 3 and 9, have not been developed at this stage of planning for SPAS. Project-level impacts associated with the connectivity of the LAWA ground access facilities and Metro facilities, including impacts on the future Metro light rail station, proposed bus routes, and long-term use of Metro's property, would be analyzed during detailed engineering and project-specific CEQA review should a SPAS alternative be selected for implementation. Please see Responses to Comments SPAS-PC00130-235 and SPAS-PC00130-142 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project.

SPAS-AL00003-5

Comment:

Rail Connection to LAX Terminals

LACMTA looks forward to working with LAWA to develop a connection between the regional rail system and LAX. Such a connection builds upon several initiatives already underway. We are already set to award contracts in early 2013 to construct the $1.7 billion Crenshaw/LAX Transit Corridor by 2018. The Crenshaw/LAX Line will create connections between the LAX airport district and both the Exposition Line and Metro Green Line light rail corridors. With this investment, passengers from many different parts of Los Angeles County (including downtown Los Angeles, the Westside, South Los Angeles, the South Bay, and the Gateway Cities) will have improved access to the LAX area at a new station near the intersection of Aviation and Century Boulevards. This new connection also brings the Metro Green Line to this station, giving LAWA savings in two ways. In the short term, the "G" shuttle operated by LAWA can have lower operating cost due to the fact that the rail system will be one mile closer. In the long-term, the distance to connect any airport transit system to the regional transit system is shortened by one mile, reducing the cost by several hundred million dollars for Automated People Mover connections contemplated in the LAX Master Plan.

Response:

The comment is noted and is consistent with the assumptions made in the SPAS Draft EIR regarding connections to regional rail. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX.

SPAS-AL00003-6

Comment:

The next step is to determine a solution that builds upon this foundation and the work you have developed through this SPAS. We have identified several alternatives through our Airport Metro Connector Study that potentially close the last gap to get to LAX terminals and provide viable alternatives to driving or being driven to the airport. We found that many of the air passengers and employees who would be attracted to more direct airport transit connections originate along corridors already served or planned to be served by the Metro Green Line and the Crenshaw/LAX Line or lines that connect to them (South Los Angeles, Inglewood and Hawthorne, the South Bay, and the Westside). We note that many of the Alternatives explored in SPAS have un-mitigable traffic impacts, including intersections several miles to the east of the airport. Improving transit connections could help to alleviate some of these traffic impacts.

Response:

The comment is noted and is hereby made part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. The SPAS Draft EIR includes several alternatives to improve transit connections to the airport. As discussed in the Project Description (Section 2.3.1.1.1), Alternative 1 would provide connectivity to public transit via the LAX dedicated busway, with a stop/connection at the new Metro transit station at Aviation/Century. (Similar improvements are included in Alternative 2.) Alternative 3 provides for the construction of the ITC, at the area referred to as Continental City, to serve as the primary connection point between the airport, the Metro Green Line, and regional bus service, as well as development of two APM systems to link the ITC, CONRAC, and CTA and link the GTC and CTA. Alternative 8 would provide connectivity to public transit via the LAX dedicated busway. Alternative 9 would include the construction of an elevated APM between Manchester Square and the CTA with stops at the future Metro LAX/Crenshaw Light Rail Transit Station at/near Century and Aviation Boulevards and the new ITF. The details of each alternative are provided in Section 2.3 of the SPAS Draft EIR.

Please see Response to Comment SPAS-PC00130-305 regarding the timing of the Airport Metro Connector Project.

SPAS-AL00003-7

Comment:

To complement the investment in the Crenshaw/LAX Line, we would recommend that LAWA investigate how soon it can make an investment in transit connections, especially if the reported performance of the roadway network relies upon an assumption of consolidation of shuttle services (Page 34 of the Appendix E2 - Ground Access Concept Development). As noted in the Preliminary SPAS Report (Table 8-1), the total investment in ground transportation envisioned in the Master Plan (as represented by Alternative 3) would exceed $8 billion (escalated costs), with more than $2.4 billion in costs for an Automated People Mover system alone. Any investment in transit considered in other alternatives presented in SPAS or considered as part of the Airport Metro Connector are significantly less in cost than the Master Plan scope of investments. This favorable cost comparison should hopefully make commitments to transit more financially feasible. Furthermore, the full cost of traffic mitigation should be calculated for another useful comparison to transit investments. Many intersections are deemed un-mitigable (Table 4.12.2-33 on Page 4-1318 to 4-1319), but it may nonetheless be useful to assign a cost to them for purposes of comparison with potential contributions to transit solutions. Doing so may help to highlight the value of transit to provide alternative access and alleviate traffic impacts.

Response:

The commentor has misunderstood and/or mischaracterized the discussion on page 34 of Appendix E2 of the Preliminary LAX SPAS Report. The discussion within Appendix E2 regarding consolidation of shuttle services pertains to the proposed Intermodal Transportation Facility (ITF) and is unrelated to transit. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX. Please also see Response to Comment SPAS-PC00130-730 regarding the treatment of economic impacts in an EIR, including costs of proposed improvements.

SPAS-AL00003-8

Comment:

Bus Connectivity to LAX Terminals

We also look forward to working with you to devise appropriate solutions to connect local buses to airport terminals. Possibilities may include enhancement to the existing bus terminal at Lot C, or a new bus terminal at Aviation and Century Boulevards. Both potential facilities can facilitate bus connections. The location of such a bus terminal shall coincide with the development of alternatives for the Airport Metro Connector as well as circulator systems contemplated within the SPAS Program. The location of such a facility should also consider potential opportunities to complement and avoid conflict with other consolidated transportation facilities. Particularly, whether at this level or at project-level environmental reviews, it will be important to devise strategies to limit the impact of concentrated traffic on the reliable operation of bus lines operating in the airport area. Finally, it will also be worthwhile to confirm how LAWA will connect the bus facilities to the terminals within the ultimate SPAS Program.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Topical Response TR-SPAS-T-1 regarding transit options into LAX, including LAWA's commitment to working collaboratively with Metro to create a robust connection between LAX and the Metro transit system.

The evaluation of the SPAS ground access system in the Preliminary LAX SPAS Report and the SPAS Draft EIR assumed that, by the SPAS horizon year (2025), Metro will relocate the current 96th Street Metro Bus Station, which is located between Vicksburg Avenue and Jenny Street, to a new bus center located adjacent to the planned Aviation/Century Station (see Section 1.8 of Appendix E2-2 of the Preliminary LAX SPAS Report). Access to the CTA from the relocated bus center would be provided by the SPAS APM or dedicated busway. LAWA would coordinate with Metro regarding connections to Metro bus terminals, either at Lot C or in a new location.

In addition, the potential for concentrated vehicular traffic impact surrounding the planned Aviation/Century Station would be reduced through increased service levels of airport employee Transportation Demand Management (TDM)/Vanpool program (which is part of the intersection mitigation program for the Aviation Boulevard and Century Boulevard intersection as stated on page 4-1292 and page 4-1307 of the SPAS Draft EIR). The combination of the APM or dedicated busway and the expansion of the TDM/Vanpool program would reduce vehicular trips and improve the operations of the bus lines on the major roadways that provide access to and from the planned Aviation/Century Station.

Detailed information on connections to Metro bus terminals would be developed during project-specific design and CEQA reviews, should a SPAS alternative be selected for implementation. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29,37.)

SPAS-AL00003-9

Comment:

Congestion Management Program Statutory Requirements

In accordance with the State of California Congestion Management Program (CMP) statute, the Traffic Impact Analysis (TIA) contained in the LAX SPAS Draft EIR identified several CMP arterial and highway monitoring stations which would be significantly impacted by the proposed project. Per the CMP TIA Guidelines published in the "2010 Congestion Management Program for Los Angeles County", Appendix D, section D.9, the following should be included in relation to CMP arterial and highway monitoring stations and associated mitigation measures as identified in the Draft EIR:

1) Criteria for Determining a Significant Impact. For purposes of the CMP, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C ≥ 0.02), causing LOS F (V/C > 1.00); if the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C ≥ 0.02). The lead agency may apply a more stringent criteria, if desired.

Response:

The commentor's summary of, and citation to, CMP TIA Guidelines, are essentially the same as presented in Section 4.12.2.4.1, CMP Thresholds of Significance, of the SPAS Draft EIR. The subject CMP thresholds were used in the assessment and determination of CMP impacts associated with the SPAS alternatives.

SPAS-AL00003-10

Comment:

2) Identification of Mitigation. Once the project has been determined to cause a significant impact, the lead agency must investigate measures which will mitigate the impact of the project. Mitigation measures proposed must clearly indicate the following:

- Cost estimates, indicating fair share costs to mitigate the impact of the proposed project. If the improvements from a proposed mitigation measure will exceed the impact of the project, the TIA must indicate the proportion of total mitigation costs which is attributable to the project. This fulfills the statutory requirement to exclude the costs of mitigating inter-regional trips;

- Implementation responsibilities. Where the agency responsible for implementing mitigation is not the lead agency, the TIA must document consultation with the implementing agency regarding project impacts, mitigation feasibility and responsibility.

Final selection of mitigation measures remains at the discretion of the lead agency. The TIA must, however, provide a summary of impacts and mitigation measures. Once a mitigation program is

selected, the jurisdiction self-monitors implementation through the mitigation monitoring requirements contained in CEQA.

Response:

The comment recites the requirement stated in the October 2010 "Congestion Management Program for Los Angeles County" to investigate mitigation for significant project impacts on the CMP arterial and freeway monitoring network. As stated in Table 4.12.2-26 on page 4-1284 of the SPAS Draft EIR, the SPAS alternatives would result in significant and unavoidable impacts at zero or one CMP freeway monitoring station relative to the Baseline (2010) Without Alternative Conditions, and at three CMP freeway monitoring stations and at one or two CMP arterial monitoring stations, relative to the Future (2025) Conditions. As discussed in Section 4.12.2.7 of the SPAS Draft EIR, no feasible mitigation for the impacts at the three CMP freeway monitoring stations and one CMP arterial monitoring station (study intersection 164, Manchester Avenue and Crenshaw Boulevard (CMP ID #24)) was identified. As discussed on pages 4-1286 and 4-1293 of the SPAS Draft EIR, the project impact at one CMP arterial monitoring station (study intersection 26, La Cienega Boulevard and Centinela Avenue (CMP ID #47) can be fully mitigated by reconfiguring the southbound approach to provide dual left-turn lanes relative to Baseline (2010) conditions under Alternative 3 and relative to Future (2025) conditions under Alternatives 1-2, 4, 8, and 9 but not under Alternative 3. This intersection is under the joint jurisdiction of the Cities of Los Angeles and Inglewood. LAWA would fund 100 percent of this improvement.

SPAS-AL00003-11

Comment:

3) Project Contribution to the Planned Regional Improvements. If the TIA concludes that project impacts will be mitigated by anticipated regional transportation improvements, such as rail transit or high occupancy vehicle facilities, the TIA must document:

- Any project contribution to the improvement, and

- The means by which trips generated at the site will access the regional facility.

Response:

The comment states that if the project relies on regional transportation improvements to mitigate its impact, then the traffic analysis must document any project contribution to those improvements and the means by which project trips will access the regional facility. The programmed transportation improvements assumed to be in place in the analysis of Future (2025) conditions are listed in Appendix K2-1 of the SPAS Draft EIR. Based on coordination with local jurisdictions and a review of regional transportation planning documents, funding for those improvements is currently in place and they will be implemented whether or not the SPAS project is adopted. No unfunded regional transportation improvements were relied on to mitigate the impacts identified with the SPAS alternatives. As discussed on page 4-1200 and shown in Table 4.12.2-6 on page 4-1201 of the SPAS Draft EIR, five percent of LAX trips were assumed to travel by public transit.

SPAS-AL00003-12

Comment:

LACMTA looks forward to reviewing the Final EIR. If you have any questions regarding this response, please contact Scott Hartwell at 213-922-2836 or by email at hartwells@metro.net.

Please send the Final EIR to the following address:

LACMTA CEQA Review Coordination
One Gateway Plaza MS 99-23-2
Los Angeles, CA 90012-2952
Attn: Scott Hartwell

Response:

The comment is noted. A copy of the Final EIR will be sent to the Los Angeles County Metropolitan Transportation Authority at least 10 days prior to certification of the Final EIR. The Final EIR will also be available at www.laxspas.org.

SPAS-AL00004 Prange, Jaclyn H Shute, Mihaly & Weinberger LLP 10/9/2012

SPAS-AL00004-1

Comment:

We submit this letter on behalf of our client, the City of El Segundo, to comment on the Draft Environmental Impact Report ("DEIR") recently released by Los Angeles World Airports ("LAWA") for the Specific Plan Amendment Study ("SPAS") at Los Angeles International Airport ("LAX"). The City of El Segundo has been an active participant in the LAX Master Plan process since its inception. In February of 2006, El Segundo, together with other petitioners, entered into a Stipulated Settlement Agreement with LAWA. El Segundo continues to monitor LAWA's efforts to implement the LAX Master Plan in order to ensure those efforts comply with the terms of the Master Plan and Stipulated Settlement. In keeping with that approach, and in the spirit of continued cooperation, we submit this comment letter on behalf of the City of El Segundo.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00004-2 through SPAS-AL00004-31 below.

SPAS-AL00004-2

Comment:

El Segundo is pleased to finally have the opportunity to submit comments on LAWA's SPAS. Although the SPAS process has been exceedingly slow, and we have raised concerns in the past regarding that slow pace,1 it is apparent from the documents released by LAWA that the delay was due in part to LAWA taking seriously its obligation to engage in meaningful reconsideration of certain previously adopted LAX Master Plan elements. LAWA has, for the most part, produced documents that clearly explain the available options and fairly describe their potential benefits and impacts.

1 The Stipulated Settlement provided clear timelines for expedient progress in the SPAS process, but that process has suffered significant delay all along the way. See Settlement Agreement § V(A) (commence study process within 60 days), § V(B) (good faith effort to select a contractor and prepare budget/scope of work for study within 6 months), § V(C) (good faith effort to complete study within 24 months). In light of the fact that more than six years have already passed since the Stipulated Settlement was approved, it is more important than ever that LAWA proceed expeditiously to complete the SPAS process.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00004-3

Comment:

This letter, which is based on our review of those documents, will: (1) advocate for LAWA adoption of El Segundo's preferred "100' north" alternative (Alternative 6); (2) underscore the importance of limiting

aircraft gates to 153 and planning for a maximum of 78.9 million annual passengers ("MAP"), as LAWA has itself proposed in the SPAS; (3) request certain clarifications and commitments relating to El Segundo's residential sound insulation program funding and flexibility; and (4) point out problems with the SPAS and DEIR analysis that LAWA should address in the Final EIR.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00004-4 through SPAS-AL00004-31 below.

SPAS-AL00004-4

Comment:

In addition, as LAWA is aware, outside of the SPAS process, El Segundo has a number of long-standing concerns related to LAX. Those concerns include the adverse noise impacts that result when aircraft: (1) make "early turns" over/toward El Segundo; and (2) violate the adopted preferential runway policy by departing from the outboard runway closest to El Segundo (violators are typically cargo freighters). El Segundo anticipates LAWA's continued cooperation with respect to these and other concerns regardless of how the SPAS process is resolved.

Response:

Please refer to Response to Comment SPAS-PC00112-1 and Section 4.10.1.5 of the SPAS Draft EIR regarding "early turn" operations and the preferential runway use policy.

The commentor discusses the violation of the current Preferential Runway Use Policy. LAWA's Preferential Runway Use policy establishes a preference for arrivals on the outboard runways and departures on the inboard runways during the day and, at night (10:00 p.m. to 7:00 a.m.), the use of only inboard runways for arrivals and departures whether during Over Ocean or Westerly Operations. To clarify, the FAA has the ability and authorization to utilize any runway when they deem necessary; using an outboard runway for a departure is not a "violation" of any kind. This policy is for a "preferential" runway. Based on the radar data of the aircraft flights in the last three years, the outboard runways were used for approximately 5 percent of the operations.

SPAS-AL00004-5

Comment:

Constraining Passenger Gates. El Segundo was gratified to see that LAWA's SPAS document clearly acknowledges the importance of limiting the number of gates at LAX as a means of limiting the airport's capacity (i.e., increased operations). Maintaining this limit indefinitely, even after the 2020 expiration of the gate cap contained in the Stipulated Settlement, is critically important. The gate cap is important because it: (1) provides some much-needed assurance to airport neighbors like El Segundo that LAX operations will not increase without limit; and (2) sends a clear message that LAWA is committed to regionalization of aviation (e.g., promoting Ontario International Airport). The FAA recognized the LAX gate cap as legitimate in its May 20, 2005 Record of Decision ("ROD") for the LAX Master Plan, in which it noted that one objective of the LAX Master Plan is to improve the efficiency of passenger operations while also "encouraging, but not requiring, other airports in the Los Angeles Basin to increase capacity." ROD at 17. As noted in the ROD, "[t]his is accomplished by restricting the overall availability of gates where passengers will board and exit an aircraft." Id.

LAWA has already recognized the importance of extending the gate cap throughout its SPAS documents by applying that number of gates to each of the alternatives studied. El Segundo encourages LAWA to strengthen that commitment in a number of ways as described below.

Continued El Segundo Gate Counts. LAWA should underscore its commitment to 153 gates by memorializing and extending El Segundo's continued authority to periodically tour the airport and count passenger gates. Section IV(F) of the Stipulated Settlement (entitled "PASSENGER GATE PROVISION") states, in relevant part: "No more than four times per year total, Petitioners shall have the

right to conduct physical inspections at LAX to verify LAWA compliance with [the LAX gate limit provision]. Petitioners shall provide LAWA with reasonable written notice of their intent to inspect, no less than 24 hours prior to the proposed inspection, to the office of the Deputy Executive Director of the Office of Quality and Compliance. LAWA shall provide Petitioners' representative with the appropriate security clearance and on-airport transportation to conduct such physical inspections."

El Segundo has conducted seven "gate counts" at LAX since the 2006 approval of the Stipulated Settlement, and anticipates continuing to conduct counts approximately annually. These counts have proved exceedingly helpful to El Segundo and have required only a limited amount of effort by LAWA (i.e., provision of a vehicle and driver for approximately an hour for each visit). Because the LAX gate limit provision of the Stipulated Settlement is currently set to expire at the end of 2020 (unless extended by the parties), it is theoretically possible that LAWA could withdraw its support for El Segundo's counts beginning in 2021. As part of the SPAS process, El Segundo is therefore seeking assurances from LAWA that it will continue to allow El Segundo to confirm LAWA's compliance with the applicable gate limit. This commitment by LAWA could be memorialized in a SPAS mitigation measure and/or in an extension of the Stipulated Settlement.

Response:

The comment requests that LAWA commit, as either a mitigation measure or an extension of the Stipulated Settlement, to allowing designated representatives of the City of El Segundo the right to conduct, no more than four times per year, physical inspections at LAX to confirm the number of passenger gates in use beyond the year 2020, which is the current date for expiration of the gate count provisions set forth in Section IV.F of the Stipulated Settlement. The comment also requests that LAWA produce a gate position report for the public at least annually, as well as reports tied to approval/implementation of those Master Plan elements that include/impact passenger gates through 2020 and beyond.

Attempts to negotiate extensions of the Stipulated Settlement provisions are beyond the scope of what is required by CEQA and no response is required to the commentor's request to extend the Stipulated Settlement provisions. CEQA requires mitigation measures to minimize significant adverse impact of a proposed project. (State CEQA Guidelines Section 15126.6.) It is not clear what significant impact would be minimized by the commitment to allow periodic gate counts proposed in the comment. As LAWA proceeds to implement any approved SPAS alternative, it would do so in compliance with all approvals issued, which limit the number of gates at LAX to 153. Note that in addition to limiting the gate count to 153, the SPAS project includes an amendment to Section 7.H of the Specific Plan (applicable to all alternatives, including the existing LAX Master Plan) that would provide opportunities for adjustments if LAX reaches 75 or 78.9 MAP earlier than expected. This amendment, set forth in detail in Chapter 7 of the Preliminary LAX SPAS Report, would address potential variations in passenger projections over time, first by requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, second, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 79.9 MAP. Therefore, it is not necessary under CEQA to implement the measures suggested in the comment.

SPAS-AL00004-6

Comment:

LAWA Gate Plans & Reports. In order for the 153 gate limit to be meaningful, it is important that LAWA at all times makes clear its current gate inventory and future intentions with regard to gates. We note LAWA's SPAS documentation includes maps of where the 153 gates would be located and how they would be configured under various alternatives (Appendix F-1, Attach. A, Figures A-D). We also note, however, that the gate position maps include a note stating that "[a]ircraft parking positions are shown for illustrative purposes only." This is understandable to some degree because the SPAS is conceptual and programmatic in nature, so further refinement and environmental review will follow at the project level. However, as LAWA proceeds to implement Master Plan elements, including one of the SPAS alternatives, it must provide ongoing public disclosure regarding how LAX's gate configuration measures up against the applicable limit of 153 gates. To do this, LAWA should produce a gate position

report for the public at least annually,2 as well as reports tied to approval/implementation of those Master Plan elements that include/impact passenger gates. This commitment by LAWA should be memorialized in a SPAS mitigation measure and in the Specific Plan as discussed below.

2 LAWA staff have periodically produced a drawing/inventory of existing LAX gate positions in connection with El Segundo's gate counts. That drawing/inventory could be used as a starting point and model for the annual report El Segundo is requesting.

Response:

The comment requests that LAWA commit, as a mitigation measure, to produce a gate position report for the public at least annually, as well as reports tied to approval/implementation of those Master Plan elements that include/impact passenger gates.

CEQA requires mitigation measures to minimize significant adverse impact of a proposed project. (State CEQA Guidelines Section 15126.6.) It is not clear what significant impact would be minimized by the commitment to annual reporting proposed in the comment. As LAWA proceeds to implement the LAX Master Plan, it would do so in compliance with all approvals issued, including FAA approvals, all of which would limit the number of gates at LAX to 153. The gate configurations would be consistent with those depicted in Figures A through D in Attachment A to Appendix F-1 of the Preliminary LAX SPAS Report. The complete footnote to these figures reads "Aircraft parking positions are shown for illustrative purposes only, assuming flexibility in passenger loading bridge, fuel pit, and terminal access and location, and including some tow in/tow out and segmented pushback operations." In other words, there may be minor adjustments to the parking positions shown in the figures, but it is anticipated that they would generally remain as depicted. It is not necessary to take additional steps to verify consistency with the 153 gate count on an annual basis.

SPAS-AL00004-7

Comment:

Longer Planning Horizon. In addition to being interested in the number of passenger gates at LAX, El Segundo is concerned about the related issue of ensuring that the airport's overall passenger activity level stays within the long established planning level of 78.9 MAP. We were therefore pleased to see that the SPAS documents point to LAWA's continued commitment to that figure. See SPAS Report Appendix F (Operational Analysis) at 11 (section 2.5). LAWA should, however, adopt a longer planning horizon of at least 2035 and plan for 78.9 MAP out to that date. Doing so would be more consistent with the most recent planning projections from SCAG. See Id. at 8-9.

Response:

The SPAS Draft EIR uses 2025 as the horizon year because that is the estimated year that buildout of any of the SPAS alternatives would be anticipated to occur. (see discussion on pages 4-3 through 4-5 at the beginning of Chapter 4 of the SPAS Draft EIR) Accordingly, the LAX Passenger Forecast prepared for the Preliminary LAX SPAS Report forecasts passengers levels to 2025. Notably, the Stipulated Settlement expires in December 2015 and the Gate Reduction provisions expire in December 2020. (Stipulated Settlement, Section I.D.) Neither CEQA nor the Stipulated Settlement requires LAWA to speculate about passenger activity levels beyond 2025. Nor is there any requirement for the SPAS EIR to plan to the same horizon year as the Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP). However, the 78.9 MAP forecast reflects that fact that all of the SPAS alternatives include (i) no more than 153 gates and (ii) the amendment of the LAX Specific Plan Section 7.H requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. Both this physical gate limit and the proposed amendment to the LAX Specific Plan reflect the fact that the practical capacity of LAX is based on market assumptions, as well as the expected physical characteristics of the various functional elements of the airport and how they are planned and expected to work together, given how the market is likely to respond and use LAX. (See Preliminary LAX SPAS Report, Section 6.2.) As history has demonstrated, it is possible that

over the next ten to twelve years, and certainly beyond 2025, that currently unexpected fluctuations in the economy, aviation industry practices, passenger demand, and other known and unknown factors may result in LAX annual passengers increasing (or decreasing) at a different rate than expected. The proposed amendments to Section 7.H of the Specific Plan are designed to respond to this possibility. To make specific planning assumptions beyond 2025, however, as requested by this comment, would be speculative. (See State CEQA Guidelines Sections 15144 and 15145.)

SPAS-AL00004-8

Comment:

Revisions to Specific Plan Section 7.H. The LAX Specific Plan (dated September 29, 2004 and amended 2007) is an important guiding document for LAX because it prohibits proposed development unless LAWA staff clearly establish that development is consistent with the adopted Master Plan and other applicable requirements, including mitigation obligations under CEQA. The "yellow light" projects are listed in Section 7.H of the Specific Plan, and LAWA appropriately proposes to amend Section 7.H at the conclusion of the SPAS process to delete that list. LAWA's SPAS documents also propose other revisions to Section 7.H of the previously adopted LAX Specific Plan. See SPAS Report Chapter 7. We understand the need to amend Section 7.H at the conclusion of the SPAS process, but would recommend it be amended to read as follows, rather than as LAWA proposes:

"H. Additional Study Requirements.

1. Specific Plan Amendment Study. LAWA shall immediately initiate a complete LAX Specific Plan Amendment Study (SPAS) comprehensively addressing security, traffic, aviation activity and corresponding environmental analysis consistent with CEQA, in the three circumstances listed below. LAWA shall complete that study prior to commencing construction of any Master Plan Project that is not already under construction when this obligation to commence a SPAS is triggered.

(a) If the annual traffic generation report required in Subsection G.1 above, and/or the annual traffic generation report considered together with any Project-specific traffic study, shows that any Master Plan Projects will be generating net new airport peak hour Trips in excess of 8236 (unless the total Trips for that year are related to construction or phasing impacts).

(b) If the annual aviation activity analysis required in Subsection G.1 above forecasts that the annual passengers for that year are anticipated to exceed 75 million.

(c) If LAWA seeks to approve, install and/or operate more than 153 passenger boarding gates."

This language is similar to the language proposed by LAWA, but preferable because it contains a more meaningful commitment to 78.9 MAP and 153 gates. For example, El Segundo's language makes express LAWA's commitment to conduct further public review and analysis before ever exceeding the clear cap of 153 gates. El Segundo's language also calls for LAWA to commence a Specific Plan Amendment Study when annual passenger levels reach 75 MAP, rather than waiting for them to reach 78.9 MAP. This earlier SPAS trigger is designed to ensure LAWA has enough lead time to plan and act appropriately (e.g., promoting regionalization, adding capacity constraints at LAX) before LAX reaches 78.9 MAP. Once levels reach 78.9 MAP, it will be too late to plan, particularly in light of the long lead time involved (see comments above regarding delay in the current SPAS process).

In addition to the above amendments to Section 7.H, El Segundo recommends Section 7G.1(b) be amended to require LAWA's annual aviation activity analysis to report on the number and location of passenger gates at LAX. Including that information in the annual report already required will help ensure LAX does not exceed the number of approved gates authorized under the Master Plan and current SPAS.

Response:

The amendment proposed in the Preliminary LAX SPAS Report to Section 7.H of the LAX Specific Plan would provide opportunities for adjustments if LAX reaches 75 or 78.9 MAP earlier than predicted in the current passenger forecasts (i.e., if unexpected fluctuations in the economy, aviation industry practices,

passenger demand, and other known and unknown factors result in LAX annual passengers increasing more quickly than expected). This amendment would address potential variations over time, first, by requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that passengers for that year at LAX are anticipated to exceed 75 MAP, and, second, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. These amendments are consistent with a practical capacity for LAX at 78.9 MAP in 2025 and are also designed to maintain LAWA's acknowledged unique and important role as an International Gateway, while encouraging domestic passengers and the airlines that serve them to increase their use of other airports in the region. (See Preliminary LAX SPAS Report, Section 6.2.)

The commentor's recommended revisions to Section 7.H will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

However, inclusion of the language proposed by the commentor to require a Specific Plan Amendment Study if annual passengers are anticipated to exceed 75 million and to require that LAWA complete such study "prior to commencing construction of any Master Plan Project that is not already under construction when this obligation to commence a SPAS is triggered" is not feasible. LAWA cannot be prohibited from implementing LAX Master Plan projects simply because traffic generation, aviation activity, or passenger activity levels increase to certain levels. LAWA's control over these activities is extremely limited. Under FAA rules, LAWA may not restrict access to the airport and may not impose any "cap" on aircraft operations, nor regulate or legally control in any way what operations the airlines might wish to undertake at any particular airport.1 Prohibiting implementation of LAX Master Plan projects if traffic generation, aviation activity, or passenger activity levels increase to certain levels until another Specific Plan Amendment Study is complete would unnecessarily limit improvement and modernization of LAX without guaranteeing identification of any factor over which LAWA has control beyond the gate provisions (i.e., no more than 153 gates) already included in all of the SPAS alternatives. By designing all of the SPAS alternatives with no more than 153 gates, in combination with the amendment proposed in the Preliminary LAX SPAS Report to Section 7.H of the LAX Specific Plan, LAWA has identified Specific Plan amendments that plan for modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP, as required by the Stipulated Settlement. Amending the Specific Plan as recommended by the commentor is not feasible and would not reduce any significant impacts of the SPAS alternatives.

Regarding the recommendation to require a Specific Plan Amendment Study "if LAWA seeks to approve, install and/or operate more than 153 passenger boarding gates," please see Response to Comment SPAS-AL00004-6.

It is not clear from the comment whether the commentor recommends omitting the amendment to Subsection 7.H.2 of the LAX Specific Plan proposed in the Preliminary LAX SPAS Report. However, LAWA believes this proposed subsection provides an important opportunity to act to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that passengers for that year at LAX are anticipated to exceed 75 MAP.

Regarding the recommendation to amend Section 7.G.1(b) of the LAX Specific Plan to require LAWA's annual aviation activity analysis to report on the number and location of passenger gates at LAX, please see Response to Comment SPAS-AL00004-6.

1. Under the Airport Noise and Capacity Act of 1990 (commonly called "ANCA") (49 USC Sections 47521-33), and its implementing regulations (14 C.F.R. Part 161), federal law prohibits an airport proprietor from unilaterally imposing any restrictions on "access" to the airport by Stage 3 aircraft. Following the phase-out of most noisy Stage 2 aircraft during the 1990s, Stage 3 aircraft comprise essentially all commercial aircraft landing at any U.S. airport. Any Stage 3 restriction is subject to review and approval by the FAA. The FAA strongly discourages any operational limits imposed under Part 161 and prefers and promotes permanent solutions to operational concerns and inefficiencies

through capacity improvements. Further, the federal Airline Deregulation Act of 1978 expressly preempted the ability of airport proprietors to control the "price, route or service of an air carrier." (49 USC Section 41713(b)(1)). The United States Supreme Court has interpreted this prohibition broadly to mean that airports "may not seek to impose their own public policies or theories of ... regulation on the operations of an air carrier." (Morales v. Trans World Airlines, Inc. (1992) 504 US 374, 384.)

SPAS-AL00004-9

Comment:

Runway Balance/Alternatives. El Segundo appreciates the DEIR's inclusion of a wide range of alternative versions of the SPAS Project. We are concerned, however, about its failure to select a single "proposed" or "preferred" project. This approach appears to contradict the CEQA Guidelines' frequent references to "the project." E.g., CEQA Guidelines § 15126.2(a) ("An EIR shall identify and focus on the significant environmental impacts of the proposed project.") (emphasis added). Moreover, the lack of a single proposed project makes reviewing the document difficult for readers, and may hamper LAWA in the identification of appropriately-tailored mitigation measures.

Response:

The SPAS Draft EIR's approach to the project description and alternatives are consistent with CEQA's requirements. Please see Response to Comment SPAS-AL00007-6, which explains why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives.

Subsequent to publication of the SPAS Draft EIR, LAWA staff recommended an alternative that couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. The environmental impacts and recommended mitigation measures associated with the LAWA Staff-Recommended Alternative are identified in Chapter 2 of this Final EIR. As indicated in that chapter, the environmental impacts and mitigation measures of the components that make up the LAWA Staff-Recommended Alternative were fully analyzed and disclosed in the SPAS Draft EIR.

SPAS-AL00004-10

Comment:

Despite the difficulties posed by the DEIR's approach, several of LAWA's fundamental choices reflect an accurate view of the burden that the current airfield design places on El Segundo. The north airfield's current limitations and the south-side location of several cargo carriers' facilities combine to impose noise impacts on El Segundo that are disproportionate to the airport's northerly impacts. El Segundo was glad to see that resolving this imbalance is among the Project's stated objectives, and that LAWA accordingly rejected alternatives, such as the three-runway airfield, that would worsen it. See DEIR at 2-2, 2-72. Similarly, the presence in several alternatives of the new Terminal 0 and the aircraft capacity improvements to the existing terminals on the north side of the airport are heartening signs that LAWA is taking this problem seriously.

Appendix E1-05 to the SPAS Report (June 2010) points the way toward one of the key means by which the SPAS projects can advance the goal of ending the runway imbalance: lengthening Runway 6R/24L. This document shows that in its current state, the runway is incapable of supporting operations by many important classes of aircraft, while runway 7L/25R (the inboard runway on the southern field) can handle a much broader set of aircraft. This disparity inevitably adds to the excessive number of operations-particularly operations by heavier craft-on the southern airfield, which in turn adds to El Segundo's disproportionate noise burden. The alternative that LAWA ultimately selects must include lengthening Runway 6R/24L.

The north airfield is similarly constrained by its lack of sufficient separation between its two runways, which limits the classes of aircraft that can use the runways. The SPAS projects must provide enough separation to make the north and south airfields equally attractive to larger aircraft while avoiding

overburdening the airport's northern neighbors: El Segundo has no interest in inflicting noise burden on others.

The DEIR makes clear that Alternative 6, extending Runway 6R/24L and moving it 100 feet north, is the alternative that best balances the airport's commitments to ease the absolute and relative noise burdens on El Segundo by improving the capacity and efficiency of the north airfield with its responsibility to minimize overall impacts. We therefore urge LAWA to select Alternative 6.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

The LAWA Staff-Recommended Alternative presented in Chapter 2 of the SPAS Final EIR seeks to reduce the inequality between the capabilities of the north and south airfields in accommodating new large aircraft, and to improve safety and efficiency in the operation of the north airfield. The LAWA Staff-Recommended Alternative is a combination of SPAS Alternatives 1 and 9, which, similar to Alternative 6 noted by the commentor, would ease the noise burden on communities to the east and southeast of the airport as compared to alternatives that do not move the existing runways, or move Runway 6R/24L southward (see the aircraft noise analysis in Section 4.10.1 of the SPAS Draft EIR); however, compared to Alternative 6, Alternative 1 better responds to the project objectives of providing north airfield improvements that support safe and efficient movement of aircraft at LAX and maintaining LAX's position as the premier international gateway (see Table 1-2 in the SPAS Draft EIR).

SPAS-AL00004-11

Comment:

At the same time, El Segundo must express its great concern with those alternatives that leave the northern airfield in its current state and therefore do nothing to resolve the present operational imbalance (Alternatives 2, 3, and 4), or that make it even worse by shifting Runway 6R/24L, and therefore the airport's entire noise contour, southwards (Alternative 7). These alternatives are wholly unacceptable to El Segundo. Including these alternatives in this document for comparison purposes may have been appropriate as a matter of good CEQA practice, but LAWA should not select any of them.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00004-12

Comment:

We would further note that the SPAS Report includes a chapter addressing the anticipated costs associated with the various SPAS alternatives (SPAS Report Chapter 8). That financial analysis provides considerable support for Alternative 6, as it would be among the least expensive options. The analysis also underscores the complete infeasibility of those alternatives that would be unacceptable to El Segundo. Alternative 3, for example, would involve astronomical costs, particularly in comparison with other options (see SPAS Report at Table 8-2). Of course, LAWA cannot and should not select a SPAS alternative based solely on cost. In this case, however, the financial analysis serves to reinforce the superiority of Alternative 6.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No response is required because this comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Nevertheless, it should be noted that, per Section 15131(a) of the State CEQA Guidelines, "[e]conomic or social effects of a project shall not be treated as significant effects on the environment." This section of the guidelines further states that "intermediate economic or social changes need not be analyzed in any greater detail than necessary" to identify a physical change caused by the economic or social changes. As outlined in Section 15002(a) of the State CEQA Guidelines, the basic purposes of CEQA are to inform decision-makers and the public about the potential significant environmental effect of proposed activities; to identify means to reduce, avoid, or mitigate environmental damage; and to disclose reasons why the decision-makers approved a project if significant environmental effects are involved. Although considerations other than environmental impacts have a role in the action taken by the decision-makers, the purpose of an EIR is to focus on environmental effects.

SPAS-AL00004-13

Comment:

Ground Transportation Alternatives and Traffic. As LAWA is aware, El Segundo's proximity to LAX means that LAX's traffic problems will significantly affect the quality of life for El Segundo residents. The list of intersection studied in the DEIR appears comprehensive and shows that LAWA has taken El Segundo's past comments about traffic impacts seriously. El Segundo submits these comments and questions to aid LAWA in further evaluating the traffic impacts of the Project.

Among the ground access improvements that can be paired with El Segundo's preferred alternative, Alternative 6, El Segundo prefers the ground access improvements in Alternatives 1 and 2. LAWA's analysis shows that Alternatives 8 and 9-the other two alternatives compatible with the airfield improvements in Alternative 6-would have a significant impact on the intersection of Sepulveda Boulevard and Imperial Highway compared to baseline conditions. DEIR at 4-1232. Given Sepulveda Boulevard's importance as a regional transportation artery, El Segundo requests that LAWA select alternatives that minimize traffic impacts on that street.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00004-14

Comment:

However, should LAWA decide to adopt an alternative that includes the consolidated rental car facility ("CONRAC"), El Segundo requests that the CONRAC be located in Manchester Square rather than in Lot C, as this appears to impose fewer traffic impacts on Sepulveda Boulevard.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00004-15

Comment:

The DEIR mentions that traffic counts were conducted for a majority of study intersections in July and August of 2010. DEIR at 4-1194. The DEIR also states that because July and August are peak traffic months, no seasonal adjustments were necessary. Id. The DEIR then states that traffic counts for an additional 36 intersections were collected in March 2012, but it does not say that any seasonal adjustments were made for those intersections. Id. If LAWA made seasonal adjustments for these 36 additional intersections, the DEIR should say so. If not, the DEIR should explain why no seasonal adjustments were necessary for counts conducted in March.

Response:

The comment requests an explanation of why no "seasonal adjustment" was made to the traffic counts collected at 36 intersections in March 2012, citing the explanation on page 4-1194 of the SPAS Draft EIR that baseline traffic counts were collected for use in this study during the peak activity months at LAX (July and August) in 2010.

The study area for the traffic impact analysis of the SPAS Alternatives was expanded during the course of the study to ensure that all potential significant impacts would be identified. Study intersections 1 through 164 were the intersections analyzed in the 2004 Master Plan EIR traffic analysis, and baseline traffic counts for the SPAS traffic analysis were collected in 2010. Following a review of the preliminary SPAS traffic impact analysis, additional locations were selected outside that area analyzed in the 2004 LAX Master Plan EIR and additional counts collected. Nearly all of the added study intersections (numbered 165 through 200) lie well to the east or north of LAX, while four of them lie south of LAX (i.e., the airport does not play a major role in determining the localized peak month of traffic for these intersections). None of the intersections with baseline traffic counts collected in March 2012 are in El Segundo. Because the effect of airport-related traffic on the overall volume of traffic in the surrounding area decreases with the distance from LAX, it was determined not to be necessary to make any special adjustments to the 2012 baseline counts to reflect peak month activity at LAX. It should be noted that project trip generation estimates were based on and reflect the peak months of activity at LAX, ensuring that the greatest potential impacts associated with project-generated traffic were analyzed.

SPAS-AL00004-16

Comment:

El Segundo would also like clarification regarding the 2025 traffic scenarios. In the 2025 Without Alternatives scenario (the 2025 baseline), LAWA did not include increases in airport-related traffic that it says will occur regardless of which alternative it approves. DEIR at 4-1208. Although we appreciate that this approach is conservative because it attributes all new trips to the alternatives when, in fact, LAWA's analysis assumes those new trips would occur regardless of the Project, we are concerned that this approach may obscure the impacts of the alternatives relative to each other. LAWA must explain whether this approach makes it more difficult to separate out the impacts of the alternatives from each other.

Response:

The comment correctly states that the cumulative traffic impact analysis in the SPAS Draft EIR was based on a comparison between the Future (2025) with Alternative scenarios and the Future (2025) without Alternatives scenario, which does not include the projected natural growth at LAX. The comment states that this approach may make it difficult to distinguish the effects of the alternatives relative to each other. As noted in the comment and discussed on page 4-1208 of the SPAS Draft EIR, future without alternative conditions were assessed without natural growth in order to provide a conservative analysis. The impacts of each alternative are thus assessed in the same way, and this consistency makes it possible to assess those impacts relative to each other. It is agreed that other comparisons may provide useful information to the public and to the decision-makers. The SPAS Final EIR presents a comparison of (1) Future (2025) with Alternative Scenario to (2) Future (2025) without Alternatives scenario that includes the natural growth at LAX (as well as other reasonably foreseeable improvements as described on page 4-1208), but does not include the physical changes proposed

under the analyzed SPAS alternatives. With the inclusion of projected natural growth at LAX in the Future (2025) without Alternative scenario, impacts would be reduced in comparison to the impacts disclosed in the Draft EIR. Please see Response to Comment SPAS-AL00003-3 for a description of an analysis where projected natural growth at LAX (i.e., 78.9 MAP in 2025) is included in the baseline to which the impacts of the SPAS improvements are compared.

SPAS-AL00004-17

Comment:

The DEIR states that it will mitigate significant traffic impacts at a variety of intersections. As an initial matter, the DEIR states that the SPAS-related mitigation measures will occur "with implementation of the SPAS alternatives." DEIR at 4-3. To mitigate a significant impact, LAWA must implement applicable mitigation measures before that impact is likely to occur (i.e., before building the improvements that will result in increased traffic).

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00004-18

Comment:

El Segundo also has concerns about the following proposed mitigation measures:

Intersection 15 - Aviation Boulevard and El Segundo Boulevard

This mitigation measure proposes to restripe the northbound and southbound approaches of Aviation Boulevard to provide an additional through lane in each direction. DEIR at 4-1292. However, the measure fails to explain how the receiving side of the intersection would accommodate these additional lanes. The receiving side for each of these changes currently has only two lanes. Thus, as proposed, the mitigation measure would result in a new lane with nowhere to go once it crosses the intersection. Furthermore, Aviation Boulevard is bordered by development on the east and west sides, so widening of the street would be difficult. Accordingly, LAWA's proposed mitigation measure is flawed and will not reduce impacts to a less-than-significant level. LAWA should explain how it will mitigate the significant impacts at this intersection in light of these constraints.

Response:

The comment questions the feasibility of the proposed mitigation measure at Aviation Boulevard and El Segundo Boulevard (study intersection 15), which would involve widening and restriping of the intersection to provide additional capacity to the north-south approaches, resulting in an additional through lane in both the northbound and southbound directions. The project-related impact at this location was identified only under Alternative 3. This improvement would require the acquisition of right-of-way and is consistent with the overall widening of Aviation Boulevard between Manhattan Beach Boulevard and Arbor Vitae Street that has been planned for several years, as discussed below.

Aviation Boulevard currently is a four-lane facility with two through lanes in each direction. The widening of Aviation Boulevard project is included among the "Quick Start" projects being pursued by the South Bay Cities Council of Governments (SBCCOG) and its status was noted as "preliminary design complete" in a file dated January 8, 2009 (http://www.southbaycities.org/node/533) and is identified as a "high priority project" in another report published by the SBCCOG (http://www.southbaycities.org/node/650). The proposed mitigation measures include the widening of Aviation Boulevard from a four-lane facility to a six-lane facility between Manhattan Beach Boulevard and Arbor Vitae Street. While the commentor suggests that the mitigation measure would result in a

discrepancy between the intersection's through lanes and the receiving side's lanes, this is incorrect. As described in the mitigation measure, the resultant configuration would include the widening of Aviation Boulevard, which would be made possible by the acquisition of a right-of-way, and would be able to accommodate one additional through lane in each direction.

As shown in Table 4.12.2-22 and Table 4.12.2-35 of the SPAS Draft EIR for Alternative 3, the v/c ratio in the morning peak hour would improve from 0.972 (LOS E) prior to mitigation to 0.880 (LOS D) with the proposed mitigation measure in place. The proposed mitigation measure at Aviation Boulevard and El Segundo Boulevard (study intersection 15) is feasible and would reduce the traffic impact at this intersection, The "with mitigation" v/c values were calculated by changing the lane configuration (to match the mitigation measure described above) in the ICU calculation. For additional detail, please see the methodology discussion in Section 4.12.2.2 of the SPAS Draft EIR.

SPAS-AL00004-19

Comment:

Intersection 60 - Sepulveda and Grand Avenue

This mitigation measure proposes to improve right turn capacity from eastbound Grand Avenue to southbound Sepulveda Avenue by allowing vehicles in the middle lane to turn right. DEIR at 4-1296. This would result in the middle lane being a shared left-turn/through/right-turn lane. However, this proposed shared lane may interfere with the left turn and through movements from this lane because of queues from vehicles turning right. Furthermore, at times, queues from the left turn and through movements would interfere with the right turn movement.

In sum, this measure will not reduce the significant impact at this intersection, and will, in fact, create more significant impacts by reducing the eastbound through capacity. Therefore El Segundo requests that LAWA revise this mitigation measure so that it does not interfere with existing movements and better mitigates the impact identified in the DEIR.

Response:

The comment questions the effectiveness of the proposed mitigation measure at Sepulveda Boulevard and Grand Avenue (study intersection 60), which would reconfigure the eastbound approach to provide additional right-turn capacity. The comment states that changing the eastbound center lane from a shared left-turn/through lane to a shared left-turn/through/right-turn lane would reduce eastbound through capacity and could reduce the additional eastbound right-turn capacity because of stopped vehicles waiting to make through or left-turn movements. The comment requests that this mitigation measure be revised. While LAWA disagrees with the suggestion that the proposed mitigation measure would interfere with existing movements, in response to this comment, LAWA has further evaluated the improvements proposed for the intersection at Sepulveda Boulevard and Grand Avenue and has identified alternative improvements that provide a comparable level of mitigation.

The signal at this intersection currently operates with split phasing: that is, with the eastbound and westbound traffic moving at separate times. The intersection is projected to be significantly impacted during the weekday afternoon peak hour under future (2025) conditions under SPAS Alternatives 1-2, 8, and 9.

In response to the comment, an alternative mitigation measure for this intersection has been developed that would modify the westbound approach to provide additional left-turn capacity. The current westbound lane configuration is two left-turn lanes, two through lanes and one right-turn lane. Restriping the westbound center lane from a through-only lane to a shared through/right-turn lane would fully mitigate the identified PM peak hour project impact under Alternatives 1-2, 8, and 9. The resulting westbound lane configuration would be two left-turn lanes, one shared through/left-turn lane, one through lane and one right-turn lane. Minor signage changes would also be necessary to indicate the changed lane assignment to motorists. This mitigation would operate within the existing east-west split signal phase and the four existing southbound lanes would be adequate to receive the left-turning vehicles from westbound Grand Avenue. This improvement would result in a lane configuration that includes triple left-turn lanes, which is very similar to what exists at the nearby El Segundo intersection

of Hughes Way and Sepulveda Boulevard. The revised mitigation measure shown below will replace the one described on page 4-1301 of the SPAS Draft EIR. Tables 4.12.2-34, 4.12.2-37, and 4.12.2-38 will also be revised in the SPAS Final EIR. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

- MM-ST (SPAS)-19. Modify the Intersection of Sepulveda Boulevard and Grand Avenue (Intersection 60) (Alternatives 1-2, 8, and 9).
The mitigation measure for this location is to restripe the westbound approach to provide additional left-turn capacity by restriping a through lane to a shared through/left-turn lane. Minor changes to the lane assignment signage would also be necessary. The resulting westbound lane configuration would be two left-turn lanes, one shared through/left-turn lane, one through lane and one right-turn lane. This improvement would be a full mitigation for project impacts under the Future (2025) With Alternatives 1-2, 8, and 9 scenarios.

SPAS-AL00004-20

Comment:

Intersection 125 - Sepulveda Boulevard and Rosecrans Avenue

The DEIR claims that the proposed mitigation measure for this intersection-widening the northbound approach-is infeasible because it would require removal of existing businesses. DEIR at 4-1289, 1302. This statement is apparently referring to the Fry's Electronics building at the southeast corner of the intersection.

However, LAWA has failed to support this determination of infeasibility with substantial evidence, as required by CEQA. See CEQA Guidelines § 15091(b). In fact, in June 2012, the City of Manhattan Beach released a Draft EIR for its proposed Manhattan Village Shopping Center Enhancement Project. This project includes a proposal to demolish the Fry's building. See Manhattan Village Shopping Center Enhancement Project DEIR at page 1-7. Therefore, removal of this building is likely feasible. Furthermore, LAWA has not supported its conclusion that the additional environmental impacts associated with this widening would render the measure infeasible because LAWA could mitigate those impacts.

Response:

The comment questions the conclusion of the SPAS Draft EIR that there is no feasible mitigation measure available for the significant impact at Sepulveda Boulevard and Rosecrans Avenue (study intersection 125). The commentor raised the same issue regarding mitigation impacts at intersection 125 in their comments on the 2009 Bradley West Project Draft EIR. LAWA provided a Response in the Bradley West Project Final EIR (BWP-AL00001-13) in which LAWA noted that:

"…this improvement is considered infeasible due to right-of-way constraints north and south of the intersection along Sepulveda Boulevard. The right-of-way constraints include the presence of a gas station on the southwest corner of the intersection, a hotel immediately south of the gas station, a Fry's Electronics store on the southwest corner and two Manhattan Village residential buildings immediately south of Fry's Electronics. The provision of additional travel lane area would cost approximately $3.6 million, which includes the cost to reconfigure (widen) a bridge structure approximately 400 feet south of Rosecrans Avenue, construction costs to implement the travel lanes and signal modifications, and the cost to acquire approximately 21,000 square feet of land/right-of-way for the travel lanes. The provision of additional travel lane area would also require the demolition of the buildings mentioned above at an estimated cost of up to $46.4 million. This cost estimate was developed using the Caltrans CCI with inflation rates applied from the California Construction Cost Index. Land values were based on data from the Los Angeles County Assessor.1 Implementation of this mitigation measure would also have environmental impacts associated with major physical construction including disruption of traffic flows, generation of construction-related air pollutant emissions and noise impacts, loss of employment from removal of several commercial uses, and loss of housing. For the reasons noted above, the potential improvements to mitigate the significant impact at this intersection were determined to be infeasible to implement." (Bradley West Project Final EIR, Volume 8, Response to Comment BWP-AL00001-13, pages 2-27 and 2-28; Footnote 1, California Department of Transportation (Caltrans), Price Index for

Selected Highway Construction Items, Second Quarter ending June 30, 2009, Available: http://www.dot.ca.gov/hq/esc/oe/contract_progress/cost-index-summary.pdf; Los Angeles County Office of the Assessor, Property Assessment Information System, 2009.)

While the mitigation measure discussed in the Bradley West Project Draft EIR and the SPAS Draft EIR are not precisely the same, the same infeasibility factors still exist. The commentor suggests that the Manhattan Village Shopping Center Enhancement Project "includes a proposal to demolish the Fry's building…[t]herefore, removal of this building is likely feasible." At the time the comment was submitted and as of the date this written response was prepared (December 18, 2012), the referenced Draft EIR and project were unapproved and uncertified. The Manhattan Village Shopping Center Draft EIR which calls for demolition of the building, provides that additional structures may be constructed in place of the Fry's store. As discussed in the Draft EIR for that project, "the specific location and orientation of actual future buildings within the Development Area has not yet been determined." (Manhattan Village Shopping Center Enhancement Project DEIR, page II-13 through 14.) This developer sponsored demolition would not eliminate the financial factors described above, or the potential need to demolish any structures constructed in its location, or any of the other surrounding structures described above.

The secondary environmental impacts associated with such a mitigation measure were also described in the Bradley West Response to Comment BWP-AL00001-13 provided above. Furthermore, the continued expansion of roadways also leads to secondary impacts to alternate modes of transit, such as pedestrian access. As discussed in the recent Statement of Reasons for Regulatory Action which amended the State CEQA Guidelines, "evidence presented to the Natural Resources Agency indicates that 'mitigation' of traffic congestion may lead to even greater environmental impacts than might result from the congestion itself."1 Furthermore, such an expansion of the roadway would conflict with the project objectives for the Manhattan Beach project which include promoting pedestrian access: "promoting pedestrian friendly design…enhance spatial relationships that promote pedestrian access within the Shopping Center site…improve pedestrian access, mobility and ADA facilities on the project perimeter…provide new and enhanced landscaping in the Shopping Center and along borders of the site to improve and enhance the street appearance and revitalize the site frontage along Sepulveda Boulevard and Rosecrans Avenue." (Manhattan Village Shopping Center Enhancement Project Draft EIR, page II-9.)

The commentor also states, "Furthermore, LAWA has not supported its conclusion that the additional environmental impacts associated with this widening would render the measure infeasible because LAWA could mitigate those impacts." The commentor is essentially requesting that the programmatic EIR prepared for the SPAS alternatives provide site-specific construction level mitigation measures to mitigate the impacts associated with an infeasible mitigation measure. The commentor provides no specific suggested mitigation measures in their comment letter. As discussed in greater detail in Response to Comment SPAS-PC00130-235, the SPAS Draft EIR is prepared at a programmatic level. An EIR prepared for "program level" entitlements "need not be as detailed as an EIR on the specific construction projects that might follow." (State CEQA Guidelines Section 15146(b).) Construction level impacts in some instances, such as construction traffic (SPAS Draft EIR Section 4.12.2.6.3) were determined to be significant and unavoidable because "it cannot be concluded at this time that all construction-related traffic impacts would be reduced to a level that is less than significant." (SPAS Draft EIR, page 4-1282.) As also discussed in Section 4.12.2.6.3, "[t]he nine alternatives currently being considered for the SPAS project are only at a conceptual level of planning. No construction plans, programs, or schedules have been formulated for any of the alternatives. As such, it would be speculative to estimate construction-related vehicle trip generation and distribution onto the local roadway network in order to evaluate traffic impacts on specific streets and intersections during peak and non-peak traffic periods." State CEQA Guidelines Section 15126.4(a)(1)(D) states, "if mitigation measures would cause one or more significant effects in addition to those that would be cause by the project as proposed, the effects of the mitigation measure shall be discussed *but in less detail than the significant effects of the project as proposed*." (Emphasis added.)

1. California Natural Resources Agency, Final Statement of Reasons for Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97, December 2009, Available: http://ceres.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf, accessed December 19, 2012.

SPAS-AL00004-21

Comment:

Intersection 55 - Sepulveda Boulevard and El Segundo Boulevard and Intersection 117 - Sepulveda Boulevard and Mariposa Ave

LAWA claims that the Project will not cause significant impacts at Intersections 55 and 117. Intersection 55 is currently operating at LOS C during the morning and midday periods and LOS E during the evening period. DEIR at 4-1220. Intersection 117 is currently operating at LOS C during the morning and evening periods. DEIR at 4-1222. In 2025, these intersections will be operating at LOS D and LOS F during certain periods, without the Project. DEIR 4-1262, 1263.

Given that Intersections 55 and 117 are already heavily impacted, it is difficult to see how the Project will not cause significant impacts at these intersections. Although LAWA's traffic model shows that the Project will not exceed El Segundo's thresholds of significance for these intersections, the Project will, in fact, significantly increase traffic impacts. Therefore, LAWA must treat the impacts on these intersections as significant and incorporate appropriate mitigation measures.

Response:

The comment cites the levels of service found in the SPAS Draft EIR for study intersections 55 and 117 under Baseline (2010) without Alternative conditions, Future (2025) without Alternative conditions, and Future (2010) with Alternative 1-2. The comment questions the SPAS Draft EIR analysis conclusion that implementation of the SPAS alternatives would not result in significant impacts to those intersections, indicating that such a conclusion is "difficult to see" given that the subject intersections are "already heavily impacted" and therefore "LAWA must treat the impacts on these intersections as significant and incorporate appropriate mitigation measures."

The accuracy of the data presented in the SPAS Draft EIR, including the characterization and quantification of baseline conditions at the intersections, is not disputed, nor is the application of the City's own impact significance criteria. While existing conditions are important issues, they are not impacts of any of the SPAS alternatives under CEQA. (See State CEQA Guidelines Sections 15125(a) and 15126.2(a); Watsonville Pilots Association v. City of Watsonville (2010) 183 Cal. App. 4th 1059 ["The FEIR was not required to resolve the [existing] overdraft problem, a feat that was far beyond its scope"].) The City of El Segundo applies its thresholds to determine the significance of a project's contribution to cumulative impacts.1 The incremental changes in V/C ratio that would occur under the various alternatives is therefore less than significant, when measured by the City's own threshold criteria.

1. The 2004 Plaza El Segundo Draft EIR Traffic analysis (Table IV.L-11 and IV.L-12) compares Cumulative Future With versus Without Project Traffic scenarios and notes that "a significant impact (increase of 0.02 or more at LOS E or F) prior to mitigation." Available at: http://www.elsegundo.org/civicax/filebank/blobdload.aspx?BlobID=2441; See also 540 E. Imperial Avenue Specific Plan Project Draft EIR (prepared by El Segundo in 2011) which applies the City's traffic thresholds to determine the significance of that project's contribution to cumulative impacts. As discussed in that document on page 4.5-26, "Under the Opening Year (2013) With Project, Option 1, all study intersections are forecasted to operate at acceptable LOS, with the exception of the intersection of Imperial Highway at Sepulveda Boulevard, which is forecasted to continue to operate at LOS F when analyzed with the ICU method, and LOS E when analyzed with the HCM method, consistent with Opening Year (2013) Without Project conditions. However, as shown in Table 4.5-7, the Option 1 project impact at this intersection would not be considered significant as it would not result in an increase in V/C greater than 0.020." (Available at: http://www.elsegundo.org/civicax/filebank/blobdload.aspx?BlobID=9174.)

SPAS-AL00004-22

Comment:

Construction Impacts

The DEIR chapter regarding traffic concludes that it would be speculative to estimate construction-related traffic impacts because no construction plans, programs, or schedules have been prepared for any alternatives. DEIR at 4-1281. The DEIR therefore discloses that construction-related traffic could, at times, result in significant and unavoidable traffic impacts. Id. at 4-1282. Because LAWA has deferred analysis of construction-related traffic impacts, it must study any such impacts in a project-level EIR when LAWA approves a specific project.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As discussed in Section 2.3.1 of the SPAS Draft EIR, the SPAS Draft EIR is a programmatic document; thus, no design or engineering plans are currently available. Please see Responses to Comments SPAS-PC00130-142 and SPAS-PC00130-235 for a discussion of the appropriateness of the programmatic review conducted for the SPAS project. LAWA would prepare project-level CEQA documents before implementation of any of the specific projects identified in the SPAS alternatives.

SPAS-AL00004-23

Comment:

Furthermore, when LAWA does approve a specific project, we request that it locate construction staging areas away from El Segundo so as to minimize traffic and other impacts on El Segundo residents.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Section 2.3.1.12 of the SPAS Draft EIR describes the locations of potential construction staging areas. As the alternatives were formulated at a programmatic level, there are no planning, design, or construction plans for any of the alternatives. Nevertheless, the potential construction staging areas represent areas that are, or will be, generally vacant, are located outside of aircraft operations, and are generally suitable for the placement of construction trailers/offices, storage of construction materials, and staging of construction activities. (Section 2.3.1.12 of the SPAS Draft EIR.) All potential construction staging areas are considered to be equally available to all of the alternatives.

SPAS-AL00004-24

Comment:

Aircraft Noise and Land Use. The DEIR's discussion of aircraft noise, split between its Land Use and Aircraft Noise chapters, makes clear that the Project will have substantial impacts, regardless of which alternative is selected. As discussed above, the size and location of the affected areas and populations varies widely among the alternatives, but all of them will have serious impacts. Mitigation measures thus must be an essential part of LAWAs analysis and planning.

Response:

A discussion of project impacts resulting from aircraft noise under Alternatives 1 through 7 is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As discussed in greater detail in Sections 4.9.8 and 4.10.1.8, the SPAS alternatives would result in some significant and unavoidable impacts associated with aircraft noise. LAX Master Plan commitments and mitigation measures that would address these

impacts are identified in Sections 4.9.7 and 4.10.8 of the SPAS Draft EIR, and include LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1.

SPAS-AL00004-25

Comment:

Inconsistent Significance Conclusions: El Segundo was disappointed to find that the DEIR does not present a clear view of the required mitigation. The document's brief consideration of noise mitigation understandably focuses on an existing measure, Master Plan MM-LU-1 (Implement Revised Aircraft Noise Mitigation), from the LAX Master Plan. This measure requires LAWA to continue to make improvements to its mandated Aircraft Noise Mitigation Program. The "ANMP" is a good starting point for mitigation of aircraft noise, as it includes the essential elements for reducing the effects of aircraft noise, including most importantly funding for residential sound insulation ("RSI") programs in El Segundo and other neighboring jurisdictions. The ANMP in its current form, however, is not sufficient, as the DEIR partially recognizes.

This recognition is only partial, however, thanks to a confusing inconsistency in the DEIR's analysis. The Aircraft Noise chapter concludes that the ANMP will "mitigate the significant noise impacts" related to residences and other facilities newly exposed to noise levels of 65 CNEL or higher. DEIR at 4-932. It does not state whether such mitigation would reduce the impact to a less-than-significant level, but implies that that it would do so. The Land Use chapter of the DEIR, however, reaches an inconsistent conclusion: Because RSI-based mitigation would take many years to implement, the ANMP "would reduce, but not eliminate, aircraft noise impacts on residential uses and non-residential facilities newly exposed to noise levels of 65 CNEL or higher." DEIR at 4-778. This implies, again without clearly concluding, that the impact would continue to be significant even after mitigation.

Response:

A discussion of LAX Master Plan Mitigation Measure MM-LU-1 is provided on pages 4-686 and 4-687 of the SPAS Draft EIR. As stated therein and incorporated as mitigation for the SPAS project, the ANMP would be expanded to include any noise-sensitive uses newly exposed to the 65 CNEL noise contour (under the selected SPAS alternative).

The commentor also suggests that the significance conclusion on page 4-932 of the SPAS Draft EIR is inconsistent with the conclusion on page 4-778 of the SPAS Draft EIR. Contrary to the suggestion in the comment, both of these sections reach the same significance conclusion.

As discussed on page 4-933 in Section 4.10.1.8 of the SPAS Draft EIR, "Because the land use mitigation measures would take several years to fully implement, it is possible that significant noise impacts would be experienced in the area after implementation of the selected SPAS alternative but before the mitigation measures are fully implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time."

As stated on page 4-778 in Section 4.9.8 of the SPAS Draft EIR, "[C]ertain residential uses and non-residential noise-sensitive facilities affected by aircraft noise would still be exposed to high noise levels due to interim impacts prior to completion of noise insulation or land recycling… As such, residual aircraft noise impacts for Alternatives 1 through 7 are considered to be significant and unavoidable." In addition, Table 1-4 of the SPAS Draft EIR, which provides a summary of impacts by topic, identifies Land Use and Planning Impacts related to Aircraft Noise Exposure, as well as Aircraft Noise impacts, as significant and unavoidable for Alternatives 1 through 7.

SPAS-AL00004-26

Comment:

RSI Funding under the ANMP, the Settlement, and the Master Plan: As an initial matter, the DEIR should be revised to reconcile the inconsistency addressed above. The Land Use conclusion-that the ANMP is insufficient to fully mitigate the impacts of the various alternatives-is likely correct for a number of reasons. The ANMP achieves mitigation chiefly through funding RSI in the communities surrounding

the airport, including El Segundo. Each year, LAWA funding allows El Segundo and other jurisdictions to assist property owners in insulating their homes, thus reducing noise impacts. The program is incremental-many homes remain uninsulated; the Project will add to this overall backlog. The ANMP's effectiveness, and the pace of its progress, thus depends in large part on the amount of funding that LAWA provides each year. At present, as the Land Use discussion apparently acknowledges, the ANMP is effective, but may not be sufficient to mitigate the Project's impacts.

As LAWA is aware, the Stipulated Settlement strengthened the ANMP by providing much-needed predictability for RSI programs in El Segundo and other jurisdictions. The Settlement did this by: (1) describing LAWA's minimum annual funding commitments; and (2) eliminating LAWA's prior avigation easement requirement in favor of a more limited noise easement that is consistent with State law. These Stipulated Settlement provisions relating to RSI will expire in 2015 if they are not extended; the Project Project's impact will extend well past that date. In fact, it is unlikely that the Project will even be complete before the Settlement is set to expire. Extending the Settlement is thus a feasible mitigation measure (or, rather, a feasible improvement to an existing measure) that will help reduce the Project's impacts.3 We urge LAWA to commit now, via this DEIR, to moving forward on such an extension.

3 Please note that a stronger ANMP will improve the mitigation of all noise impacts, including single-event noise impacts, which the DEIR's analysis indicates are significant (e.g., 4-838-4-841), but which are not discussed in the conclusion section of the Aircraft Noise chapter (4-932-4-933).

Response:

Regarding the commentor's statement that there are inconsistencies between the Aircraft Noise section (Section 4.10.1 of the SPAS Draft EIR) and the Land Use section (Section 4.9 of the SPAS Draft EIR), refer to Response to Comment SPAS-AL00004-25 above.

The comment also states that "single-event noise impacts, which the DEIR's analysis indicates are significant (e.g., 4-838 - 4-841), are not discussed in the conclusion section of the Aircraft Noise chapter (4-932 - 4-933)." Two different analyses were included in the referenced pages (1) "Nighttime Awakenings" (Section 4.10.1.6.1.2.1) and (2) "Classroom Disruption" (Section 4.10.1.6.1.2). Impacts associated with Nighttime Awakenings were determined to be less than significant. Impacts associated with Classroom Disruption were determined to be significant under Alternative 1. The significant impacts associated with "Classroom Disruption" from Section 4.10.1.6.1.2 were summarized on page 4-932 in Table 4.10.1-60. The following discussion on SPAS Draft EIR page 4-933 notes that "LAX Master Plan Mitigation Measures MM-LU-3, Conduct Study of the relationship between Aircraft Noise Levels and the Ability of Children to Learn, and MM-LU-4, Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise, would ultimately serve to mitigate adverse noise impacts on schools presented in Table 4.10.1-60." For clarification, revisions have been made to Section 4.9.5 of the SPAS Draft EIR to list LAX Master Plan MM-LU-3 and MM-LU-4 as applicable LAX Master Plan mitigation measures. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

The following paragraph on page 4-933 of the SPAS Draft EIR notes, however, that "because the land use mitigation measures would take several years to fully implement, it is possible that significant noise impacts would be experienced in the area after implementation of the selected SPAS alternative but before the mitigation measures are fully implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time." This conclusion regarding interim impacts is also applicable to school facilities significantly impacted under the "Classroom Disruption" impact analysis. For clarification, revisions have been made to Section 4.10.1.8; please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

The comment also suggests that "the Stipulated Settlement strengthened the ANMP by providing much-needed predictability for RSI [Residential Sound Insulation] programs in El Segundo and other jurisdictions. The Settlement did this by: (1) describing LAWA's minimum annual funding commitments; and (2) eliminating LAWA's prior avigation easement requirement in favor of a more limited noise easement that is consistent with State law…Extending the Settlement is thus a feasible mitigation measure…" As discussed in Section 4.9.3.3 on page 4-664 of the Draft EIR, LAWA will continue to implement its ANMP, with the assistance of the affected jurisdictions, and shall update the entire ANMP

from time to time to ensure it reasonably represents the mitigation and funding programs that are in place, being implemented, or proposed for future implementation.

In addition, LAWA is committed to implementing the mitigation measures described in the SPAS Draft EIR, including the Aircraft Noise Mitigation Program, the LAX Master Plan Commitments and Mitigation Measures described in SPAS Draft EIR Sections 4.9.3.3 and 4.10.1.5. As recognized in the subsequent paragraph by the commenter, the ANMP described in SPAS Draft EIR Section 4.9.3.3, is being implemented pursuant to California Code of Regulations, Title 21, Subchapter 6, Section 5000 et seq. Other programs such as the LAX Master Plan Commitments and Mitigation Measures are being implemented consistent with the mitigation monitoring and reporting program (MMRP) adopted for the LAX Master Plan (see CEQA Guidelines Section 15097; see also Board Resolution No. 21481.) The Stipulated Settlement further notes that "This funding cap under this Settlement will not affect the ability of each jurisdiction to demonstrate its ability to effectively use additional ANMP funding. LAWA will consider each of these requests on a case-by-case basis through the existing ANMP process." (Stipulated Settlement, Section VI and Exhibit A.) The suggestion in the comment would therefore be repetitive of existing requirements and would not reduce or avoid a significant impact.

SPAS-AL00004-27

Comment:

Beyond the Stipulated Settlement, LAWA also has significant continuing obligations with respect to RSI in El Segundo under its adopted Master Plan and State law. Under State law, LAWA is required to work to sound insulate noise-impacted residences in El Segundo. See California Airport Noise Standards (California Code of Regulations, Title 21, Subchapter 6). Under its adopted Master Plan, LAWA also committed to:

- "[E]xpand and revise [its] existing Aircraft Noise Mitigation Program (ANMP) in coordination with affected neighboring jurisdictions [such as El Segundo], the State, and the FAA,"
-"[A]ccelerate the ANMP's timetable for achieving full compatibility of all land uses within the existing noise impact area,"
- "Continue[] implementation of successful programs to convert existing incompatible land uses to compatible land uses through sound insulation of structures,"
- "Increase[] annual funding by LAWA for land use mitigation,"
- Reevaluate "avigation easements requirements with sound insulation mitigation,"4 and
- Provide "additional technical assistance, where needed, to local jurisdictions to support more rapid and efficient implementation of their land use mitigation programs."

Master Plan MM-LU-1 (Implement Revised Aircraft Noise Mitigation).

In light of these commitments, El Segundo expects LAWA to maximize RSI grant funding and continue accepting/acquiring noise (not avigation) easements even if the Stipulated Settlement is allowed to expire. Making such commitments clear and binding in the present DEIR would strengthen the ANMP further and is another feasible mitigation that could reduce the Project's noise impacts. Specifically, LAWA should add mitigation measure commitments to: (1) "continue to accept/acquire noise (not avigation) easements," and (2) "Maximize RSI funding at levels equal to or greater than those contained in the Stipulated Settlement."

4 As LAWA's reports on MMRP implementation have indicated, "[a]vigation easements are no longer required for sound insulation." See LAX MMRP 2010 Annual Report at 18.

Response:

Please see Response to Comment SPAS-AL00004-26 concerning provisions related to residential grant funding and noise easements.

SPAS-AL00004-28

Comment:

We also noted with interest that LAWA's financial analysis for the SPAS includes a recognition that LAWA will have significant ongoing expenses related to RSI. See SPAS Report, Chapter 8, fns. 1 and 4 in Tables 8-1, which references "continued sound proofing" as a "LAX Base Development Project." We urge LAWA to include in the next version of this document additional detail regarding how much grant funding it expects to provide annually for RSI programs in El Segundo and elsewhere. This information is not only key to understanding the efficacy of mitigation, it is critically important in that it would let El Segundo know how much funding is available annually. This data, in turn, allows El Segundo to maximize the number of homes treated and do so efficiently, improving El Segundo's service to its residents and LAWA's mitigation of the Project's impacts.

Response:

The purpose of Chapter 8 of the Preliminary LAX SPAS Report is to provide estimated costs and an approximation of funding sources for the SPAS alternatives. LAX Base Development Projects, which include continued residential soundproofing, are included in the financial projection model in order to account for other major capital improvement programs that would be undertaken at LAX within the same general timeframe as SPAS. It is not the purpose of Chapter 8, nor a requirement of CEQA, to provide detailed information regarding funding associated with individual LAX Base Development Projects, such as continued soundproofing, to support planning related to the implementation of mitigation.

Similar arguments were also raised by the petitioners in Schenck v. County of Sonoma (2011) 198 Cal.App.4th 949 [Section V(A); Unpublished portion of the opinion]. As discussed in Schenck, "[a]lthough plaintiff's expert suggested that the LOS at the intersections in the area of the project would be adversely impacted, and funds were not available to improve the intersections, substantial evidence of effective mitigation measures was presented. Approval of the project was conditioned on payment by Mesa of traffic impact mitigation fees targeted for the County's Capital Improvement Plan for the airport industrial area. According to the conditions of approval, the final amount of the mitigation fees would be determined by the Sonoma County Department of Transportation and Public Works from an engineer‘s estimate. …The imposition of fees on Mesa to mitigate traffic impacts is not an unreasonably indefinite or nebulous mitigation measure… The County did not abuse its discretion by concluding that the payment of traffic impact fees constituted a reasonable mitigation program. The County identified specific plans for improvements designed to mitigate traffic impacts, and offered a commitment to allocating the mitigation fees to those projects. The precise timetables for the completion of the improvements were neither known nor delineated, but the County was not required to set forth with certainty the schedules for implementation of the identified roadway improvements."

The funding for the noise mitigation programs described in the SPAS Draft EIR is not nebulous, and will be implemented consistent with the existing requirements described in Response to Comment SPAS-AL00004-26.

SPAS-AL00004-29

Comment:

Construction-Related Aircraft Noise Impacts: We would also note a serious omission in the DEIR's analysis of aircraft noise impacts: it does not consider temporary changes in the airport's noise contours during construction of the northern airfield modifications. Any runway closures or other limitations on capacity will necessarily increase operations on the southern runway. This will shift the noise contours southward and significantly increase impacts on El Segundo. New homes will be exposed, and the currently-exposed population will face more intense noise. Similar noise shifts during the relatively recent modification to the southern airfield should give LAWA a useful guide to projecting this temporary, but potentially significant impact. Disclosing these temporary effects is not only essential under CEQA, but is also important to the process of selecting and planning the SPAS Project: any version of the Project (whether or not currently among the analyzed alternatives) that would minimize construction time should receive serious consideration.

Response:

Potential aircraft noise impacts resulting from temporary changes in the airport's noise contours during construction of the north airfield improvements would be determined and characterized primarily by the construction approach and construction phasing for those improvements. As indicated on page 2-57 of the SPAS Draft EIR, the nine SPAS alternatives were formulated at a conceptual level only and there are no specific planning, design, or engineering studies or construction plans for any of the alternatives. In conjunction with the preparation of more detailed design and engineering plans for airfield improvements, it is anticipated that several potential options for construction approaches and phasing will be explored, each having different ramifications relative to runway closures. For example, relocation of Runway 6L/24R 350 feet northward under Alternative 5 could involve constructing much or all of the new runway while the existing runway is kept operating, given the substantial distance between the existing and proposed runway. Following completion of the new runway, removal of the old runway and construction of the centerfield parallel taxiway might occur while the new runway is operating. To the extent that runway closures are needed, it is unknown whether closures would occur as a single continuous period or would occur incrementally, with each option having different implications relative to temporary changes in airport noise contours. The nature, timing, and duration of potential runway closures would need to take into consideration the time of year when such closures occur and the associated level of activity at LAX. To minimize the impacts on operations and passengers, any runway closures would need to be avoided around the busy summer months (July and August) and around the holiday season (from Thanksgiving through Christmas). LAWA and the FAA would need to carefully evaluate different runway closure options during such periods. For example, it is possible that some runway and taxiway improvements would be constructed during the nighttime hours, in which case runway closures would be relatively limited, and the number and nature of affected flights would also be limited, especially if the closure hours occur during over-ocean nighttime operations when both arriving flights and departing flights are primarily over the ocean. This type of detail regarding when and how the north runway improvements contemplated under the various SPAS alternative is not currently known, but can and would be more appropriately determined during more detailed levels of project planning and engineering and development of a suitable construction approach.

As discussed on page 4-3 of the SPAS Draft EIR, the SPAS Draft EIR is a program-level document prepared pursuant to the State CEQA Guidelines. State CEQA Guidelines Section 15168(a) states that a program EIR "may be prepared on a series of actions that can be characterized as one large project" and applies to projects that are related either geographically or as logical parts in the chain of contemplated actions. A program EIR is prepared at a more general level of planning than a project-level EIR and allows a lead agency to "consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (State CEQA Guidelines Section 15168(b)(4)).

Program EIRs are commonly used in conjunction with the tiering process, which is "the coverage of general matters in broader EIRs (such as on general plans or policy statements) with subsequent narrower EIRs or ultimately site-specific EIRs…concentrating solely on the issues specific to the EIR subsequently prepared." (State CEQA Guidelines Section 15385.) Under CEQA's tiering principles, it is proper for a lead agency to focus a first-tier EIR on only the program's general impacts, "leaving project-level details to subsequent EIRs when specific projects are being considered." (State CEQA Guidelines Section 15152(c); In re Bay-Delta (2008) 43 Cal.4th 1143, 1174-1175.)

The aforementioned tiered approach of first providing program-level analysis of the overall proposal followed by a project-level analysis of specific components, pursuant to CEQA, is the same approach used for the LAX South Airfield Improvement Project (SAIP). The overall impacts of those improvements, along with the other improvements proposed under the LAX Master Plan were addressed at a program level in the LAX Master Plan Final EIR, and were then followed by a more detailed analysis, including construction impacts such as, but not limited to, temporary changes in airport noise contours, within a project-level EIR. The impacts analysis in the project-level EIR was based on the construction approach and phasing program formulated in light of detailed design, engineering, and construction plans specific to the SAIP, thereby providing a more accurate and meaningful analysis that what could have been otherwise speculated upon at the program level.

SPAS-AL00004-30

Comment:

Ground Run Up Enclosures: Finally, the previously approved LAX Master Plan commits LAWA to construct two ground run-up enclosures (GREs) to shield airport neighbors from the noise associated with engine run-ups during maintenance activities at LAX. See 2003 Master Plan Addendum at 2-95. Moreover, the 2010 Stipulated Variance approved by LAWA, El Segundo and others provides that LAWA will design two GREs by 2015.

The DEIR notes that LAWA may at some point construct a new GRE at the west end of LAX as part of a larger aircraft maintenance area. See DEIR at 5-17, 5-19, Figure 5-2. This is the only GRE we found mentioned in the SPAS document. To comply with its Master Plan and Variance commitments, LAWA should ensure it plans for a second GRE and proceed expeditiously with design of both GREs so they can be constructed and operated as soon as possible.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

Please see Response to Comment SPAS-PC00130-132 for a discussion of the construction of future ground run-up enclosures at LAX and the requirements of the California Department of Transportation noise variance for LAX (i.e., the "2010 Stipulated Variance" referenced by the commentor).

SPAS-AL00004-31

Comment:

Conclusion: In sum, LAWA should move forward expeditiously to correct the deficiencies discussed in this letter, and should take no action to adopt any alternative until it has made such corrections. Once it has done so, El Segundo encourages LAWA to ultimately select SPAS Alternative 6 (100' North).

Response:

The commentor's preference for Alternative 6 is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Please see Responses to Comments SPAS-AL00004-1 through SPAS-AL00004-30 above for responses to comments by the commentor, including responses alleging deficiencies in the SPAS Draft EIR.

SPAS-AL00005 Feger, Dan Burbank-Glendale-Pasadena Airport Authority 10/10/2012

SPAS-AL00005-1

Comment:

The Burbank-Glendale-Pasadena Airport Authority ("Authority") has reviewed the July 2012 Los Angeles International Airport ("LAX") Specific Plan Amendment Study ("SPAS") Draft Environmental Impact Report ("DEIR") released by Los Angeles World Airports ("LAWA"). The Authority's interest in the LAX SPAS primarily arises from the contemplated regionalization of air traffic. Specifically, the Authority is concerned about the proposed LAX Specific Plan amendment to require that, upon a forecast of more than 75 million annual passengers, LAWA shall conduct a domestic passenger survey/study and an airline survey/study with the goal of creating conditions that encourage passengers and airlines to utilize other airports in the region.

The Authority believes that the DEIR fails to comply with the requirements of the California Environmental Quality Act ("CEQA") and the State CEQA Guidelines. Accordingly, the Authority respectfully requests that LAWA suspend any further consideration of the LAX SPAS until a DEIR that fully discloses and analyzes the potential impacts of air traffic regionalization has been prepared and recirculated for public review and comment. The Authority objects to any further action by LAWA on the LAX SPAS until the necessary and proper environmental review has been completed.

The DEIR exceeds 1,800 pages, yet barely seven of them (pp. 6-5 to 6-11) are devoted to an analysis of the environmental impacts of LAWA's proposed air traffic regionalization. Moreover, those seven pages essentially defer meaningful assessment of every environmental impact category by repeatedly asserting that "it would be speculative at this point to estimate" how affected airports would be impacted. This cursory discussion violates CEQA, particularly Slate CEQA Guidelines Sections 15144 and 15145. The former provision mandates that a lead agency "must use its best efforts to find out and disclose all that it reasonably can." The latter requires a lead agency to conduct a "thorough investigation" prior to making a finding that an impact is "too speculative for evaluation" and terminating discussion of that impact.

Although LAWA may not know right now exactly how many passengers and airlines it will be able to shift to other airports in the region, LAWA certainly can make a good faith effort at evaluating whether those airports (at existing and planned capacity) and their surrounding environs (including existing and planned land uses and infrastructure) can accommodate any shifting without unmitigated environmental impacts. To comply with CEQA, the DEIR must be revised to address matters such as noise, traffic, and air quality impacts that inevitably will result if LAWA were to achieve its goal of redistributing passenger and airline activity in the region.

The Authority appreciates the opportunity to submit these comments and hopes that they will result in a productive dialog between our agencies, and will lead to an air traffic regionalization solution that benefits all airport operators without adversely affecting the regional environment.

Response:

As stated in Section 6.2 of the SPAS Draft EIR, any attempt at this time to estimate the nature, volume, and timing of shifting aviation activity from LAX to any one or combination of the other five major commercial airports in Southern California would itself be highly speculative. Therefore, forecasting the resultant environmental impacts at each affected airport would also be highly speculative.

Section 6.2 does disclose the types of environmental impacts that could occur at the affected airports, to the extent they are reasonably foreseeable. Less detail is required in an EIR's impact analysis when the impacts are outside the project area, indirect, and difficult to predict. (Napa Citizens for Honest Government vs. Board of Supervisors (2001) 91 Cal.App.4th 342, 369.) The approach taken in Section 6.2 of the SPAS Draft EIR is consistent with Section 15145 of the State CEQA Guidelines which provides that if "after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." CEQA does not require a lead agency to foresee the unforeseeable. (State CEQA Guidelines Section 15144.)

The commentor suggests that the SPAS Draft EIR should have evaluated whether the other five airports (at existing and planned capacity) and their surrounding environs (including existing and planned land uses and infrastructure) can accommodate any shifting of aviation activity without unmitigated environmental impacts. However, this environmental setting information would be relevant only if it were feasible to forecast the nature, volume, and timing of shifting aviation activity from LAX to each airport so that impacts at each airport could then be assessed. In the absence of the ability to forecast such impacts, there is no reason to present environmental setting information for each of the five airports. An EIR's description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives. (State CEQA Guidelines Section 15125(a).)

SPAS-AL00006 Calzada, Michael F City of Inglewood Residential Sound Insulation Department 10/10/2012

SPAS-AL00006-1

Comment:

Please accept this transmission of the RSI Department comments re: the LAX SPAS DEIR. This letter is to augment the submittal of BuchalterNemer submitted earlier today.

These comments are intended to augment the City of Inglewood's comments prepared on the City's behalf by the firm of BuchalterNemer regarding the LAX Specific Plan Amendment DEIR.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00006-2 through SPAS-AL00006-12 below. The comment letter prepared by BuchalterNemer that is referred to in this comment, which was prepared on behalf of the City of Inglewood, City of Culver City, City of Ontario, and County of San Bernardino, has been assigned letter number SPAS-AL00007; please see responses to comment letter SPAS-AL00007.

SPAS-AL00006-2

Comment:

The City of Inglewood as a neighboring community has been engaged in collaborative efforts with LAWA in mitigating noise impacts of LAX for over a generation.

From early legal wrangling to the creation of stakeholder discussions resulting in the adoption of Airport Noise Contour and Land Use Compatibility study findings in the 1970's to 1984, to the resolution of lawsuits in respect to the 2004 Master Plan, the City has constructively engaged a succession of administrations in defining and then dealing with the affects of aircraft noise at minimum.

The Stipulated Agreement which followed the Master Plan in 2006, in addition to the adopted Mitigation Monitoring and Reporting Program for the Master Plan's Specific Plan, has enabled a mutually beneficial framework from which results can be measured.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00006-3

Comment:

It is with this historical framework in mind that these comments on the LAX Specific Plan Amendment (SPA) and Draft Environmental Impact Report (DEIR). Fundamentally it appears that the LAX proposed alternatives will accommodate an increase of operations while attempting to achieve efficiencies in operational safety and transportation systems. Increasing operations will have an ongoing adverse impact on the community of Inglewood.

Response:

LAWA is proceeding with the LAX SPAS process to identify LAX Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP while enhancing safety and security, and, among other things, minimizing environmental impacts on the surrounding communities (see Chapter 1 of the SPAS Draft EIR.) However, none of the

SPAS alternatives will increase passenger activity at LAX; such growth will occur with or without implementation of any of the SPAS alternatives, as stated on page 1-13 of the SPAS Draft EIR. The SPAS Draft EIR analysis of impacts in all environmental categories, including aircraft noise, as may be of particular interest to the commentor, account for the increase in airport operations that is projected to occur between the baseline year (2009) and the future horizon year (2025).

As provided in Section 1.2.1 of the SPAS Draft EIR, a SPAS project objective is to minimize environmental impacts on surrounding communities. LAWA seeks to identify and apply ways to avoid, reduce, or minimize environmental impacts on surrounding communities. Please see the various sections of the SPAS Draft EIR for discussions of potential environmental impacts as well as Table 1-6 for a listing of the applicable LAX Master Plan mitigation measures and SPAS-specific mitigation measures.

SPAS-AL00006-4

Comment:

The City of Inglewood continues to be concerned with the long term impacts to health due to noise (sleep interruption and deprivation, and interruptions to learning and educational study) and air quality from airfield operations, aircraft exhaust and increased traffic; impacts to the traffic circulation to and from the airport along with congestion within and through the community.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

An overview of the effects of noise on humans, including hearing loss, communication interference, sleep disturbance, physiological responses, and annoyance, is provided in Section 4.10.1.1.3 of the SPAS Draft EIR. In addition to potential effects related to hearing loss and annoyance, as described in Section 4.10.1.2.3, the aircraft noise analysis completed for the SPAS Draft EIR includes an evaluation of the effects of single event aircraft noise relative to the potential for increased aircraft activity (i.e., number of arriving or departing flights) occurring at night to result in increased nighttime awakenings (sleep disturbance), and relative to potential disruption of classrooms and the educational process from overflights of additional aircraft during school hours. The aircraft noise impacts, including single event noise impacts, associated with the SPAS alternatives are discussed in Section 4.10.1.6 of the SPAS Draft EIR. As indicated therein, none of the alternatives would result in a significant impact relative to sleep awakenings. Under Alternatives 1 through 7, significant impacts would occur with an additional school being newly exposed to the 55 dBA Lmax. Each alternative would also result in significant impacts due to sustained interruption of classroom teaching at newly exposed schools through interior noise levels in excess of 35 dBA Leq(h). Implementation of LAX Master Plan mitigation measures would ultimately reduce impacts to these schools to a level that is less than significant. However, interim impacts prior to completion of mitigation measures would remain significant and unavoidable.

It should be noted that, while it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. As indicated in Sections 4.9, Land Use and Planning, and 4.10.1, Aircraft Noise, and summarized in Tables 1-16 and 1-17 of the SPAS Draft EIR, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward (Alternatives 1, 5, and 6) than would occur in moving 6R/24L southward (Alternatives 3 and 7) or not moving either runway (Alternatives 2 and 4), and the total residential population newly exposed to 65 CNEL would be lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to >65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) or do not move the runways (Alternatives 2 and 4). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower with alternatives that move Runway 6L/24R northward--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas

north of the airport. That is, although more homes to the north of the airport would be impacted by noise with a northward move of Runway 6L/24R, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in an overall decrease in the numbers of homes and people exposed to aircraft noise impacts.

Regarding air quality, as indicated in Section 4.2 of the SPAS Draft EIR, even after mitigation, construction activities would result in significant and unavoidable air quality impacts under all of the alternatives. Specifically, under all of the alternatives except for Alternative 4, construction emissions of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx), particulate matter with an equivalent aerodynamic diameter of 10 micrometers (PM10), and particulate matter with an equivalent aerodynamic diameter of 2.5 micrometers (PM2.5) would be significant and unavoidable. Under Alternative 4, significant and unavoidable construction emissions would occur for NOx and PM10. Under all of the alternatives, even after mitigation, construction-related concentrations of nitrogen dioxide (NO2) and PM10 would be significant and unavoidable.

Operation of the airport would also result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

As indicated in Section 4.7.1 of the SPAS Draft EIR, incremental cancer risks and incremental chronic non-cancer health hazards within the study area under all the alternatives would be less than significant for all receptor types (i.e., child resident, school child, adult resident, adult worker). Additionally, under all the alternatives, health effects to on-airport workers would be less than significant. Incremental acute non-cancer health hazards at small areas at or near the LAX fence-line under all the alternatives would be slightly above the threshold of significance and are considered to be significant and unavoidable for all analyzed receptor types (i.e., residents, recreational users, school child, off-site adult workers). The primary toxic air contaminant of concern contributing to this impact is associated with emissions of acrolein from aircraft operations, which would occur in 2025 even in the absence of SPAS. It should be noted that, with the exception of Alternative 3, acute non-cancer health hazard impacts in 2025 would be lower under the SPAS alternatives than if no airfield improvements were implemented. Moreover, these significant impacts would occur at or near the fence-line; it is expected that actual impacts in the community would be less than significant.

Relative to off-airport traffic impacts, as addressed in Section 4.12.2 of the SPAS Draft EIR, the majority of the 200 intersections evaluated within the SPAS off-airport transportation study area would not be significantly impacted under Alternatives 1, 2, 3, 4, 8, and 9; however, significant impacts to some off-airport intersections and/or Congestion Management Plan (CMP) facilities would occur under each of these alternatives. The total number of significantly-impacted intersections and/or CMP facilities would vary slightly among those alternatives. Alternatives 5, 6, and 7 focus on airfield and terminal improvements that, in themselves, would not affect off-airport traffic, but would be coupled with the ground transportation improvements proposed under Alternatives 1, 2, 8, or 9, the impacts of which are summarized above.

SPAS-AL00006-5

Comment:

The SPAS proposed alternatives and in turn the proposed north airfield operations will alter the present noise contours.

Response:

A discussion of project impacts resulting from aircraft noise and alteration of the noise contours is provided in Sections 4.9.6 and 4.10.1.6 of the SPAS Draft EIR. As shown in Figures 4.9-7, 4.9-8, 4.9-9, 4.9-10, 4.9-11, 4.9-12, and 4.9-13, in Section 4.9.6 of the SPAS Draft EIR, alterations to the 65 CNEL noise contour under Alternatives 1 through 7 would result in some residential and non-residential noise-sensitive uses being newly exposed to noise levels of 65 CNEL or higher. As also shown in Figures 4.10.1-15, 4.10.1-18, 4.10.1-21, 4.10.1-24, 4.10.1-26, 4.10.1-29, and 4.10.1-32, some noise-sensitive uses would be exposed to increases of 1.5 CNEL or higher within the 65 CNEL or higher noise

contours. LAX Master Plan commitments and mitigation measures that would address these impacts are identified in Sections 4.9.7 and 4.10.1.8 of the SPAS Draft EIR, and include LAX Master Plan Mitigation Measures MM-LU-1, MM-LU-3, MM-LU-4, MM-N-4, and LAX Master Plan Commitment N-1. As concluded in Sections 4.9.7, 4.9.8, and 4.10.1.8 of the SPAS Draft EIR, interim impacts, prior to implementation of these LAX Master Plan Mitigation Measures, and LAX Master Plan Commitment N-1 would be significant and unavoidable. In addition, impacts on parks and certain residential uses with outside private habitable areas newly exposed to noise levels of 75 CNEL or higher would be significant and unavoidable.

SPAS-AL00006-6

Comment:

The introduction of multi-modal integration with regional transit, and a consolidated rental/parking area(s) will all have an impact on local circulation patterns.

Response:

The changes to the on-airport and off-airport transportation systems associated with changes in transit activity, the development of a CONRAC and relocated parking facilities are discussed in the transportation impacts analyses included in Section 4.12.1, On-Airport Transportation, and Section 4.12.2, Off-Airport Transportation, of the SPAS Draft EIR. Consolidation of the existing rental car operations dispersed around the airport into a single location will support the utilization of a single consolidated rental car shuttle system, thereby reducing the number of individual company shuttles currently traveling on local streets. The approved Metro Crenshaw/LAX Transit Line and Station will promote the use of transit to and from the airport, thereby reducing individual car trips. The proposed elevated/dedicated bus system (Alternatives 1, 2, and 8) and APM systems (Alternatives 3 and 9), which include a stop at the Metro facility noted above, will also help reduce vehicle trips on surface streets at and near the airport. The comment is noted and is hereby made part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091 (d); State CEQA Guidelines Section 15204 (a)).

SPAS-AL00006-7

Comment:

The following are comments concerning potential areas of impact and areas which require consideration in the preparation of the final DEIR.

1. Incorporated as reference are comments made November 29, 2010 concerning the preparation of the LAX Specific Plan Amendment DEIR.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00006-8 through SPAS-AL00006-12 below. The City of Inglewood submitted two comment letters dated November 29, 2010 in response to the 2010 NOP for the SPAS Draft EIR: one comment letter from the City of Inglewood's Residential Sound Insulation Department, and one comment letter prepared by Chevalier, Allen & Lichman LLP on behalf of the Cities of Inglewood and Culver City. Copies of both of these comment letters on the 2010 SPAS Draft EIR NOP are provided in the second part of Appendix A of the SPAS Draft EIR (see pages 14 through 30 and 33 through 37, respectively). The comments in both comment letters were considered and addressed in the SPAS Draft EIR and elaborated upon in responses to this comment letter (i.e., SPAS-AL00006) and SPAS-AL00007. In particular, a copy of the November 29, 2010 comment letter on the 2010 SPAS Draft EIR NOP from Chevalier, Allen & Lichman LLP on behalf of the Cities of Inglewood and Culver City is included as an attachment to, and is considered part of, comment letter SPAS-AL00007; please see Responses to Comments SPAS-AL00007-60 through SPAS-AL00007-75 which address each separate comment provided in the November 29, 2010 Chevalier, Allen & Lichman LLP comment letter.

SPAS-AL00006-8

Comment:

2. The data source for the Population and Population per Household for Table 4.9-2 and Table 4.9-4 at page 4-633 should be re-examined.

a. At Table 4.9-2 a total of 12,596 people are shown for living within both single-family and multi-family units. This averages to 2.76 persons per household. As the City of Inglewood has aged and become relatively younger, the family size has decreased nominally over ten years according to the 2010 Census. However, the basis for utilizing a factor less than 3.0 persons per household requires scrutiny.

Response:

The population and dwelling unit totals presented in Table 4.9-2, in Section 4.9.3.3 of the SPAS Draft EIR, were estimated based on GIS data for each parcel within the land use study area and 2010 U.S. Census data, rather than an average of 2.76 persons per household.

The parcel-based database provided by LAWA included a numerical value for the amount of dwelling units (i.e., dwelling unit value) within each residential parcel, which was derived from the Los Angeles County Assessor's GIS database. The majority of dwelling unit values per parcel range between 1 and 4, while some parcels containing high density residential uses range up to 444 dwelling units per parcel.

PCR Services Corporation, as part of their update to the LAWA database, then added the census tract number to the database that each parcel was located within, as well as the total population amount recorded for that census tract.

Subsequently, PCR calculated a population factor for each census tract by dividing the total population within a census tract by the sum of all dwelling units within all parcels within the same census tract (based on LAWA's dwelling unit value assigned to each residential parcel). This population factor is, therefore, applicable to all parcels within that census tract. Finally, each parcel's individual dwelling unit value was multiplied by that parcel's respective population factor in order to establish a population by parcel value.

Both the parcel-level dwelling unit value and the population by parcel value were the basis for all calculations pertaining to the existing (2009 baseline) population and dwelling unit values provided in Sections 4.9 and 4.10.1 of the SPAS Draft EIR.

SPAS-AL00006-9

Comment:

b. Examining Table 4.9-4 reveals a person per household factor of 2.59 for single-family and 2.80 for multi-family. As a result there are possibly greater than 5,000 more persons in Inglewood within the Study Area than are shown. Therefore Table 4.9-2 may under count the affected population as well.

Response:

The population and dwelling unit totals presented in Table 4.9-4, in Section 4.9.3.3 of the SPAS Draft EIR, were estimated based on GIS data for each parcel within the land use study area and 2010 U.S. Census data, rather than the average person per household factors suggested by the commentor. Please see Response to Comments SPAS-AL00006-8, regarding the methodology used to derive the population and dwelling units presented in Table 4.9-4.

SPAS-AL00006-10

Comment:

3. The discussion of the present status of the adopted Mitigation Monitoring and Reporting Program at page 4-686 states support of increased funding for and more expeditious implementation of noise mitigation measures. This would include funding for Land Use Mitigation and Noise Mitigation for residential uses. This is welcomed. In light of recent federal prerogatives, the standing of the State of California regulations and policies affecting airport operations must take precedence.

Response:

The comment is noted and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00006-11

Comment:

4. Within Appendix J1-1 Aircraft Performance, the methodology for noise measurements was described at 3.1.1.3, page 11.

i. Assumptions for relative humidity and temperature which affect the perception and tolerance of noise were detailed. These assumptions are considerations and factors affecting the modeling and noise sensitivity.

ii. In light of increasing climatic temperatures and growing fluctuations in climatic conditions in North America, what is the potential affect of a 2009 baseline when temperatures may increase on average or humidity decreases or increases significantly through 2025 and how might this affect the noise modeling? How significantly if at all will this affect the ensuing impact area?

Response:

The assumptions for relative humidity and temperature for evaluating aircraft noise impacts are described in Section 3.1.1.3 in Appendix J1-1 of the Draft EIR. Section 15130(b) of the State CEQA Guidelines recognizes that the discussion of cumulative impacts "need not provide as great detail as is provided for the effects attributable to the project alone." The SPAS Draft EIR addresses climate change in Section 4.6, which acknowledges that "global average temperature and mean sea level are expected to rise…" over the next 100 years (SPAS Draft EIR Section 4.6.1.1.) While the SPAS Draft EIR qualitatively acknowledges temperature increase at a state wide general level, it is speculative at this time to predict parcel specific temperature changes at the 2025 horizon year at specific enough level to incorporate into the quantitative cumulative aircraft noise analysis. Furthermore, potential temperature changes associated with climate changes are not expected to substantively affect the significance of the conclusions or analysis presented in the noise section (Section 4.10) of the SPAS Draft EIR.

This is the same issue which was raised in a CEQA Superior Court decision in which the petitioners alleged "that the EIR should have assessed how the environmental effects of the Project would change as the climate changes." The Court upheld the validity of the EIR and held that "an EIR should not be based on speculation, and in this case [respondent] concluded that the local effects of climate change are not sufficiently known to allow quantitative modeling or analysis…[Respondent] is not claiming that climate change is speculative, but instead it concluded that the particular effects on this locale and this Project are not sufficiently known to allow modeling and quantitative analysis." (County of Butte v. Department of Water Resources (2012) Case No. CV 09-1258 [Statement of Decision].) A similar issue was raised in 2009 by the City of Inglewood on the Bradley West Project Draft EIR, in which LAWA similarly explained that "To provide an analysis of potential climate change-related impacts associated with the eight topics listed by the commentor would be speculative at best." (Bradley West Project Final EIR, Response to Comment BWP-AL00003-8.)

SPAS-AL00006-12

Comment:

iii. If there are measurable or discernible affects, then how the Air Quality impacts might be interpreted as well?

Response:

As discussed in Response to Comment SPAS-AL00006-11, the potential effect of climate change on parcel specific temperature and relative humidity by 2025 would be highly speculative. In a recent study, six different global climate models were used to estimate future temperatures in California under two different future greenhouse gas emission scenarios.1 The results indicated that ambient temperature changes in Southern California might roughly range from 0 to 3.6 degrees F (0 to 2 degrees C), with an average of approximately 1.8 degrees F (1 degree C). Even assuming the worst case regional scenario, this level of change in ambient temperature would not substantively change the estimated air quality impacts presented in Section 4.2 of the SPAS Draft EIR.

1. Cayan, D., M. Tyree, D. Pierce, T. Das (Scripps Institute of Oceanography). 2012. Climate Change and Sea Level Rise Scenarios for California Vulnerability and Adaptation Assessment. California Energy Commission. Publication No.: CEC-500-2012-008.

SPAS-AL00007 Lichman, Barbara E Buchalter Nemer, A Professional Law Corporation (City of Inglewood, Culver City, Ontario, and County of San Bernardino) 10/10/2012

SPAS-AL00007-1

Comment:

The following are the comments of the City of Inglewood, City of Culver City, City of Ontario and County of San Bernardino (collectively "Cities/County") concerning the Draft Environmental Impact Report for the Los Angeles International Airport Specific Plan Amendment Study ("DEIR"). From a global perspective, Cities/County view the DEIR as just the latest illustration of the ancient adage - "The more things change, the more they stay the same," where the DEIR reflects the same analytic deficiencies as Cities brought to the attention of Los Angeles World Airports ("LAWA") in their comments on the environmental review of the Draft and Supplemental Draft Environmental Impact Report/Environmental Impact Statement, Los Angeles International Airport Proposed Master Plan and Master Plan Addendum in 2003 and comments on the Notice of Preparation of Draft Environmental Impact Report (SCH No. 1997061047) - Los Angeles International Airport Specific Plan Study on June 17, 2008 and Revised Notice of Preparation of Draft Environmental Impact Report (SCH No. 1997061047) -Los Angeles International Airport Specific Plan Study on November 29, 2010, which are attached to this letter as Exhibits 1, 2 and 3 respectively, and incorporated in it by reference.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-2 through SPAS-AL00007-36 below.

It should be noted that the SPAS Draft EIR is not tiered off of the LAX Master Plan EIS/EIR, although portions of the LAX Master Plan Final EIR are incorporated by reference (see page 1-105 in Section 1.7 of the SPAS Draft EIR). Please note that responses to "the Cities'/County's" previous comments on the LAX Master Plan EIS/EIR are provided in responses to comment letters AL00044 (City of Ontario); AL00007 (County of San Bernardino); AR00006, AL00009, AL00010, AL00011, AL00012, AL00018, and SAL00020 (City of Culver City); and AR00006, AL00017, AL00023, AL00039, AL00049, SAL00007, SAL00009, and SAL00016 (City of Inglewood) included in Part II of the LAX Master Plan Final EIR; as

well as FAL00001 (City of Inglewood, City of Culver City) included in FAA's Record of Decision on the LAX Master Plan. The previously submitted comments identified above, including SAL00016, a copy of which is attached as Exhibit 1 of this comment letter (i.e., SPAS-AL00007), regarding the LAX Master Plan EIR/EIS do not raise any new significant environmental issues or address the adequacy of the SPAS Draft EIR and no detailed responses will be provided here. (CEQA Section 21091 (d); State CEQA Guidelines, Section 15204 (a).)

It is acknowledged that copies of the City of Inglewood's and City of Culver City's comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR are attached as Exhibits 2 and 3 of this comment letter, respectively. Copies of these comment letters on the 2008 and 2010 SPAS Draft EIR NOPs are provided in the first part of Appendix A (pages 10 through 14) and the second part of Appendix A of the SPAS Draft EIR (see pages 14 through 30 and 33 through 37), respectively. The comments in both comment letters were considered and addressed in the SPAS Draft EIR and elaborated upon in responses to this comment letter and to comment letter SPAS-AL00006. In addition, please see Responses to Comments SPAS-AL00007-37 through SPAS-AL00007-59 and SPAS-AL00007-60 through SPAS-AL00007-75 which address each separate comment provided in the Cities' comment letters on the 2008 and 2010 NOPs for the SPAS Draft EIR, respectively.

SPAS-AL00007-2

Comment:

Specifically, the DEIR continues LAWA' s long tradition of:

(1) Failing to designate a "project," substituting instead an array of project components, leaving it up to the reviewer to aggregate and analyze the collective impacts of the various ground and air components, in defiance of the mandate of the California Environmental Quality Act, Cal. Pub. Res. Code § 21000 et seq., ("CEQA") for an "accurate, stable and finite description." See, e.g., Planning and Conservation League v. Castaic Lake Water Agency, 180 Cal.App.4th 210, 234 (2010);

Response:

The SPAS Draft EIR's approach to the project description and alternatives is consistent with CEQA's requirements. Please see Response to Comment SPAS-AL00007-6, which explains why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives.

SPAS-AL00007-3

Comment:

(2) Failing to designate a proper "No Project" Alternative where Alternative 3, the existing, approved Master Plan, still includes the "Yellow Light" projects that were required by a settlement of the case of City of El Segundo, et al. v. City of Los Angeles, et al., Riverside County Superior Court Case No. RIC426822 ("Settlement") to be replaced by other projects that serve the same purposes, and over which Settlement the Court still retains jurisdiction;

Response:

The Stipulated Settlement does not require the Yellow Light Projects to be replaced by other projects that serve the same purposes. Rather, as stated in Section V.C of the Stipulated Settlement, LAWA is required to "identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 million annual passengers while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA." LAWA is further required in Section V.D. to focus the LAX Specific Plan Amendment Study on, among other things, "Potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 million annual passengers (the Alternative Projects)." However, nothing in the Stipulated Settlement

requires LAWA to adopt such Alternative Projects, any amendments to the LAX Specific Plan are subject to approval by the Los Angeles City Council, and, pursuant to Section V.H of the Stipulated Settlement, should the Los Angeles City Council approve an LAX Specific Plan amendment, LAWA would be required to seek review and approval of, at a minimum, changes to the LAX Airport Layout Plan, as well as FAA review of any proposed changes to the LAX Master Plan. In the absence of such approvals, the LAX Specific Plan would not be amended and the LAX Specific Plan would continue to exist in its present format.

The LAX Specific Plan currently reflects the approved LAX Master Plan (i.e., Alternative D (identified as Alternative 3 in the SPAS Draft EIR). As stated in Section 1.2 of the SPAS Draft EIR, the proposed project is the LAX Specific Plan Amendment Study. In the absence of an amendment to the LAX Specific Plan, the CEQA "No Project" Alternative would be implementation of the existing LAX Specific Plan (i.e., LAX Master Plan Alternative D, which is also SPAS Alternative 3). When a proposed project is the revision of a plan, the State CEQA Guidelines (Section 15126,6(e)(3)(A)) specifically provide that the no project alternative shall be the continuation of the existing plan into the future. Therefore, the SPAS Draft EIR properly designated the CEQA "No Project" Alternative.

Also, please see Responses to Comments SPAS-AL00007-7 and SPAS PC00130-749 regarding the CEQA "No Project" Alternative.

SPAS-AL00007-4

Comment:

(3) Disclaiming the manifest capacity enhancing impacts, both on and off-airport, of the project, including potential shifting of flight paths over the proximate communities of Inglewood and Culver City, despite FAA's definition of capacity as "throughput rate, i.e., the maximum number of operations that can take place in an hour," FAA Advisory Circular 150/5060-5, § 3, and despite the DEIR's long discussion of the way in which greater runway separation will facilitate greater efficiency, and, thus, "throughput" by, among other things, providing an airfield "consistent with FAA design standards for the largest aircraft types currently in service . . . for all weather conditions," and "[m]inimize modifications of standards, waivers, or operational restrictions, all of which reduce airfield efficiency and level of service." DEIR, § 1.2.1.1, p. 1-11; and

Response:

Appendix F-2 of the Preliminary LAX SPAS Report addresses peak hour throughput for Alternatives 1, 2, 3, and 4 in Tables 10, 12, 14 and 16, respectively.

As discussed and illustrated, beginning on page 1-18 in Section 1.2.2 of the SPAS Draft EIR, Alternative 4 represents the existing north airfield configuration with no improvements, except for RSA improvements that do not affect daily operations, while Alternatives 1, 2, and 3, represent materially different airfield improvement configurations for future conditions. Alternative 1 moves Runway 6L/24R northward, lengthens the runways, adds a centerfield parallel taxiway, and makes various taxiway improvements. Alternative 2 does not move any runways or add a centerfield parallel taxiway, but does lengthen Runway 6R/24L and provides various taxiway improvements. Alternative 3 moves Runway 6R/24L southward, lengthens the runways, adds a centerfield parallel taxiway, and makes various taxiway improvements.

As shown in Tables 10, 12, 14, and 16 beginning on page 63 of Appendix F-2 of the Preliminary LAX SPAS Report, the peak hour throughput of Alternatives 1, 2, and 3 is only one operation per hour higher than Alternative 4.

As discussed and illustrated, beginning on page 1-25 in Section 1.2.2 of the SPAS Draft EIR, the airfield improvements associated with Alternatives 5, 6, and 7 are generally comparable to those of Alternatives 1 and 3, with the main differences being the lateral movement of runways and such differences would not result in substantially different peak hour throughput changes than those of Alternatives 1 and 3 compared to Alternative 4. Therefore, these Alternatives do not have "manifest capacity enhancing impacts."

SPAS-AL00007-5

Comment:

(4) Failing to adequately analyze the project's air quality, greenhouse gas, noise, land use and planning, and surface transportation impacts.

Response:

The comment introduces more detailed comments that follow. Detailed responses have been prepared and are provided herein for those other comments. Relative to air quality and greenhouse gas, please see Responses to Comments SPAS-AL00007-9 through SPAS-AL00007-18. Relative to noise, please see Responses to Comments SPAS-AL00007-19 through SPAS-AL00007-23. Relative to land use and planning, please see Responses to Comments SPAS-AL00007-24 through SPAS-AL00007-30. Relative to surface transportation, please see Responses to Comments SPAS-AL00007-32 through SPAS-AL00007-35.

SPAS-AL00007-6

Comment:

I. THE DEIR DOES NOT COMPORT WITH CEQA'S MANDATE TO DESIGNATE AN ACCURATE, STABLE AND FINITE PROJECT DESCRIPTION

In a new twist on the same old theme, the DEIR fails to designate a project at all. Rather, it states that LAWA will choose a "project" at the conclusion of public comments and in the Final EIR ("FEIR"), see, e.g., § 1-26, 1.2.3 ["more detailed evaluation of that relationship [between each project objective and each SPAS alternative] will be completed in conjunction with further evaluation of the alternatives through preparation of the Final ER and during the public hearings process."].

In lieu of a "project," the DEIR provides an array of airfield and surface traffic choices from which the public can choose "one from Column A and two from Column B" and, thereby, purportedly, compute the environmental impacts of each. In taking this approach, the DEIR flies in the face of judicial authority which unanimously requires not only that a project include "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change . . ." CEQA Guidelines § 15378(a); Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora, 155 Cal.App.4th 1214, 1222 (2007), but also that the scope of the environmental review conducted, even for the Initial Study, "must include the entire project. Specifically, 'all phases of project planning, implementation, and operation must be considered' as early as in the Initial Study of the project." CEQA Guidelines § 15063(a)(1); Tuolumne, supra, 155 Cal.App.4th at 1222. Therefore, whether a program or project ER is contemplated, by the time the DEIR stage is reached, a coherent whole must be presented to the public, not interchangeable parts in as yet indeterminate combination.

Here, in direct contravention of these unequivocal requirements, the DEIR presents nine options from which the public may choose. The options are not "alternatives" to one another in the standard sense, because only options 1 through 4 are complete projects, i.e., include both airfield components and off-airfield surface traffic components. Alternatives 5 through 7 omit any mention of associated surface traffic or its impacts. Conversely, options 8 through 9 evaluate only surface traffic, and omit any mention of airfield improvements. Apparently, this approach was chosen on the assumption that the impacts of various components are additive, e.g., the air quality and noise impacts of Alternative 5 can simply be added to those of Alternatives 8 or 9 as assumed in the EIR. Certain impacts, however, such as noise are evaluated logarithmically. That means the noise impacts from the surface traffic discussed in Alternatives 8 and 9 may be subsumed within the far greater noise impacts calculated from airfield operations when the two are added together, masking the true impacts of both.

Nor can the DEIR's approach be justified on the ground that the airfield and surface traffic options have "independent utility," see, e.g., Planning and Conservation League, supra, 180 Cal.App.4th at 237, and would occur with or without the project. It is clear from the DEIR that surface traffic improvements are critical to the stated purpose of the project as a whole, the replacement of the "Yellow Light" projects, as

defined in the Settlement, which includes both airfield and surface traffic projects. See, e.g., DEIR, Project Description, § 2.2, Objective No. 2, "Improve the Ground Access System at LAX to Better Accommodate Airport-Related Traffic, Especially as Related to the Central Terminal Area." [Emphasis added.]

In short, the DEIR fails to designate a "project" or preferred alternative at all. Rather, it confronts the public with four "projects" and five components of a single project, and asks it to evaluate several in combination, all with the same level of specificity, as any one or more may be chosen to be implemented. The same sort of obfuscation was summarily rejected by the court in Woodward Park Homeowners Association, Inc. v. City of Fresno, 150 Cal.App.4th 683, 711 (2007). In that case, the court rejected the use of a baseline predicated on a previously approved project, rather than the existing physical condition of the property, which would have required the public to research prior published documents to create a relevant comparison with project impacts. Its holding applies to the complex conglomeration of options at issue here including the synergistic impacts of each of those options with those projects of Alt. D, the current Master Plan, which are still being implemented. "The sum of the earlier identified impacts and those identified now would be the actual impacts of the present project. . . Even assuming this [addition] would have been possible, an agency cannot satisfy its CEQA obligations by imposing a burden of that kind on the public." Id. at 711.

Response:

The SPAS Draft EIR's approach to the project description and alternatives is consistent with CEQA's requirements and facilitated public review of the alternatives. The SPAS Draft EIR's "component approach" to the project description and "mix and match" approach to the alternatives were specifically upheld as complying with CEQA's requirements in California Oak Foundation v. Regents of the University of California (2010) 188 Cal.App.4th 227. In that case, the court upheld a project description for proposed UC Berkeley campus improvements consisting of four "integrated projects." (Id., at 269-275.) It also upheld a "mix and match approach" to the project alternatives, wherein the EIR stated that: "[r]ather than an 'all-or-nothing' situation, the consideration of alternatives allows for a 'mix-and-match' approach, in which components from different alternatives may be substituted for one another." (Id., at 275-277.)

The SPAS Draft EIR was prepared to specifically respond to the requirements outlined in Section 7.H of the LAX Specific Plan, as amended, as well as Section V of the Stipulated Settlement. These documents identify specific requirements that must be met by SPAS. Section 7.H of the LAX Specific Plan, as amended, requires LAWA to "initiate a complete LAX Specific Plan Amendment Study comprehensively addressing security, traffic, aviation activity, and corresponding environmental analysis consistent with CEQA" prior to seeking an LAX Plan Compliance determination for any one of the projects referred to as the Yellow Light Projects. Section V.C of the Stipulated Settlement requires LAWA to "prepare a proposed LAX Specific Plan Amendment Study and prepare all necessary environmental documents." Section V.D of the Stipulated Settlement further requires LAWA to focus SPAS on "potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers," and refers to these potential alternative designs, technologies, and configurations as the "Alternative Projects". Therefore, per the requirements of the LAX Specific Plan, as amended, and the provisions of the Stipulated Settlement, the project that LAWA is required to undertake is an LAX Specific Plan Amendment Study.

Moreover, the LAX SPAS is required to focus on "Alternative Projects," not a single proposed project. In fact, the analysis of multiple alternatives in the SPAS Draft EIR was consistent with the stated request of the petitioners during the scoping process for SPAS. The document titled "Petitioner's Overview of Guiding Principles for Environmental Analysis: LAX Specific Plan Amendment Study EIR," which was submitted to LAWA by the City of El Segundo, City of Inglewood, City of Culver City, County of Los Angeles, and ARSAC states: "All alternatives should be subject to a full and fair evaluation in the SPAS DEIR and LAWA should remain open to options that would avoid or mitigate impacts to its neighbors, taking care not to prematurely select a preferred alternative." All five of the petitioners included these Guiding Principles in their comments on the 2008 SPAS NOP and three of the petitioners, the City of Inglewood, City of Culver City, and ARSAC, included the Overview of Guiding

Principles as part of their comments on the SPAS Draft EIR (see Comments SPAS-AL00007-53 through SPAS-AL00007-59 and SPAS-PC00130-962 through SPAS-PC00130-968).

Although LAWA did not identify a single proposed project in the SPAS Draft EIR, LAWA complied with CEQA in the description and analysis of each alternative. CEQA does not require that a Draft EIR disclose a single proposed project or preferred alternative. When CEQA is silent on a topic, NEPA is often used to help interpret CEQA. (See, e.g., No Oil Inc. V City of Los Angeles (1974) 13 Cal.3d 68, 118.) NEPA regulations specifically provide that a lead agency may omit selection of a preferred alternative in a Draft EIS, but do require that the preferred alternative be disclosed in the Final EIS. (40 CFR Section 1502.14(e).) The SPAS Draft EIR identifies the "whole of an action" that would be associated with each alternative analyzed as well as the "direct physical change in the environment, or reasonably foreseeable indirect physical change" under each alternative. (State CEQA Guidelines Section 15378(a)). Section 2.3.1 of the SPAS Draft EIR provides a thorough description of each alternative, including details regarding the physical configuration, dimensions of airfield improvements, and square footages of new building area. Existing facilities that would require modification or relocation under each alternative are identified in Section 2.3.1.10, and land that would need to be acquired under each alternative is identified in Section 2.3.1.11. The function of each of the new ground access facilities is further detailed in Appendix E2-2 of the Preliminary LAX SPAS Report. Despite the fact that the SPAS Draft EIR does not identify a single preferred alternative, the project description provided in the SPAS Draft EIR for each alternative analyzed is accurate, stable, and finite.

The interchangeability among different project components is detailed on page 2-8 of the SPAS Draft EIR. Contrary to the statement by the commentor that only Alternatives 1 through 4 are complete projects, and that Alternatives 5 through 7 omit any mention of surface traffic or that Alternatives 8 and 9 omit any mention of airfield improvements, page 2-8 clearly states that Alternatives 5 through 9 "would only address all of the problems that the Yellow Light Projects were designed to address in conjunction with another alternative… or portion thereof." Moreover, the SPAS Draft EIR does not suggest that the airfield/terminal improvements or the ground access improvements have independent utility from one another, or that one set of improvements would be advanced in the absence of the other.

Contrary to the statements of the commentor, the public is not asked to "aggregate and analyze the collective impacts of the various ground and air components" (Comment SPAS-AL00007-2) or to evaluate any of the alternatives in combination (Comment SPAS-AL00007-6). Rather, the impacts of each alternative are evaluated in their entirety and presented specifically so that the decision-makers, public agencies, and members of the public are able to discern the impacts of the airfield and terminal components versus the impacts of the ground access components so that the impacts of these components in combination can be easily determined without placing an undue burden on decision-makers or the public to determine these impacts. Nor is the public required to research prior published documents to determine the impacts of the various alternatives evaluated in the SPAS Draft EIR. The Woodward Park Homeowners Association case is not relevant to the SPAS Draft EIR because it dealt with missing information in an EIR's description of baseline conditions. By contrast, all of the impacts of the SPAS alternatives are presented in the SPAS Draft EIR, including "synergistic" impacts, and summary tables are provided that compare the impacts among the alternatives, with specific explanations regarding impacts associated with the combination of airside/terminal and ground access components (see Tables 1-4 and 1-5 of the SPAS Draft EIR). All phases of the each alternative are evaluated in the SPAS Draft EIR, including construction and operation. In addition, the cumulative impacts of each alternative, in combination with other past, present, and reasonably foreseeable future projects, including continued implementation of the LAX Master Plan, are evaluated in Chapter 5 of the SPAS Draft EIR. The SPAS Draft EIR was prepared with a sufficient degree of analysis to provide the decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.)

The commentor is incorrect in stating that the inclusion of alternatives whose components are interchangeable precludes the ability to evaluate the "synergistic" impacts of the alternatives. For example, as described in Section 4.2.6 of the SPAS Draft EIR, in order to provide a complete evaluation of air quality impacts, "the emissions of those alternatives that focus solely on airfield and related terminal improvements (Alternatives 5, 6, and 7) were combined with the range of emissions that could occur under various ground improvements scenarios. Similarly, the emissions of those alternatives that focus solely on ground access improvements (i.e., Alternatives 8 and 9) were combined with the range

of emissions that could occur under various airfield/terminal improvements scenarios… In doing so, the total potential emissions associated with these focused alternatives can be better compared to the emissions associated with the "fully integrated" alternatives (i.e., Alternatives 1 through 4…)." Similarly, in order to fully account for the combined impacts of noise from various sources (i.e., aircraft, road traffic, construction traffic and equipment, and transit), Section 5.5.10.5 of the SPAS Draft EIR evaluated the combined noise impacts associated with each SPAS alternative.

Finally, subsequent to publication of the SPAS Draft EIR, LAWA staff recommended an alternative that couples the airfield and terminal improvements associated with Alternative 1 with the ground access components associated with Alternative 9. The environmental impacts and recommended mitigation measures associated with the LAWA Staff-Recommended Alternative are identified in Chapter 2 of this Final EIR. As indicated in that chapter, the environmental impacts and mitigation measures of the components that make up the LAWA Staff-Recommended Alternative were fully analyzed and disclosed in the SPAS Draft EIR. Given that the SPAS Draft EIR clearly explains the potential for interchangeability between the SPAS alternatives, and explains that the ground access improvements in Alternative 9 are compatible with the airfield and terminal improvements in Alternative 1, the LAWA Staff-Recommended Alternative is within the range of alternatives that the public could reasonably have anticipated LAWA's decision-makers to consider.

SPAS-AL00007-7

Comment:

II. THE DEIR INCORRECTLY RELIES ON ALTERNATIVE 3 AS THE "NO PROJECT" ALTERNATIVE WHERE IT INCLUDES IMPLEMENTATION OF THE "YELLOW LIGHT" PROJECTS THAT WERE ELIMINATED BY THE SETTLEMENT

The purpose of the "no project" alternative is to allow a comparison of the environmental impacts of approving the proposed project with the effects of maintaining the status quo. CEQA Guidelines § 15126.6(e)(1). When the project involves revisions of an existing plan, policy, or ongoing operation, the "projected impacts of the proposed plan or alternative plans would be compared to the impacts that would occur under the existing plan." CEQA Guidelines § 15126.6(e)(3)(A). See also, Woodward Park Homeowners, supra, 150 Cal.App.4th at 711. CEQA Guidelines § 15126.6(e)(3)(C) further provides that the lead agency "should proceed to analyze the impacts of the no project alternative by projecting what would reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services." In addition, an EIR's analysis of the no project alternative must also include a discussion of conditions existing at the time the notice of preparation is published, or, in the alternative, upon commencement of the environmental analysis. CEQA Guidelines § 15126.6(e)(2).

In this case, Alternative 3 does seem to meet the basic definition, i.e., the situation on the ground including all previously approved projects. However, this is not a conventional case. Alternative 3 here includes "Yellow Light" projects which, according to the Settlement, are to be replaced with other projects which serve the same purpose. Therefore, Alternative 3 actually includes more components than are currently permitted or can be expected to be implemented.

In this unique situation, Alternative 4 would seem to be the appropriate "No Project" Alternative. That is because Alternative 4 represents the "project" with "Yellow Light" projects, i.e., those that cannot "reasonably be expected to occur in the foreseeable future if the project were not approved," CEQA Guidelines § 15126.6(e)(3)(C), eliminated.

It is also notable that Alternative 4 is used as the benchmark of analysis in the air quality analysis, Table 4.2-14, as the closest to the "no Yellow Light" condition. ["Of the nine alternatives, Alternative 4 has the least amount of improvements and most closely represents a future (2025) 'no Yellow Light Projects' scenario. . ."]. DEIR, p. 4-121. In summary, the existing Master Plan represented by Alternative 3 is not, in this peculiar case, the proper No Project Alternative against which to benchmark the impacts of the project.

Response:

Please see Responses to Comments SPAS-AL00007-3, SPAS PC00130-749, and SPAS-PC00130-873 regarding the CEQA "No Project" Alternative. As explained in Response to Comment SPAS-AL00007-3, the Stipulated Settlement does not require the Yellow Light Projects to be replaced by other projects that serve the same purposes. Therefore, Alternative 3 represents "what would reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans...." (State CEQA Guidelines Section 15126.6(e)(3)(C)).

As stated on page 2-22 in Section 2.3.1.4 of the SPAS Draft EIR, "Alternative 4 represents what would reasonably be expected to occur if all ongoing and reasonably foreseeable non-Yellow Light improvements identified in the LAX Master Plan (i.e., "Alternative D") were implemented, and none of the Yellow Light Projects or any of the identified alternatives to the LAX Master Plan Program were constructed or implemented. Analysis of Alternative 4 will allow decision-makers and the public to evaluate the impacts of simply eliminating the Yellow Light Projects from the LAX Master Plan Program." Alternative 4 is not an appropriate No Project alternative, however, because it does not include the Yellow Light Projects, which are included in the existing LAX Specific Plan and reasonably expected to occur in the absence of the project. Further, Alternative 4 is not an appropriate No Project alternative because its implementation would require formal adoption by BOAC and the Los Angeles City Council to amend the LAX Specific Plan, as outlined in Chapter 6 of the SPAS Draft EIR.

As discussed on page 4-121 in Section 4.2.6.3 of the SPAS Draft EIR, in the discussion of air quality impacts, in addition to comparing results to 2009 baseline conditions, comparisons were provided to Alternative 4 in order to identify changes in emissions that are primarily attributable to the specific characteristics of each alternative, while controlling for effects of emissions standards common to all alternatives. As noted by the commentor, and stated in the SPAS Draft EIR, of the nine alternatives, Alternative 4 has the least amount of improvements and most closely represents a future (2025) "no Yellow Light Projects" scenario, from which to measure the differences in emissions that would occur with implementation of the improvements associated with each other alternative. In addition, using Alternative 4 as one basis of comparison among alternatives better captures the differences in aircraft emissions that are directly attributable to the different airfield configurations currently being considered, whereas comparisons to 2009 baseline conditions include emissions associated with both the growth in aircraft activity anticipated to occur between 2009 and 2025, which is common to all alternatives, and the changes in aircraft emissions that are attributable to the proposed airfield configuration under each alternative. Notwithstanding the use of Alternative 4 to compare air quality impacts of the alternatives for informational purposes, the SPAS Draft EIR clearly identifies that existing conditions or, in the case of some disciplines, 2009 baseline conditions, are the baseline or benchmark against which project impacts are determined. (See pages 4-4 and 4-5 of the SPAS Draft EIR for a discussion of the baseline year analyzed in the SPAS Draft EIR. The baseline year that was evaluated for each environmental discipline is identified in the subsections of Chapter 4 of the SPAS Draft EIR.) The SPAS Draft EIR also clearly and appropriately identifies Alternative 3, not Alternative 4, as the No Project alternative, as explained above.

SPAS-AL00007-8

Comment:

III. THE DEIR IMPROPERLY DISCOUNTS THE CAPACITY ENHANCING POTENTIAL OF THE PROJECT

As was true with respect to the 2003 Master Plan EIR, the DEIR here strongly emphasizes the safety enhancing purposes of the project, and downplays its capacity enhancing potential. In fact, the DEIR emphasizes that a 30-40% increase in aircraft and passenger activity is projected to occur regardless of the project (i.e., would occur if none of the SPAS alternatives was implemented). DEIR, p. 1-47, § 1.4. Nevertheless, the proposed "safety" improvements, including increased runway separations and extension eastward for the north runways, the addition of centerline taxiways, and high speed runway exits, to accommodate departures of the New Large Aircraft ("NLA") and other aircraft that cannot currently access the North Airfield without delay, are inextricably linked to capacity, defined by FAA as "throughput rate, i.e., the maximum number of operations that can take place in an hour." FAA Advisory Circular 150/5060-5, § 3.

The DEIR itself does not disclaim this link to capacity enhancement. It makes clear that the further separation of the north runways is necessary to efficiently accommodate NLAs, and to allow for some larger aircraft currently using the South Complex to use the North Complex as well. See, e.g., DEIR, pp. 1-10, 2-2. Nevertheless, aircraft activity is held constant across all evaluated runway alternatives. In other words, the number of flights into and out of LAX is identical (2053 operations per peak day), as is the aircraft fleet mix through which those flights are conducted. By assuming constant aircraft activity in 2025 under all four runway "integrated" alternatives, the DEIR is implying that LAX can handle the forecasted aircraft demand - even that related to the new generation of NLA - regardless of whether any redesign of the northernmost runways is implemented. That is, the DEIR assumes that the same aircraft, in the same numbers, will fly into and out of LAX whether the runways are moved or left as is, whether or not more efficient runway exits are constructed, and whether or not taxiways are or are not reconfigured. The explicit assumption is that the potential improvements will enhance the safety of these aircraft operations. However, in this case the improvements made to enhance safety also enhance effective runway capacity. It is this additional capacity that should allow for differential levels of activity under the various alternatives.

However, and despite the DEIR's admission that the various airfield alternatives will have differential operational effects, depending on the type of aircraft, time of day and weather, the capacity enhancing impacts of these differential operational effects remain stubbornly unanalyzed because of "budget considerations."1 Neither the CEQA Guidelines nor the courts recognize such budget constraints on reasonable analyses, fundamental to a complete picture of project impacts. Until such analyses are conducted and their results reported, including an analysis of the differential operational characteristics of options 1 through 7, and their resulting capacity enhancing characteristics, including the potential for more divergent flight paths taking additional aircraft over proximate communities such as Culver City and Inglewood than currently exist, the DEIR will remain fatally defective.

1 See LAX Specific Plan Amendment Study Report, Appendix F-2, p. 1: "For the purposes of developing detailed airside design assumptions that could be utilized in modeling a reasonable range of airfield configuration options, and do so in an efficient and cost-effective manner taking into account contract scope and budget considerations, the simulation analysis focused on only Alternatives 1 through 4. Based on the detailed information developed for those alternatives, the SPAS Environmental Team was able to estimate performance assumptions and projections for Alternatives 5 through 7, as utilized in the aircraft noise and air quality analyses."

Response:

As required by the Stipulated Settlement, the formulation and evaluation of alternatives to the LAX Master Plan Yellow Light Projects are consistent with a practical capacity of 78.9 MAP. As described in Appendix F-1 of the Preliminary LAX SPAS Report, passenger activity levels at LAX are not expected to reach 78.9 MAP until 2024. The 78.9 MAP forecast reflects the fact that all of the SPAS alternatives include (i) no more than 153 gates and (ii) amendment of the LAX Specific Plan Section 7.H, requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. Both this physical gate limit and the proposed amendment to the LAX Specific Plan reflect the fact that the practical capacity of LAX is based on market assumptions, as well as the expected physical characteristics of the various functional elements of the airport and how they are planned and expected to work together, given how the market is likely to respond and use LAX. (See Preliminary LAX SPAS Report, Section 6.2.) Based on the Design Day Flight Schedule (DDFS), including aircraft fleet mix and aircraft gating, associated with that projection, detailed airfield simulation modeling (i.e., SIMMOD) was conducted for SPAS Alternatives 1 through 4, which is presented in Appendix F-2 of the Preliminary LAX SPAS Report. As indicated in Appendix F-2, the modeling demonstrated that there was not a substantial difference between the alternatives relative to average delay times and unimpeded taxi times. Additionally, relative to the commentor's indication that airfield capacity is represented by "throughput rate i.e., the maximum number of operations that can take place in an hour," the modeling demonstrated that the number of peak hour throughput operations is not materially different between SPAS Alternatives 1 through 4. The similarities between alternatives relative to peak hour throughput is

evident in comparing Tables 10, 12, 14, and 16 in Appendix F-2 for Alternatives 1, 2, 3, and 4, respectively.

Please note that upon review of Appendix F-2 of the Preliminary LAX SPAS Report, typographical errors were found in Table 14 on page 91 and Table 16 on page 107. Regarding Table 14 for Alternative 3, the Peak Operations Hour Volumes were underestimated. The corrected values for Alternative 3 Peak Operations are as follows:

2025 SPAS Alternative 3 Peak Operations

Configuration	Daily Total	Peak Throughput Hour
VFR Visual West Flow	2,053	135
VFR ILS West Flow	2,053	136
VFR ILS East Flow	2,053	133
IFR West Flow	2,053	125
Average All-Weather Throughput	2,053	135

This typographical error does not effect, invalidate, or undermine the results and conclusions of the SPAS Draft EIR SIMMOD simulation analyses or the public reviews of the SPAS Draft EIR, because the peak throughput hour values erroneously presented in the SPAS Draft EIR were only marginally different from the correct peak throughput hour values (presented above) with, at most, a difference of 4 operations (VFR ILS East Flow, 137 vs. 133). In addition, this typographical error does not have any effect on the conclusions presented in Section 4 of Appendix F-2 of the Preliminary LAX SPAS Report or on the average all weather delay and unimpeded taxi time values presented in Table 17 on page 108 of Appendix F-2 of the Preliminary LAX SPAS Report. As shown in the revised text, the average all-weather throughput number of operations is 135 compared to 133, as originally shown in Appendix F-2 of the Preliminary LAX SPAS Report. In response, page 91 of Appendix F-2 of the Preliminary LAX SPAS Report has been revised. Please see Chapter 4, of the Final LAX SPAS Report.

Regarding Table 16 for Alternative 4, as indicated near the top of the table, the number of daily operations projected for the year 2025 is 2,053; however, the Daily Totals listed for the VFR and IFR operations were inadvertently listed as "2,285" and the associated Peak Throughput Hour volumes were overestimated. The corrected values for Alternative 4 Peak Operations are as follows:

2025 SPAS Alternative 4 Peak Operations

Configuration	Daily Total	Peak Throughput Hour
VFR Visual West Flow	2,053	134
VFR ILS West Flow	2,053	133
VFR ILS East Flow	2,053	137
IFR West Flow	2,053	122
Average All-Weather Throughput	2,053	133

The above typographical error does not effect, invalidate, or undermine the results and conclusions of the SPAS Draft EIR SIMMOD simulation analyses, because the SPAS Draft EIR simulation analyses assumed 2,053 total daily operations, and not 2,285. All Alternative 4 simulation results presented in Sections 3.4 and 4 of Appendix F-2 of the Preliminary LAX SPAS Report are therefore correct. In response, page 107 of Appendix F-2 of the Preliminary LAX SPAS Report has been revised. Please see Chapter 4 of the Final LAX SPAS Report.

A comparison of the peak hour throughput values between the alternatives indicates that the range of airfield improvements associated with these alternatives, such as moving Runway 6L/24R 260 feet northward adding a centerfield taxiway, or moving Runway 6R/24L 340 feet south and adding a

centerfield taxiway, or not moving either runway and not adding a centerfield taxiway, does not substantially affect the peak hour operational capacity of the airfield based on the airport activity level projected for 2025 (i.e., 78.9 MAP). The similarities in the SIMMOD results for the various airfield configurations supports the assumption that the same aircraft fleet mix can be comparably accommodated under all the alternatives (i.e., there is not substantial variation in the SIMMOD results to suggest that certain airfield configurations would create substantial delays or operational problems for certain size and types of aircraft within the fleet mix).

The decision to complete SIMMOD modeling for Alternatives 1 through 4, but not for Alternatives 5 through 7, was made in light of the diverse range of airfield improvement configurations associated with Alternatives 1 through 4, which could yield substantially different airfield operation results, and the fact that the modeling results for Alternatives 5 through 7 would likely either fall within the range of, and/or be generally comparable to, the results for Alternatives 1 through 4. Specifically, Alternative 5 includes the relocation of Runway 6L/24R 350 feet northward and the addition of a centerfield taxiway, which would be generally comparable to Alternative 1, which proposes the relocation of Runway 6L/24R 260 feet northward and the addition of a centerfield taxiway - the main operational capability difference being that Alternative 5 could accommodate ADG VI aircraft during poor visibility conditions, which are relatively infrequent at LAX. Alternatives 6 and 7 include relocation of Runway 6L/24R northward by 100 feet or relocation of Runway 6R/24L southward by 100 feet, both with the addition of a centerfield taxiway. Both of these alternatives included runway and taxiway improvements that fall within the range of airfield improvements offered by Alternatives 1 and 3. Given these similarities, it was possible to draw reasonable conclusions about Alternatives 5, 6 and 7 based on the results of SIMMOD modeling for Alternatives 1 through 4. This analysis is consistent with CEQA, which requires that an "evaluation of the environmental effects of a proposed project need not be exhaustive," and "the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible." (State CEQA Guidelines Section 15151.)

SPAS-AL00007-9

Comment:

IV. THE DEIR AIR QUALITY SECTION OMITS DATA AND ANALYSIS CRITICAL TO A DETERMINATION OF THE IMPACTS OF THE VARIOUS ALTERNATIVES

In another exercise in "déja vu all over again," the DEIR air quality analysis omits both the data and analysis necessary to fully and accurately disclose the air quality impacts of any of the potential alternatives.

Response:

All results from the air quality impact analysis necessary to allow the lead agency decision-makers and the public to see the differences between the alternatives with regard to air emissions and ambient concentrations, are provided in the SPAS Draft EIR. The methodology for the analysis is presented in Section 4.2.2, existing conditions are described in Section 4.2.3, thresholds of significance are listed in Section 4.2.4, the impacts from construction are presented in Section 4.2.6.1 and impacts from operations are presented in Section 4.2.6.2.

Table 4.2-10 summarizes peak daily construction emissions for each alternative and pollutant. Construction emissions for each of the project areas under each alternative are included in Appendix C, Attachment 1. Ambient concentrations associated with construction activity under each alternative are provided in Tables 4.2-11 and 4.2-12, and Appendix C, Attachment 1 provides the air pollutant concentrations at each receptor for each alternative around the airport in tabular format.

Incremental operational emissions relative to the existing conditions for each alternative under two different weather conditions (visual flight rule conditions and instrument flight rule conditions) are summarized in Table 4.2-13. Incremental operational emissions relative to Alternative 4 for the future alternatives under the same two weather conditions are summarized in Table 4.2-14. Total emissions for each alternative are included in Appendix C, Attachment 2.

The estimated concentrations of gas-phase pollutants (carbon monoxide, nitrogen dioxide, and sulfur dioxide) are presented in Table 4.2-15, and concentrations of particulate matter (PM10 and PM2.5) are

presented in Tables 4.2-16. Appendix C, Attachment 3 provides the ambient concentrations at each receptor for each pollutant under each alternative for each weather condition.

The emission calculation spreadsheets, as well as EDMS and AERMOD model input and output files on two CDs were provided to the SCAQMD on November 29, 2012.

The air quality impacts from each alternative originally developed have been fully disclosed in the SPAS Draft EIR. Since publication of the SPAS Draft EIR, the LAWA Staff-Recommended Alternative (SRA) was announced. The SRA combines the airside and terminal improvements from Alternative 1 with the ground access improvements from Alternative 9. Please see Chapter 2 of this Final EIR for evaluations of environmental impacts associated with the SRA.

Please see Responses to Comments SPAS-AL00007-10 through SPAS-AL00007-18 for additional information specific to the information and analysis the commentor believes has been omitted.

SPAS-AL00007-10

Comment:

A. The DEIR Presents Supporting Data Insufficient to Allow the Public to Verify the Accuracy of the DEIR's Analysis

As a threshold matter, the DEIR only reflects air quality modeling for options 1 through 4 (the integrated alternatives). For options 5 through 7, specific aircraft modeling (e.g., runway assignments, delay times, etc.) was not performed. Instead, results were apparently inferred from modeling data for Alternatives 1 through 4, again for "budget considerations." LAX Specific Plan Amendment Study Report, Appendix F-2, p. 1. Moreover, the "inferred" data are not presented in either the main body of the DEIR or the appendices, and, therefore, it is not possible to evaluate the purported "inferences," even if they had been documented with data. This is especially true for Alternative 5 which proposes to move Runway 24R 350 feet to the north, essentially requiring extrapolation of the data beyond the 260 foot northward movement of Runway 24R proposed in Alternative 1.

Response:

Please see Response to Comment SPAS-AL00007-8 for an explanation of the detailed airfield simulation modeling (i.e., SIMMOD) that was conducted for SPAS Alternatives 1 through 4 (as presented in Appendix F-2 of the Preliminary LAX SPAS Report) and why this modeling provided adequate information to make reasonable assumptions for Alternatives 5, 6, and 7.

The effect of weather conditions on taxi and delay time can be seen in the Average Delay and Unimpeded Taxi Time (Minutes per Operation) values shown in Tables 9 (Alternative 1) and 11 (Alternative 2) in Appendix F-2 (pages 61 and 71) of the Preliminary LAX SPAS Report. When the airport is operating under visual flight rules (VFR), the average delay and unimpeded taxi times for Alternative 1 are slightly greater than those for Alternative 2. The benefit of having access to the centerfield taxiway is overshadowed by the increased taxi time needed to get in from Runway 24R under Alternative 1 compared to Alternative 2 when the weather is good. However, under instrument flight rules (IFR), the average delay and unimpeded taxi time for Alternative 1 are slight less than those for Alternative 2. In the case of poor weather, the benefit of having access to the additional taxiway more than compensates for the increased taxi time to get into the terminal from the moved out runway.

The general effects of the changes in taxi and delay times can be seen in Table 4.2-13 of the SPAS Draft EIR (pages 4-122 through 4-125). Alternative 1 provides lower aircraft emissions under poor weather IFR conditions (these are the highest values in the emission ranges), while Alternative 2 provides lower aircraft emissions under good weather VFR conditions (these are the lowest values in the emission ranges). Note that the differences in aircraft emissions between Alternative 1 and Alternative 2 are the differences in taxi and ground delay emissions, since the other aircraft operating modes are essentially identical between Alternative 1 and Alternative 2.

The changes in taxi time, delay time, and associated emissions between Alternative 1 and Alternative 2 under VFR conditions were assumed to be linear. To save a step in the emissions calculations, the

taxi/delay emissions were directly adjusted for the distances to Runway 24R under Alternatives 5 and 6. Taxi time and emissions increased as Runway 24R is moved further north, thus the emissions for Alternatives 5 and 6 under VFR conditions were simply based on the ratios of the distances that Runway 24R is moved north relative to Alternative 1. In the case of Alternative 5, that ratio is 350 ft/260 ft; and for Alternative 6 the ratio is 100 ft/260 ft (SPAS Draft EIR, pages 1-5 and 1-6). It was also assumed that the changes in taxi time, delay time, and associated emissions between Alternatives 1 and 2 under IFR conditions was linear. The taxi/delay emissions for Alternatives 1 and 2 under IFR and VFR weather conditions were obtained from the EDMS aircraft emissions files.

Alternative 7 was addressed in a similar manner, except that the linear ratios were developed from the differences between Alternative 2 and Alternative 3, since both Alternative 3 and Alternative 7 move Runway 24L to the south. The average delay and unimpeded taxi times (minutes per operation) for Alternative 3 are found in Table 13 (page 89) in Appendix F-2 of the Preliminary LAX SPAS Report. The differences in aircraft emissions between Alternative 2 and Alternative 3 in Table 4.2-13 of the SPAS Draft EIR (pages 4-122 through 4-125) represent the differences in taxi/delay emissions between these two alternatives. Again, the high end of the emission range for aircraft represents IFR (poor) weather conditions, and the low end represents VFR Visual (good) weather conditions. The ratio to obtain Alternative 7 delay and taxi times was based on the distance that Runway 24L is moved south compared to the distance it is moved south for Alternative 3 (100 ft/340 ft, from the SPAS Draft EIR, pages 1-5 and 1-19). As noted above, the taxi/delay emissions for Alternatives 2 and 3 under IFR and VFR weather conditions were obtained from the EDMS aircraft emissions files.

The general effects of the changes in taxi and delay times can be seen in Table 4.2-13 of the SPAS Draft EIR (pages 4-122 through 4-125). Alternative 5 provides the lowest aircraft emissions under poor weather IFR conditions (these are the highest values in the emission ranges), while Alternative 2 provides the lowest aircraft emissions under good weather VFR conditions (these are the lowest values in the emission ranges).

SPAS-AL00007-11

Comment:

In addition, the data that is provided is inadequate to assess even the impacts of the "modeled" Alternatives 1 through 4. First, under the constant activity approach discussed in Section III above, the only variables that should affect airside emissions are taxi time and delay time. Aircraft approach, takeoff and climbout emissions should be identical across the evaluated alternatives, as should Ground Support Equipment ("GSE") and Auxiliary Power Unit ("APU") emissions. The DEIR, however, fails to present aircraft emissions by operating mode, making it impossible to confirm the expected consistency using presented data.

Specifically, the DEIR contains no comparative tables either listing or summarizing the way in which GSE and APU populations were estimated, the way in which those populations were assigned activity estimates, or the way emissions were calculated from the activity. Instead, there is the cursory discussion referencing:

(1) A purported survey of data on specific GSE types and their times in mode for servicing common aircraft types, although the discussion does not reveal how "common types" were chosen, why the analysis did not apply to all aircraft using GSE, and what times in mode are applicable to GSE;

(2) Use of the FAA's Emissions Dispersion Modeling System ("EDMS") to supplement site specific data, without complete disclosure of the "site specific" data supplemented and the analytic interaction between the site specific data and the EDMS assumptions;

(3) General use of emissions factors from the California Air Resources Board ("CARB") OFFROAD2007 Model and 2011 Inventory Model for In-Use Off-Road Equipment in the analysis of GSE emissions without revealing the way in which each was used and the specific emissions factors derived from either. This is in spite of the fact that the DEIR acknowledges that "future year inventories of alternative-fueled GSE were based on these evaluations and LAX environmental policies." DEIR, p. 4-92; and

(4) For APU emissions rates, use of emissions factors from EDMS without disclosing the way in which the assumption that all gates would be equipped with preconditioned air (making APU use less necessary) was reached, the numerical impacts of that assumption, or the data or analysis underlying the assumption. DEIR, p. 4-93.

Response:

Please see Response to Comment SPAS-AL00007-8 for a detailed response to the commentor's concerns regarding what it refers to as the "the constant activity approach." The commentor is correct in reaching a reasonable and logical conclusion that the only notable variables between the SPAS alternatives that affect airside emissions are taxi time and delay time, and that there are not material differences between the alternatives relative to aircraft approach, takeoff, and climbout emissions. The airspace similarities between alternatives are evident in the relevant data sets associated with the SPAS Draft EIR, including in Appendix J1-1 of the SPAS Draft EIR, which presents, in detail, the assumptions for average annual day operations, aircraft fleet mix, runway assignments, and specific flight track utilization percentages for arrivals and departures. This is not a flaw in the analysis. The information presented in Appendix J1-1 draws from the detailed airfield simulation modeling (SIMMOD) presented in Appendix F-2 of the Preliminary LAX SPAS Report, which was conducted for baseline (2009) conditions and for future (2025) conditions with various SPAS alternatives. As described in the methodology discussion for the air quality analysis in Section 4.2.2.2 of the SPAS Draft EIR, the estimates of aircraft emissions were based on the SIMMOD data. While the information provided within, and in conjunction with, the SPAS Draft EIR provides a reasonable basis for a reader and decision-makers to reach the conclusion that the most notable variables between alternatives that affect airfield emissions are taxi time and delay time, detailed input and output files from the FAA Emissions and Dispersion Modeling System (EDMS) runs completed for the SPAS alternatives are available, upon request, in electronic format and are also available for public review in hard-copy form at LAWA's Capital Programming and Planning Division, Room 208, One World Way, Los Angeles, California. Technical working files that delineate raw EDMS input/output data would be approximately 60,000 to 80,000 pages long if printed. Because of the sheer volume and the lack of added value they provide, the technical working files were not included within the SPAS Draft EIR air quality technical appendix. Instead, the summary EDMS output results for each alternative was included in the 400+ page Appendix C of the SPAS Draft EIR. The detailed input/output EDMS data were available upon request to LAWA (SPAS Contact Person: Diego Alvarez as indicated on SPAS public notices and SPAS website) during the 75-day public review period of the SPAS Draft EIR.

Regarding the commentor's discussion of GSE and APU emissions, the detailed emission inventories, by source types including GSE and APU categories, were included in Appendix C, Attachment 2 of the SPAS Draft EIR. Tables 1 through 8 of Attachment 2 provide the emissions for aircraft, GSE, APU for the Environmental Baseline and Alternatives 1 through 7 under instrument flight rule weather conditions. Tables 21 through 28 of Attachment 2 provide the emissions for aircraft, GSE, APU for the Environmental Baseline and Alternatives 1 through 7 under visual flight rule weather conditions. As noted in the comment, aircraft emissions during taxi and delay (idling) are the sources of differences in aircraft emissions between each alternative. Please see Response to Comment SPAS-AL00007-10 for a discussion of the differences in aircraft taxi and delay times by alternative. Please also see Response to Comment SPAS-PC00159-9 for a discussion of the prevalence of instrument versus visual flight rule weather conditions at the airport.

With regard to APU operational emissions, the EDMS default assignments of APU to aircraft, and associated emission rates, were used in the analysis. In addition, the EDMS default assumption of 26 minutes of APU operating time per landing and takeoff operation (LTO) was used in the analysis. This operating time assumption was applied to aircraft at all passenger gates and cargo ramps. No benefit from the use of preconditioned air and gate power was assumed in this analysis. See also, Response to Comment SPAS-AL00007-15 for a discussion of APU and greenhouse gas emissions.

With regard to GSE, the inventory of equipment collected in 2006 was used to determine the mix of equipment types and fuel types. The 2006 inventory included 3,047 pieces of equipment of which 27 percent was diesel, 32 percent was gasoline, 24 percent was electric, and 17 percent was natural gas or liquefied petroleum gas (LPG). The same ratio of diesel, gasoline, electric, and natural gas/LPG use

by equipment type was applied to the 2009 and 2025 inventories. The 2009 and 2025 GSE inventories have not taken credit for anticipated conversion of convention-fueled equipment to alternative fuels or electric power. The annual activities (operating hours per year) and emission factors for GSE in 2006 were obtained from the ARB OFFROAD2011 model for most equipment and pollutants. For any equipment or pollutant that was not included in OFFROAD2011, the OFFROAD2007 model was used instead. The annual activity of GSE was varied to account for the changes in total operations between 2006, 2009 and forecasted 2025. Since 2009 operations were lower than 2006, the GSE total annual activity in 2009 is also lower than in 2006. The 2025 GSE activity is much higher than either 2006 or 2009. The OFFROAD emission factors for calendar year 2009 were used in the 2009 baseline calculations, and the OFFROAD emission factors for calendar year 2025 were used in each of the 2025 alternative calculations.

SPAS-AL00007-12

Comment:

Finally, the aircraft emissions data that is presented in the DEIR reveals a fundamental inconsistency between Alternatives 3, Master Plan Alternative D, and Alternative 4, the "No Project" Alternative for air quality purposes (see, e.g., Table 4.2-14). Presented data for Alternative 4 indicates 27.72 minutes per landing/takeoff cycle ("LTO"), and for Alternative 3, Alt. D, 29.56 minutes, i.e., more aircraft emissions for the same total traffic. The 2003 Master Plan EIR, however, reached precisely the opposite conclusion with the taxi and delay times for the "No Action" Alternative exceeding that of Alt. D by 3%, and Alt. D exhibiting airside emissions generally 5% lower than those of the "No Action" Alternative.2

2 The total taxi and delay times for Alternative D (in the 2003 Master Plan EIR (then the Preferred Alternative)) was 31 minutes per LTO cycle, compared to 29.6 minutes per LTO cycle in the current DEIR.

Response:

The attempt to compare Alternative 4 in the SPAS Draft EIR with the No Action Alternative from the LAX Master Plan EIR is inappropriate. These two scenarios are not the same, and the airport simulation modeling assumptions used in the current analysis was updated relative to the modeling conducted for the LAX Master Plan EIR 10 years ago.

The No Action Alternative under the LAX Master Plan EIR represented the physical layout and facilities at the airport as it existed in 1996, with estimated operational levels for 2015. Alternative 4 under the SPAS Draft EIR starts with the physical layout and facilities at the airport as it existed in 2009; therefore, it is not the same as the No Action Alternative in the LAX Master Plan Final EIR. By 2009, several non-yellow light projects had been completed, most notably the South Airfield Improvement Project (SAIP) and the Crossfield Taxiway Project (CFTP). The SAIP included the construction of a center taxiway between the south airfield runways (Runway 25L and Runway 25R). This improvement alone would be expected to change taxi and delay times since an aircraft that just landed could move back towards the gates along the new taxiway while waiting for an inboard aircraft to depart, and thus would not have to sit at the end of the runway waiting for the departing aircraft to pass. Alternative 4 in 2025 would also include airport improvements that are currently underway, including the Bradley West Project. Thus, it is not surprising that Alternative 4 has slightly better average taxi and delay times as Alternative 3. The airport simulation modeling conducted for the SPAS Draft EIR was expected to be different than the modeling completed for the LAX Master Plan EIR 10 years ago.

SPAS-AL00007-13

Comment:

B. Reverse Thrust Emissions are Omitted from the Air Quality Analysis

Just as in the 2003 Master Plan EIR, and as addressed in Inglewood's comments on that document attached, emissions associated with reverse thrust operations are not considered in the current DEIR. The bottom line then, as now, is that reverse thrust operations are common at LAX under all alternatives (see, e.g., DEIR, p. 4-829), and there is an accepted procedure for estimating them. They

are, moreover, a high thrust, high nitrogen oxide ("NOx") mode of operation. Thus, even though short in duration (normally 15 to 20 seconds per arrival), a high amount of NOx is produced, all of which is emitted at ground level. The absence of any analysis of reverse thrust, therefore, casts doubt on the aggregate analysis of NOx emissions from all project alternatives.

Response:

The current version of EDMS, EDMS v.5.1.3, was used to model aircraft emissions in the following six operational modes: engine startup, taxi out, takeoff, climb out, approach, and taxi in. As stated in the EDMS User's Manual (FAA 2010):

"EDMS models aircraft activity with 6 modes of operation corresponding to the following portions of a Landing-Takeoff (LTO) cycle. These modes of operation only apply to the aircraft main engines; APU emissions are calculated and presented separately.

1. Approach: The airborne segment of an aircraft's arrival extending from the start of the flight profile (or the mixing height, whichever is lower) to touchdown on the runway.

2. Taxi In: The landing ground roll segment (from touchdown to the runway exit) of an arriving aircraft, INCLUDING REVERSE THRUST [emphasis added], and the taxiing from the runway exit to a gate.

3. Startup: Aircraft main engine startup occurs at the gate. This methodology is only applied to aircraft with ICAO certified engines. All other aircraft will not have startup emissions. Aircraft main engine startup produces only THC, VOC, NMHC, and TOG emissions. A detailed speciated organic gases profile does not exist for main engine startup emissions.

4. Taxi Out: The taxiing from the gate to a runway end.

5. Takeoff: The portion from the start of the ground roll on the runway, through wheels off, and the airborne portion of the ascent up to cutback during which the aircraft operates at maximum thrust.

6. Climb Out: The portion from engine cutback to the end of the flight profile (or the mixing height, whichever is lower)."

Therefore, reverse thrust emissions have been included in the calculation of aircraft emissions for all alternatives.

SPAS-AL00007-14

Comment:

C. The DEIR Omits Critical Engine Assignments

The DEIR contains no information regarding the specific engine types used in the modeling of aircraft operations.3 As a result, it is impossible to evaluate whether the selection methodology and resulting emissions estimates are accurate. This omission is important because aircraft engines available and employed by different airlines for a given airframe can differ dramatically in their emissions profiles. Thus, the selection of specific engine types can have a significant bearing on the overall air quality impacts of any alternative that affects aircraft operations. As with the issue of reverse thrust emissions, aircraft engine selection was addressed in detail in Inglewood's comments on the 2003 Master Plan EIR. At minimum, the DEIR should provide a list of the engine assignments utilized in the air quality modeling so that the potential significance of the engine differentials can be determined. The omission of that data renders the DEIR air quality analysis deficient.

3 See also comments on noise analysis which suffers from the same omission.

Response:

The data were not omitted from the analysis; full information and data were presented. The engine types used in the air quality impact analysis are directly tied to the aircraft fleet mixes. The detailed

aircraft fleet mixes used in the air quality analysis are the same as those used in the noise analysis, and are presented in Table 3 (2009 Baseline fleet mix) and Table 8 (2025 fleet mix) in Appendix J1-1 of the SPAS Draft EIR. Each fleet mix is also summarized in Table 8 (2009) and Table 12 (2025) in Appendix F-1 of the Preliminary LAX SPAS Report. The EDMS model used to calculate aircraft emissions provides default engine selections for most of the aircraft types, and these defaults were used in the air quality impact analysis.

Please see Response to Comment SPAS-AL00007-11 regarding the availability of detailed input and output files from the FAA Emissions and Dispersion Modeling System (EDMS) runs completed for the SPAS alternatives.

Please refer to Response to Comment SPAS-AL00007-13 regarding reverse thrust emissions.

SPAS-AL00007-15

Comment:

D. The DEIR Lacks Any Evaluation of the Project's Greenhouse Gas Impacts

Greenhouse gas ("GHG") emissions from APU are not estimated in the DEIR, on the premise that "[a]lthough operations of APUs are expected to contribute to GHG emissions, EDMS does not estimate CO2 emissions or fuel consumption; therefore, APUs are not included in the emissions inventory," DEIR, p. 4-390. It is true that EDMS does not provide such capability, but that does not lead to the conclusion that GHG emissions cannot be estimated. While no formal model may be available, there are brake specific fuel consumption data available for APU engines. These data, combined with APU design and operational characteristics, and the carbon content of jet fuel, can be used to generate CO2 emissions estimates for APU engines. Methane and nitrous oxide emissions may be less certain, but "typical" emissions factors for similarly operating engines can be applied without inordinate error (as methane and nitrous oxide emissions constitute only a few percent of total GHG emissions for typical mobile sources). In reality, the use of zero as a "default" emission rate for GHGs (an assumption implicit in cases where non-zero emissions are not estimated) reflects an analytic error that is grossly more significant than the error that might be associated with an imprecise, but non-zero, GHG emission estimation methodology.

The failure to analyze GHG emissions is legally insupportable as well. In Communities for a Better Environment v. City of Richmond, 184 Cal.App.4 70 (2010), the court found the City of Richmond's initial failure to conduct any GHG analysis on a proposed refinery, as well as its ultimate failure, once analysis was conducted, to prescribe mitigation measures, rendered the EIR defective. Id. at 93.

Response:

The commentor is incorrect in stating that "The DEIR Lacks Any Evaluation of the Project's Greenhouse Gas Impacts." Section 4.6 and Appendix F of the SPAS Draft EIR provide over 100 pages of information and analysis related to greenhouse gas (GHG) emissions associated with the SPAS alternatives. As evidenced by, and summarized in, Tables 4.6-5 and 4.6-6 of the SPAS Draft EIR, the analysis includes GHG emissions estimates for the construction and operation of each of the nine SPAS alternatives. Potential sources of GHG emissions addressed in the analysis include construction equipment, aircraft engines, aircraft ground support equipment, motor vehicles in parking areas and on roadways, electricity consumption (i.e., GHG emissions associated with the generation of electricity), solid waste disposal, and indoor/outdoor water usage (i.e., GHG emissions associated with the energy required to pump water). As acknowledged by the commentor, the emissions dispersion modeling system (EDMS), which is the industry-accepted standard, estimating emissions associated with aircraft operations, does not have the capability of estimating GHG emissions from aircraft auxiliary power units (APUs), and, for that matter, nor do other industry-accepted emission estimates models commonly used for EIRs, such as the California Emissions Estimate Model (CalEEMod) developed by air districts (including the South Coast Air Quality Management District) and the California Air Resources Board. In the absence of industry- and air resources agency-recognized models and methods for estimating GHG emissions from APU operations, the SPAS Draft EIR did not include such estimates for the SPAS alternatives. An additional consideration for why the SPAS Draft EIR did not speculate on the GHG emissions associated with APU operations is that the emissions would be essentially the same for all of

the SPAS alternatives. This is because all of the SPAS alternatives would have the same aircraft fleet mix and the same number of aircraft gates where the APUs would operate (i.e., APUs are typically used for temporary power and cabin cooling while an aircraft is at a gate and the main engines are turned off and ground power/cooling are not connected to the aircraft).

Notwithstanding the above, the commentor describes one possible means of estimating GHG emissions from APU operation, which LAWA's air quality experts have carefully reviewed and offer the following comparable means of developing an estimate:

GHG emissions were estimated from operation of APUs when an aircraft is on the ground with its engines shutdown. APUs burn Jet A fuel and create exhaust emissions like the engines that power flight. The Federal Aviation Administration's (FAA's) EDMS does not estimate GHG emissions from APUs, nor does it estimate fuel usage from APUs. As a result, it was necessary to estimate GHG emissions separately from EDMS.

EDMS assigns APUs to specific airframes; therefore, it was possible to decipher the types of APUs used by aircraft at the airport. A 1995 report entitled Technical Data to Support FAA's Advisory Circular on Reducing Emissions from Commercial Aviation1 contains fuel flow data that was used to translate an APU's minutes of operation per landing/takeoff operation (LTO) into fuel consumption data. Professional judgment was used to assign APUs from the 1995 report when there was not an exact match with the type of APU assigned in EDMS. Although the 1995 report was never finalized by the FAA and would therefore only contain draft fuel flow values, these values were used because APU fuel consumption data is otherwise not readily available.

Total annual fuel consumption was ultimately calculated from each aircraft's annual LTOs, the surrogate APU's fuel flow (pounds per hour), and the APU operating time per LTO. A density of 6.74 pounds per gallon was assumed, which is the average density from the ASTM International Standard for Jet A (Specification D1655-04a).2 The density was used to convert the fuel flow data from pounds to gallons.

Emissions were estimated for carbon dioxide (CO2), methane (CH4), and nitrous oxide (N2O). Emission factors for Jet A were obtained from The Climate Registry's 2012 Climate Registry Default Emission Factors.3 Global warming potentials from The Climate Registry's General Reporting Protocol4 were used to convert mass emissions of each GHG to carbon dioxide equivalent (CO2e) emissions.

Emissions were estimated for both baseline (existing) conditions and for future alternatives. Because the annual LTOs do not change between future alternatives, it was only necessary to estimate emissions for one future alternative. The following table summarizes GHG emissions from the APUs.

Table 1

LAX Auxiliary Power Unit GHG Emissions Inventory

	Emissions (CO2e, metric tons)			
Year	CO_2	CH_4	N_2O	Total[1]
2009	43,922	26	433	44,380
2025	59,915	35	591	60,540

Notes:

CH_4 = methane
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
N_2O = nitrous oxide

[1] Totals may not add due to rounding.

Source: CDM Smith, 2012.

With the addition of the APU emissions of GHG to the overall inventory of GHG estimates for baseline conditions and each of the SPAS alternatives, which is presented in Table 4.6-6 of the SPAS Draft EIR, the significance conclusions of the GHG impacts analysis would not change. The resultant change in impacts with the addition of APU emissions, measured in terms of the percent reduction in GHG emissions compared to baseline conditions, would be less than one-half percent for all of the alternatives compared to the percentages presented in the SPAS Draft EIR. This would not result in a new significant impact or a substantial increase in the severity of an impact for GHGs.

The subject table, as revised to include the APU emissions, has been revised. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

SPAS-AL00007-16

Comment:

E. The DEIR Omits from its Evaluation of Construction Emissions the Realignment of Lincoln Boulevard

While the DEIR addresses construction impacts at some length, it appears to omit a significant component of those impacts, the reconstruction, including undergrounding, of portions of Lincoln Boulevard. Options 1, 5 and 6, which include relocation of Runway 6L/24R to the north, include, of necessity, the relocation of 6,080 feet of Lincoln Boulevard, and, to varying degrees, its depression into a tunnel.4

Nevertheless, and despite the substantial construction activity required to realign, and tunnel to accommodate, a major thoroughfare, the DEIR entirely omits to study, or report on, the construction related impacts of the reconstruction of more than a mile of proximate roadway. See, e.g., DEIR, p. 4-88.5 The remainder of the DEIR's discussion of construction emissions suffers from the same deficiencies. See also, DEIR, pp. 4-112 and 4-118 re: emissions for Alternative 5, which alternative involves in the most radical realignment of Lincoln Boulevard.

4 "Alternative" 1 requires 250 linear feet of tunnel; "Alternative" 5, 765 feet; and "Alternative" 6, 540 feet.
5 "Construction activities were assumed to be located on the north airfield and at the north terminals, in the Central Terminal Area (CTA), at Manchester Square, in the current Parking Lot C, at the proposed Intermodal Transportation Facility (ITF) site just south of Lot C, on the east side of Aviation Boulevard south of Century Boulevard, on the Automated People Mover (APM) routes along Century Boulevard and 98th Street, and on the west side where batch plant operations permitted by the SCAQMD and USEPA and project support activities could occur."

Response:

The construction emissions associated with the realignment of Lincoln Boulevard were included in the construction emissions estimates for Alternatives 1, 5, and 6 in Section 4.2.6.1 of the SPAS Draft EIR. As noted in Section 4.2.2.1, detailed construction schedules and phasing programs were not available

at the time SPAS Draft EIR was developed due to the conceptual nature of the alternatives. Therefore, the emissions were estimated, first, by updating the detailed construction emissions for Alternative 3 from the detailed air quality impacts analysis conducted for Alternative D in the LAX Master Plan Final EIR, taking into account the type of construction activity evaluated (i.e., airfield improvements, demolition, terminal construction, road work, etc.). The current costs for various construction activities to complete Alternative 3 were then estimated. Finally, the ratio of costs to complete the given alternative to the cost for Alternative 3 was used as the factor that was multiplied by the Alternative 3 emissions to estimate the construction emissions for the given alternative.

The total construction rough order of magnitude (ROM) cost estimates for the alternatives are summarized in the Preliminary LAX SPAS Report, Section 8, Table 8-1. The Lincoln Boulevard realignment costs are included under the "Airfield Improvements" line item for Alternatives 1, 5, and 6, since it will be those airfield improvements that require the roadway realignment. Detailed costs for the Lincoln Boulevard realignment under Alternatives 1, 5 and 6 are presented in the Preliminary LAX SPAS Report, Appendix G, Table AF-3. The construction emissions for airfield improvements are summarized in Section 4.2.6.1, Table 4.2-10, of the SPAS Draft EIR. The various construction activity emissions are broken out for each alternative in Appendix C, Attachment 1, Table 1 of the SPAS Draft EIR. To conclude, the Lincoln Boulevard realignment construction emissions were included in the air quality construction emission inventories for Alternatives 1, 5, and 6. Lincoln Boulevard would not require realignment under the other SPAS alternatives. As noted in the comment, Alternative 5 would require a greater amount of construction activity than Alternatives 1 and 6, as it would have comparatively a longer depressed ("tunnel") segment, even though the physical alignment of the re-routed roadway would be the same for all three subject alternatives. Based on the comparatively greater amount of construction cost (i.e., construction activity) for Alternative 5, its construction emissions for "Airfield/Terminal Construction" in Table 4.2-10 are the highest of any alternative.

SPAS-AL00007-17

Comment:

F. The DEIR Lacks Any Data or Analysis of Sulfur Dioxide Emissions

Finally, emissions of sulfur dioxide ("SO2") do not appear to have been estimated for GSE, motor vehicles, or stationary sources, based on the omission of any SO2 data from the "detailed" operational emissions tables included in DEIR Appendix C (see, e.g., Table 21, Operational Concentrations). SO2 emissions are exclusively a function of the sulfur content of fuel, which is relatively easily assessed, leaving no stated reason for their omission, but a gaping hole in the analysis.

Response:

Sulfur dioxide (SO2) emissions from aircraft and auxiliary power units (APUs) are summarized in Section 4.2.6.2 of the SPAS Draft EIR for all alternatives. These are the only two airport-related source types with SO2 emissions above 1 pound per day. Emissions of SO2 from all other airport sources are negligible since the fuel sulfur contents of mobile vehicle fuels (diesel and gasoline) are extremely low due to regulations that control the sulfur content of on-road and off-road fuels. The major fuel used in continuously operated stationary sources at the airport is natural gas, which also has very low fuel sulfur contents. Diesel fuel sulfur content has been limited to a maximum of 15 parts per million by weight (ppmw) since 2006. Prior to the requirement for this ultra-low sulfur diesel fuel, diesel fuel had a limit of 500 ppmw, and SO2 emissions from diesel trucks and equipment represented a substantial contributor to the region's SO2 emission inventory. Aside from aircraft, the only other sources in the South Coast Air Basin today with substantial SO2 emissions are ocean going vessels.

Note that the aircraft and APU daily emissions for all alternatives do exceed the operational significance threshold for SO2 set by the South Coast Air Quality Management District, as shown in Table 4.2-13 in Section 4.2.6.2 of the SPAS Draft EIR. Therefore, SO2 operational emission impacts were listed as significant and unavoidable in Table 1-7 of the SPAS Draft EIR.

SPAS-AL00007-18

Comment:

In summary, budget constraints are not a sufficient excuse for depriving the public of the requisite air quality analysis and complete disclosure under CEQA. Moreover, this project will eventually require FAA funding. In order to obtain it, the project must comply with the conformity requirements of 42 U.S.C. § 7506(c), and its implementing regulation, 40 C.F.R. 93.150, et seq. Compliance will require that the project not exceed the emissions thresholds set forth in that section. It is Cities/County' s position that LAWA will be unable to establish the requisite conformity absent the filling of the data void specified here. And any reliance on a previous finding of conformity, based on the 2003 Master Plan EIR and associated conformity analysis, is seriously misplaced. That analysis never established conformity methodologically, but relied on an "exemption" provided by Southern California Air Quality Management District ("SCAQMD"), which was not delegated the duty of granting such an "exemption" under the then existing statutory regime. Thus, Cities/County strongly recommend the DEIR be revised to provide a thorough disclosure of the various options' air quality impacts, in order to satisfy both Federal and State unequivocal mandates.

Response:

Please see Response to Comment SPAS-AL00007-8 for an explanation of the detailed airfield simulation modeling (i.e., SIMMOD) that was conducted for SPAS Alternatives 1 through 4 (as presented in Appendix F-2 of the Preliminary LAX SPAS Report) and why this modeling provided adequate information to make reasonable assumptions for Alternative 5, 6, and 7. Please refer to Responses to Comments SPAS-AL00007-9 through SPAS-AL00007-17 regarding data used in the air quality impact analysis, and its availability. The SPAS Draft EIR provides reasonable and appropriate information for, and analysis of, all nine alternatives, as presented in sufficient detail in Section 4.2 and Appendix C, to allow the lead agency to assess the differences between the alternatives and to determine the significant impacts associated with each alternative relative to air quality.

Regarding the comment on the conformity requirements of 42 U.S.C. Section 7506(c), approval of any of the SPAS alternatives would require further review by FAA, which would entail compliance with all applicable federal laws, including the National Environmental Policy Act and the conformity requirements under the federal Clean Air Act. The analysis of air quality in the SPAS Draft EIR complies with CEQA analysis and does not preclude a future conformity finding by the FAA.

SPAS-AL00007-19

Comment:

V. THE DEIR FAILS TO ADEQUATELY DISCLOSE THE PROJECT'S NOISE IMPACTS

The DEIR is dramatically deficient in its purported analysis of the noise impacts of the various alternatives. Notably, none of the noise contours depicted in the DEIR include the 1992 contour employed by LAWA for sound insulation purposes in Inglewood, see DEIR, p. 4-665.

Response:

Section 4.10 of the SPAS Draft EIR discusses in great details the SPAS Draft EIR noise analyses, including aircraft noise (Section 4.10.1), road traffic noise (Section 4.10.2), construction traffic and equipment noise (Section 4.10.3) and transit noise and vibration (Section 4.10.4).

Specifically, Section 4.10.1 of the SPAS Draft EIR presents the methodology, assumptions, and results of the SPAS Draft EIR aircraft noise analyses. Contrary to the commentor's suggestion, the aircraft noise impacts were fully analyzed. See Section 4.10.1.6, beginning on page 4-828, for a detailed analysis of aircraft noise impacts under each alternative.

As discussed on page 4-828, the aircraft noise impact analysis evaluated the aircraft noise levels associated with the completion of each SPAS alternative by 2025 to the aircraft noise levels associated

with the 2009 baseline conditions. The analysis of each alternative, starting with Alternative 1 in Section 4.10.1.6.1 on page 4-829, included the following: a narrative of the noise exposure patterns associated with the alternative; a comparison of the alternative aircraft noise contours with the 2009 baseline noise contours; results in terms of areas, total dwelling units, estimated population and non-residential noise-sensitive facilities; a list of significant noise impacts of the alternative compared with the baseline 2009 conditions and the 2025 "No Additional Improvements" conditions. In addition, an analysis of single event aircraft noise exposure including the analysis of nighttime awakenings and classroom disruption was undertaken for each alternative.

The comment also states that "Notably, none of the noise contours depicted in the DEIR include the 1992 contour employed by LAWA for sound insulation purposes in Inglewood…" The commentor does not explain why this information is relevant to the CEQA analysis. Section 4.9.3.3 on page 4-665 of the SPAS Draft EIR notes that all incompatible land uses within the 1992 fourth quarter 65 CNEL noise contour or within 65 CNEL areas extending beyond the 1992 contour based on the most recent quarterly report, are eligible for participation in the ANMP." As discussed in Section 4.9.3.3 on page 4-664 of the SPAS Draft EIR, LAWA will continue to implement its ANMP, with the assistance of the affected jurisdictions, and shall update the entire ANMP from time to time to ensure it reasonably represents the mitigation and funding programs that are in place, being implemented, or proposed for future implementation. The commentors have been provided with the 1992 contour on prior occasions. For example, the 1992 65 CNEL contour was provided in the LAX Master Plan EIS/EIR which the commentors previously reviewed and commented upon. The information is available in Section 4.2 of that document, See Figure F4.2-31, available online at: http://www.ourlax.org/docs/final_eir/part1/08_0402_LandUse.pdf.

SPAS-AL00007-20

Comment:

Perhaps most notably, the noise analysis does not appear to have been based on the Integrated Noise Model ("INM"), the model required for use by FAA. FAR Part 150, Appendix A, § A150.103(a); FAA Order 1050.1E, § 14.2b. Instead, the flight tracks depicted in the EIR and used in the noise analysis appear to be radar tracks, wholly independent of the INM protocol.

Response:

Contrary to the assertions in the comment, the SPAS Draft EIR noise analysis was based upon the Federal Aviation Administration's Integrated Noise Model (INM) version 7b, as discussed on page 4-797 of the SPAS Draft EIR. The INM input include runway coordinates, flight tracks, fleet mix, activity levels, runway and flight track use, average local temperatures, time of day, and departure trip length data.

Flight tracks are defined to represent the typical corridors used by aircraft approaching and departing the runways at an airport. The term "flight corridor" is used to represent a generalized route defined by a group of aircraft flight tracks that share similar direction. When using the INM, these flight tracks are specified to represent the actual flight patterns associated with an airport. INM generalized flight tracks are designed to represent the center of a specific flight corridor (the backbone), and dispersed tracks (sub-tracks or side-tracks) linked to the center track, accounting for the dispersion of aircraft approach and departure paths around the center track. While the comment suggests that the Draft EIR "lacks critical fundamental data concerning types of aircraft…," this information was included in the SPAS Draft EIR. The location and the utilization of the aircraft flight tracks modeled in the INM model were created based on the actual radar tracks for the arriving and departing aircraft at LAX. The INM flight track location and utilization by aircraft category is described in Section 3.1.1.2 in Appendix J1-1 of the Draft EIR.

SPAS-AL00007-21

Comment:

Moreover, the noise analysis lacks critical fundamental data concerning types of aircraft, numbers of each type of aircraft projected, the number of operations anticipated for each aircraft type, and the source of the data in the DEIR database. Instead, the DEIR substitutes percentages without revealing

the source or calculation of those percentages. Given the differential noise signatures of the various aircraft, the absence of such critical raw data alone renders the noise analysis entirely inadequate.

Response:

Please see Response to Comment SPAS-AL00007-20 regarding the data and methodology used for the aircraft noise analyses.

SPAS-AL00007-22

Comment:

Finally, the DEIR fails to explain why "Alternative" 5, with the greatest runway displacement of 350 feet, results in the least population exposed to the 65 CNEL contour, and the third least exposed to an increase of 1.5 decibels within the 65 CNEL contour, DEIR, p. 4-738, § 4.9.6.5, despite the fact that the "Alternative" 5 noise contour contains the second highest population newly exposed to the 75 decibel noise contour, DEIR, p. 1-83. Similarly, the DEIR concludes, without explanation, that "Alternative" 2, which does not contemplate any runway displacement, implicates more impacted land use than any other alternative, DEIR, p. 4-706, § 4.9.6.2.

Response:

A comparison of noise exposure effects under Alternatives 1 through 7 is presented in Table 1-16 of the SPAS Draft EIR. As shown on this table, Alternative 5 would result in the least population newly exposed to the 65 CNEL noise contour and the third least population exposed to an increase of 1.5 CNEL or higher within the 65 CNEL or higher noise contours. As also depicted on this table, Alternative 5 contains the second highest residential units and acres newly exposed to the 75 CNEL. This table does not indicate that Alternative 2 would result in the greatest impact compared to the other SPAS alternatives.

While it is true that the relocation of Runway 6L/24R northward under Alternative 5 would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. As summarized on the top of EIR page 1-84 of the SPAS Draft EIR "[t]he density of the population is not constant across the area exposed to noise above 65 CNEL or higher, consequently while the area of exposure may be similar among alternatives, the numbers of persons, dwellings or non-residential noise-sensitive facilities varies among the alternatives." Similar discussion was also provided in Section 4.10.1.6.8 of the SPAS Draft EIR.

As indicated in Sections 4.9 and 4.10.1, and summarized in Tables 1-16 and 1-17 of the SPAS Draft EIR, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward under Alternative 5 than would occur by not moving either runway under Alternative 2, resulting in the total residential population newly exposed to 65 CNEL being lowest under Alternative 5 than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to noise levels greater than 65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that do not move the runways (such as Alternative 2). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower under Alternative 5--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas north of the airport. That is, although more homes to the north of the airport would be impacted by noise with a northward move of Runway 6L/24R under Alternative 5, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in an overall decrease in the numbers of homes and people exposed to aircraft noise impacts. Regarding the 75 CNEL noise contour, under Alternative 5 the 75 CNEL contour from the south airfield would extend slightly east and north compared to Alternative 2 due to differences in aircraft operations, runway use patterns, and other assumptions under these alternatives.

SPAS-AL00007-23

Comment:

These apparent, but unexplained inconsistencies, are merely systematic of a larger issue within the DEIR. While the DEIR cavalierly reaches numerous conclusions, not merely about noise, but also about air quality and other impacts, those conclusions are never fully explained either in the body of the DEIR or in its associated appendices. Thus, while the DEIR's noise analysis is notable for its lack of underlying data and coherent analysis, its failure to explain its conclusions in such a way as to allow the public to adequately evaluate them is endemic to the entire DEIR.

Response:

Please see Responses to Comments SPAS-AL00007-19 through SPAS-AL00007-22 regarding the commentor's concerns about noise impacts. The SPAS Draft EIR thoroughly analyzes all relevant environmental impacts of the SPAS alternatives, using data, evidence, and reasoning to support conclusions. Detailed modeling was conducted in order to determine environmental effects, including preparation of an activity forecast and design day flight schedule, airfield simulation modeling, and modeling of impacts related to noise, air quality, greenhouse gas emissions, human health risk, on-airport transportation, off-airport transportation, and hydrology and water quality. For some disciplines, including biological resources and cultural resources, fieldwork was conducted to identify resources that may be affected by the SPAS alternatives. The findings of the analysis are documented in the SPAS Draft EIR, which is approximately 1,800 pages in length. Printed and electronic appendices total approximately 6,000 pages, and provide underlying data generated in support of the impact analyses.

The comment does not identify any specific impact conclusions in the SPAS Draft EIR that allegedly are unsupported by explanations. Therefore, it is not possible or necessary to respond to this comment in greater detail. (See State CEQA Guidelines Sections 15088 and 15204.)

SPAS-AL00007-24

Comment:

VI. THE DEIR'S LAND USE AND PLANNING ANALYSIS SIGNIFICANTLY MISSTATES THE IMPACTS OF, AND MITIGATION POTENTIAL FOR, THE PROJECT

The DEIR relies on its land use and planning analysis as the bulk of its mitigation for the yet to be fully analyzed noise impacts of the various project options. That reliance is misplaced, not only from a substantive perspective, because the noise impacts still remain to be accurately analyzed, but also from a procedural perspective, as implementation of the FAA purchase and sound insulation programs upon which LAWA relies for mitigation, are years, even decades in the future, and, under recently published FAA policies, may never be applicable at all for a substantial portion of the impacted population.

Response:

See Response to Comment SPAS-AL00007-19 regarding a discussion of the extensive analysis of aircraft noise impacts contained in the SPAS Draft EIR. The comment also suggests that "sound insulation programs upon which LAWA relies for mitigation, are years, even decades in the future…" (See also Section 4.9.8 of the SPAS Draft EIR.) As acknowledged in Section 4.10.1.8 of the SPAS Draft EIR, because these programs will take time to implement "…significant noise impacts would be experience in the area after implementation of the selected SPAS alternative but before the mitigation measures are fully implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time."

SPAS-AL00007-25

Comment:

The DEIR's land use impacts analysis, § 4.9.6, p. 4-689, is procedurally flawed in several ways. First, it benchmarks the consistency of its alternatives to the existing LAX Specific Plan, recognizing at the same time that it is the fundamental purpose of the DEIR to document the amendment of the existing Specific Plan. Thus, the DEIR creates a moving target as a benchmark for analysis.

Response:

With the exception of Alternative 3, the SPAS alternatives, if adopted, would require an amendment to the existing LAX Specific Plan. The nature of these amendments is outlined in Section 6.1 of the SPAS Draft EIR. However, unless and until the LAX Specific Plan is amended as a result of the SPAS process, the existing LAX Specific Plan, as previously amended by Ordinance No. 179,148, is the applicable, adopted plan. Analysis in the SPAS Draft EIR appropriately evaluates plan consistency with existing, adopted plans. This approach is consistent with the State CEQA Guidelines (See e.g., State CEQA Guidelines Appendix G, IX.b.). The point raised by the commentor (i.e., that the purpose of SPAS is to consider future amendments to the LAX Specific Plan) is acknowledged on page 4-689 of the SPAS Draft EIR, which states "As part of this analysis, the discussion below evaluates the consistency of each alternative with the existing LAX Specific Plan, as amended, recognizing that as part of SPAS, the LAX Specific Plan may be amended depending on the alternative selected for implementation." The subsequent analysis of each SPAS alternative identifies the types of amendments to the LAX Specific Plan that would be required were the alternative adopted. The SPAS Draft EIR does not create a moving target as a benchmark for analysis, as stated by the commentor. Rather, as stated above and in the SPAS Draft EIR, each alternative is evaluated against the applicable, adopted plan, (i.e., the existing LAX Specific Plan).

SPAS-AL00007-26

Comment:

Second, with respect to the potential acquisition of property as mitigation for noise impacts, the DEIR indefinitely and impermissibly defers evaluation of the need for acquisition associated with changes in Runway 6L/24R's Runway Protection Zone ("RPZ"), brought about by the runway's movement north, despite the identification in § 4.7.2 of land uses in the RPZs for all options, thus leaving potential mitigation requirements unsatisfied. Communities for a Better Environment, supra, 184 Cal.App.4th at 92, citing CEQA Guidelines § 15126.4(a)(1)(b) ["Formulation of mitigation measures should not be deferred until some future time."].

In doing so, the DEIR may be incorrectly relying on the claim that, in gaining compliance with the "clear zone" requirements for the RPZ, and included Runway Safety Area ("RSA"), FAA has the option of redirecting or removing an object. Page 4-512, § 4.7.2.6.1. FAA has no such option, because only the local land use jurisdiction possesses such power.

Response:

Section 2.3.1.11 of the SPAS Draft EIR identifies and describes the parcels that are proposed for acquisition under each alternative, as necessary to accommodate SPAS-related improvements such as those associated with the ground transportation system improvements. The impacts associated with the proposed property acquisitions are addressed in Section 4.9, along with a discussion of measures to reduce the impacts, such as LAX Master Plan Commitment RBR-1, Residential and Business Relocation Program. No acquisition of property located within RPZ areas is proposed as part of the SPAS project nor is it certain that acquisition of such property would be required in the future.

Section 4.7.2 of the Draft EIR addresses changes in the runway RPZs for each of the seven airfield improvement alternatives (SPAS Alternatives 1 through 7), delineates the types of existing uses that would fall within the RPZ areas, and discloses the possibility that incompatible structures or uses within RPZ areas may need to be modified or removed. As indicated in the subject section, such action is a

possibility and not a certainty, as the nature and extent to which existing structures and uses pose a substantial safety risk, and, if so, what appropriate measures should be implemented, would be assessed in consultation with the FAA as part of detailed project planning and processing of an Airport Layout Plan (ALP) amendment for the selected alternative, if any. It should be noted that much of the area that would be located in the RPZ for each alternative is already within the existing RPZ for the existing north runway complex, which has been in place for several decades (i.e., the presence of incompatible structures and uses within the north airfield RPZ is not new or unique to the SPAS alternatives, nor has their presence been determined by the FAA or others to be such a hazard as to require removal). This can be seen in comparing Figure 4.7.2-4 of the SPAS Draft EIR, which identifies the parcels currently within the RPZ areas for baseline (2010) conditions, with the RPZ parcel maps for the various SPAS alternatives (i.e., Alternatives 1 through 7 as presented in Figures 4.7.2-7, 4.7.2-9, 4.7.2-11, 4.7.2-13, 4.7.2-15, 4.7.2-17, and 4.7.2-19).

Section 4.7.2 of the SPAS Draft EIR, specifically pages 4-522 through 4-526, addresses changes in the potential secondary or indirect impacts associated with the modification or removal of structures or uses within the RPZ, if required in the future. The subject analysis includes discussion of potential measures to reduce impacts. Given that neither the need for, or nature of, actions to modify or remove existing structures or uses have been determined and will not be known until sometime in the future, it would be premature and speculative to reach a final significance conclusion at this time. That is also the case relative to delineating specific mitigation measures for impacts that are unknown at this time. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144-15145.) Additionally, it is unknown whether actions to modify or remove existing structures or uses, if needed, would require property acquisition. In the event acquisition is required, implementation of LAX Master Plan Commitment RBR-1 would serve to reduce impacts. If and when removal, modification or acquisition actions were required, the discretionary approvals associated with such actions would be subject to environmental review under CEQA, at which time feasible mitigation measures to reduce potential impacts to a less than significant level would be required.

Regarding the latter part of the comment, the commentor does not accurately reflect the text of the LAX Draft EIR in suggesting that Section 4.7.2.6.1 states or implies "FAA has the option of redirecting or removing an object." The relevant text in the last paragraph on page 4-512 reads as follows: "…options for addressing potential safety hazards associated with objects located within controlled airspace areas can range widely and can include (1) doing nothing (i.e., for low-risk objects); (2) placing high-visibility markings and lighting on the object to make it highly visible to pilots and indicating such objects on avigation maps; (3) lowering, reducing, or removing the object, and; (4) modifying an approach or departure procedure to allow aircraft to safely navigate around or above an object that penetrates a Part 77 surface. The most appropriate option(s) would be determined in conjunction with detailed airfield improvement engineering and would be subject to FAA review and concurrence prior to FAA approval of an ALP amendment for such an airfield modification." As described above, LAWA would consult and coordinate with the FAA in determining what, if any, measures related to the RPZ should be pursued, but that does not give the FAA local land use authority.

SPAS-AL00007-27

Comment:

Moreover, the DEIR disclaims the need for any acquisition under options 5 through 7, purportedly because only airfield projects are at issue in those options, not the "integrated" options 1 through 4, thus disavowing the need for mitigation. The basis for this disclaimer is not discernible, in that the DEIR makes clear that it is the movements of the runways under options 5 and 6, as well as 1 and 3, that create the need for acquisition of property in the RPZ in the first instance, not the surface traffic options that are "integrated" into options 1 through 4.

Response:

Section 2.3.1.11 of the SPAS Draft EIR identifies and describes the parcels that are proposed for acquisition due to SPAS-related improvements. As can be seen in Figures 2-11 through 2-14, most of

the parcels proposed for acquisition are located to the east and northeast of the CTA, where ground access improvements would occur. While Alternatives 5 through 7 focus on airfield and terminal improvements and do not, in themselves, propose any ground transportation system improvements, selection of any one of those alternatives would be paired with the ground transportation system improvements proposed under either Alternative 1, Alternative 2, Alternative 8, or Alternative 9, and acquisition would occur accordingly. As described above in Response to Comment SPAS-AL00007-26, it is unknown whether acquisition would be necessary for addressing the presence of incompatible structures or uses within RPZ areas under any alternative. While CEQA requires a lead agency to use its best efforts to find out and disclose all that it reasonably can, if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, it should note its conclusion and terminate discussion of the impact. (State CEQA Guidelines Sections 15144-15145.)

SPAS-AL00007-28

Comment:

From a substantive perspective, the DEIR omits relevant factors in the calculation of land use impacts resulting from the project. First, it entirely omits from its land use impacts analysis the Westchester Business District, part of which may be affected by the RPZ for one or more of the alternatives, without accompanying explanation.

Response:

Regarding analysis of property acquisition impacts on the Westchester Business District associated with the RPZ, please see Responses to Comments SPAS-AL00007-26 and SPAS-PC00130-931. As shown in Figure 2-11 in Section 2.3.1.11 of the SPAS Draft EIR, no acquisition is proposed within the Westchester Business District. As explained on page 4-690 in Section 4.9.6.1 of the SPAS Draft EIR, "The need, if any, for acquisition associated with changes in the Runway 6L/24R RPZ would be determined by FAA in later stages of planning and therefore, is not addressed in this EIR. However, Section 4.7.2, Safety, identifies land uses within the RPZ under each alternative."

Furthermore, as described in Response to Comment SPAS-AL00007-26, it is unknown whether acquisition of areas within the RPZ, including portions of the Westchester Business District, would be necessary for addressing the presence of incompatible structures or uses under any alternative. Such information would be developed during project-specific CEQA review should an alternative calling for shifting Runway 6L/24R northward be selected. It is appropriate for a first-tier program level EIR to defer detailed descriptions and impact analysis of individual projects in the program to future project-level CEQA documents. (State CEQA Guidelines Section 15383; Koster v. County of San Joaquin (1996) 47 Cal.App.4th 29, 37.)

SPAS-AL00007-29

Comment:

Second, it deceptively portrays the City of Los Angeles as the jurisdiction with the greatest existing impacted total land area, DEIR, p. 4-668, see also Table 4.9-4, by including the land mass of the airport in the calculation. If the calculation were not arbitrarily skewed by including the land area of the airport, the origin of the impact, in the determination of the impact's scope, it is the City of Inglewood that would have, by far, the greatest land area impacted.6 The analysis, as well as the planning, should be predicated on that assumption alone.

6 Table 4.9-2 seems to indicate that Inglewood has the greatest existing land area of noise impacted uses, in direct contradiction to the statement that "[t]he jurisdiction with the greatest total area (on- and off-airport) within the 65 CNEL, or higher noise contour is the City of Los Angeles ...," DEIR, p. 4-668.

Response:

Table 4.9-2, on page 4-668, and Table 4.9-4, on page 4-673 in Section 4.9.3.4 of the SPAS Draft EIR present two different land use summaries, neither of which includes on-airport property. Table 4.9-2

discusses areas within the "65 CNEL and higher" contour, whereas Table 4.9-4 discusses the aircraft noise "Study Area."

Table 4.9-4 is a summary of all land uses, including residential, noise-sensitive, industrial, commercial, government, and other uses within the land use study area (shown in Figure 4.9-6) and, contrary to the comment, it does not include on-airport property and does not present impacted land area. As presented in Table 4.9-4 and shown in Figure 4.9-6 of the SPAS Draft EIR, the 5,265.77 acres within the City of Los Angeles does not include airport property and the largest portion of the land use study area is located in the City of Los Angeles.

Table 4.9-2 of the SPAS Draft EIR is a summary of existing impacted land uses within the 65 CNEL or higher noise contours under 2009 baseline conditions and is graphically represented in Figure 4.10.1-12 of the SPAS Draft EIR. As shown in Table 4.9-2, the greatest number of acres within the 65 CNEL and higher noise contours (985.81 acres) is in the City of Inglewood. As discussed in the accompanying text on page 4-668 this does not include on-airport property ["As indicated in Table 4.9-2, approximately 2,674 acres (off-airport) are within the 65 CNEL or higher noise contours"].

SPAS-AL00007-30

Comment:

Finally, the DEIR asserts that the impacts of noise can be mitigated to insignificance by sound insulation, as set forth in MM-LU-1. The DEIR ignores the fact that a sound insulation program encompassing the vast area already exposed to LAX's noise impacts, as well as new areas in surrounding communities, will take decades to implement, if it is funded by FAA at all. And the totality of that funding is now in question. FAA recently published Program Guidance Letter 12-09, "AIP Eligibility and Justification Requirements for Noise Insulation Projects," August 17, 2012 ("PGL") which will limit the access of populations newly brought into the 65 CNEL contour, or affected by an increase of 1.5 dB or more, to sound insulation of all but a small percentage of homes with an average, across all habitable rooms, of less than 45 dB interior noise levels (see, September 17, 2012 letter to FAA regarding "Program Guidance Letter - 12-09 - AIP Eligibility and Justification Requirements for Noise Insulation Projects," attached to this letter as Exhibit 4). This means, among other things, that those who are newly impacted by the project, but also who, in good faith, installed sound insulation with their own funds in some rooms; or who could afford to sound insulate bedrooms but not public spaces; or whose dwellings were below the 45 dB interior noise standard under the former operational configuration but will be changed under the new regimen, may be left without mitigation, at least for the foreseeable future, a salient fact that is not acknowledged, let alone discussed or analyzed in the DEIR.

Response:

The comment states that the "DEIR asserts that the impacts of noise can be mitigated to insignificant by sound insulation, as set forth in MM-LU-1. The DEIR ignores the fact that a sound insulation program encompassing the vast area already exposed to LAX's noise impacts, as well as new areas in surrounding communities, will take decades to implement, if it is funded by the FAA at all.". Contrary to the suggestion in the comment, the SPAS Draft EIR provides more than just MM-LU-1 to mitigate impacts. The SPAS Draft EIR also recognizes that there may be interim aircraft noise impacts prior to implementation of noise insulation programs.

Additional land use measures are proposed under the SPAS alternatives as discussed on page 4-777 in Section 4.9.7 of the SPAS Draft EIR. In addition, mitigation measures related to aircraft noise abatement techniques are proposed as discussed on pages 4-928 through 4-932 in Section 4.10.1.7 of the SPAS Draft EIR. Nevertheless, the SPAS Draft EIR acknowledges that some aircraft noise impacts would be significant and unavoidable. Specifically, as presented on page 4-933 in Section 4.10.1.8 of the SPAS Draft EIR, "Because the land use mitigation measures would take several years to fully implement, it is possible that significant noise impacts would be experienced in the area after implementation of the selected SPAS alternative but before the mitigation measures are fully implemented. Thus, significant and unavoidable interim noise impacts would be experienced over an indeterminate period of time." As stated on page 4-778 in Section 4.9.8 of the SPAS Draft EIR, "[C]ertain residential uses and non-residential noise-sensitive facilities affected by aircraft noise would

still be exposed to high noise levels due to interim impacts prior to completion of noise insulation or land recycling."

The comment also states "The FAA recently published Program Guidance Letter 12-09, 'AIP Eligibility and Justification Requirements for Noise Insulation Project,' August 17,2012 ('PGL') which will limit access of population newly brought into the 65 CNEL contour, or affected by an increase of 1.5 dB or more…This mean among other things, that those who are newly impacted by the project…may be left without mitigation a salient fact that is not acknowledged, let alone discussed or analyzed in the DEIR." As the commentor is aware, the SPAS Draft EIR was released in July 2012. The referenced FAA Guidance was released subsequent to this date on August 17, 2012.1. The FAA Guidance Letter 12-09 does not change the SPAS Draft EIR's significance conclusions.

The referenced letter states "the reason for this PGL is to reconfirm the two-step requirement for eligibility for residential and other noise insulation projects. The AIP Handbook interprets 14 CFR Part 150 to require that structures be located in the existing or forecast early day-night average (DNL) 65 decibel (db) noise contour (or, under limited circumstances, a lower dB noise contour formally approved by a local government to determine compatibility of residences, and that noise insulation project be designed to achieve interior noise levels of 45 dB to qualify for federal funding…FAA has become aware that there may be confusion and ambiguity in our guidance about the second step, that interior noise levels must be 45 dB or greater for a residence or other eligible structure, such as a school, to be eligible for AIP funding for noise insulation."

The performance standards for the ANMP and the LAX Master Plan Mitigation Measure MM-LU-1 is "the relevant performance standard to achieve compatibility for land uses that are incompatible due to aircraft noise…is adequate acoustic performance to ensure an interior noise level of 45 CNEL or less." (See Section 4.9.5 of the SPAS Draft EIR.) This is also the recognized goal for residential noise levels in the California Building Code. (See Title 24, California Code of Regulations (California Building Code or "CBC"), Part 2, Volume 1, Section 1207.11.2.) To ensure that interior noise levels have been reduced to 45 CNEL or less after soundproofing (in conformance with Title 21), post-construction noise tests are conducted to verify the efficacy of sound insulation. To date, all post-testing has confirmed that interior noise levels meet this requirement.

As described on page 4-933 in Section 4.10.1.8 of the SPAS Draft EIR, once implemented, "the LAX Master Plan noise and land use mitigation measures are intended to fully mitigate the significant noise impacts that would be caused by the SPAS alternatives." As also described on page 4-686 in Section 4.9.5 of the SPAS Draft EIR, the performance standard for this noise insulation measure is 45 CNEL; therefore, any homes that have achieved this interior noise level are considered less than significant under CEQA, contrary to the suggestion in the comment.

Furthermore, as acknowledged in the Stipulated Settlement, Section I.G, "Notwithstanding any provision of this Settlement, LAWA shall not be required to take any actions or to expend any funds (i) that are prohibited or disapproved by an FAA determination or any other regulatory agency…" (See also Stipulated Settlement, Sections III and VI.)

1. FAA Program Guidance Letter 12-09, Eligibility and Justification Requirements for Noise Insulation Projects, Available: http://www.faa.gov/airports/aip/guidance_letters/media/pgl_12_09_NoiseInsulation .pdf, accessed January 10, 2013.

SPAS-AL00007-31

Comment:

In summary, even though noise mitigation is alleged to be feasible, the DEIR is inadequate, both because necessary mitigation measures are entirely omitted with respect to the impacts of property acquisition; and because, in the alternative, even where mitigation measures are provided (although vague), "mandatory performance standards to ensure that the measures, as implemented, will be effective," Communities for a Better Environment, supra, 184 Cal.App.4th at 94, are similarly absent.

Response:

As discussed on page 4-667 of the SPAS Draft EIR, the residential acquisition program includes measures to hydroseed and landscape after demolition of any structures in the program. The commenter also suggests that unspecified mitigation measures are "vague." The ANMP program (Mitigation Measure MM-LU-1), discussed on pages 4-686 and 4-687 of the SPAS Draft EIR clearly identifies a performance standard for the measure, (i.e., "to ensure an interior noise level of 45 CNEL or less"). Please see Responses to Comments SPAS-AL00007-24 through SPAS-AL00007-30 for more detailed discussion of property acquisition and mitigation measures.

SPAS-AL00007-32

Comment:

VII. The DEIR Does Not Adequately Analyze or Mitigate the Project's Admittedly Significant Surface Traffic Impacts

In spite of the DEIR's acknowledgment of the significance of the project's direct and indirect impacts on various intersections within the study area, it relegates those impacts to the category of "significant but unavoidable." It is Cities/County' s position, however, that not only are those impacts, in fact, more extensive than reported in the DEIR, but also avoidable through the application of reasonable mitigation measures not offered in the DEIR.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-33 through SPAS-AL00007-35 below.

SPAS-AL00007-33

Comment:

A. The DEIR Does Not Fully Delineate or Mitigate the Surface Traffic Impacts of the Project on Culver City

First, the criteria used in the DEIR for calculating the project's intersection impacts on Culver City is inaccurate. More than five years ago, Culver City requested that LAWA and City of Los Angeles Department of Transportation ("LADOT") use "thresholds of significant transportation impact identified in LADOT's traffic impact analysis guidelines to analyze the impact on intersections and streets in Culver City." (See, letter of October 31, 2006 from Charles Herbertson, Culver City Director of Public Works and City Engineer to Jim Richie, LAWA, attached to this letter as Exhibit 5).

The rationale behind Culver City's request is directly related to the SPAS. "This will simplify the preparation and review of the LAX Specific Plan traffic study, since the City of Los Angeles and Culver City share jurisdiction of several intersections that will be analyzed as part of the study." (See also, letter to Gloria Jeff, General Manager, City of Los Angeles Department of Transportation, October 31, 2006, attached to this letter as Exhibit 6).

Nevertheless, the traffic study used Culver City's, not City of Los Angeles' traffic impact analysis criteria to assess the impact of the project on Culver City intersections. Use of Culver City criteria significantly understates the project's impacts on those intersections. For instance, using LADOT criteria, the intersections of Centinela/Washington Boulevard (Intersection No. 30), Overland/Culver (Intersection No. 43) and Sepulveda/Slauson (Intersection No. 130) would, in fact, be impacted, as would the non-signalized intersections of Overland/Sawtelle (Intersection No. 154) and Walgrove/Washington (Intersection No. 156) which are already revealed as impacted in the DEIR. Despite the acknowledged significance of the impacts on the latter intersections, however, the DEIR states that they already meet the Manual of Uniform Traffic Control Devices ("MUTCD") warrants for the installation of these traffic signals and, therefore, Culver City should be fully responsible for the installation of the traffic signals. In this instance, as the project contributes to the significant impacts on those intersections, it stands to reason that Los Angeles should be responsible for the installation of traffic signals to mitigate the impacts.

Response:

The comment states that the thresholds of significance used in the SPAS Draft EIR traffic impact analysis for Culver City differ from those that the City of Culver City requested LAWA use, referring to a letter dated October 31, 2006. The commentor also suggests that Intersections 30, 43, 130, 154, and 156 "would in fact, be impacted" with the application of LADOT's thresholds. The commentor does not provide any evidence or specific details regarding these impacts. For example: (1) comment does not specify whether the comment is in reference to the "Baseline (2010) With Alternative" analysis (Section 4.12.2.6.1) or the "Future (2025) With Alternative" analysis (Section 4.12.2.6.2); (2) the comment does not specify whether the comment is in reference to Alternative 1, 2, 3, 4, 5, 6, 7, 8, or 9; and, (3) the comment does not specify whether the comment is in reference to AM, MD, or PM peak hours.

Contrary to the assertions in the comment, the referenced letter from 2006 stated that "the City of Culver City is in the process of updating our guidelines for preparing traffic studies" and requested that "in the interim" LADOT's thresholds be used for development projects in the City of Los Angeles. Culver City's revised traffic study guidelines were considered by the Culver City Planning Commission in a public hearing on June 17, 2009, which was continued to June 30, 2009. The revisions proposed to change Culver City's thresholds of significance to conform to those used by the City of Los Angeles. Culver City's website does not include formal minutes for those two meetings, but it does include videos of them. In minute 181 of the June 30, 2009 hearing, a vote was taken to retain Culver City's existing thresholds of significance, rather than adopt the standards used by the City of Los Angeles.1

The methodology for assessing potential traffic impacts at the signalized and unsignalized intersections that were analyzed is described on pages 4-1194 through 4-1196 of the SPAS Draft EIR, including intersections in Inglewood and Culver City. Thresholds of significance used in the SPAS off-airport transportation analysis, including for intersections in Culver City, are stated on pages 4-1225 through 4-1228 in Section 4.12.2 of the SPAS Draft EIR. The letter referred to in the comment was written prior to the June 30, 2009 decision by the Culver City Planning Commission. The use of these thresholds was confirmed with Culver City's Traffic Engineer, Mr. Barry Kurtz in March 2011 (the same contact person referenced in Culver City's October 31, 2006 letter), as stated in Footnote 700 at the bottom of page 4-1225. Similarly, LAWA confirmed the same traffic thresholds of significance with Culver City's Traffic Engineering Manager, Mr. Max Paetzold, on April 17, 2009, for LAWA's Bradley West Project Draft EIR. (Bradley West Project Draft EIR, page 4-118, fn 62.)2 LAWA, as the lead agency, has the discretion to select and apply thresholds of significance for its projects. (CEQA Guidelines Section 15064(b); Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 477.) The thresholds of significance used in the SPAS Draft EIR for intersections in Culver City were appropriate, in light of the above facts.

The comment also suggests that use of LADOT thresholds would "simplify the preparation and review of the LAX Specific Plan traffic study, since the City of Los Angeles and Culver City share jurisdiction." As noted in Section 4.12.2.4 of the SPAS Draft EIR, "Intersections lying on the boundary of multiple jurisdictions were evaluated using the more conservative criteria."

The comment also states that the City of Los Angeles should be responsible for the installation of traffic signals at the intersections of Overland Avenue and Sawtelle Boulevard (study intersection 154) and Washington Boulevard and Walgrove Avenue (study intersection 156).

Based on application of the thresholds of significance and the analytical techniques described above, the SPAS off-airport transportation impacts analysis in Section 4.12.2 of the SPAS Draft EIR found that both of these unsignalized intersections would be significantly and unavoidably impacted under all SPAS alternatives under cumulative conditions in 2025 for certain times of day (see Table 4.12.2-19).

LAWA discussed potential mitigation measures for Intersections 154 and 156 on pages 4-1304 through 4-1305 of the SPAS Draft EIR. As explained therein, signalization of these intersections could fully mitigate the project's impacts, "[h]owever, installation of a traffic signal at this location would be the responsibility of Culver City. If installation of the signal becomes feasible, LAWA would provide a fair share contribution…" LAWA therefore did not take credit for these mitigation measures and concluded

that these impacts would remain significant and unavoidable. (See Table 4.12.2-33 of the SPAS Draft EIR.)

As discussed in this comment, Culver City has complete jurisdiction over these intersections (i.e., there is no shared jurisdiction with the City of Los Angeles, as shown in Table 4.12.2-11), and implementation of any improvements at these locations can only be implemented by Culver City. Culver City Municipal Code ("CCMC") § 7.02.010 provides "the City Engineer is authorized to regulate the timing of traffic signals so as to permit the movement of traffic in an orderly and safe manner…and shall erect appropriate signs giving notice thereof." Similarly, CCMC § 7.02.015 provides "[u]pon the request of the City Engineer, the Public Works Director is authorized to place official traffic control devices within or adjacent to intersections…" Similar restrictions are provided for the marking of crosswalks (CCMC § 7.02.055), and pavement (CCMC § 7.02.040). All of which would be required for the signalization of these intersections. Violations of these provisions can result in an infraction (CCMC § 7.02.220) or even a misdemeanor (CCMC § 7.02.040). Furthermore, LAWA is not a property owner at these intersections and cannot apply for permits associated with such signalization. (See CCMC § 17.500.015.) For all of the reasons described in this paragraph, LAWA cannot legally be "responsible for the installation of traffic signals" at these intersections.

The commentor also states that "the [intersections 154 and 156] already meet the Manual of Uniform Traffic Control Devices ('MUTCD') warrants for the installation of these traffic signals…" Contrary to the assertion in the comment, the SPAS Draft EIR concludes impacts at these intersections would be significant at the horizon year in 2025, not current conditions, as implied in the comment. Footnote 713 on page 4-1304 of the SPAS Draft EIR also provides that "this analysis [regarding fulfillment of the standards for traffic signal warrants] is intended to examine the general correlation between the planned level of future development and the need to install new traffic signals. It *estimates future development-generated traffic* compared against a *sub-set* of the standards traffic signal warrants recommended in the Federal Highway Administration Manual on Uniform Traffic Control Devices and associated State guidelines. *This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured, rather than forecast, traffic data…Furthermore, the decision to install a signal should not be based solely upon the warrants, since the installation of signals can lead to certain types of collisions*." (Emphasis added.)

As described above, LAWA does not have legal authority to implement the intersection improvements, and there are a number of planning considerations and policy choices regarding the signalization of these intersections which have not been made by Culver City. As discussed on page 4-1304 of the SPAS Draft EIR relative to Intersections 153 and 154, "LAWA would provide a fair share contribution, subject to FAA approval, to this improvement." This stipulation would also apply to the potential mitigation measure for Intersection 156; hence, the discussion at the top of page 4-1305 of the SPAS Draft EIR is hereby amended, for the SPAS Final EIR, to include a similar statement ("If installation of a signal becomes feasible at this location, LAWA is willing to provide a fair share contribution, subject to FAA approval, to this improvement, which would fully mitigate the project impact at this location."). Mitigation measures MM-ST (SPAS)-39 and MM-ST (SPAS)-40 have been included in the SPAS Final EIR for these intersections. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

While the commentor suggests that LAWA should be fully responsible for installation of this traffic improvement, this is a cumulative impact, much of which is created by ambient growth in the region, unrelated to the SPAS alternatives. For example, the Baseline (2010) Without Alternative delay for the PM peak hour is 27.2 (see Table 4.12.2-14); this delay increased to 45.9 under the Future (2025) Without Alternative scenario. The Future (2025) With Alternative 1-2 scenario, which includes ambient growth unrelated to the project (see page 4-1209 of the SPAS Draft EIR), only increases this value to 51.4. The majority of this cumulative impact is not caused by this SPAS alternative. Mitigation Measures are limited by constitutional nexus and rough proportionality requirements (State CEQA Guidelines Section 15041(a)), and similar limitations imposed by the FAA. LAWA is therefore willing to pay a fair share contribution; however, there is an insufficient nexus to require LAWA to pay for the entire improvement, nor would such payment be roughly proportional to the impact caused by the SPAS alternatives.

SPAS-AL00007-34

Comment:

Further, the DEIR traffic study, DEIR, p. 4-1301, indicates the project would have a significant impact at the intersection of Lincoln Boulevard and Washington Boulevard (Intersection No. 110), which is not in Culver City, but in the City of Los Angeles. The DEIR indicates that the addition of a southbound through lane would fully mitigate the project at this location. However, adding a southbound lane would require widening of the southbound approach and departure and is not considered feasible. In addition, the DEIR finds that there are no other feasible improvements that could fully mitigate the project's impacts , and, thus, declines to mitigate, leaving the impact on that intersection significant and unavoidable.

With respect to the intersection of Lincoln Boulevard and Washington Boulevard, as with respect to other intersections within the project study area of which the DEIR deems the impacts "unavoidable," there are, in fact, feasible mitigation measures that would alleviate these impacts. For example, with respect to northbound Lincoln Boulevard to westbound Washington Boulevard, the County of Los Angeles' SR90 connector road to Admiralty Way would mitigate the project's impact at this intersection as it would reduce the left turn traffic demand. Similarly, the Costco project at the intersection of Lincoln Boulevard and Washington Boulevard was required to pay Culver City $1.5 million toward the SR90 connector road to Admiralty Way to mitigate Costco's impact at this intersection. In the same way, LAWA should be responsible for contributing toward the SR90 connector road to Admiralty Way to mitigate the SPAS project's significant impacts that, with the named mitigation, would be avoidable.

SPAS-AL00007-35

Comment:

B. The DEIR Does Not Fully Delineate or Mitigate the Surface Traffic Impacts of the Project on Inglewood

The traffic analysis is flawed as it relates to Inglewood as well. First, although the Future (2025) with Alternative Impact Analysis Summary Table lists 25 of the 29 Inglewood intersections studied as having significant traffic impacts with one or more alternatives, the DEIR indicates that some potential intersection improvements such as those for the intersection of Arbor Vitae Street and Aviation Boulevard are not feasible (see, e.g., § 4.12.2.6.4, p. 4-1283; § 4.12.2.7, p. 4-1285; and § 4.12.2.7.1, p. 4-1291). The DEIR does not, however, set forth the specific criteria upon which that determination was based. This is despite the fact that lack of right of way was cited as one factor of concern, but the acquisition of right of way is common as an element of intersection capacity improvement. The inevitable conclusion is that, even though Inglewood is a significant, perhaps primary conduit, for airport directed traffic, the DEIR shortchanges the manifest traffic, as well as other, impacts on Inglewood as well as on Culver City.

Response:

The comment contends that the traffic analysis in the SPAS Draft EIR is flawed as it relates to Arbor Vitae Street and Aviation Boulevard (study intersection 10) because it does not set forth the rationale for finding the mitigation measures related to this intersection infeasible. The comment states that acquisition of right-of-way is "common as an element of intersection capacity improvement."

The language evaluating the potential feasibility of traffic improvements is from Section 4.12.2.7.1 of the SPAS Draft EIR. The level of detail provided for this evaluation is consistent with CEQA. As noted under State CEQA Guidelines Section 15126.4(a)(5), "If the Lead Agency determines that a mitigation measure cannot be legally imposed, the measure need not be proposed or analyzed. Instead, the EIR may simply reference that fact and briefly explain the reasons underlying the lead agency's decision." While the SPAS Draft EIR provided a substantial amount of information regarding infeasibility and feasibility of mitigation measures, this information is not required to be in the EIR, contrary to the suggestions in the commentor's letter. (See Flanders Foundation v. City of Carmel-by-the Sea (2012) 202 Cal.App.4th 603, 617-618; San Franciscans Upholding the Downtown Plan v. City and County of San Francisco (2002) 102 Cal.App. 4th 656, 696.)

The approach to developing mitigation measures is described on pages 4-1284 and 4-1285 of the SPAS Draft EIR. For each study intersection where a significant impact was identified, a specific discussion is provided which evaluated potential mitigation measures. The commentor also suggests that the only grounds for infeasibility were right-of-way constraints, which is incorrect. At the intersection of Arbor Vitae Street and Aviation Boulevard (study intersection 10), which is specifically mentioned in the comment, a potential improvement is discussed on page 4-1291 of the SPAS Draft EIR but found to be infeasible due to lack of right-of-way, impacts to existing businesses including a service station, an automobile repair shop and a multi-story charter school building, (economic, policy infeasibility, and inconsistency with the project objectives (i.e., inconsistent with the objective of advancing "economic growth and vitality of the Los Angeles region")), and potential environmental impacts associated with demolition and construction. While the comment is correct that acquisition of right-of-way is among the considerations when developing traffic improvements, it is often among the elements that limit the ability of cities to implement improvements. In the traffic study prepared for the City of Inglewood for the Hollywood Park Redevelopment Project, right-of-way acquisition at the six significantly impacted intersections (including Crenshaw Boulevard and Century Boulevard) was not considered; rather, the recommended mitigation measures were limited to contributions to develop and enhance the City of Inglewood ITS system.1 Thus, the analysis in the SPAS Draft EIR is consistent with earlier analysis done for a project in Inglewood in that it considered lack of right-of-way to be a reasonable basis for a finding of infeasibility.

The mitigation measure deemed infeasible in the SPAS Draft EIR entailed widening both the eastbound and westbound approaches, as well as the eastbound departure, at the intersection. In conjunction with development of the SPAS Final EIR, further evaluation of potential mitigation options for this impact was conducted by LAWA, resulting in a refinement to analysis provided in the SPAS Draft EIR and the identification of other potential intersection improvements that would address the significant impact at this intersection. Specifically, further investigation indicated that it is possible to modify only the eastbound approach to provide a separate right-turn lane (resulting in one left-turn lane, two through lanes and one right-turn lane). Based on this intersection improvement, the impacts at Intersection 10 identified under Alternatives 1-2, 4, 8 and 9 would be fully mitigated; however, this improvement would not be sufficient to fully mitigated the impact under Alternative 3. Based on the above, the text regarding Intersection 10 on page 4-1291 of the SPAS Draft EIR has been revised in the SPAS Final EIR and a corresponding mitigation measure added to Section 4.12.2.7.2 as MM-ST (SPAS)-37, both of which are shown below. Tables 4.12.2-33, 4.12.2-34, 4.12.2-36, 4.12.2-37, and 4.12.2-38 have also be revised in the SPAS Final EIR. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

- 10. Arbor Vitae Street and Aviation Boulevard (Alternatives 1-2, 3, 4, 8, and 9).
Widen the eastbound approach to the intersection of Arbor Vitae Street and Aviation Boulevard to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes and one right-turn lane. Implementation of this improvement can be accomplished within the existing right of way and would fully mitigate the significant impacts under Alternatives 1-2, 4, 8, and 9. Under Alternative 3 this modification to the eastbound intersection approach would not provide effective mitigation and no other feasible improvements have been identified to mitigate the impact under Alternative 3. Therefore, this impact would remain significant and unavoidable under Alternative 3.

- MM-ST (SPAS)-37. Modify the Intersection of Arbor Vitae Street and Aviation Boulevard (Intersection 10) (Alternatives 1-2, 4, 8, and 9).

The mitigation measure for this location is to widen the eastbound approach to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes, and one right-turn lane. This improvement would fully mitigate the project impact under the Future (2025) With Alternatives 1-2, 4, 8, and 9 scenarios.

SPAS-AL00007-36

Comment:

In summary, the DEIR's inadequacies are no less substantial and significant for being, in many cases, repeats of old errors, because the public living and working in the project study area will be the ultimate victims of these analytic deficiencies. From a more global perspective, the DEIR represents not only a flawed attempt to implement an as-yet undesignated project with as-yet unanalyzed environmental impacts, but, insofar as LAWA's efforts go exclusively toward the expansion of capacity and associated improvements at LAX, also a patent abnegation of responsibility under the Settlement to regionalize air travel for the purpose of mitigating LAX' s impacts on close-in populations, while providing increased air travel opportunities to the rest of Southern California. Due to the DEIR's manifest inadequacies, Cities/County strongly recommend LAWA revise and recirculate the DEIR in strict compliance with CEQA's unequivocal mandates.

Response:

The SPAS Draft EIR is complete, adequate, and meets the requirements of CEQA. LAWA has carefully reviewed all of the comments submitted on the SPAS Draft EIR and prepared written responses, supported by substantial evidence, for all of those comments. Because no "significant new information" as defined in Section 15088.5 of the State CEQA Guidelines has been added to the SPAS Draft EIR, recirculation of the Draft EIR is not required.

Please see Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, of the SPAS process, and other efforts, supports a regional approach to accommodating air travel demands in Southern California. As also described therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization.

SPAS-AL00007-37

Comment:

The following are the comments of the Cities of Inglewood and Culver City ("Cities") concerning the Notice of Preparation ("NOP") for the Los Angeles International Airport ("LAX") Specific Plan Amendment Study ("SPAS"). The NOP commences the environmental review of the implementation of five development activities at LAX, including construction of the Ground Transportation Center ("GTC"), Automated People Mover ("APM") from the GTC to the Central Terminal Area ("CTA"), and associated on-site road improvements; demolition of Terminals 1, 2 and 3; and reconfiguration and separation of Runways 6L/24R and 6R/24L on the North Runway Complex (these activities, taken together will be referred to as "Project"). Cities regard the Project as a component of a more comprehensive expansion plan, including, but not limited to, construction of Midfield Satellite Terminal, a Crossfield Taxiway, and additional gates at the Tom Bradley International Terminal ("TBIT").

Response:

Comments SPAS-AL00007-37 through SPAS-AL00007-59 provide comments on the 2008 NOP prepared for the LAX Specific Plan Amendment Study. All of these comments were considered prior to preparation of the 2010 NOP and the SPAS Draft EIR. Responses to specific comments are provided below. The five development activities summarized by the commentor reflect the LAX Master Plan Yellow Light Projects that are identified in the LAX Specific Plan and the LAX Master Plan Stipulated Settlement. Consistent with the requirements of the Stipulated Settlement, the SPAS identifies and

evaluates potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address, consistent with a practical capacity of LAX at 78.9 MAP. As indicated in Chapter 2 of the SPAS Draft EIR, the proposed project is the SPAS, for which nine alternatives have been identified and are evaluated. The SPAS alternatives, being based on the Yellow Light Projects, are designed to be consistent with the overall framework of the LAX Master Plan. As was demonstrated through the course of the LAX Master Plan approval process, Alternative D, the approved LAX Master Plan alternative, is not an expansion plan.

The commentor is incorrect in stating that the SPAS project is a "component of a more comprehensive expansion plan" including, but not limited to, "construction of Midfield Satellite Terminal, a Crossfield Taxiway, and additional gates at the Tom Bradley International Terminal ("TBIT")," and provides no rationale for that claim. While these projects were conceptually approved in connection with the LAX Master Plan in 2004, they have independent utility from the SPAS alternatives because they can be implemented with or without implementation of a SPAS alternative. Further, these three projects, and many other LAWA projects, were explicitly considered in the SPAS Draft EIR cumulative impact analysis; see Section 5.3 of the SPAS Draft EIR.

SPAS-AL00007-38

Comment:

As a threshold issue, please be advised that Cities respond to Question No. 2, NOP, p. 2, as follows: neither City falls within the category of "responsible agency" or "trustee agency," as those terms are defined in 14 Cal.Code Regs. §§ 15096, 15381, and 15386.1

1 CEQA's implementing regulations will be referred to throughout these comments as "CEQA Guidelines".

Response:

The comment is noted.

SPAS-AL00007-39

Comment:

Please be further advised that the following comments concerning significant environmental issues raised by the Project, alternatives and mitigation measures are necessarily preliminary, due to the attenuated character of the NOP. Cities therefore reserve their right to supplement these comments in response to future environmental documents.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-41 through SPAS-AL00007-52 below. Please also see Responses to Comments SPAS-AL00007-60 through SPAS-AL00007-75 for responses to comments submitted by the commentor on the 2010 SPAS Draft NOP.

SPAS-AL00007-40

Comment:

Finally, Cities attach to these comments as Exhibit A "Petitioners' Overview of Guiding Principles for Environmental Analysis: LAX Specific Plan Amendment Study EIR" ("Guiding Principles"). Exhibit A represents the general approach to evaluation of the proposed development offered jointly by Petitioners in the case of City of El Segundo, et al. v. City of Los Angeles, et al., Riverside County Superior Court Case No. RIC 426822, the settlement of which gave rise to the Project.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-53 through SPAS-AL00007-59 below.

SPAS-AL00007-41

Comment:

I. THE "TIERING" OF THE NOP ON THE "APPROVED MASTER PLAN" RESULTS IN IMPROPERLY ATTENUATED ENVIRONMENTAL REVIEW.

The NOP states that the SPAS EIR will be a Supplemental EIR, tiered from the LAX Master Plan EIR (NOP, p.4), "providing new or revised analyses of the environmental impacts specific to the alternatives associated with the SPAS EIR..." LAWA, in its NOP for the Crossfield Taxiway Project (which was almost contemporaneous with the publication of this NOP), justified expedited environmental review on the premise that adequate environmental review was already completed during the prior Master Plan environmental review.

While the Legislature has directed local agencies to "tier" EIR's whenever feasible..., the utility of tiering is limited to those situations where the individual projects are consistent with the larger project such as the approved Master Plan project which has already been environmentally reviewed. "Tiering is a process by which agencies can adopt programs, plans, policies, or ordinances with EIRs focusing on the 'big picture' and can then use streamlined CEQA review for individual projects that arc consistent with such...[first tier decisions]..." Koster v. County of San Joaquin, 47 Cal.App.4th 29, 36 (1996). [Emphasis added.]

Despite the fact that the "approved Master Plan" remains in place, many of its most salient features, such as off-site ticketing facility; closure of the. CTA to surface traffic; and movement of Runway 6R/24L 340 feet to the south, thus necessitating the restructuring of Terminals 1 through 3, have been replaced by the Project currently being evaluating under this NOP. These radical changes significantly differ from the projects and environmental impacts originally evaluated in conjunction with the approved Master Plan. As an example, the proposed movement of Runway 6R/24L 340 feet north is a radical departure from the movement contemplated in the Master Plan, possibly impacting, among other things, the size and location of the noise contours and the Runway Protection Zone ("RPZ"). This change in preference, including the City of Los Angeles' decision to effectively eliminate the options of moving Runway 6R/24L 340 feet south, demolition of Terminals 1 through 3, and movement of passenger check-in off site, severely attenuates the previous attributes of Alternative D. Thus, it is questionable that the original Master Plan project, characterized as Alternative D, actually exists as an alternative for purposes of the environmental and development process.

In short, the significant differences between Alternative D, the "No Project/No SPAS Alternative (Approved Master Plan)," and the actual "No Project Alternative" raises the question of what is left of the original Master Plan, in terms of viable project alternatives, to make tiering an appropriate option. Given these circumstances, the Cities question the appropriateness of the "tiering" of the NOP projects upon the Master Plan EIR.

Response:

The SPAS EIR is not tiered from the LAX Master Plan EIR, nor is it a Supplemental EIR. When the NOP was published, LAWA anticipated that the SPAS EIR would be a supplemental EIR tiered from the LAX Master Plan EIR, but ultimately determined that tiering was not appropriate because the overall analytical framework for the SPAS EIR would be entirely updated from that presented in the LAX Master Plan EIR. This includes updated baseline conditions (i.e., 1996/2000 in the LAX Master Plan EIR versus 2009/2010 for the SPAS EIR), new planning horizon year-future conditions (i.e., 2015 in the LAX Master Plan EIR versus 2025 for the SPAS EIR), new/recent biological surveys, new on-airport and off-airport traffic studies, new air quality analyses, new greenhouse gas emissions, which was not a recognized CEQA topic at the time the LAX Master Plan EIR was prepared, all new noise analyses including aircraft noise, roadway traffic noise, construction noise, and transit noise. Portions of the SPAS EIR incorporate by reference information from other documents, as set forth in Section 1.7 of the SPAS Draft EIR, including portions of the LAX Master Plan Final EIR and the LAX Master Plan

Alternative D Mitigation Monitoring and Reporting Program (MMRP). However, the SPAS Draft EIR provides a comprehensive, programmatic analysis of impacts specific to each of the nine alternatives considered therein. Thus, although the improvements associated with SPAS Alternative 3 are essentially the same as those proposed under the LAX Master Plan Alternative D, the analysis of SPAS Alternative 3 is not based on the LAX Master Plan Final EIR's analysis of Alternative D except in those instances where information and data from the LAX Master Plan Final EIR is relevant and has been incorporated by reference.

The commentor is incorrect in stating that the salient features of the approved LAX Master Plan "have been replaced" by the SPAS project. Pursuant to the Stipulated Settlement, the SPAS project is a study of potential alternative designs, technologies, and configurations for the LAX Master Plan Program. At this time, no decision has been made as to which, if any, of these alternatives may ultimately be selected. In the meantime, LAWA continues to move forward with those non-Yellow Light projects approved under the LAX Master Plan that are not subject to the SPAS requirement of the Stipulated Settlement.

SPAS-AL00007-42

Comment:

II. THE NOP'S PROJECT DEFINITION IS INCOMPLETE.

The five components of the Project being environmentally reviewed are apparently derived from the Stipulated Settlement between Petitioners in El Segundo, et al. v. City of Los Angeles ("Settlement"), § V which provides for "potential alternative designs, technologies, and configurations for the LAX Master Plan program that would provide solutions to the problems that the yellow light projects were designed to address consistent with a practical capacity of LAX at 78.9 million annual passengers (the 'Alternative Projects')." Stipulated Settlement, § V.D.2.

First, it should be noted that the Project's five components actually boil down to only two: (1) the North Airfield Reconfiguration; and (2) the proposed GTC. This is because the APM and onsite road improvements are necessitated by, and part and parcel of, the proposed GTC. It also appears, according to the description of the various components and their alternatives in the NOP, that the APM and onsite road improvements would only occur for the purpose of linking the GTC and CTA. Thus, if the GTC were not built (the existing condition), the ancillary transportation improvements would not occur either.

In addition, the options relating to the demolition of Terminals 1 through 3 are constrained to "yes" or "no". As there is no off-site ticketing facility proposed, as there was in Alternative D, there is, in reality, no "yes" option, because such an option would effectively obliterate 30% of the airport's terminal capacity, without any potential replacement.

Response:

The five components of SPAS addressed in the SPAS Draft EIR--the GTC, APM2 from the GTC to the CTA, demolition of CTA Terminals 1 through 3, north runway reconfiguration, and onsite road improvements associated with the GTC and APM2--are identified in Section 7.H.1 of the LAX Specific Plan, as amended, which requires LAWA to initiate a complete LAX Specific Plan Amendment Study prior to seeking an LAX Plan Compliance determination for any one of these projects. Section 2.3.1 of the SPAS Draft EIR identifies the problems these Yellow Light Projects were designed to address and discusses the various alternative designs, technologies, and configurations associated with reconfiguration of the north airfield, demolition of Terminals 1 through 3, and construction of the GTC and APM2, which would link the GTC to the CTA.

Section 2.3.1 of the SPAS Draft EIR discusses the characteristics of each proposed alternative, including any improvements or modifications of ground access facilities. The "onsite road improvements associated with development of the GTC", and identified as one of the Yellow-Light Projects, consist of a specific set of new roadways located east of Aviation Boulevard and west of La Cienega Boulevard, and north of Imperial Highway and south of Arbor Vitae Street, and would only occur for the purpose of linking the planned facilities along Aviation Boulevard, including the ITC, GTC,

and public parking, and, as noted by the commentor, these specific "onsite road improvements" would not be required in the absence of the GTC.

The SPAS process identified seven alternative configurations for the north airfield, which are all evaluated in the SPAS Draft EIR. Demolition of Terminals 1 through 3 were not merely constrained to "yes" or "no" options. Rather, as an alternative to demolishing the terminal concourses, new and modified terminal facilities are proposed in the CTA to provide for additional passenger processing capabilities, including most notably a new Terminal 0, as well as lengthening the Bradley West concourse and MSC and replacing Terminal 3. Please see Section 2.3.1 of the SPAS Draft EIR for a description of the terminal facilities/changes proposed under each alternative. Elimination of the GTC resulted in two alternative configurations for use of Manchester Square (i.e., parking or a combination of parking and a CONRAC) (see Alternatives 1, 2, 8, and 9). Finally, two alternative technologies for transporting passengers between proposed facilities in Manchester Square and the CTA were evaluated, including a dedicated busway and an APM.

SPAS-AL00007-43

Comment:

Moreover, at least one of the two remaining components, the North Airfield Runway Reconfiguration, is inextricably linked to other projects either in planning or ongoing at LAX, but excluded from the NOP's current project definition. For example, it has long been conceded by LAWA that one of the principal purposes of the North Airfield Reconfiguration is to provide sufficient runway separation to allow unencumbered access by New Large Aircraft ("NLA"), expected to begin service at LAX in 2010, and thereby to equalize operations between the two runway complexes. The Crossfield Taxiway Project, being evaluated concurrently but separately with this NOP, has substantially the same purpose, i.e., to allow free access for NLAs and effective passage between the South and North Airfields (Crossfield Taxiway NOP, p. 4).

For purposes of CEQA review, a "project" is "the whole of an action which has potential for resulting in either a direct physical change to the environment or a reasonably foreseeable indirect change." CEQA Guidelines § 15378(a). "A public agency may not divide a single project into smaller individual projects in order to avoid its responsibility to consider the environmental impacts of the project as a whole." Sierra Club v. Westside Irrigation District, 128 Cal.App.4th 690, 698 (2005).2

Here, the synergistic impacts of the various projects is beyond question. The Crossfield Taxiway is a necessary component of access to and from the North Airfield with impacts that are not addressed in this NOP. Similarly, the new midfield satellite terminal, and the gate additions at the TBIT are intimately related to the changes in the North Airfield Complex, as the new, associated taxiway system appears to encourage expedited access from the North Airfield Complex, without which the North Airfield Complex would become a victim of the same airfield gridlock that LAWA now purports to foresee for the whole airport, if the Project is not implemented.

Although "where the second activity is independent of, and not a contemplated future part of, the first activity, the two activities may be reviewed separately, even though they may be similar in nature," Sierra Club, 128 Cal.App.4th at 699, i.e., have independent utility, that circumstance does not exist here. Even now, the above specified projects are moving forward at the same time, toward a single, connected goal, the enhancement of the LAX airfield capacity, with particular emphasis on NLA serving the international market. It is therefore Cities' position that the various planned projects should be included in the Project Definition for the NOP and evaluated in the same EIR.

2 The National Environmental Policy Act, 42 U.S.C. § 4321, et seq., ("NEPA"), under which this Project must also be reviewed in order for LAWA to obtain Federal funding for its implementation, further requires that the environmental analysis of multiple actions must be included in a single document "when the record raises 'substantial questions' about whether there will be 'significant environmental impacts' from the collection of anticipated projects." Klamath-Siskiyou Wildlands Center v. BLM, 387 F.3d 989, 999 (9th Cir. 2004).

Response:

Although the Crossfield Taxiway Project, Bradley West Project, and planned Midfield Satellite Concourse all have a relationship to the north airfield, these projects are not Yellow Light Projects as defined in the LAX Specific Plan, as amended, or in the Stipulated Settlement. Their implementation is not dependent on implementation of any of the Yellow Light Projects or alternatives to the Yellow Light Projects that have been evaluated in the SPAS Draft EIR, and none of the elements of any of the SPAS alternatives is dependent on implementation of any of these projects. These projects have independent utility from the SPAS alternatives, including the reconfiguration of the north airfield, and are important improvements at LAX regardless of whether or not future modifications to the north airfield runways occur under SPAS. A proposal that is related to a project but has independent utility and is not necessary for the project to proceed need not be included as part of the project description and may be reviewed in its own EIR, as a separate project. (Communities for a Better Env't v. City of Richmond (2010) 184 Cal.App.4th 70.) An EIR need not examine the impacts of facilities that are planned independently of the project and would not change the scope or nature of the project. (Anderson First Coalition v. City of Anderson (2005) 130 Cal.App.4th 1173.) Construction of the Crossfield Taxiway Project and Bradley West Project did not commit LAWA to proceeding with any of the SPAS alternatives, nor would construction of the Midfield Satellite Concourse. Each of these projects were evaluated independently in project-level EIRs, and have specific objectives that are separate from the objectives of SPAS relative to the north airfield. See, in particular, Section 2.3 of both the Crossfield Taxiway Project Final EIR and the Bradley West Final EIR.1,2 for a discussion of the relationship between each of these projects and SPAS, see Section 3.3.2 of these Final EIRs. Moreover, the SPAS Draft EIR provides a project description that is sufficient to allow adequate evaluation and review of the environmental impact of the project. (San Joaquin Rapto Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645, 655.)

Section V.F of the Stipulated Settlement provides that, while the LAX SPAS is being processed, LAWA may continue to process and develop projects that are not Yellow Light Projects, consistent with the LAX Specific Plan Compliance Review procedures. Such was the case with the Crossfield Taxiway Project and Bradley West Project, and will be the case with the Midfield Satellite Concourse Project. However, each of these projects is considered in the analysis of cumulative impacts associated with the SPAS alternatives. See Section 5.3 of the SPAS Draft EIR for an identification of cumulative projects, including these projects. In addition, see Response to Comment SPAS-AL00007-44 regarding the analysis of cumulative impacts in the SPAS Draft EIR. As indicated in that response, these projects were appropriately identified as independent projects causing related impacts and analyzed in the context of the cumulative impact analysis.

1. City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport Crossfield Taxiway Project, January 2009.
2. City of Los Angeles, Los Angeles World Airports, Final Environmental Impact Report for Los Angeles International Airport Bradley West Project, September 2009.

SPAS-AL00007-44

Comment:

III. THE EIR'S CUMULATIVE IMPACT ANALYSIS SHOULD AT MINIMUM INCLUDE ALL PROJECTS NOT INCLUDED IN THE SPAS.

Even if, for argument's sake, the myriad of projects currently planned or being implemented at LAX were not part of a larger project "the agency may prepare one EIR for all projects, or one for each project, but shall in either case comment upon the cumulative effect," CEQA Guidelines § 15165. "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project, when added to other closely related past, present and reasonably foreseeable probable future projects." CEQA Guidelines § 15355.

It is beyond dispute that the complex of projects at issue in this NOP are "closely related" both to each other, as well as to other "present", or, at minimum, "reasonably foreseeable future projects such as the Midfield Satellite Terminal and the Crossfield Taxiway. Their collective scope, however, requires more

than a simple "comment". If the projects are not evaluated as part of the same project, substantially the same attention should be paid to their impacts in the cumulative impacts analysis. Absent the requisite attention to the collective effects of the myriad of projects that are or will shortly be implemented to enhance "throughput rate", i.e., capacity, FAA Advisory Circular 150/5060-5, page 1, on the LAX airfield, the EIR will be inadequate.

Response:

The SPAS Draft EIR included all past, present, and reasonably foreseeable airfield- and terminal-related improvement projects with the potential for impacts that could combine with impacts of the SPAS alternatives in the cumulative impacts analysis (see Section 5.3 of the SPAS Draft EIR, particularly Section 5.3.1, Section 5.3.2, and Figure 5-2), as requested by the comment. As identified in Section 5.3, cumulative airfield-related projects included the South Airfield Improvement Project (i.e., southerly relocation of Runway 7R/25L and construction of a center parallel taxiway, completed in 2008); the Crossfield Taxiway Project (i.e., construction of a new north-south taxiway, Taxiway R, in the midfield, completed in 2010); Taxilanes S and T, which are being constructed in conjunction with the Bradley West Project; future Midfield Satellite Concourse (MSC) Taxiways; various runway and taxiway modifications, including those required to meet Runway Safety Area (RSA) requirements, on Runways 7L/25R, 6L/24R, and 6R/24L; and other airfield improvements. Substantial cumulative terminal-related projects include the Bradley West Project, currently under construction; the future MSC, including both a concourse in the midfield area and a passenger processing facility in the CTA; and improvements to both the north and south terminals. As explained in Section 3 of Appendix F-2 of the Preliminary LAX SPAS Report, the cumulative projects identified above were assumed in the simulation analysis of future conditions with implementation of the SPAS alternatives. Therefore, the simulation analysis represents future conditions with the airfield and terminal changes associated with each of the SPAS alternatives as well as changes associated with these cumulative projects.

All of the cumulative projects identified in Section 5.3 of the SPAS Draft EIR have independent utility from the SPAS alternatives (i.e., their implementation is not dependent on implementation of any of the SPAS alternatives, and none of the elements of any of the SPAS alternatives is dependent on implementation of any of the projects identified in Section 5.3). Therefore, these projects were appropriately identified as independent projects causing related impacts and analyzed in the context of the cumulative impact analysis. CEQA does not require an EIR's cumulative impact analysis to "pay substantially the same attention" to the direct and cumulative impacts of a project. Section 15130(b) of the State CEQA Guidelines specifies that the "discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone."

Also, please note that the comment does not identify any specific probable future projects at LAX that were omitted from the SPAS Draft EIR cumulative impact analysis.

SPAS-AL00007-45

Comment:

IV. THE NOP FAILS TO ADDRESS SURFACE TRAFFIC IMPACTS RESULTING FROM THE PROJECT.

Cities are concerned about the Project's potentially significant impacts on surface traffic, not merely in areas immediately contiguous to LAX, but also on routes frequently traveled to get there. Cities are already suffering from the surface traffic generated by current operations, most, if not all, of which remains unmitigated. As passenger traffic and capacity at LAX increases, so does traffic on the surface streets and interstates (I-405, I-105) used to access it. As the traffic on the freeways becomes more congested, travelers exit these freeways seeking alternative routes which usually end up being the surface streets of Inglewood, Culver City and Westchester, in particular Sepulveda Blvd.(N/S) as far north as Slauson Ave. & Centinela Ave.; La Cienega (N/S) from Centinela to Imperial Highway; as well as Manchester and Century Blvds. (E/W) and Imperial Hwy. (E/W).

The proposed Project has the potential to cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system. It may easily exceed the level of service

standard established by the county Congestion Management Agency for designated roads and highways; cause a substantial increase in hazards; and increase demand for off-street parking. This increased surface traffic also has strong potential to adversely affect the infrastructure of the streets, as well as air quality, in neighborhoods in the proximity of the airport as well as throughout the region. Those impacts must be addressed in the EIR, not only because they are a direct result of the Project individually, but also because there will be additional contributions from other projects, "past, present and reasonably foreseeable" cumulatively.

Response:

The comment states that increased traffic on freeways can result in greater use of surface streets as alternative routes and that the SPAS Draft EIR should address project impacts in the context of cumulative development in the area. The use of Los Angeles' travel demand forecasting model in the traffic analysis allows for the precise considerations discussed in the comment. As described in Section 4.12.2.2.2, the model includes growth dynamically and iteratively assigns traffic over the entire roadway network, including both freeways and surface streets. As described on page 4-1208 in Section 4.12.2.2.3, the 2025 forecasts included projected growth. The off-airport transportation analysis included a broad geographic scope, as shown in Figure 4.12.2-1, which included intersections in Inglewood, Culver City, and Westchester (City of Los Angeles). Parking is discussed in Section 4.12.1.2, Section 4.12.1.3.6, and Section 4.12.1.9.3 of the SPAS Draft EIR. The air quality analysis also included emissions associated with vehicle trips, as described in greater detail in Section 4.2.2.2 of the SPAS Draft EIR. The off-airport transportation evaluation for the SPAS EIR includes several analyses conducted to comply with Los Angeles County Congestion Management Plan (CMP) requirements. These are described in Section 4.12.2.2.1 beginning on page 4-1196.

SPAS-AL00007-46

Comment:

In addressing such impacts, it is important that consideration is given to appropriate avoidance and mitigation measures that take into consideration the "actual" traffic patterns and impacts on the surface traffic in Cities and neighboring communities. Cities strongly urge LAWA to develop effective surface traffic mitigation such as that previously proposed in detail during the SPAS process, including, but not limited to, an additional off ramp on the northbound 405 freeway south of LAX ("Lennox off ramp") to offload traffic directly into the airport before it enters Culver City, and another off ramp on the south bound 405 freeway directly into the Manchester Square development. It appears the "Keep Access to CTA - Building Transportation Centers at Manchester Square and at Aviation/Imperial and Provide Drop Off/Pick Up Area East of Terminal 1 option, as part of the 100 feet to the North alternative takes traffic off the 405 freeway northbound, but not southbound. The Cities (and their consultants) are looking forward to working closely with LAWA on developing and implementing reasonable mitigation measures and alternatives to address surface traffic..

Response:

The comment states that development of traffic mitigation measures should take into consideration the "actual" traffic patterns in the surrounding communities. The comment also urges LAWA to consider additional freeway off-ramps as potential mitigation measures. The Los Angeles' travel demand forecasting model, described in Response to Comment SPAS-AL00007-45, was calibrated and validated for use in the SPAS Draft EIR analysis, and included both static and dynamic validation procedures to ensure that it is appropriate for SPAS. The LAX Master Plan proposed to develop a new freeway interchange on I-405 at Lennox Boulevard.

The comment suggests that the SPAS alternatives include "an additional off ramp on the northbound 405 freeway south of LAX ('Lennox off ramp') to offload traffic directly into the airport before it enters Culver City." A new interchange on I-405 at Lennox Boulevard was not considered to be an effective mitigation measure for SPAS because it would not directly serve the most substantial traffic-generating elements of the SPAS alternatives. Under the existing LAX Master Plan (SPAS Alternative 3), it is assumed that the CTA is closed to private vehicles and that the vast majority of passenger pick up and drop off activities would occur at the Ground Transportation Center located in Manchester Square. Manchester Square is located immediately west of I-405 and one-half mile north of Lennox Boulevard.

Because of the volume of airport-related traffic traveling to and from the GTC under the LAX Master Plan, a Lennox Interchange with direct connections to the GTC was proposed as a traffic mitigation alternative. SPAS Alternatives 1-2, 4, 8, and 9 assume that the CTA remains open to private vehicles and that the majority of passenger pick up and drop offs occur in the CTA. A new interchange at Lennox Boulevard is not considered under CEQA to be an effective mitigation measure in Section 4.12.2 of the SPAS Draft EIR since there are more convenient freeway ramps already existing for the proposed airport facilities.

The comment also suggests the SPAS alternatives include "another off ramp on the south bound 405 freeway directly into the Manchester Square development." The SPAS Alternatives 1, 2, 8, and 9 provide direct access from the I-405 Freeway southbound off-ramp to Manchester Square.

SPAS-AL00007-47

Comment:

V. THE PROPOSED MOVEMENT OF RUNWAY 6L/24R 340 FEET NORTH HAS SIGNIFICANT CAPACITY AND NOISE ENHANCING POTENTIAL.

The NOP proposes an alternative that moves Runway 6L/24R 340 feet to the North, as well as an extension of approximately 1495 feet west, with the width increased by 50 feet, and a new Modified Group VI parallel center taxiway 520 feet south of relocated Runway 6L/24R and 520 feet north of Runway 6R/24L. The NOP suggests that the planned reconfiguration is designed to address safety issues, e,g., "reduce the risk of runway incursions, enhance the safety of aircraft operations at LAX, and provide a better balance in operations between the North Airfield and the South Airfield."

Leaving aside the obvious, that a firm conclusion on the runway reconfiguration's safety effects cannot be definitively determined until the North Airfield Safety Study, currently being conducted by LAWA, is completed and evaluated by the public, analyses performed by consultants on behalf of Cities already indicates that: (1) there exist numerous measures that are more efficient in effecting safety goals, such as improved runway lighting and marking, especially since only a small proportion of the total incursions and incidents at LAX occurred on the North Airfield; and (2) the proposed separation has significant capacity enhancing potential, particularly that of allowing triple simultaneous arrivals to both the North and South Runway Complexes.

Response:

LAWA issued the original Notice of Preparation (NOP) for the SPAS Draft EIR in March 2008 and, following completion of the LAX North Airfield Safety Study (NASS) in spring 2010, issued a Revised NOP in October 2010. The LAX NASS is specifically noted on page 4 of the NOP. The NASS is also referenced and summarized on page 4-505 in Section 4.7.2 of the SPAS Draft EIR and provided in its entirety as Appendix H-6 of the Preliminary LAX SPAS Report. Please refer to Response to Comment PC00130-168 regarding the NASS and the opinion of the academic panel involved in that study.

In recent years, the FAA and LAWA have worked together to implement numerous safety measures, as discussed beginning on page 4-484 in Section 4.7.2.3 of the SPAS Draft EIR. Nevertheless, as evidenced by the north airfield safety studies referenced in Section 4.7.2.3, safety and incursion problems still exist at the north airfield. The SPAS alternatives are designed to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX. (See Section 2.2 of the SPAS Draft EIR.)

None of the runway separation distances proposed in the SPAS Alternatives 1 through 7 provide enough distance to change any of the current approach capabilities, either for visual flight rule or instrument flight rule conditions. Per FAA Advisory Circular 150/5300-13A, parallel runway separation for simultaneous visual operations is 700 feet, and the Advisory Circular recommends 1,200 for runway with ADG V and VI activity. Following FAA guidelines, LAX does not have sufficient runways spacing to operate simultaneous triple visual approaches. During instrument operations, FAA recommends 5,000 feet between runways for simultaneous triple approaches. Therefore, none of the proposed SPAS alternatives provide "significant capacity enhancing potential" as suggested by the commentor.

SPAS-AL00007-48

Comment:

Moreover, the reconfiguration will likely affect the size and location of the noise contours, moving them north and cast, beyond the scope of the relatively extensive 1992 noise contour used by LAWA for the determination of sound-mitigation construction funding for Inglewood.

Response:

This comment was provided in response to the release of the 2008 Notice of Preparation of the SPAS Draft EIR.

Please refer to Section 4.10.1 of the SPAS Draft EIR which presents the methodology, assumptions, and results of the SPAS Draft EIR aircraft noise analyses. Section 4.10.1.6, beginning on page 4-828, presents a detailed analysis of aircraft noise impacts under each SPAS alternative, along with results in tabular format and figures depicting aircraft noise contours.

Upon selection of a preferred SPAS alternative, LAWA will assess any potential implications to any LAWA noise monitoring and residential soundproofing program, as well as the use of the 1992 noise contour. Please see Section 4.9.3.3 of the SPAS Draft EIR for discussion the Aircraft Noise Mitigation Program (ANMP) and updates to that program. As discussed therein, "all incompatible land uses within the 1992 fourth quarter 65 CNEL noise contour or within 65 CNEL areas extending beyond the 1992 contour based on the most recent quarterly report, are eligible for participation in the ANMP." Please also see Response to Comment SPAS-AL00007-19.

SPAS-AL00007-49

Comment:

The reconfiguration may also displace overflights on approach to relocated Runway 6L/24R to the north, thereby bringing increased noise impacts, as well as air quality and other impacts not only to Inglewood, but to Culver City as well.

Response:

As described and depicted in Section 3.2 in Appendix J1-1 of SPAS Draft EIR, the assumed location of flight tracks would change with the proposed location of the runways under each SPAS alternative. These changes are accounted for in several sections of the SPAS Draft EIR.

The SPAS Draft EIR addresses impacts associated with aircraft noise in Sections 4.9 and 4.10.1. As shown in Figures 4.9-7 through 4.9-13 and 4.10.1-14 through 4.10.1-33 of the SPAS Draft EIR, none of the SPAS alternatives would result in significant aircraft noise impacts to areas within the City of Culver City. While it is true that those alternatives involving the relocation of Runway 6L/24R northward (i.e., Alternatives 1, 5, and 6) would result in increased aircraft noise impacts to areas immediately north and northeast of the airport, there would be an accompanying decrease in aircraft noise impacts to areas east, southeast, and south of the airport. As indicated in Sections 4.9 and 4.10.1 and summarized in Tables 1-16 and 1-17 of the SPAS Draft EIR, there would, in general, be fewer residential units exposed to 65 CNEL by moving Runway 6L/24R northward (Alternatives 1, 5, and 6) than would occur in moving 6R/24L southward (Alternatives 3 and 7) or not moving either runway (Alternatives 2 and 4), and the total residential population newly exposed to 65 CNEL would be lowest under Alternative 5 (i.e., relocate Runway 6L/24R 350 feet northward) than under any other alternative. Relative to a 1.5 CNEL increase above 65 CNEL, which includes areas currently exposed to >65 CNEL, the total residential units and residential population exposed to such an increase is consistently higher for alternatives that move Runway 6R/24L southward (Alternatives 3 and 7) or do not move the runways (Alternatives 2 and 4). These differences in the numbers of homes and people being exposed to aircraft noise impacts--specifically, that total overall aircraft noise impacts would be lower with alternatives that move Runway 6L/24R northward--are due to the fact that the land use/development intensities in areas to the east, southeast, and south are higher than in the areas north of the airport. That is, although more homes to

the north of the airport would be impacted by noise with a northward move of Runway 6L/24R, an even greater number of homes to the east, southeast, and south of the airport would no longer be impacted by noise, resulting in an overall decrease in the numbers of homes and people exposed to aircraft noise impacts.

Regarding air quality, as indicated in Section 4.2 of the SPAS Draft EIR, operation of the airport would result in significant and unavoidable impacts to air quality. Even after mitigation, operational emissions of sulfur dioxide (SO2), PM10, and PM2.5 would be significant and unavoidable under all of the alternatives. Operational concentrations of NO2, PM10, and PM2.5 would also be significant and unavoidable under all of the alternatives.

SPAS-AL00007-50

Comment:

Finally, the NOP gives little attention to the environmental impacts of the original impetus for the runway separation, i.e., to accommodate the NLA which have a wing span of 262 feet and carry up to 800 passengers.

Response:

The increased runway separation proposed under various SPAS alternatives serves a number of purposes that relate to several aircraft types, not just new large aircraft (NLA). As described in Chapter 2 of the SPAS Draft EIR, the increased separation proposed under Alternatives 1, 3, 5, 6, and 7 allows for addition of a centerfield parallel taxiway, the safety benefits of which are described in Section 4.7.2. While the commentor is correct about the wingspan of an NLA, specifically an Airbus A380, being 262 feet, the reference to NLA carrying up to approximately 800 passengers is misleading given that seating capacity is only for a cabin design that is entirely economy-class seating, whereas the standard common three-class cabin design (i.e., First Class, Business/Executive Class, and Coach) has a seating capacity of approximately 525 passengers.1 The seating capacity of the A380 aircraft operated by QANTAS, which has the most daily A380 flights of any carrier at LAX, is 450.

The SPAS Draft EIR provides a comprehensive analysis of the environmental impacts of each SPAS alternative, taking into account the existing (2009) and future (2025) fleet mix that includes NLA (i.e., ADG VI aircraft such as the A380). Please see Appendix F-1 of the Preliminary LAX SPAS Report for a discussion of the 2009 and 2025 Passenger Forecast and Design Day Flight Schedule models, which includes projections about the number of NLA expected to operate at LAX in 2025. The effects of operations of NLA at LAX, including increased activity of NLA, are analyzed throughout the SPAS Draft EIR.

SPAS-AL00007-51

Comment:

It should be noted that neither NOP Figure 5, nor Figure 11, fully depicts the configuration of the North Airfield, as both omit: (1) the displaced threshold intended for use on Runway 6L/24R, to ensure arrivals at the same runway point as on the current runway length; and (2) the Runway Protection Zones ("RPZ") for both runways. The latter are important because of the constraints on the use of the land that falls within them. Specifically, FAA regulations require that RPZ property belonging to the airport be kept largely clear of structures in order to "enhance the protection of people and property on the ground." FAA Advisory Circular 150/5300-13, § 212. Moreover, to the extent that property within other jurisdictions such as Westchester fall within the RPZ, the ALUCP for LAX may constrain the reuse of such property by its owners, California Public Utilities code § 21675(a).

Response:

The displaced thresholds and Runway Protection Zones (RPZ) are not depicted in the 2008 NOP, which was prepared in accordance with Section 15082 of the State CEQA Guidelines. Section 15082 states that the NOP must include, among other things, the location of the project, as demonstrated either by street address and cross street or by attaching a specific map. The maps included in the NOP show the location of the project, as well as the various alternatives discussed in the Preliminary LAX SPAS Report and SPAS Draft EIR.

However, graphics depicting displaced thresholds intended for use on Runway 6L/24R in each alternative were developed for the SPAS Draft EIR. For additional information on the displaced thresholds for each alternative, see Figures 2-1 through 2-9 in Sections 2.3.1.1 through 2.3.1.9 of the SPAS Draft EIR.

Full descriptions of airfield surfaces, including RPZs, are included in the SPAS Draft EIR. For additional information on RPZs for each alternative, see the Airfield Surfaces portion of Sections 4.7.2.6.1 through 4.7.2.6.9 of the SPAS Draft EIR.

SPAS-AL00007-52

Comment:

In summary, the proposed runway reconfiguration is potentially damaging to Cities. Cities have, instead, offered, in partnership with co-Petitioners El Segundo and ARSAC, and continue to support, the alternative which allows movement of Runway 6L/24R 100 feet to the north. (See, NOP, Figure 11). Petitioners offer this alternative in recognition of LAWA's need to facilitate operations on the airfield, but with the equivalent understanding that such improvement need not come at Petitioners' environmental expense. Movement of Runway 6L/24R 100 feet to the north will allow the same runway separation as now exists on the South Runway Complex, the current targeted recipient complex for all NLA traffic, which LAWA has deemed "safe" for that purpose. The 100 feet north alternative would, thus, allow precisely the same balance between the runway complexes as that articulated as a primary goal in the LAX Master Plan § 1.1, Goal 7, while, at the same time, providing environmental mitigation to surrounding communities.

In short, the alternative that allows movement of Runway 6L/24R 100 feet to the north offers LAWA the same benefits it sought for the South Complex, without either the adverse impacts, or potential controversy that will unavoidably accompany the increased capacity, air and surface traffic, and environmental impacts attendant upon movement of Runway 6L/24R 340 feet to the north. Petitioners strongly urge that the alternative of moving Runway 6L/24R 100 feet to the north be adopted as the EIR's preferred alternative.

Cities appreciate this opportunity to comment and look forward to partnering with LAWA to implement a mutually acceptable and environmentally sensitive airport development.

Response:

The commentor's preference toward Alternative 6, which would move Runway 6L/24R 100 feet to the north, is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project.

The SPAS Draft EIR evaluated the potential environmental impacts of all SPAS alternatives. Please also note that the comment presents a personal opinion as to the efficacy of the proposed alternatives that is not supported by facts or substantial evidence.

SPAS-AL00007-53

Comment:

Petitioners' Overview of Guiding Principles for Environmental Analysis:
LAX Specific Plan Amendment Study EIR

Submitted by Petitioners: City of El Segundo, City of Inglewood, City of Culver City, County of Los Angeles, and Alliance for a Regional Solution to Airport Congestion (ARSAC).

Background: In January of 2005, Petitioners filed lawsuits challenging the approval of the LAX Master Plan Program and the associated Environmental Impact Report (EIR) prepared by Los Angeles World Airports (LAWA) under the California Environmental Quality Act (CEQA). These suits were resolved by a 2006 Stipulated Settlement between LAWA and Petitioners. In response to the Notice of Preparation (NOP) recently released by LAWA for the Specific Plan Amendment Study (SPAS) Draft EIR, Petitioners now jointly submit this overview of principles that should guide LAWA in that environmental review process. Petitioners will also submit detailed individual comments.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-54 through SPAS-AL00007-59 below.

SPAS-AL00007-54

Comment:

LAWA's Obligation to Avoid and Reduce Impacts to Surrounding Communities. As LAWA proceeds with refinement and analysis of options as part of the SPAS process, it must continually recognize its obligation to avoid and mitigate impacts to the communities that surround LAX. Options under consideration must be evaluated and ranked based on how they would impact the environment, public health and safety in surrounding communities (e.g., noise, air quality, traffic). All alternatives should be subject to a full and fair evaluation in the SPAS DEIR and LAWA should remain open to options that would avoid or mitigate impacts to its neighbors, taking care not to prematurely select a preferred alternative.

Response:

As provided in Section 1.2.1 of the SPAS Draft EIR, a SPAS project objective is to minimize environmental impacts on surrounding communities. The SPAS Draft EIR demonstrates LAWA's commitment to identify and apply ways to avoid or mitigate environmental impacts on surrounding communities. Please see the various sections of the SPAS Draft EIR for discussions of potential environmental impacts as well as Table 1-6 for a list of all applicable LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS-specific mitigation measures to minimize impacts on surrounding communities. There is no requirement in the LAX Specific Plan, the Stipulated Settlement, or CEQA to rank options under consideration as to how they would impact the environment, public health, and safety in the surrounding community. However, Alternative 2 was designated in Section 1.5 of the SPAS Draft EIR as the environmentally superior alternative; this designation took into consideration impacts on the surrounding community.

Please see Response to Comment SPAS-AL00007-6 regarding the fact that nine alternatives were subject to a full and fair evaluation in the SPAS Draft EIR. LAWA did not "prematurely select" a preferred alternative; LAWA staff did not identify a Staff-Recommended Alternative until after publication of the SPAS Draft EIR and the close of the public review period. Please see Chapter 2 of this Final EIR for a discussion of the LAWA Staff-Recommended Alternative and its associated environmental impacts and recommended mitigation measures.

SPAS-AL00007-55

Comment:

Continued Consultation with Surrounding Communities. The alternatives described in the SPAS NOP were developed and selected by LAWA during a lengthy consultation process with Petitioners. That consultation process grew out of the 2006 Stipulated Settlement, which states, in relevant part, that An LAX Specific Plan Amendment Process Advisory Committee shall be created consisting of representatives of the City of Los Angeles, County of Los Angeles, El Segundo, Inglewood, Culver City, and ARSAC, LAWA shall consult with the Committee during each significant step of the LAX Specific

Plan Amendment Process." Petitioners wish to recognize LAWA's compliance to date with this provision of the Stipulated Settlement. LAWA must now ensure that it continues to consult with Petitioners as the EIR process proceeds and the SPAS alternatives are developed in more detail. In particular, LAWA should take care to consult with Petitioners regarding the details and analysis of the alternatives supported by any Petitioner.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. LAWA has and continues to consult with Petitioners as the EIR process proceeds. In compliance with Section V.J of the Stipulated Settlement, LAWA established the LAX SPAS Advisory Committee. The Advisory Committee members included representatives from the County of Los Angeles, City of Los Angeles, City of El Segundo, City of Culver City, City of Inglewood, and Alliance for a Regional Solution to Airport Congestion (ARSAC). (See generally Chapter 5 of the Preliminary LAX SPAS Report.) LAWA held 24 meetings with the Advisory Committee between March 2006 and June 2012. A list of these dates is provided in Appendix D-2 of the Preliminary LAX SPAS Report. An additional meeting was held with the Advisory Committee on December 4, 2012. Meetings were scheduled prior to and following the public meetings that LAWA convened to seek community input on SPAS, as well as at each significant step of the SPAS process. The Advisory Committee members provided input and feedback on various aspects of the airport planning process, and suggested alternatives to be studied as part of SPAS. Documentation of the Advisory Committee meetings through June 2012 is provided in Appendix D-2 of the Preliminary LAX SPAS Report.

SPAS-AL00007-56

Comment:

Extension of Gate Constraint. LAWA, FAA and the Petitioners all agree that limiting the number of gates at LAX will promote efficient passenger operations and encourage other airports in the Los Angeles basin to increase capacity to serve aviation demand. Accordingly, the long term success of the regional approach to serving aviation demand depends on maintaining appropriate gate constraints at LAX. The 2006 Stipulated Settlement between LAWA and the Petitioners limits the number of permissible gates at LAX to 163 and, commencing in 2010, requires LAWA to begin reducing the number of operating gates at LAX to 153. This settlement provision is operative through December 31, 2020. As part of the SPAS process, LAWA must analyze the continuation of the LAX gate constraints beyond 2020, as well as the possible enhancement of those constraints at a level that will efficiently serve up to 78.9 million annual passengers at LAX, while encouraging growth elsewhere in the region, including at the other airports owned and operated by LAWA.

Response:

This comment was submitted in connection with the commentor's comments on the 2008 SPAS NOP and, as such, was considered by LAWA in determining the scope of the EIR and in developing the SPAS project description. The statement in the comment that "The 2006 Stipulated Settlement between LAWA and the Petitioners limits the number of permissible gates at LAX to 163 and, commencing in 2010, requires LAWA to begin reducing the number of operating gates at LAX to 153" paraphrases Section IV.B.1 of the Stipulated Settlement, but does not acknowledge Section IV.C, which explains that Section IV.B.1 "shall not apply if either (1) total passenger operations at LAX are below 75 million annual passengers or (2) the LAX Master Plan Program is substantially revised pursuant to the LAX Specific Plan Amendment Process such that the total number of gates is reduced to 153 or less."

As described in Section 2.3 of the SPAS Draft EIR, all of the SPAS alternatives are designed to have no more than 153 passenger gates. The comment requests a continuation of the gate constraints identified in Section IV.B of the Stipulated Settlement beyond December 31, 2020, which is the final operative date of such constraints, pursuant to the Stipulated Settlement, and "enhancing" those constraints. None of this is required by the Stipulated Settlement, particularly where, as here, all of the SPAS alternatives are designed to have no more than 153 passenger gates. The comment does not identify any significant environmental impact of the SPAS that would be reduced or avoided by continuing the gate constraints beyond 2020, any specific means of enhancing the constraints, or any

impact that would be reduced by doing so. Note that in addition to limiting the gate count to 153, the SPAS project includes an amendment to Section 7.H of the Specific Plan (applicable to all alternatives, including the existing LAX Master Plan) that would provide opportunities for adjustments if LAX reaches 75 or 78.9 MAP earlier than expected. This amendment, set forth in detail in Chapter 7 of the Preliminary LAX SPAS Report, would address potential variations in passenger projections over time, first by requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and, second, by requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 79.9 MAP.

SPAS-AL00007-57

Comment:

Airfield Balance. In the NOP, LAWA indicates that under the LAX Master Plan, one of its goals is to "provide a better balance in operations between the North Airfield and the South Airfield." Petitioners support this goal and urge LAWA to conduct a full analysis of whether and to what extent each of the proposed. SPAS alternatives would help achieve better airfield balance. Petitioners agree that total flight operation balance can lead to less operational crowding, which is good for all.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. As identified in Section 1.2.1 of the SPAS Draft EIR, an objective of the SPAS effort is to "provide north airfield improvements that support the safe and efficient movement of aircraft at LAX". Runway 24L is not long enough under existing conditions to accommodate some fully-loaded departing aircraft, resulting in higher utilization of the south airfield. (Section 2.3.1 of the SPAS Draft EIR.) As explained in Section 4.7.2 and Table 4.7.2-8 of the SPAS Draft EIR, some of the SPAS alternatives propose changes to the north airfield that will accommodate larger aircraft. These changes will alleviate the problem of having to taxi large aircraft to the south complex, thus improving airfield balance. (See page 5-80 of the Preliminary LAX SPAS Report.) This is especially important given that operation of large aircraft (i.e., ADG V and VI) is expected to increase substantially by the year 2025. (See Table 8 and Table 12 of Appendix F-1 of the Preliminary LAX SPAS Report).

Please see Section 1.2.1 of the SPAS Draft EIR for a discussion of the problem that "the primary north airfield departure runway (6R/24L) is too short for certain larger aircraft (e.g., fully-loaded Boeing 747-400) on long-haul flights, requiring those aircraft to taxi to the south airfield, resulting in less efficient operations and disproportionate environmental impacts." As discussed and depicted in Section 2.3.1 of the SPAS Draft EIR, each of the SPAS airfield alternatives (Alternatives 1 through 7) includes an extension to Runway 6R/24L to help balance long-haul departures between the north and south airfields. Additionally, see Table 1-3 of the SPAS Draft EIR for a preliminary assessment of the alternatives and whether or not an alternative would promote airfield balance. Please also refer to Response to Comment PC00130-511 for additional discussion regarding airfield balance.

SPAS-AL00007-58

Comment:

Regional Approach. Petitioners strongly support a regional approach to accommodating passenger and cargo aviation demand throughout Southern California. Because the area around LAX is fully developed, and because we must reduce vehicle miles traveled to improve air quality, decrease greenhouse gases, and increase productivity, a regional solution to serving aviation demand is essential. The regional approach, which is fully supported by the Southern California Association of Governments, must be a key component of everything LAWA does, including in the SPAS process. LAWA should vigorously pursue accommodating aviation demand at Palmdale and Ontario, and work aggressively with other airport operators and local governments to advance the regional approach.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports the regionalization of air travel demand in Southern California. As also described therein, the LAX Specific Plan amendment proposed as part of SPAS further supports such regionalization.

SPAS-AL00007-59

Comment:

DEIR Public Review Period. The NOP indicates that LAWA intends to provide just 45 days for public review and comment on the Draft SPAS EIR. In light of the complexity of this project and LAWA's tendency to produce lengthy CEQA documents, Petitioners anticipate that 45 days will not be sufficient.

Response:

This comment is noted. LAWA provided a 75-day review period for the SPAS Draft EIR. Section 21091(a) of the Public Resources Code requires that the review period for a Draft EIR that is submitted to the State Clearinghouse for review shall be at least 45 days. (See also State CEQA Guidelines Section 15105.) The review period for the SPAS Draft EIR provided an additional 30 days for public comment beyond the requirements of CEQA.

SPAS-AL00007-60

Comment:

The following are the comments of the Cities of Inglewood and Culver City ("Cities") concerning the Revised Notice of Preparation ("Revised NOP") for the Los Angeles International Airport ("LAX") Specific Plan Amendment Study ("SPAS").' The Revised NOP commences the environmental review of proposed alternatives to the implementation of five development projects at LAX, including a Ground Transportation Center ("GTC"), Automated People Mover ("APM") from the GTC to the Central Terminal Area ("CTA"), and associated on-site road improvements; demolition of Terminals 1, 2 and 3; and reconfiguration and separation of Runways 6L/24R and 6R/24L on the North Runway Complex (these activities, taken together will be referred to as "Project"). Cities regard the Project as a component of a more comprehensive expansion plan, including, but not limited to, construction of Midfield Satellite Terminal, a Crossfield Taxiway, and redesign and addition of gates at the Tom Bradley International Terminal ("TBIT").

1 Cities of Inglewood and Culver City are Petitioners and Settling Parties in the case of El Segundo, et al. v. City of Los Angeles, et al., Riverside County Superior Court Case No. RIC 426822.

Response:

Comments SPAS-AL00007-60 through SPAS-AL00007-75 provide comments on the 2010 NOP prepared for the LAX Specific Plan Amendment Study. All of these comments were considered prior to preparation of the SPAS Draft EIR. Responses to specific comments are provided below.

SPAS-AL00007-61

Comment:

As a threshold issue, please be advised that Cities respond to Question No. 2, Revised NOP, p. 2, as follows: Cities do not fall within the category of "responsible agency" or "trustee agency," as those terms are defined in 14 Cal.Code Regs. §§ 15096, 15381, and 15386.2

2 CEQA's implementing regulations will be referred to throughout these comments as "CEQA Guidelines."

Response:

The comment is noted.

SPAS-AL00007-62

Comment:

Please be further advised that the following comments concerning significant environmental issues raised by the Project, alternatives and mitigation measures are necessarily preliminary, due to the attenuated character of the Revised NOP. Cities therefore reserve their right to supplement these comments in response to future environmental documents.

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00007-63 through SPAS-AL00007-75 below.

SPAS-AL00007-63

Comment:

I. THE REVISED NOP STILL CONTEMPLATES "TIERING" OF THE NOP ON THE "APPROVED MASTER PLAN" WHICH WILL RESULT IN IMPROPERLY ATTENUATED ENVIRONMENTAL REVIEW.

The Revised NOP continues to state, despite Cities' prior comments on the Original NOP concerning the pitfalls of this approach, that the SPAS EIR will be a Supplemental EIR tiered from the LAX Master Plan EIR (NOP, p.5), "providing new or revised analyses of the environmental impacts specific to the alternatives associated with the Yellow Light Project options. . ." Moreover, LAWA, in its NOP for the Crossfield Taxiway Project (which was published contemporaneously with the publication of the Original NOP), justified expedited environmental review on the premise that adequate environmental review was already completed during the prior Master Plan environmental review. While the Legislature has directed local agencies to "tier" EIRs whenever feasible, the utility of tiering is limited to those situations where the individual projects are consistent with the larger project such as the approved Master Plan project which has already been environmentally reviewed. "[T]iering is a process by which agencies can adopt programs, plans, policies, or ordinances with EIRs focusing on 'the big picture,' and can then use streamlined CEQA review for individual projects that are consistent with such . . . [first tier decisions]. . ." Koster v. County of San Joaquin, 47 Cal.App.4th 29, 36 (1996). [Emphasis added.]

In this case, despite the fact that the "approved Master Plan" remains in place, many of its most salient features, such as the Ground Transportation Center ("GTC"); closure of the CTA to surface traffic; and movement of Runway 6R/24L 340 feet to the south, necessitating the restructuring of Terminals 1 through 3, are being replaced by the Projects currently being evaluated under this Revised NOP. Thus, because of the proposed amendments, the components of the proposed Airport Master Plan differ materially from the project originally evaluated in the approved Master Plan and cannot serve as a "baseline" for analysis. As an example, the proposed movement of Runway 6R/24L 400 feet north is a radical departure from the movement contemplated in the Master Plan 340 feet south, possibly impacting, among other things, the size and location of the noise contours and the Runway Protection Zone ("RPZ").

Moreover, the inclusion of alternatives reflecting the Yellow Light Projects, the original components of the Airport Master Plan, does not rectify the problem. The Yellow Light Projects are "yellow light" because the Settlement between the parties in the above-referenced action contemplates their replacement.3 Therefore, the yellow light projects cannot serve as the basis for either the "Existing Condition Alternative," or the "No Project Alternative" because the Settlement ensures that they do not exist in the Airport Master Plan now, and that they will not in the future.

In short, the significant differences between the "No Project/No SPAS Alternative (Approved Master Plan)," and the actual "No Project Alternative" raises the question of what is left of the original Master Plan, in terms of viable project alternatives, to make tiering an appropriate option. Given these circumstances, the Cities question the appropriateness of the "tiering" of the Revised NOP projects upon the Master Plan EIR.

3 See, e.g., Settlement, § V.D.1. "Potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address . .." [Emphasis added.] and Settlement, § V.D.3 "Potential environmental impacts that could result from replacement of the Yellow Light projects with the Alternative Projects, and potential mitigation measures that could provide a comparable level of mitigation to that described for the Yellow Light Projects . . ." [Emphasis added.]

Response:

Much of the content of this comment is similar to that of comment SPAS-AL00007-41; please refer to Response to Comment SPAS-AL00007-41. The latter portion of the comment suggests that implementation of the Yellow Light Projects, as proposed in the LAX Master Plan, cannot be considered as the basis "for either the 'Existing Conditions Alternative,' or the "No Project Alternative.'" Please see Response to Comment SPAS-AL00007-7 for the reasons why this implication is incorrect, including the fact that the Yellow Light Projects remain part of the approved LAX Master Plan. The Stipulated Settlement does not prohibit implementation of the Yellow Light Projects, but rather the Stipulated Settlement and the LAX Specific Plan require a Specific Plan Amendment Study prior to seeking an LAX Plan Compliance determination for any of the Yellow Light Projects.

SPAS-AL00007-64

Comment:

II. THE PROJECT DOES NOT CREATE CONDITIONS THAT ENCOURAGE AIRLINES TO GO TO OTHER AIRPORTS IN THE REGION.

Cities submit that the Revised NOP contemplates projects which, when taken together, defy the Settlement's mandate that the SPAS will, among other things, "creat[e] conditions that encourage airlines to go to other airports in the region." Settlement, § V.C. As an example, the Revised NOP acknowledges that the most extreme alternatives for the North Airfield reconfiguration, and particularly the 400 foot north alternative, are explicitly aimed at "accommodat[ing] the largest aircraft types currently in service and anticipated for the future (Group V and Group VI aircraft) . . ." Revised NOP, p. 6, by creating a "Modified Group VI airfield," Id., which can operate the largest aircraft models substantially without operational restrictions. By doing so, Los Angeles World Airports ("LAWA") staff is overtly setting the stage for the exacerbation of the outflow of airline traffic and passengers from other LAWA operated airports, particularly Ontario International Airport ("ONT"), and into LAX.

ONT has lost 22 years of traffic growth since 2007, a loss of $400 million to the Inland Empire economy and more than 8,000 jobs. Moreover, airlines are continuing to downsize ONT and it lost its last international passenger flight in February, 2010. Certainly, part of the problem can be attributed to the current state of the national economy, but by no means all, as other airports in the region such as Palm Springs, Long Beach and John Wayne actually gained passengers during the period 2000-2009. While passenger traffic at ONT declined 27.7% between the years 2000 and 2009, LAX itself lost comparatively fewer passengers at 9%.

The best explanation lies in ONT's cost structure when compared with that of LAX and surrounding airports, as well as LAWA's de-emphasis on encouraging growth. For example, ONT's airline costs per passenger are higher than at any other secondary airport in Southern California or the United States (the second highest airport costs for Southwest Airlines after New York's LaGuardia). Moreover, L.A.'s Living Wage Ordinance for airport workers add significant cost burden to airlines serving ONT.

Equally important is the LAWA staff's emphasis on supporting LAX. When ONT lost its last international passenger flight, LAWA staff publicly stated that ONT would not receive international flights in the future. In addition, L.A. Airport Commissioners have publicly spoken on the need to make LAX the priority for restoring passenger traffic to the region. To add insult to injury, no credible marketing plan has been introduced for ONT or airports under LAWA sponsorship other than LAX. In 2010, for example, LAWA will spend $6.4 million marketing LAX, but only $450,000 marketing ONT.

This trend, and its encouragement by the dramatic reconfiguration of the North Airfield, has impacts not only for the Inland Empire, but for residents living around LAX as well. While the Settlement requires that the SPAS, among other things, "identify specific plan amendments that . . . minimiz[e] environmental impacts on surrounding communities," Settlement § V.C., it is clear that the dramatic reconfiguration of the airfield necessary to accommodate Category VI aircraft will affect the size and location of the LAX noise contours, moving them north and east; potentially displace overflight on approach to the north; and realign Runway Protection Zones at each end of the North Airfield runways, causing additional, hitherto unanalyzed constraints on land use in communities to the north and east.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H further supports such regionalization.

Topical Response TR-SPAS-REG-1 specifically discusses the status of LAWA's management initiatives and marketing efforts for the LA/Ontario International Airport. The objectives of such initiatives are specifically targeted towards reducing expenses, increasing passenger traffic, and increasing airline activity at ONT. LAWA and executive management of the City of Los Angeles have implemented, and will continue to evaluate and pursue, numerous measures relative to increased stability and growth of ONT. Such measures are intended to enhance the viability and attractiveness of ONT as a preferred airport for passengers and airlines within the Southern California regional airport system. However, the topical response points out that even though LAWA controls both ONT and LAX, LAWA cannot force passengers or airlines to utilize one airport over the other.

The comment on the 2010 Revised NOP does not accurately reflect the discussion presented in the subject document. The 2010 Revised NOP does not state or imply that "the most extreme alternatives for the North Airfield reconfiguration, and particularly the 400 foot north alternative, are explicitly aimed at 'accommodat[ing] the largest aircraft types currently in service and anticipated in the future (Group V and Group VI aircraft)…'" The text that is quoted by the commentor from page 6 of the Revised NOP is an excerpt from the discussion of the problems that the north airfield reconfiguration was designed to address, which describes how the north airfield design under the approved LAX Master Plan was intended to address the issue of meeting FAA design standards for ADG V and VI aircraft. The full text surrounding the subject excerpt is as follows:

"The North Airfield configuration set forth in the approved LAX Master Plan was designed to accommodate the largest aircraft types currently in service and anticipated for the future (Group V and VI aircraft), reduce the risk of runway incursions, enhance the safety and efficiency of aircraft operations at LAX, and provide a better balance in heavy aircraft operations between the North Airfield and the South Airfield. The North Airfield configuration set forth in the approved Master Plan would achieve these goals by relocating Runway 6R/24L 340 feet to the south of the existing runway centerline in order to accommodate a 75-foot-wide centerfield taxiway between Runway 6L/24R and Runway 6R/24L with 520 feet separation between each of the runway centerlines and the new taxiway centerline." As described in Section 2.2 of the SPAS Draft EIR, one of the objectives of the SPAS project is to provide north airfield improvements that support the safe and efficient movement of aircraft at LAX, which includes, among other things as listed on page 2-2 of the SPAS Draft EIR, LAWA's desire to provide airfield improvements that are consistent with FAA design standards for all-weather operation of ADG V and VI aircraft currently in service and anticipated for the future at LAX. As described in Section 2.3 of the SPAS Draft EIR, a broad range of airfield improvement alternatives was developed for evaluation in the SPAS Draft EIR, each of which responds differently to meeting that objective and only one of which (Alternative 5) fully meets that objective.

The commentor goes on to state that by creating a Modified Group VI airfield, which "can operate the largest aircraft models substantially without operational restrictions" LAWA staff is "overtly setting the stage for the exacerbation of the outflow of airline traffic and passengers from other LAWA operated airports, particularly Ontario International Airport ('ONT'), and into LAX." Aircraft Design Group (ADG) VI aircraft for commercial passenger service is currently limited to only the Airbus A380 and Boeing

747-8, with the A380 having been used for scheduled passenger service since October 2007 and 747-8 just now starting to be used for scheduled passenger service. To date, scheduled passenger service using ADG VI aircraft has been limited to long-haul international flights, especially to and from Asia, Australia, New Zealand, and, more recently, Europe. Providing airfield improvements at LAX that meet FAA design standards for ADG VI aircraft, which would alleviate the need for special operational procedures by airport operations staff and FAA air traffic control tower when a ADG VI aircraft in arriving, taxiing, or departing on the north airfield, is very unlikely to draw passenger activity away from LAWA's other airports such as LA/Ontario International Airport and Van Nuys given that the market segment likely to be using such aircraft (i.e., long-distance international carriers at major airports offering a variety of services and connecting flights) are currently not serving those airports to begin with and/or are not likely to be candidates for new service.

Regarding minimization of impacts, comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. As noted above, the SPAS Draft EIR includes and addresses a broad range of alternatives pertaining to improvements for the north airfield, including several options for relocation of runways. Chapter 4 provides a comprehensive analysis of the environmental impacts and mitigation measures associated with each option, including, but not limited to, aircraft noise impacts with changes in noise contours evaluated (see Section 4.10.1) and aircraft safety including runway safety areas (RSAs), protection zones (RPZs), and FAR Part 77 imaginary surfaces (see Section 4.7.2), and land uses in communities around LAX (see Section 4.9).

SPAS-AL00007-65

Comment:

III. THE "REVISIONS" TO THE NOP APPEAR LITTLE MORE THAN JUSTIFICATIONS FOR "PRE-COMMITMENT" TO THE MOST EXTREME ALTERNATIVE(S) FOR NORTH AIRFIELD RECONFIGURATION.

Agencies may not "pre-commit" to project approval because "[a] fundamental purpose of [CEQA review] is to provide decision-makers with information they can use in deciding whether to approve a proposed project . . ." Laurel Heights Improvement Association v. Regents of the University of California, 47 Cal.3d 376, 394 (1988) [emphasis in original]. Here, with the exception of some prefatory comments, a substantial component of the changes memorialized in the Revised NOP go to justify adoption of the most draconian alternatives proposed for the reconfiguration of the North Airfield.

Response:

Section 3.1.1 of the 2010 SPAS NOP factually describes existing conditions related to the north airfield, describes the problems the north airfield reconfiguration in the LAX Master Plan was designed to address, and presents six reconfiguration options. There is nothing in the 2010 SPAS NOP or the SPAS Draft EIR to suggest that LAWA preferred one reconfiguration option over another, or that LAWA was pre-committed to any of the options. Please also see Response to Comment SPAS-AL00007-67 below.

SPAS-AL00007-66

Comment:

First, it should be noted that the Project's five components still actually boil down to two: (1) the North Airfield Reconfiguration; and (2) the proposed GTC. This is because the APM and on-site road improvements are necessitated by, and part and parcel of, the proposed GTC. It also appears, according to the description of the various components and their alternatives in the Revised NOP, that the APM and on-site road improvements would only occur for the purpose of linking the GTC and CTA. Thus, if the GTC were not built (the existing condition), the ancillary transportation improvements would not be necessary.

In addition, the alternatives relating to the demolition of Terminals 1 through 3 are constrained to "yes" or "no." As, under the express terms of the Settlement, alternatives to the GTC must be found and

evaluated, there is, in reality, no "yes" option, because such an option would effectively obliterate 30% of the airport's terminal capacity, without any potential replacement.

Response:

The content of this comment is essentially the same as comment SPAS-AL00007-42; please see Response to Comment SPAS-AL00007-42.

SPAS-AL00007-67

Comment:

Moreover, the NOP revisions appear to be largely aimed at justifying the most extreme alternative for reconfiguration of the North Airfield. On the one hand, the Revised NOP dismisses the conclusions of the North Airfield Safety Study ("Safety Study") regarding the purported contribution of the Project to airfield safety.4 While it is true that the Safety Study did find that the existing runway configuration already provides a high level of safety, it went on to state that the Project could not be justified on safety grounds.

Apparently, at least partially relinquishing the safety justification, the Revised NOP emphasizes instead the attributes of a "Modified Group VI airfield . . designed to accommodate the new generation of wide-bodied airplanes that began to operate at LAX in 2008," Revised NOP, p. 6. The rationale articulated in the Revised NOP is that "the North Airfield configuration set forth in the approved LAX Master Plan [movement of Runway 6L/24R 340 feet south] was designed to accommodate the largest aircraft types . . . reduce the risk of runway incursions, enhance the safety and efficiency of aircraft operations at LAX, and provide a better balance in heavy aircraft operations between the North Airfield and the South Airfield," Revised NOP, p. 6.

In taking that position, the Revised NOP ignores the data arising from the first four years of the Specific Plan Amendment Study process, in which Petitioners participated, and during which it was determined that less extreme alternatives such as movement of Runway 6L/24R 100 feet to the north could also accommodate centerline taxiway and other airfield improvements, Revised NOP, p. 6, increase the length of Runway 24L, Id., and, thus, also reduce the risk of runway incursion, enhance safety and efficiency of aircraft operations and provide a better balance between runway complexes.

4 "Completion of LAX North Airfield Safety Study (February 19, 2010), which found that, although the current north airfield configuration provides a high level of safety, changes to the configuration by further separating the runways could create even greater safety and might significantly reduce airport congestion during peak hours." Revised NOP, p. 4.

Response:

The project addressed in the SPAS Draft EIR is the SPAS, including the range of alternatives addressed therein (see Section 1.2 of the SPAS Draft EIR). The North Airfield Safety Study (NASS) does not address the SPAS project; its purpose was to "inform decision makers on the scope and severity of operation safety problems of the north airfield and a range of potential solutions." (See Section 4.7.2 of the SPAS Draft EIR for additional discussion of the NASS.) Note also that the NASS represents a subjective value judgment on the importance of reducing the risk of a fatal runway collision, which is not shared by the FAA, the federal agency responsible for the safety of civil aviation.

The alternatives addressed in the SPAS Draft EIR include the concept of relocating Runway 6L/24R 100 feet to the north, presented as Alternative 6, as well as several other options for runway and taxiway improvements. An evaluation of airfield safety considerations associated with each of the airfield improvement options (i.e., Alternatives 1 through 7) is presented in Section 4.7.2, the results of which are summarized in Table 1-12 of the SPAS Draft EIR. The ultimate determination of whether to select one of the SPAS alternatives and the rationale for such a determination is left to the decision-makers. This comment will be provided to the decision-makers for their review prior to making a decision.

SPAS-AL00007-68

Comment:

In summary, given LAWA's apparent continuing dedication to the attributes of the Project set forth in the approved Master Plan, and reconfirmed in the Original NOP, it appears from the Revised NOP that the Project has fallen victim to the flaw of "pre-commitment" that will render the EIR based on it, inadequate.

Response:

Please see Response to Comment SPAS-AL00007-65, which demonstrates that LAWA was not pre-committed to a particular alternative.

SPAS-AL00007-69

Comment:

IV. THE EIR'S CUMULATIVE IMPACT ANALYSIS SHOULD, AT MINIMUM, INCLUDE ALL PROJECTS PLANNED OR RECENTLY IMPLEMENTED AND NOT INCLUDED IN THE SPAS.

"The agency may prepare one EIR for all projects, or one for each project, but shall in either case comment upon the cumulative effect," CEQA Guidelines § 15165. "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects." CEQA Guidelines § 15355(b).

Here, the synergistic impacts of the various projects is beyond question. The Crossfield Taxiway is a necessary component of access to and from the North Airfield. Similarly, the new Midfield Satellite Terminal, and the reconstruction and addition of gates at the TBIT are intimately related to the changes in the North Airfield complex, as the new, associated taxiway system appears to encourage expedited access from the North Airfield complex, without which the North Airfield complex would become a victim of the same airfield gridlock that LAWA now purports to foresee for the whole airport if the Project is not implemented.

It is beyond dispute that the complex of projects currently being implemented or contemplated in the Revised NOP are "closely related" to other "present", or, at minimum, "reasonably foreseeable future" projects such as the Midfield Satellite Terminal and the Crossfield Taxiway. Their collective scope, however, requires more than a simple "comment." As the projects were not evaluated as part of the same project, substantially the same attention should be paid to their impacts in the cumulative impacts analysis. Absent the requisite attention to the collective effects of the myriad of projects that are or will shortly be implemented to enhance "throughput rate", i.e., capacity, FAA Advisory Circular 150/5060-5, page 1, on the LAX airfield, the EIR will not adequately disclose the Project's capacity enhancing potential and concomitant environmental impacts.

Response:

This comment is substantially the same as Comment SPAS-AL00007-44. Please see Response to Comment SPAS-AL00007-44.

SPAS-AL00007-70

Comment:

V. THE PROPOSED MOVEMENT OF RUNWAY 6L/24R 400 FEET NORTH HAS ADDITIONAL CAPACITY AND NOISE ENHANCING POTENTIAL.

The Revised NOP, after more than five years of discussion of the Specific Plan Amendment, at this late date reveals an entirely new set of alternatives for the North Airfield Reconfiguration that include an even more extreme alternative than the movement of Runway 6L/24R 340 feet north in the Original

NOP. This proposed increased runway separation will have a concomitantly increased impact on surrounding communities.

Response:

As noted on page 6 of the 2010 NOP, north airfield reconfiguration options then under consideration had been modified since the 2008 NOP in response to changed conditions and additional planning efforts. These north airfield reconfigurations were further refined when the alternatives were finalized for inclusion in the SPAS Draft EIR. The 2010 NOP did not include an entirely new set of alternatives for the north airfield reconfiguration. Rather, the 2010 NOP included three of the same north airfield reconfigurations that were included in the 2008 NOP in addition to three new reconfigurations. It should be noted that the "more extreme alternative" to which the commentor refers (i.e., movement of Runway 6L/24R 400 feet north) was not carried forward for analysis in the SPAS Draft EIR. Rather, the most northerly movement of Runway 6L/24R considered in the SPAS Draft EIR was 350 feet north, only 10 feet farther north that the 340 north option included in the 2008 NOP. The concept development process is documented in Chapter 5 of the Preliminary LAX SPAS Report. The impacts of all of the SPAS alternatives were fully evaluated in the SPAS Draft EIR, including impacts associated with the various configurations of the north airfield. As demonstrated in the SPAS Draft EIR, the impacts associated with the various north airfield configurations cannot be uniformly characterized. In some cases, alternatives with increased runway separation would have greater impacts than lesser separations, in some cases, alternatives with increased separation would have lesser impacts, and in some cases, impacts would be similar regardless of the alternative.

SPAS-AL00007-71

Comment:

Most notably, the reconfiguration will almost certainly affect the size and location of the noise contours, moving them north and east, beyond the scope of the relatively extensive 1992 noise contour used by LAWA for the determination of sound mitigation construction funding for Inglewood.

Response:

The content of this comment is similar to comment SPAS-AL00007-48; please see Response to Comment SPAS-AL00007-48.

SPAS-AL00007-72

Comment:

The reconfiguration may also displace overflights on approach to relocated Runway 6L/24R to the north thereby bringing increased noise impacts, as well as air quality and other impacts, not only to Inglewood but to Culver City as well.

Response:

The content of this comment essentially the same as comment SPAS-AL00007-49; please refer to Response to Comment SPAS-AL00007-49.

SPAS-AL00007-73

Comment:

Finally, the Revised NOP gives little attention to the potential impacts of the original impetus for the runway separation, i.e., to accommodate the New Large Aircraft ("NLA") which have a wingspan of 262 feet and carry up to 800 passengers.

Response:

The content of this comment is essentially the same as comment SPAS-AL00007-50; please refer to Response to Comment SPAS-AL00007-50.

SPAS-AL00007-74

Comment:

It should be noted that none of the figures in the Revised NOP depicting the options for reconfiguration of the North Airfield contain the accompanying Runway Protection Zones ("RPZ"). Depiction of RPZs is important because of the constraint on the use of land that falls within them. Specifically, FAA regulations require that RPZ property belonging to the airport be kept largely clear of structures in order to "enhance the protection of people and property on the ground." FAA Advisory Circular 150/5300-13, § 212. Moreover, to the extent that property within other jurisdictions such as Westchester falls within the RPZ, the ALUCP for LAX may dramatically constrain the use of such property by its owners, see, Cal. Pub. Util. Code § 21675(a).

Response:

The Runway Protection Zones (RPZ) under existing (baseline) conditions and under SPAS alternatives 1 through 7 are depicted in Figures 4.7.2-3 and 4.7.2-4 (baseline conditions) in Section 4.7.2.3 and Figures 4.7.2-6 through 4.7.2-19 (Alternatives 1 through 7) in Section 4.7.2.6 of the SPAS Draft EIR. Additionally, the types and quantities of parcels that fall within the RPZ, but are not within the Airport Property Boundary are identified in accompanying tables (Table 4.7.2-3 (baseline conditions) and Tables 4.7.2-9 through 4.7.9-15 (Alternatives 1 through 7)). As discussed in Section 4.7.2.6 and shown on the figures, residential uses are currently located within the RPZ east of Runway 6L/24R and would remain in the RPZ under Alternatives 2, 3, 4, and 7. Under Alternatives 1, 5, and 6, the RPZ would shift westward and residential uses would no longer be within the RPZ.

SPAS-AL00007-75

Comment:

In summary, the revised alternatives for runway reconfiguration in the Revised NOP are, in large part, damaging to Cities. Cities have, instead, offered, in partnership with co-Petitioners El Segundo and ARSAC, and continue to support, the alternative which allows movement of Runway 6L/24R 100 feet to the north. (See, Revised NOP, Figure 7). Petitioners offer this alternative in recognition of LAWA's need to facilitate operations on the airfield but with equivalent understanding that such improvements need not come at Petitioners' environmental expense. Movement of Runway 6L/24R 100 feet to the north will allow the same runway separation as now exists on the South Runway Complex, the current targeted recipient complex for NLA traffic; is sufficient to accommodate a center taxiway to enhance efficiency and expedite movement of the NLAs; and has been deemed "safe" by LAWA for that purpose. The 100 feet north alternative would, thus, allow precisely the same balance between the runway complexes as that articulated as a primary goal in the LAX Master Plan, § 1.1, Goal 7, while, at the same time, providing environmental mitigation to surrounding communities.

In short, the alternative that allows movement of Runway 6L/24R 100 feet to the north offers LAWA substantially the same benefits it sought for the South Complex, without either the adverse impacts or potential controversy that will unavoidably accompany the increased capacity, air and surface traffic, and environmental impacts attendant upon movement of Runway 6L/24R to the north in accordance with the most extreme alternatives proposed in the Revised NOP. Petitioners strongly urge that the alternative of moving Runway 6L/24R 100 feet to the north be adopted as the EIR's Preferred Alternative.

Cities appreciate this opportunity to comment and look forward to partnering with LAWA to implement a mutually acceptable and environmentally sensitive airport development.

Response:

The content of this comment is similar to comment SPAS-AL00007-52; please refer to Response to Comment SPAS-AL00007-52.

SPAS-AL00008 Fujioka, William T County of Los Angeles Chief Executive Office Operations and Budget 10/10/2012

SPAS-AL00008-1

Comment:

Thank you for the opportunity to submit written comments on the Specific Plan Amendment Study Draft Environmental Impact Report (SPAS Draft EIR) prepared by Los Angeles World Airports (LAWA). The County of Los Angeles supports the modernization of LAX and we are glad to provide these comments to assist in the process. Our complete comments are contained in the attached document. Below is a brief summary highlighting our key issues and questions for your consideration and response:

Response:

The comment is noted. Please see Responses to Comments SPAS-AL00008-2 through SPAS-AL00008-54 below.

SPAS-AL00008-2

Comment:

- Settlement compliance: As a signator to the Stipulated Judgment, the County is keenly interested in seeing, as part of this Draft EIR, a discussion that sets forth all of the environmental commitments contained in the Settlement Agreement and illustrates how each commitment is implemented in the proposed SPAS alternatives.

Response:

The comment is noted and is hereby part of the Final EIR, and will be forwarded to the decision-makers for their consideration prior to taking any action on the SPAS project. Environmental commitments in the Stipulated Settlement relevant to SPAS are reflected in the project objectives described in Section 2.2 of the SPAS Draft EIR. No further response is required because the comment does not raise any new significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)).

SPAS-AL00008-3

Comment:

- The Draft EIR should address a definitive project; selected alternatives do not fulfill the "Rule of Reason:" We believe that a definitive project description at the beginning is necessary to ensure that all environmental impacts of the project are analyzed to avoid a piecemeal approach, and to allow for meaningful public comment. These objectives are not achieved by discussing a group of alternatives and then selecting the project at the end of the process, allowing no remaining time for public input. Moreover, the approach is not consistent with the "Rule of Reason," wherein alternatives set forth in an EIR "shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project" per California Environmental Quality Act (CEQA) Guidelines §15126.6(c). This problem is evident in Draft EIR §7.1 which states that the significant unavoidable adverse impacts identified in the EIR (including direct impacts related to air quality, human health risk, traffic, noise, and land use) "pertain to all of the alternatives unless otherwise noted."

Response:

The SPAS Draft EIR's approach to the project description and alternatives was consistent with CEQA's requirements. Please see Response to Comment SPAS-AL00007-6, which explains why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. Chapter 2 of this Final EIR presents the LAWA Staff-Recommended Alternative, which was identified after receiving and

considering all comments on the SPAS Draft EIR. The description of the LAWA Staff-Recommended Alternative and the summary of its impacts is not significant new information, and all of the comments received on the SPAS Draft EIR, and the responses to those comments provided in Chapter 4 of this Final EIR, apply to the LAWA Staff-Recommended Alternative, which will be considered by the decision-makers when they deliberate, in a public process with public input, on whether to approve a particular SPAS alternative.

The SPAS alternatives evaluated in the SPAS Draft EIR reflect a reasonable range, consistent with the requirements of CEQA. The alternatives analyzed in the SPAS Draft EIR meet CEQA's "rule of reason," which governs the choice of EIR alternatives, in that they permit a reasoned choice and allow informed decision-making. (State CEQA Guidelines Section 15126.6(a) and Section 15126.6(f); City of Maywood v. Los Angeles Unified School District (2012) 208 Cal.App.4th 362, 419.) It is true that State CEQA Guidelines Section 15126.6(f) states that alternatives must be limited to those that avoid or substantially lessen the impacts of "the project." However, this Guidelines provision must be interpreted in light of the SPAS' approach to alternatives, in which the SPAS Draft EIR does not present a single preferred alternative. Rather, each of the SPAS alternatives includes certain features that could avoid or substantially lessen certain impacts of other alternatives that do not include these features.

Sections 1.2.2 and 2.3.1 of the SPAS Draft EIR identify the reasons for analyzing Alternatives 1 through 9. The extent to which each alternative would attain the objectives of SPAS is identified in Table 1-2 of the SPAS Draft EIR. Additionally, Chapter 5 of the Preliminary LAX SPAS Report describes the basis, nature, and characteristics of the early alternative concepts and the associated concept development process. The SPAS Draft EIR includes sufficient information about each alternative to allow meaningful evaluation and analysis. (State CEQA Guidelines Section 15126.6(d)). Table 1-4 of the SPAS Draft EIR provides a summary of the impacts of each alternative. Review of this table identifies the extent to which an alternative would avoid or substantially lessen any significant effects of another alternative. For some, but not all, environmental impact topics, none of the alternatives would avoid or lessen the significant impacts associated with the topic. In these cases, no feasible alternatives or mitigation measures have been identified that would avoid or lessen such impacts.

SPAS-AL00008-4

Comment:

- Passenger and gate provisions are now moot: Delays and weak economic conditions have largely rendered moot the passenger and gate provisions contained in the Settlement Agreement. Furthermore, gate limits in the FAA Record of Decision may conflict with the Settlement provisions, and it is unclear how inconsistencies would be reconciled.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-27; please refer to Response to Comment SPAS-AL00008-27.

SPAS-AL00008-5

Comment:

- Alternatives should be analyzed in terms of passenger capacity: It would be helpful for LAWA to present a graphic layout of gates or calculations supporting the stated ratio of passengers to gates. The Draft EIR should offer these data so that reviewers can confirm that any and all of the Master Plan alternatives conform to agreed-upon passenger limitations.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-27; please refer to Response to Comment SPAS-AL00008-27.

SPAS-AL00008-6

Comment:

- The Draft EIR should discuss the relationship between the Ground Transportation Center (GTC), Narrow Body Equivalent Gates and passenger capacity: The Draft EIR should discuss the passenger capacity of the GTC in Alternative 3 so that reviewers can gauge conformance of proposed alternatives to Million Air Passengers (MAP) limits in the Settlement.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-28; please refer to Response to Comment SPAS-AL00008-28.

SPAS-AL00008-7

Comment:

- The reconfigured terminals should be analyzed in terms of passenger capacity: As you know, the number of gates correlates directly with passenger capacity. Accordingly, the Draft EIR should identify the location of all gates and detail how aircraft gates will service passengers including remote gates, as well as address type of aircraft, hours of operation, layout and other pertinent factors.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-29; please refer to Response to Comment SPAS-AL00008-29. All of the SPAS alternatives are designed and analyzed for a practical capacity of 78.9 MAP, and provide no more than 153 gates at that capacity. (See Chapter 1 of the SPAS Draft EIR.)

SPAS-AL00008-8

Comment:

- Runway capacity increases should be defined for all alternatives: In order for readers to understand the aircraft and passenger serving capacity of alternatives, the airfield modeling data and a summary of the runway specific aircraft assignments should be provided for each alternative. The Draft EIR should also provide information about the passenger growth-inducing impact of increasing peak hour Instrument Flight Rules (IFR).

Response:

The comment summarizes the concerns expressed in more detail in comments SPAS-AL00007-4 and SPAS-AL00008-30; please refer to Response to Comment SPAS-AL00007-4 regarding runway capacity under each SPAS alternative; and Response to Comment SPAS-AL00008-30 regarding peak hour Instrument Flight Rules (IFR) operations. Please also see Response to Comment SPAS-AL00008-29 regarding considerations associated with characterizing the "practical capacity" of an airport.

SPAS-AL00008-9

Comment:

- 1995 MAP estimates are outdated: MAP estimates should be recalculated to account for changing economic conditions, technology, business models, and use of leisure time.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-31; please refer to Response to Comment SPAS-AL00008-31.

SPAS-AL00008-10

Comment:

- Significant adverse impacts to nine County intersections need to be mitigated: Individual agencies need to provide evidence where traffic mitigation measures are judged infeasible, or the measures must be funded and implemented. The County Department of Public Works does not agree that the Draft EIR adequately analyzes and discloses the impacts and appropriate mitigations for County intersections. The County requests that LAWA consult and work with its Public Work's engineering staff before finalizing the EIR.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-32; please refer to Responses to Comments SPAS-AL00008-32, as well as SPAS-AL00001-1, and SPAS-AL00009-1. CEQA does not require discussion of infeasible mitigation measures. As discussed under State CEQA Guidelines Sections 15126.4(a)(1) and (a)(5), "The EIR shall describe *feasible* measures…If the Lead Agency determines that a mitigation measure cannot be legally imposed, the measure need not be proposed or analyzed." (Emphasis added; see also Concerned Citizens of South Central Los Angeles v. Los Angeles Unified School Dist. (1994) 24 Cal.App.4th 826, 841.)

Los Angeles County, including the Public Works Department, has been given the opportunity to comment on the Notices of Preparation prepared for SPAS, as well as the SPAS Draft EIR. Los Angeles County submitted comments on the Notice of Preparation (see Appendix A of the SPAS Draft EIR), and the SPAS Draft EIR. (See comment letters SPAS-AL00001, SPAS-AL00008, SPAS-AL00009.) Please see Response to Comment SPAS-AL00008-32 for additional discussion of consultation with Los Angeles County.

SPAS-AL00008-11

Comment:

- Secondary traffic impacts should be studied in this Draft EIR: The Draft EIR should analyze overall system deficiencies caused by diversion of traffic from significantly impacted intersections to other routes.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-33; please refer to Response to Comment SPAS-AL00008-33.

SPAS-AL00008-12

Comment:

- Mitigation options are suggested: Additional traffic mitigation measures are suggested for Draft EIR consideration in order to mitigate the significant adverse impacts to County intersections.

Response:

The comment notes that additional traffic mitigation measures are suggested for consideration, at which the specific suggestions are presented later in comments SPAS-AL00008-34 through SPAS-AL00008-42; please refer to Responses to Comments SPAS-AL00008-34 through SPAS-AL00008-42.

SPAS-AL00008-13

Comment:

- Noise impacts need further study: The Draft EIR should show both model and measurement data for the 2009 baseline in order for readers to assess the difference between the two approaches. Further, a 3 decibel (dB) difference should not be discounted in the Draft EIR as less than significant.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-44; please refer to Response to Comment SPAS-AL00008-44.

SPAS-AL00008-14

Comment:

- Noise impacts on Lennox would be influenced by differential use of the north and south runways: Replacement of Terminals 1, 2 & 3 with linear concourse could increase pressure on the South airfield; the County requests that LAWA guarantee a semi-equal balance of north/south runway selection to protect Lennox from even greater noise impact.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-47; please refer to Response to Comment SPAS-AL00008-47.

SPAS-AL00008-15

Comment:

- Noise impacts on Lennox raise Environmental Justice concerns: Lennox, a minority community, is the only residential neighborhood around LAX with homes in the 75 dB Community Noise Equivalent Level (CNEL). Environmental justice aspects of this impact merit review under CEQA, including mitigation focused on regionalization and balanced airfield operations.

Response:

Please refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and other efforts, supports the regionalization of air travel demand in Southern California. As indicated therein, the potential LAX Specific Plan amendment to Section 7.H identified as part of SPAS further supports such regionalization. As indicated in Section 2.2 of the SPAS Draft EIR, one of the project objectives of SPAS is to improve airfield balance, especially with respect to improving the ability of the north airfield to accommodate the departure of large heavy aircraft such as Boeing 747-400 on long-haul flights, the majority of which currently operate on the south airfield. As described in Section 2.3, several of the SPAS alternatives - specifically, Alternatives 1, 2, 3, 5, 6, and 7, propose a 1,250 foot or greater extension on the east end of Runway 6R/24L, which is the primary departure runway for the north airfield, to better accommodate such aircraft and improve airfield balance. The improved ability for more aircraft to use the north airfield would reduce operations on the south airfield, which is directly west of Lennox.

Also, please note that CEQA does not require the SPAS EIR to include an environmental justice analysis. CEQA is concerned with physical impacts on the environment, such as whether and where the SPAS alternatives increase noise levels. It is not concerned with the social or economic status of the affected communities, or whether low income or minority communities are disproportionately affected by noise impacts. "Economic and social changes resulting from a project shall not be treated as significant effects on the environment." (State CEQA Guidelines Section 15131(a)). "[T]he question under CEQA is whether a project will affect the environment of persons in general, not whether a project will affect particular persons." (Eureka Citizens for Responsible Government v. City of Eureka (2007) 147 Cal.App.4th 357, 377.)

SPAS-AL00008-16

Comment:

- Air emissions from the 405 Freeway should be considered in the air quality assessment: Draft EIR background air quality analyses did not include readings along eastern boundary where the 405 Freeway is a major pollutant source; readings on eastern boundary should be included in the EIR.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-49; please refer to Response to Comment SPAS-AL00008-49.

SPAS-AL00008-17

Comment:

- Air quality mitigation measures in the Draft EIR are insufficient: LAWA should revise the Draft EIR to eliminate generalized air quality enforcement language and to incorporate state of the art mitigations.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-50; please refer to Response to Comment SPAS-AL00008-50.

SPAS-AL00008-18

Comment:

- Regionalization is the key to avoiding or reducing significant "unavoidable" adverse impacts: Requirements of the Settlement Agreement §VII and VIII have not been largely addressed by LAWA, although Draft EIR §6.2 demonstrates that regionalization is the key to mitigating the significant 'unavoidable' impacts listed in Draft EIR §7.1. LAWA should address this relationship and adopt regionalization to fulfill its CEQA obligation to mitigate significant impacts with feasible mitigation measures.

Response:

The commentor is incorrect in asserting that "Regionalization is the key to avoiding or reducing significant ‘unavoidable' adverse impacts" and that "Draft EIR § 6.2 demonstrates that regionalization is the key to mitigating the significant ‘unavoidable' impacts listed in Draft EIR § 7.1."

Section 7.1 of the SPAS Draft EIR identifies unavoidable significant impacts related to air quality, greenhouse gases, human health risk assessment, land use (as related to aircraft noise impacts), aircraft noise, construction equipment noise, cumulatively considerable contribution to combined noise levels (i.e., aircraft noise, road traffic noise, construction-related noise, and transit noise), on-airport transportation, off-airport transportation, and solid waste. Section 6.2 of the SPAS Draft EIR notes that a shift in future aviation activity from LAX to other airports in the region may reduce impacts specific to LAX, but also notes that such a shift in aviation activity to other airports in the region would be accompanied by a shift in such environmental impacts to the affected airports. The discussion in Section 6.2 also indicates that without knowing the location(s) and extent to which activity at LAX is diverted elsewhere in the region, it is speculative to conclude what those specific impacts would be and the extent of any shift. It is reasonable to anticipate, however, that redirecting flights from LAX to other airports in the region would not eliminate impacts related to air pollutant emissions, including greenhouse gas, noise, increased traffic generation, and solid waste generation, but rather would shift such impacts to elsewhere in the region.

Please also refer to Topical Response TR-SPAS-REG-1 regarding the fact that LAWA, through the LAX Master Plan, the SPAS process, and multiple other efforts, supports a regional approach to accommodating air travel demands in Southern California; however, LAWA does not have the ability or authority to force regionalization to occur.

SPAS-AL00008-19

Comment:

- The County strongly supports alternatives that connect LAX to the regional rail system: The lack of an adequate transit system is responsible for some of the most pressing environmental impacts on unincorporated communities around LAX. Alternatives that would provide connections between LAX

and the Crenshaw/LAX light rail line or the existing Metro Green Line Station will greatly improve airport access, and at the same time reduce traffic and noise concerns. The EIR should compare the benefits to traffic of transit and transportation mitigation options.

Response:

The comment summarizes the concerns expressed in more detail in comment SPAS-AL00008-53; please refer to Response to Comment SPAS-AL00008-53.

SPAS-AL00008-20

Comment:

Thank you once again for this opportunity to comment upon this critically important undertaking. The County looks forward to receiving responses to the comments offered herein. We know you are committed to good faith compliance to the requirements of CEQA and to terms of the Settlement Agreement, which will facilitate modernization of LAX, a goal that is shared equally by LAWA and the County of Los Angeles.

Response:

The comment is noted. A copy of the Final EIR will be sent to the County of Los Angeles at least 10 days prior to certification of the Final EIR. The Final EIR will also be available at www.laxspas.org.

SPAS-AL00008-21

Comment:

1.0 BACKGROUND AND SUMMARY

1.1 Background

During 2001, A.C. Lazzaretto & Associates was retained by the County of Los Angeles (County) to review and comment on the Draft Environmental Impact Statement/Environmental Impact Report (DEIS/EIR) prepared for Los Angeles World Airport's (LAWA) Proposed Los Angeles International Airport (LAX) Master Plan. The 2001 Draft EIS/EIR addressed three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan.

A.C. Lazzaretto & Associates assembled a team of environmental review experts to review the document for consistency and accuracy. Working in collaboration with County staff, a detailed comment letter was prepared and submitted to LAWA on 28 June 2001. Thereafter, in response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, LAWA suspended work on the earlier EIS/EIR to develop a fourth alternative (Alternative D, the Enhanced Safety & Security Plan). LAWA issued a Supplement to the Draft EIS/EIR for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process. The Supplement offered no response to comments submitted on the 2001 DEIS/EIR.

Response:

The comment summarizes some of the background associated with the LAX Master Plan EIR and does not pertain to the SPAS Draft EIR. As a point of clarification, however, to the commentor's indication that the 2003 Supplement to the LAX Master Plan Draft EIR offered no response to the comments submitted on the 2001 LAX Master Plan Draft EIR: the Supplement was, by name and function, a supplement to the Draft EIR, which focused on the analysis of Alternative D that was added to the range of LAX Master Plan alternatives. The LAX Master Plan Final EIR published in 2004 provided written responses to all comments received on the 2001 Draft EIR and on the 2003 Supplement, consistent with the intent and requirements of CEQA.

SPAS-AL00008-22

Comment:

Following publication of the SDEIS/EIR, the County again retained A.C. Lazzaretto & Associates to review and comment on the revised document, and A.C. Lazzaretto & Associates in turn assembled the team of environmental review experts that had reviewed the 2001 document. The focus of this review was on document consistency, accuracy, and plan changes incorporated since release of the original Draft EIS/EIR. Results of the 2003 SDEIS/EIR review indicated that many of the concerns expressed in the County's earlier comment letter remained, particularly with respect to LAWA's unconvincing efforts to limit growth at LAX and strengthen the role of outlying airports; the County expressed these concerns in a comment letter submitted to LAWA during October 2003. LAWA thereafter prepared a Final EIS/EIR that restated contested points from the earlier 2001 and 2003 Draft EIS/EIR documents, with no substantive effort to respond to the many comments and questions raised by the County (as noted in a May 2004 comment letter directed to the Final EIS/EIR).

Response:

The comment summarizes some of the history associated with the LAX Master Plan EIR and the County's consultant's involvement in providing comments on the LAX Master Plan Draft EIR, which was subsequently finalized, ultimately certified as complete, and is considered adequate pursuant to the requirements of CEQA. The comment does not pertain to the SPAS Draft EIR.

SPAS-AL00008-23

Comment:

During August 2004, LAWA released two compromise plans regarding the LAX Master Plan process: the "LAX Plan" (referred to as the 'Consensus Plan' and developed through the efforts of Los Angeles City Councilwoman Cindy Miscikowski), and an alternative LAX Modernization Proposal ('Alternative Plan E-1, developed through the efforts of Councilman Bernard Parks). The County undertook a detailed review to determine the extent to which these plans would resolve seven long-standing concerns:

1. The need to establish a long-term cap on operations at LAX;
2. Affirmative steps to expand the regional airport system in tandem with LAX;
3. The obligation to mitigate impacts on Manchester Square related to environmental justice and neighborhood compatibility;
4. The incorporation of essential safety and security design features on and around the airport;
5. The pressing need to fast track transportation improvements that will remove airport traffic from local community roadways; and
6. Unambiguous commitments to comply with agreed-upon negotiating elements.

The compromise plans offered by Council Members Miscikowski and Parks both sought to resolve significant concerns associated with Master Plan Alternative D, as outlined in the Final EIS/EIR. However, neither plan assured that the concerns raised by the County Board of Supervisors would be resolved with respect to future development of LAX.

Response:

The comment summarizes some of the history associated with the LAX Master Plan EIR and the County's consultant's involvement in providing comments on the LAX Master Plan Draft EIR. The LAX Master Plan Final EIR was subsequently prepared and certified as being completed in compliance with CEQA. The comment does not pertain to the SPAS Draft EIR.

SPAS-AL00008-24

Comment:

In September 2004 LAWA released an Addendum to the Final EIR for the modernization of LAX. The Final EIR Addendum provided additional discussion pertaining to a proposed relocation and property

acquisition plan, environmental justice, air quality, a feasibility analysis of the three "Alternative E" proposals, and refinements to the Environmental Action Plan as well as refinements to the LAX Specific Plan for Alternative D. LAWA did not release the Addendum for public review or comment (both would be voluntary under CEQA), and the Los Angeles City Council thereafter certified the environmental documents and approved the project (Alternative D) on December 2004.

During January 2005 a number of lawsuits were filed challenging the City's CEQA approvals. Settlement discussions ensued in an effort to resolve concerns of the County and other agencies and organizations' while providing a clear pathway for LAWA to move forward with the Master Plan Process. The settlement process continued throughout 2005, and in February 2006 the final Judgment Pursuant to Stipulated Settlement (Settlement) was filed with the Superior Court of the County of Riverside.

The Settlement Agreement Recitals note that the "petitioners have long been concerned about the impacts of LAX operations on traffic, noise, human health risks and the quality of life in communities surrounding LAX, as well as the need to limit future growth at LAX through a broad regional effort to meet air transportation demand at other airports in the region." The introduction further notes that the Settlement Agreement is intended to serve in lieu of a court determination of the merits of the parties' claims, and the Court shall retain jurisdiction over enforcement of the mutual obligations specified in the Settlement Agreement.

Pursuant to the Settlement Agreement, the petitioners dismissed all causes of action against the City and LAWA challenging the Master Plan approvals. The City's responsibility under the Settlement Agreement is to minimize environmental impacts of LAX operations, which have been of long-standing concern. The SPAS Draft EIR, however, does not provide detailed analyses that clearly demonstrate to the petitioners how the proposed project alternatives would adequately address the long-standing environmental issues that underlie LAWA's Specific Plan and Settlement obligations.

1 The Petitioners included the cities of El Segundo, Inglewood and Culver City, the Alliance for a Regional Solution to Airport Congestion [ARSAC], and the County of Los Angeles.

Response:

The comment provides some background regarding the LAX Master Plan Stipulated Settlement Agreement not directly related to the SPAS Draft EIR. It then concludes with a statement that the SPAS Draft EIR does not provide sufficient detailed analyses showing how the SPAS alternatives would adequately address the long-standing environmental issues that underlie the LAX Specific Plan and Stipulated Settlement obligations. While this particular comment does not elaborate on what specific aspects of the SPAS Draft EIR analysis are lacking, it is assumed that those concerns are expressed elsewhere in the comment letter, in which case please see Responses to Comments SPAS-AL00008-1 through SPAS-AL00008-23 and Responses to Comments SPAS-AL00008-25 through SPAS-AL00008-54. Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA.

The SPAS Draft EIR includes and analyzes a broad range of airfield improvement alternatives, all of which include numerous LAX Master Plan commitments, LAX Master Plan mitigation measures, and SPAS mitigation measures to minimize impacts on surrounding communities. Table 1-6 in the SPAS Draft EIR lists those commitments and measures for each alternative, which are described in greater detail in Chapter 4 of the document.

SPAS-AL00008-25

Comment:

1.2 Summary

The County has examined the SPAS Draft EIR and project alternatives in terms of the commitments contained in the Settlement Agreement and in the Specific Plan. Provided below in Table 1 is a very brief synopsis of key elements of the Settlement Agreement. The County's comments are summarized thereafter (in Table 2) and presented in the sections that follow. Section 8 provides a Glossary of terms and acronyms used herein.

Table 1. SYNOPSIS OF STIPULATED SETTLEMENT REQUIREMENTS

SECTION	**SUMMARY OF SETTLEMENT AGREEMENT REQUIREMENTS**
I	***Settlement Overview***
II	***Dismissal of Actions, Release of Claims***
III	***Federal Aviation Administration (FAA) Determination regarding LAWA Expenditures***
IV	***Passenger Gate Provisions*** A. No more than 163 gates through 12/31/15 B1. Eliminate 2 Narrow Body Equivalent Gates (NBEG)/year up to 10 total, with a maximum of 153 gates through 12/31/20 B2. LAWA gets NBEG credits if gates are closed ahead of schedule B1 doesn't apply if fewer than 75 million air passengers (MAP) or if the Master Plan is revised to have 153 gates or less B1 doesn't apply during emergency or peak periods; a maximum of 30 days of peak periods each year B1 doesn't apply to general aviation, charter flights or similar operations, etc. LAWA to identify gates to be closed; petitioners may conduct inspections up to 4 times each year The West Satellite Concourse and Automated People Mover no longer classified as "yellow light' projects but as "green light" projects; Specific Plan to be amended with support of Petitioners
V	***SPAS Process*** Process to begin within 60 days of Settlement Agreement LAWA to complete Phase I within 6 months After Phase I is complete, LAWA has 24 months to prepare the SPAS (i.e., the current review) with all required environmental documentation needed to modernize LAX with service capacity up to 78.9 MAP SPAS to focus on Yellow Light issues, security, traffic, aviation, environmental impacts, mitigations LAWA to identify the study methodology per CEQA/NEPA requirements LAWA may simultaneously pursue non Yellow-Light projects while study underway Local agencies to be consulted during CEQA traffic analysis, selecting up to 15 added intersections for analysis, with mitigation for significant impacts and LAWA funding or fair share contribution Final Specific Plan to conform to FAA requirements Security issues to be assessed by experts Specific Plan Advisory Committee to be created (LA City, LA County, El Segundo., Culver City, Inglewood, the Alliance for a Regional Solution to Airport Congestion (ARSAC) and consulted at each major step of process
VI	***Funding of Mitigation Measures*** LAWA to fund Mitigation Measures provided FAA authorizes use of airport revenue funds
VII	***Regional Airport Working Group*** LAWA to invite FAA, the Southern California Assn. of Governments (SCAG), 5 Counties (LA, San Bernardino, Orange County, Ventura County, Riverside County) &airport operators to participate in regional airport working group working toward regional distribution of air traffic. Group shall (a) coordinate with Southern California Regional Airport Authority (or equivalent), (b) consider Regional Airport Authority JPA; and (c) support appropriate legislation; LA City to retain control of LAX, Ontario (ONT), Palmdale & Van Nuys airports.
VIII	***Regional Strategic Planning Initiative***

	LAWA to develop a Regional Strategic Planning (RSP) initiative to encourage expanded passenger & cargo use of Ontario & Palmdale airports, with annual reports & marketing strategies. First RSP due by 31 Dec 2006.
IX	***Outreach to Airport Neighbors*** LAWA to join working group with ARSAC & Council District 11 to recommend to the Board of Airport Commissioners (BOAC) how to better respond to neighbors' concerns and enhance relations. Key goals: • Effectively share info regarding LAWA & LAX Projects • Identify and work with community to address LAWA neighbors' concerns re: operations at LAX • Coordinate LAWA staff responsibilities for responding to complaints with LAWA staff & follow-up to verify that they've been addressed • Work with neighbors & elected officials to resolve community issues & review stakeholder liaison position.
X	***Avigation Easements*** LAWA to refrain from requiring avigation easements as precondition for funding mitigations Where acoustics are inadequate to achieve sound levels, (1) an easement may be required if the home was built after 1989, (2) If built before 1989 & exposed to 75+ Community Noise Equivalent Level (CNEL), LAWA may require an easement at Fair Market Value, and (3) easements must conform to Caltrans format Eligible homeowners must authorize & confirm sound installation & acknowledge extent of mitigation Prior easements and agreements are not a part of the settlement provisions. Future zone changes that create noise-impacted parcels shall have avigation easements in place
XI	***West Employee Parking Structure*** LAWA to prepare a project EIR for the West Employee Parking project before any approvals are granted.
XII	***LAX Connection to Green Line*** LAWA to study ways to connect LAX to Green Line; results due within 1 year of the Settlement (by February 2007).
XIII	***Enforcement***
XIV	**Extraordinary Financial Situations**
XV	**Miscellany**

Table 2. SUMMARY OF LOS ANGELES COUNTY COMMENTS ON SPAS DRAFT EIR

ISSUES	BRIEF COMMENT SUMMARY	SEE SECTION
The EIR should Show how alternatives achieve Settlement commitments	The Draft EIR needs to provide a detailed analysis that sets forth all of the environmental commitments in the Settlement and shows how each is implemented in the proposed SPAS alternatives.	**1.0**
Under CEQA an EIR must be Addressed to 'Project' (not a series of alternatives), and the selected Alternatives violate the Rule of Reason	The Draft EIR offers a "discussion of the objectives associated with completion of the SPAS process" without identifying a preferred alternative as the true project; this approach leads to an incomplete analysis and is improper under CEQA. Moreover, the nine Alternatives described in this EIR do not fulfill the 'Rule of Reason' because the significant adverse impacts are shared by all alternatives whereas the Rule of Reason calls for selection of alternatives that would avoid or lessen project impacts.	**2.0**
Passenger & Gate Provisions are Moot	Delays and economic conditions have rendered moot the Settlement passenger and gate provisions. Furthermore, gate limits in the FAA Record of Decision (ROD) may conflict with Settlement provisions; it is unclear how inconsistencies would be reconciled. All should be updated.	**3.0**
Alternatives Must be analyzed in terms of Passenger Capacity	LAWA has never presented a graphic layout of gates or calculations supporting the stated ratio of passengers to gates; the Draft EIR should offer these data.	**3.**[1]
Relationship of GTC, NBEG and MAP	Alternative 3 includes construction of a massive remote terminal (the GTC) that would replace terminals now located in the Central Terminal Area (CTA). The Draft EIR needs to discuss the passenger capacity of the GTC and the potential for the GTC to replace the need for NBEGs so that reviewers can gauge conformance of proposed alternatives to MAP limits and other terms and commitments contained in the Settlement.	**3.2**
The Capacity of Reconfigured Terminals should be Assessed	The reconfigured linear terminal in Alternative 3 introduces new variables into the assessment of passenger capacity. These variables must be explained and analyzed as part of the Draft EIR. It also needs to analyze how north airfield improvements will change runway usage and aircraft types, in turn impacting passenger capacities at LAX.	**3.3**

Runway Capacity Increases should be defined for all Alternatives	In order for readers to understand the aircraft and passenger serving capacity of the alternatives, the Draft EIR must include the airfield modeling data and a summary of the runway specific aircraft assignments for each alternative. The Draft EIR should also provide information about the passenger growth-inducing impact of increasing peak hour IFR. These data will facilitate assessment of the full passenger carrying capacity associated with each alternative.	**3.4**
1995 MAP estimates are now outdated	MAP estimates should be recalculated to account for changing economic conditions, technology, business models, and use of leisure time.	**3.5**
Significant Impacts to 9 County Intersections must be Mitigated	Individual agencies need to provide evidence where traffic mitigation measures are judged infeasible, or the measures must be funded and implemented	**4.1**
Secondary Traffic Impacts require Study in this DEiR	The Draft ER must analyze overall system deficiencies caused by diversion of traffic from significantly impacted intersections to other routes.	**4.[2]**
Suggested Traffic Mitigation Options	Additional measures are offered for Draft EIR consideration to mitigate significantly impacted County intersections.	**4.3**
Noise impacts require further study	The Draft EIR must show both model and measurement data for the 2009 baseline to assess the difference between the two approaches and identify potential biases, and a 3 decibel (dB) difference should not be discounted as less than significant.	**5.0 and 5.1**
Differential use of the north & south runways impacts noise levels in Lennox.	Replacement of Terminals 1, 2 & 3 with linear concourse could increase pressure on south airfield; County requests that LAWA guarantee a semi-equal balance of north/south runway selection to protect Lennox from even greater noise impact.	**5.2**
Environmental Justice requires Balanced Airfield Operations to reduce Lennox noise	Lennox, a minority community, is the only residential neighborhood around LAX with homes in the 75 dB CNEL. Environmental justice aspects of this impact merit review under CEQA, including mitigation focused on regionalization and balanced airfield operations.	**5.3**
Regionalization is a Viable means to reduce Noise and Air- Quality Impacts	Regionalization must be included in the mix of mitigation measures. Most of the measures in the current mitigation plan are based on voluntary actions, and the benefits from departure pattern changes, if approved, are negligible in terms of overall noise level reductions.	**5.4**
Air Quality impacts require further study in the Draft EIR	Draft EIR background air quality analyses omitted readings along the eastern boundary, where the 405 Freeway is a major pollutant source; readings on eastern boundary should be included in the background measurements provided in the Draft EIR.	**5.5**
Air Quality mitigations are weak	LAWA should revise the EIR to eliminate nebulous air quality	**5.6**

and outdated	enforcement language and to incorporate state of the art mitigations.	
Regionalization is key to reducing significant 'unavoidable' adverse project impacts	Requirements of Settlement §VII & §VIII have been virtually ignored by LAWA, Draft EIR §6.2 demonstrates that regionalization is key to mitigating the significant 'unavoidable' impacts listed in Draft EIR §7.1. LAWA must disclose this relationship and pursue Regionalization to fulfill its CEQA obligation to reduce significant impacts with feasible mitigation.	**6.1 and 6.2**
The County Strongly Supports Alternatives that Connect LAX to the Regional Rail System	The construction of the Crenshaw/LAX light rail line with a stop at LAX will greatly improve airport access, at the same time reduce traffic and noise concerns. Please provide clarification as to the Metro connections and/or improvements associated with each of the potential SPAS alternatives.	**7.0**

Response:

The comment is noted. The commentor's synopsis of the Stipulated Settlement requirements provided in Table 1 of the comment is noted; this synopsis does not require further response because it does not raise any significant environmental issues or address the adequacy of the environmental analysis included in the SPAS Draft EIR (Public Resources Code Section 21091(d); State CEQA Guidelines Section 15204(a)). Table 2 of the comment summarizes the concerns expressed in more detail in comments SPAS-AL00008-26 through SPAS-AL00008-54; please refer to Responses to Comments SPAS-AL00008-26 through SPAS-AL00008-54.

SPAS-AL00008-26

Comment:

2.0 DISCUSSION OF VARIOUS ALTERNATIVES AS THE "PROJECT" DOES NOT COMPLY WITH CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

The Draft EIR (DEIR), which is delineated a "Program EIR", describes the project as a "discussion of the objectives associated with the completion of the SPAS process; the specific characteristics of the SPAS alternatives considered and carried forward for evaluation in the EIR; and the SPAS alternatives considered, but rejected from further consideration." DEIR, p. 1-45.

Such a "discussion" does not qualify as a project under CEQA. Therein, a project is defined to mean "an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment." [Public Resources Code section 21065.] A "discussion of alternatives" can have no impact. It is the development of the alternative as a project that would have the impact. Moreover, Public Resources Code §21080.5 states that "the phrase 'carrying out or approving a project' shall include the carrying out or approval of a plan for a project that expands or enlarges an existing publicly owned airport by any political subdivision ..." But, the DEIR does not analyze a plan. In short, while a project can be a plan, it is not a discussion of various plans.

The DEIR is essentially a "project alternatives" section to an EIR required by CEQA Guideline §15126.6, which requires analysis of a reasonable range of alternatives to the project. A table in the DEIR: "presents a preliminary evaluation of the relationship between each project objective and each SPAS alternative. A more detailed evaluation of that relationship will be completed in conjunction with further evaluation of the alternatives through preparation of the Final EIR and during the public hearing process." (DEIR 1-26) Delaying the choice of the project among alternatives (as opposed to choosing an alternative as the initial project) does not comply with CEQA. While a project may be refined as part of the CEQA process (e.g., due to comments), it appears the intent is not to allow the initial choice of the project to be identified from the group of alternatives until the end of the process.

A definitive project description at the beginning is necessary to ensure that all environmental impacts of the project are analyzed, avoid a piecemeal approach, and allow for meaningful public comment. None of those objectives are achieved by discussing a group of alternatives and then picking the project at the end of the process, which allows no time left for public input. Moreover, the approach undermines the 'Rule of Reason' wherein alternatives set forth in an EIR "shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project". (CEQA Guidelines §15126.6(c)). This shortcoming is particularly evident in the list of significant unavoidable adverse project impacts. As identified in Draft EIR §7.1, the significant unavoidable impacts identified in the EIR 'pertain to all of the alternatives unless otherwise noted' and include direct impacts related to air quality, human health risk, traffic, noise, and land use.

In sum, selecting the project at the end of the process turns CEQA on its head. The problem of defining the project as a discussion of alternatives is highlighted by the following statement in the DEIR with respect to project impacts: "All of the SPAS alternatives would result in lower GHG emissions from aircraft operations ... than would occur in 2025 without the project." If the "project" as defined in the DEIR is a discussion, that statement makes no sense. Rather, it implies that the "project" is really one of the alternatives. Failure to identify which of the alternatives is the real project until the end detrimentally impacts the ability of the public to comment on the specific project. It also would preclude LAWA from relying on the EIR as a program EIR, as it seems to intend. Instead, once selecting its alternative, LAWA would then need to do a new EIR on that alternative as the master project in order to use or reply upon that EIR for the subsequent projects developed under that alternative.

- LAWA should revise the current SPAS DEIR so that the project incorporates a chosen set of improvements to meet the seven objectives set forth in pages 2-1 through 2-5 of the DEIR. LAWA should present all other options as alternatives to the proposed project.

Response:

The SPAS project is not a "discussion of various plans." The text on page 1-45 of the SPAS Draft EIR quoted by the commentor is quoted out of context. The subject text merely outlines the content of Chapter 2, stating that the chapter "provides a discussion of: the objectives associated with completion of the SPAS process; the specific characteristics of the SPAS alternatives considered and carried forward for evaluation in this EIR; and the SPAS alternatives considered, but rejected from further consideration," as well as a description of the intended uses of this EIR. Page 1-10 of the SPAS Draft EIR clearly states that "the proposed project is the LAX SPAS," and describes that the SPAS process "involves the identification and evaluation of potential alternative designs, technologies, and configurations for the LAX Master Plan Program that would provide solutions to the problems that the Yellow Light Projects were designed to address,… [and] includes identification of potential amendments to the LAX Specific Plan that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP while enhancing safety and security, minimizing environmental impacts on the surrounding communities, and creating conditions that encourage airlines to go to other airports in the region, particularly those owned and operated by LAWA."

Please see Responses to Comments SPAS-AL00007-6 and SPAS-AL00008-3 for an explanation of why the analysis of nine alternatives in the SPAS Draft EIR instead of a single proposed project was consistent with CEQA's requirements and facilitated public review of the alternatives. As noted in Response to Comment SPAS-AL00008-3, the SPAS alternatives evaluated in the SPAS Draft EIR reflect a reasonable range, consistent with the requirements of CEQA. (State CEQA Guidelines Section 15126.6.) Section 15126.6(a) of the State CEQA Guidelines states that "[t]here is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason." As indicated in Response to Comment SPAS-AL00007-6, the SPAS Draft EIR was prepared with a sufficient degree of analysis to provide the decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. (State CEQA Guidelines Section 15151.) All of the environmental impacts of each alternative are analyzed, and the "whole of the action" is analyzed. Presentation of the impacts of the nine SPAS alternatives allows for meaningful public comment. Nothing would be gained had LAWA selected one of the nine alternatives as the proposed project in the SPAS Draft EIR, and then evaluated the other options as alternatives to the proposed project.

The SPAS Draft EIR is not defective because it integrates the project description and the alternatives description into a single chapter. Rather, a lead agency is free to choose its own format for an EIR, as long as each Guidelines requirement is covered somewhere in the document. (State CEQA Guidelines Section 15120(a).)

Regarding the commentor's statement that, once it has selected an alternative, LAWA would need to do a new EIR on that alternative, the identification of a staff-recommended alternative by LAWA does not require recirculation of the SPAS Draft EIR, as the impacts of all of the SPAS alternatives were fully analyzed and disclosed in the SPAS Draft EIR. See Section 2.1.3 of this Final EIR for a discussion of the relationship between the LAWA Staff-Recommended Alternative and the SPAS Draft EIR. Selection of a staff-recommended alternative does not meet any of the criteria for recirculation outlined in Section 15088.5 of the State CEQA Guidelines. Similarly, should the decision-makers ultimately approve the LAWA Staff-Recommended Alternative or another alternative evaluated in the SPAS Draft EIR, additional CEQA review would not be required, because the conditions requiring preparation of a Supplemental or Subsequent EIR would not exist. (State CEQA Guidelines Section 15162.)

The commentor appears to recommend that the SPAS Draft EIR should have pre-committed to and described "the real project," without being open to the possibility that other feasible alternatives might be selected. However, EIRs should be prepared "as early as feasible in the planning process," and lead agencies may not take actions that could foreclose feasible alternatives before completing the CEQA process. (State CEQA Guidelines Section 15004(b).)

SPAS-AL00008-27

Comment:

3.0 SETTLEMENT SECTION IV PASSENGER GATE PROVISIONS HAVE BEEN RENDERED MOOT

A careful review of the Draft EIR points to the need for additional relevant environmental information about passenger service levels and gates. The information is required to verify that LAWA and the City of Los Angeles are fulfilling their obligations to the petitioners under the Settlement Agreement, and to fulfill the full disclosure requirements of CEQA. Moreover, it appears that economic conditions have rendered moot key provisions contained in Settlement §IV.

3.1 Airport passenger capacity should be analyzed and disclosed for each Alternative

The mainstay of the 2005 Settlement Agreement between petitioners and LAWA is a cap of 78.9 Million Air Passengers (MAP) through benchmark years 2015 and 2020 (when the Settlement expires.) The ostensible controlling factor is to limit LAX to using 163 aircraft passenger gates (153 by 2015 if 75 MAP is achieved). The following table from the LAWA website displays passenger levels starting in 1994.

Table 3: LAX PASSENGER LEVELS 1994-2011

Year	Departing	Arriving	Total
1994	**25,812,087**	**25,238,188**	**51,050,275**
1995	**27,234,353**	**26,674,870**	**53,909,223**
1996	**29,162,942**	**28,811,617**	**57,974,559**
1997	**30,313,688**	**29,828,900**	**60,142,588**

1998	**30,826,859**	**30,388,853**	**61,215,712**
1999	**32,298,944**	**31,980,627**	**64,279,571**
2000	**33,836,077**	**33,467,105**	**67,303,182**
2001	**31,007,930**	**30,598,274**	**61,606,204**
2002	**28,181,481**	**28,042,362**	**56,223,843**
2003	**27,544,606**	**27,438,232**	**54,982,838**
2004	**30,343,873**	**30,360,695**	**60,704,568**
2005	**30,649,324**	**30,840,074**	**61,489,398**
2006	**30,500,130**	**30,540,936**	**61,041,066**
2007	**31,244,261**	**31,194,322**	**62,438,583**
2008	**29,930,985**	**29,884,661**	**59,815,646**
2009	**28,288,211**	**28,232,632**	**56,520,843**
2010	**29,605,542**	**29,463,867**	**59,069,409**
2011	**30,923,005**	**30,939,047**	**61,862,052**

Examination of Table 3 demonstrates that passenger levels in 2011 are essentially the same as they were in 1998, and approximately 10% below levels of 2000. Passenger levels increased 4.7% in 2011 and are increasing at a similar rate thus far in 2012. Even if this accelerated rate of growth persists (which is unlikely), LAX will not reach the 78.9 MAP level until 2017. SCAG, FAA and industry sources are forecasting more moderate growth rates, indicating that levels may not reach 78.9 MAP until well beyond 2020. Furthermore, the SPAS Draft EIR is based on an increase of 31% in operations between 2009 and 2025 (based on extrapolating the daily aircraft operations figures appearing on Draft EIR Table 4.10 1-7 as shown in Table 3) which would bring the total to only 74.01 MAP in 2025.

Table 4, based on Draft EIR Table 4.10 calculates the 2025 MAP by extrapolating the 1493 daily operations and 56.52 MAP from 2009. The 2025 MAP projection of 74.01 may be somewhat low owing to a slight increase in the use of larger aircraft, but still the 2025 MAP level is far below the 78.9 MAP included in the Settlement Agreement. Based on this analysis, it is probable that limitations in the Settlement Agreement are not in danger of being exceeded. However, it is beneficial to maintain a cap on the growth of LAX within the Settlement timeframe.

Table 4. DAILY AIRCRAFT OPERATIONS BY AIRCRAFT TYPE FOR 2009 & 2025 FORECASTS[2]

	NJT	SJT	SNB	LNB	SWB	LWB	NLA	TOTAL
2009	158	259	630	207	87	151	1	1493
% of total	11%	17%	42%	14%	6%	10%	0%	
2025	146	344	741	283	218	194	29	1955
Change	-12	85	111	76	131	43	28	462
% of total	-8%	33%	18%	37%	151%	28%	2800%	31%
TOTAL	7%	18%	38%	14%	11%	10%	1%	

2 NJT-non-jet aircraft; SJT=small jet aircraft; SNB=small narrow body aircraft; LNB=long narrow body aircraft; SWB=small wide body aircraft; LWB=large wide-body aircraft; NLA=new larger aircraft.

The Settlement Agreement also includes a provision that the proposed gate limitations will not "restrict access to LAX below those disclosed in the FAA Record of Decision (ROD) for the No Project and Approved Project Scenario for 2015." The ROD indicates that the No Project scenario would be 78.7 MAP. The FAA ROD does not specifically indicate the Project Scenario for 2015, and the FAA ROD makes no mention of gates. Furthermore, Settlement §IV.A and §1V.B trigger the restrictions on gate levels only when and if passenger levels at LAX exceed 75 MAP. Since it is highly unlikely that LAX will reach that level before 2020 (when the Settlement is scheduled to expire) the gate restrictions also are rendered moot.

To reduce environmental impacts, the County's objectives related to the LAX Master Plan include limiting the ultimate service level of LAX to 78.9 MAP, a figure derived in part from forecasts conducted by LAWA in 1995 indicating demand at LAX would be 98 MAP in 2015. Clearly, given the above data, those forecasts have proven to be wide of the mark. The primary mechanism for achieving this is a limit of 153 NBEG.

- Passenger and gate provisions should be updated to reflect delays and economic conditions that have rendered moot the provisions contained in the Settlement. Furthermore, gate limits in the FAA Record of Decision (ROD) may conflict with Settlement provisions. LAWA should specify how inconsistencies will be resolved in terms of the access limits in FAA's Approved Project Scenario for 2015 and the gate limitations contained in the Settlement Agreement.

Response:

Comments regarding LAWA's compliance with the Stipulated Settlement require legal conclusions that are beyond the scope of what is required by CEQA. In accordance with CEQA requirements, the SPAS Draft EIR provides full disclosure of the environmental impacts associated with each of the SPAS alternatives at a future (2025) passenger activity level of 78.9 MAP compared to baseline conditions (2009 at 56.5 MAP). As further described below, all of the SPAS alternatives are designed to provide no more than 153 passenger gates at buildout in 2025, and the impacts analysis is based on a future activity level of 78.9 MAP in 2025, which already takes into account economic conditions over the past several years that have substantially slowed the rate of activity growth at LAX.

The comment's characterization of the LAX Master Plan Stipulated Settlement's provisions regarding number of passenger gates and future activity levels is incorrect. Specifically, it is incorrect that "the mainstay of the 2005 Settlement Agreement between petitioners and LAWA is a cap of 78.9 Million Air Passengers (MAP) through benchmark years 2015 and 2020 (when the Settlement expires.)" Under FAA rules, LAWA may not restrict access to the airport and may not impose any "cap" on aircraft operations, nor regulate or legally control in any way what operations the airlines might wish to

undertake at any particular airport.1 The Stipulated Settlement's gate reduction provisions are set forth in Section IV of the agreement and require LAWA to gradually discontinue operations at narrow body equivalent gates ("NBEG") at LAX such that the total number of passenger gates will be reduced to 153 by the end of 2015. However, this requirement does not apply if either (1) total passenger operations at LAX are below 75 MAP, or (2) the LAX Master Plan Program is substantially revised pursuant to the SPAS process such that the total number of gates is reduced to 153 or less. (Stipulated Settlement, Section IV.C.) The FAA reviewed these requirements in 2005 and determined that "the passenger gate provision in Section IV [of the Stipulated Settlement] is consistent with the FAA's Final Environmental Impact Statement (EIS) dated January 2005, and the Record of Decision (ROD) dated May 20, 2005." (Letter from Catherine Lang, FAA, to Lydia Kennard, LAWA, dated December 13, 2005.)

The Stipulated Settlement also requires that the SPAS identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP, and also requires that the SPAS alternatives be consistent with a practical capacity of 78.9 MAP. (Stipulated Settlement, Sections V.C and V.D.) As indicated in Section 1.2.1 of the SPAS Draft EIR, one of the objectives of the SPAS is to: "Plan improvements that do not result in more than 153 passenger gates at 78.9 MAP," and all of the SPAS alternatives include no more than 153 passenger gates at buildout in 2025.

The commentor makes certain assumptions and extrapolations using the historical LAX passenger data referenced in the comment. The associated resulting numbers of operations, passenger activity levels and daily operations by aircraft type represent the commentor's own interpretation of future activity at LAX based on conjecture with no supporting evidence. Appendix F-1, LAX 2009-2025 Passenger Forecast and Design Day Flight Schedule Development, of the Preliminary LAX SPAS Report, provides a detailed analysis of forecast activity associated with SPAS, based on substantial evidence. In preparing these forecasts and projections for the SPAS Draft EIR, LAWA relied on aviation planning experts with substantial experience in the development of airport activity forecasts, and also took into consideration recent activity forecasts for LAX prepared by the FAA. Details regarding the methodology and assumptions used in developing the activity level forecast for SPAS are documented in Appendix F-1 of the Preliminary LAX SPAS Report. A new activity level forecast for LAX was developed for SPAS, recognizing that the previous forecast for the LAX Master Plan was outdated and did not account for several influences that subsequently occurred, such as increased fuel prices and the worldwide economic recession, which clearly indicated that LAX would not reach a passenger activity level of 78.9 MAP by 2015. Based on the methodology and assumptions described therein, LAWA's experts estimated that a future activity level of 78.9 MAP at LAX would occur by approximately 2024. The 78.9 MAP forecast reflects that fact that all of the SPAS alternatives include (i) no more than 153 gates and (ii) amendment of the LAX Specific Plan Section 7.H, requiring action to encourage further shifts in passenger and airline activity to other regional airports if the annual aviation activity analysis forecasts that the annual passengers for that year at LAX are anticipated to exceed 75 MAP, and requiring a Specific Plan Amendment Study if the annual aviation activity analysis forecasts that LAX annual passengers for that year are anticipated to exceed 78.9 MAP. Both this physical gate limit and the proposed amendment to the LAX Specific Plan reflect the fact that the practical capacity of LAX is based on market assumptions, as well as the expected physical characteristics of the various functional elements of the airport and how they are planned and expected to work together, given how the market is likely to respond and use LAX. (See Section 6.2. of the Preliminary LAX SPAS Report)

Although economic conditions and other factors have resulted in lower activity levels at LAX than originally anticipated in the LAX Master Plan, the provisions of the Stipulated Settlement are not moot, nor do they conflict with the FAA ROD.

1. Under the Airport Noise and Capacity Act of 1990 (commonly called "ANCA") (49 USC Sections 47521-33), and its implementing regulations (14 C.F.R. Part 161), federal law prohibits an airport proprietor from unilaterally imposing any restrictions on "access" to the airport by Stage 3 aircraft. Following the phase-out of most noisy Stage 2 aircraft during the 1990s, Stage 3 aircraft comprise essentially all commercial aircraft landing at any U.S. airport. Any Stage 3 restriction is subject to review and approval by the FAA. The FAA strongly discourages any operational limits imposed under Part 161 and prefers and promotes permanent solutions to operational concerns and inefficiencies through capacity improvements. Further, the federal Airline Deregulation Act of 1978 expressly preempted the ability of airport proprietors to control the "price, route or service of an air carrier." (49

USC Section 41713(b)(1).) The United States Supreme Court has interpreted this prohibition broadly to mean that airports "may not seek to impose their own public policies or theories of ... regulation on the operations of an air carrier." (Morales v. Trans World Airlines, Inc. (1992) 504 US 374, 384.)

SPAS-AL00008-28

Comment:

3.2 The Draft EIR should reexamine the ratio of passengers to equivalent gates

LAWA has never presented calculations relating to the MAP/Gate ratio, and neither the Master Plan nor the current Draft EIR contains algorithms supporting the ratio of passengers to gates, as indicated in the ACL & Associates' 2004 report. Numerous variables complicate the ability of aircraft loading gates to serve passengers, and many of these variables are airport-specific (e.g. size, location, terminal layout, hours of operation, etc.). The Settlement uses the term NBEG to link gates to passenger capacity, but there is no single recognized science for this ratio and the term in not contained in the Settlement definitions. Moreover, there is no established consensus on the number of gates currently in use at LAX, nor the types of gate, nor their status in terms of NBEG. (Wikipedia lists 108 gates attached to the nine terminals). The Settlement states there were/are 163 gates at LAX, and this number includes every conceivable aircraft parking spot on the airfield (in the words of the Settlement: "wherever passengers will board and exit an aircraft"). In the 2004 report, ACL indicated the true number of gates was closer to 133 as reported in the Master Plan document itself. Because the number of gates correlates directly with passenger capacity, the Draft EIR should disclose in graphic form the location of every extant aircraft gate for each alternative or combined alternative. Considering that LAWA has been operating LAX continually for over 75 years, this task should be easily accomplished. To offer some comparison of the variable relationship between MAP and the number of gates, Table 5 presents current conditions at the highest passenger volume U.S. airports as of 2011:

Table 5. 2011 MAP, NUMBER OF GATES & MAP/GATE RATIOS FOR U.S. AIRPORTS
(Source: Airport Operating Council International and Wikipedia)

AIRPORT	2011 MAP	GATES	MAP/GATE
Atlanta	92.4	206	448,544
Chicago O'Hare	66.7	192	347,396
LAX	61.8	108	572,222
Dallas Fort-Worth	57.7	231	249,784
Denver	52.8	152	347,368
John F. Kennedy (New York City)	27.7	151	183,444
San Francisco	40.8	102	400,000

A review of Table 5 indicates LAX is currently utilizing its gates to process passengers at a much higher rate than other comparable airports. (Table 5 has not been corrected for NBEG, and the number of gates at LAX was set at 108 according to Wikipedia which lists only "contact" gates, that is, attached to a terminal.) The high figure for LAX is likely due to the use of remote gates. This comparison is presented only as an indication of the type of analysis that needs to be completed by the Master Planning team.

- The Draft EIR must provide information for each of the proposed alternatives in sufficient detail to assess the potential capacity of each of the proposed gates to serve passengers given the type of aircraft, the hours of operation, the physical layout of the terminal waiting lounges and other factors pertinent to the analysis. This information must be included in the Draft EIR as part of the Project Description and assessed in the Growth Inducing analysis with respect to gate and capacity limitations contained in the Settlement Agreement.

- In conjunction with the gate/MAP analysis, and because the number of aircraft gates is a determining factor for the enforcement of passenger constraints, each alternative must reveal exactly where each gate will be located and the capacity or design function of each gate (e.g., Narrow Body, Long Narrow Body, Large Wide Body, New Large Aircraft, etc.). This will enable reviewers of the Draft EIR to ascertain the number of passengers each alternative is capable of serving. The Draft EIR must also disclose the passenger-carrying capacity of all remote gates, particularly in light of the widespread use (at LAX and other major airports) of remote gates that rely on buses or foot travel to link passengers to the terminal.

- Alternative 3 includes construction of what is essentially a massive remote terminal known as the GTC. This facility would replace terminals now located in the Central Terminal Area (CTA) and provide passenger processing and baggage check in. Passengers and baggage would flow to aircraft via an Automated People Mover and via a baggage tunnel. The Draft EIR should discuss the passenger-serving capacity of the GTC and the potential that the GTC could replace the need for NBEGs.

Response:

The commentor references comments submitted by the County of Los Angeles in 2003 on the LAX Master Plan Supplement to the Draft EIR. In accordance with CEQA requirements, LAWA prepared written responses to all comments received on the LAX Master Plan Draft EIR and the LAX Master Plan Supplement to the Draft EIR; the LAX Master Plan Final EIR, which includes those responses as Part II of the document, was certified as complete and adequate under CEQA. The LAX Master Plan Final EIR is available on LAWA's website at the following address: http://www.ourlax.org/publications.aspx. All of the SPAS alternatives plan for the same number of passenger gates, 153, and a future passenger activity level of 78.9 MAP as in Alternative D of the LAX Master Plan, and those planning parameters are consistent with the provisions of the Stipulated Settlement and with the detailed analysis of forecast activity associated with SPAS provided in Appendix F-1, LAX 2009-2025 Passenger Forecast and Design Day Flight Schedule Development, of the Preliminary LAX SPAS Report.

The commentor is incorrect in stating that there is no consensus regarding gates currently in use at LAX. Pursuant to Section IV.F. of the Stipulated Settlement, Petitioners (i.e., Cities of El Segundo, Inglewood, and Culver City, County of Los Angeles, and ARSAC) have the right to conduct physical inspections for gates verification at LAX. Such inspections affords Petitioners the opportunity to observe first-hand the location and use of all passenger gates at LAX. LAWA has accommodated all Petitioner requests for such gate inspections/verifications and the results of the inspections are reflected in current LAX gate maps accessible on the internet at http://www.lawa.org/welcome_lax.aspx?id=1180 - Click on the link named "LAX Current Passenger Gate Positions." This gate count was most recently verified by Petitioners in January 2012. As indicated in the Gate Summary, there were 136 gates in use at LAX at that time.

Regarding the commentor's request to "disclose in graphic form the location of every extant aircraft gate for each alternative," please refer to Figures A through D in Appendix F-1 of the Preliminary LAX SPAS Report for illustrations and information on the assumed numbers of gate positions under the 2009 and 2025 conditions. Each figure contains a summary table with the number of gates at each terminal and commuter position. Accordingly, 159 passenger gates were assumed in use in 2009 and 153 passenger gates were assumed in use under each SPAS alternative in 2025.

The 2011 passenger and gate data obtained by the commentor from the Airport Operating Council International and Wikipedia (Table 5 of the comment) is acknowledged. The data presented in that table contradicts the commentor's earlier statement preceding the table, which indicates "Because the number of gates correlates directly with passenger capacity,…" As evidenced in the table, with numbers ranging from approximately 183,000 passengers per gate to over 570,000 passengers per gate, no apparent correlation can be drawn between the number of passenger gates and passenger capacity without assessing multiple contributing factors, most of which are very specific to each airport.

The commentor's calculations of 572,222 passengers per gate for LAX is invalid (refer to Table 5 of the comment). As of January 2012, and per the LAWA current gate map referenced above, the number of passenger gates currently in use is 136 gates (108 Central Terminal Area (CTA) gates, 18 West Remote passenger gates and 10 gates at the American Eagle Commuter Facility). The commentor

appears to have only used 108 gates as a denominator. The commentor further acknowledged that this high number may be due to the use of remote gates at LAX. If the intent were to compute the number of passengers per CTA gate only (i.e., 108 passenger gates), the numbers of passengers should be discounted to take out the volumes of passengers being accommodated at the West Remote Gates and at the American Eagle Commuter Facility. Dividing 61.8 MAP by 108 gates suggests that all LAX passengers are accommodated at CTA gates, which is not accurate.

The commentor requests information sufficient to assess the "potential capacity of each of the proposed gates to serve passengers" in an attempt to determine if these facilities conform to the passenger and gate levels stated in the Stipulated Settlement. The Stipulated Settlement requires that the SPAS identify Specific Plan amendments that plan for the modernization and improvement of LAX in a manner that is designed for a practical capacity of 78.9 MAP, and also requires that the SPAS alternatives be consistent with a practical capacity of 78.9 MAP. (Stipulated Settlement, Sections V.C and V.D.) As indicated in Section 1.2.1 of the SPAS Draft EIR, one of the objectives of the SPAS is to: "Plan improvements that do not result in more than 153 passenger gates at 78.9 MAP," and all of the SPAS alternatives include no more than 153 passenger gates at buildout in 2025.

The actual size of any new terminal facility would ultimately be determined through additional project-level planning and design work for each individual project.

Regarding the request for information on "where each gate will be located and the capacity or design function of each gate," please refer to the following:

- Figures B through D in Appendix F-1 of the Preliminary LAX SPAS Report for illustrations of the assumed gate position layouts under each SPAS alternative
- Response to Comment SPAS-PC00130-188 for a list of assumed numbers of gates under SPAS Alternatives 1 through 4 by terminal and Aircraft Design Group (ADG)
- Response to Comment SPAS-PC00130-770 for additional information on the assumed 2025 DDFS fleet mix

Regarding the request for "passenger-carrying capacity of all remote gates", as indicated under the heading of "Terminal Facilities" on pages 2-10, 2-17, 2-21, 2-30, 2-33, and 2-37 in Chapter 2 of the SPAS Draft EIR, under Alternatives 1, 2, 3, 5, 6, and 7, the west remote gates would be eliminated upon completion of the airfield and terminal improvements associated with these alternatives. Figures B through D in Appendix F-1 of the Preliminary LAX SPAS Report depict the largest commuter passenger aircraft assumed to be accommodated at each commuter position. The largest commuter passenger aircraft assumed to operate at the commuter positions in 2025 is an Embraer Regional Jet 140 with 44 seats.

Regarding the Ground Transportation Center (GTC), the planned size of many related facilities, including the GTC, was based on programmatic estimates made during the LAX Master Plan study. The development of related airport facilities (GTC, terminals, Automated People Mover, etc.) was planned to meet the forecasted 78.9 MAP passenger level and 153 gate totals. The actual size of each related facility would ultimately be determined through additional project-level planning and design work for each individual project.

SPAS-AL00008-29

Comment:

3.3 Capacity of the reconfigured terminal in Alternative 3 must be assessed

Alternative 3 would replace the piers at terminals 1, 2 and 3 with a singular linear terminal, and would replace vehicle parking in the Central Terminal Area with terminal facilities. The reconfigured terminal area and the addition of a GTC inject vastly different variables into the equation predicting air passenger capacity. There are substantial capacity differences between a linear terminal, such as exist at John Wayne Airport, and the pier terminals now existing at LAX terminals 1, 2 and 3. Linear terminals allow free flow of passengers between gates, provide flexible passenger enplaning and deplaning, provide flexible aircraft parking, and possess other advantages. The Draft EIR should assess these variables in

order to compare existing passenger capacity with the passenger capacity of proposed alternatives. In general, linear terminals provide more capacity than pier terminals because of the ease of entry through security, the absence of bottlenecks at the pier entry point, and the free flow of passengers through the lounge areas.

- For the reasons enumerated above and because the number of gates is the seminal focus of the Settlement, the capacity of the reconfigured terminal spaces must be assessed in terms of NBEG. The EIR must assess these variables in order to compare existing passenger capacity with the passenger capacity of proposed alternatives.

Response:

The commentor submits that "capacity of the reconfigured terminal in Alternative 3 must be reassessed." The planned size and capacity of many related facilities, including the linear concourse to replace Terminals 1, 2, and 3 under SPAS Alternative 3, was based on programmatic estimates made during the LAX Master Plan study. Section 3.3 of Appendix F-2 of the Preliminary LAX SPAS Report discusses the terminal assumptions for Alternative 3, including the gate positions for the linear concourse. (Also see Appendix F-2 of the Preliminary LAX SPAS Report for a discussion of the gate positions and terminal assumptions for all the alternatives.) As described in Section 6.2 of the Preliminary LAX SPAS Report, LAX Master Plan Alternative D was designed to serve the same practical capacity as the then existing airport would have served without the LAX Master Plan improvements (i.e., the same number of passengers that would have been served if no LAX Master Plan improvements had been made). All of the SPAS alternatives have similarly been designed with 153 gates and analyzed at a practical capacity of 78.9 MAP. As described in Section 6.2 of the Preliminary LAX SPAS Report, the term "practical capacity" in this context means a forecast of activity determined by how LAX's various components will function together in the context of real-world market conditions, particularly given the market conditions projected in LAX's forecast. While practical capacity is not based solely on market assumptions, it takes into account the expected physical characteristics of the various functional elements of the airport and how they are planned and expected to work together, given how the market is likely to response to and use LAX. Section 6.2 of the Preliminary LAX SPAS Report also sets forth a potential revision to Section 7.H of the LAX Specific Plan that would provide opportunities for adjustments if LAX reaches 75 or 78.9 MAP earlier than expected. Therefore, it is not necessary to reassess the capacity of the reconfigured terminal in SPAS Alternative 3.

SPAS-AL00008-30

Comment:

3.4 Runway capacity increases must be defined for all Alternatives

Alternatives 1 through 7 include various improvements to the north airfield, all designed to increase aircraft flow and safety. They also increase the peak hour Instrument Flight Rules (IFR) capacity of the north airfield. Peak hour IFR capacity is a key measure of the ability of a runway system to serve aircraft operations. Such information is not included in the DEIR. The inclusion of this information in the Draft EIR is critical to understanding the capacity of the proposed physical improvements. The FAA provides guidance to assessing airfield capacity in AC 150-5060-5; and the analysis is supported by a variety of advanced modeling techniques. Draft EIR Table 4.10 1-7 includes a footnote indicating the use of 2011 SIMMOD model runs and Integrated Noise Model (INM) output files. (SIMMOD is a sophisticated airfield modeling computer program; details are available at http://web.mit.edu/aeroastro/www/labs/AATT/reviews/simmod.html.) The Noise section of the Draft EIR uses INM to generate noise contours and other noise impact levels.

While the technical appendices may include detailed runway use information, the Draft EIR does not include easily accessible tables indicating how many aircraft are assigned to each runway for each build alternative. Although projected noise contours are significantly larger under the build alternatives, the Draft EIR provides only one table in the Noise section that lists daily operations per aircraft type.

- In order for readers to understand the aircraft and passenger serving capacity of the alternatives, the Draft EIR must include the airfield modeling data and a summary of the runway specific aircraft assignments for each alternative. (At the time of our review, the web version of the Draft EIR included

no link to the appendices where this information may be located.) Furthermore, the Draft EIR should provide information regarding the passenger growth-inducing impact of increasing the peak hour IFR. Together, these data will enable reviewers to assess the full passenger carrying capacity that could feasibly be associated with each alternative.

Response:

The commentor's statement that the proposed SPAS alternative improvements to the north airfield would "increase the peak hour Instrument Flight Rules (IFR) capacity of the north airfield" is not valid.

As discussed on page 1-10 in Section 1.2.1 of the SPAS Draft EIR, improvements proposed under the SPAS alternatives are meant to "support the safe and efficient movement of aircraft at LAX." The SPAS improvements did not include any changes that would enhance instrument approach capabilities to the north airfield runways. Refer to pages 1-10 and 1-11 in Section 1.2.1 regarding a list of existing problems associated with the current airfield design at LAX. Today, simultaneous dual approaches to Runways 6L/24R and 6R/24L under IFR conditions are not possible. Under IFR conditions, the northern runways at LAX are treated as a single runway because the spacing between the two runway centerlines is less than 2,500 feet. Please refer to the Federal Aviation Administration (FAA) guidance in Advisory Circular 150/5300-13a, Section 316 on page 85 regarding parallel runway separation requirements. None of the SPAS alternatives would provide a minimum of 2,500 feet between Runways 6L/24R and 6R/24L that would allow an increase in IFR capacity. Please refer to Section 4.7.2.3 under the section heading of "Runway Separation Distances" on pages 4-487 and 4-488 of the SPAS Draft EIR regarding additional information on runway separation distances and simultaneous operations.

In addition, Appendix F-2 of the Preliminary LAX SPAS Report documents the results of the airspace SIMMOD simulation under the following airspace configurations: Visual Flight Rule (VFR) with visual approaches, VFR with Instrument Landing System (ILS) approaches and Instrument Meteorological Conditions (IMC) with instrument approaches. As presented in Table 7 on page 45 (2009 conditions), Table 10 on page 63 (SPAS Alternative 1), Table 12 on page 73 (SPAS Alternative 2), Table 14 on page 91 (SPAS Alternative 3) and Table 16 on page 107 (SPAS Alternative 4), the assumed percentage of IMC with instrument approaches (i.e., approaches under IFR conditions) was kept identical to that assumed under the 2009 conditions (i.e., 4.1 percent of the total annual operations). When compared to the 2009 conditions, the resulting increase of the peak hour throughput under IMC with instrument approaches under the SPAS alternatives is due to an increase in the total number of operations, not an increase of the airport runway system IFR capacity. Under each of these four SPAS alternative, the resulting peak hour throughput varies slightly between 122 and 125 hourly operations under IMC with instrument approaches, compared to 103 hourly operations in 2009. Regarding information on the SPAS Draft EIR modeled results in terms of peak hour throughput, refer to Response to Comment SPAS-AL00007-4.

The commentor further discusses FAA guidance related to assessing airfield capacity, as well as modeling techniques such as SIMMOD airspace simulation and the Integrated Noise Model (INM) aircraft noise modeling. Both modeling technics were used for the purposes of the SPAS Draft EIR and were documented in Appendix F-2 of the Preliminary LAX SPAS Report (SIMMOD airspace modeling) and in Appendices J1-1 and J1-2 of the SPAS Draft EIR (aircraft noise modeling).

The commentor requests additional information related to "airfield modeling data and a summary of the runway specific aircraft assignments for each alternative." Airfield modeling data represent large amounts of data required to run both the INM and the airspace simulation SIMMOD model. Such databases cannot readily be provided in manageable tabular format and often require the INM and SIMMOD models to be accessed. However, in response to this comment, Table 1 below provides additional detail regarding the assumptions used in the SPAS Draft EIR noise analysis, specifically the number of Average Annual Day (AAD) operations modeled in the INM by runway, type of operation (arrival/departure), aircraft category, and scenario (2009, Alternatives 1, 2, 3, and 4).

Table 1

Aircraft Noise Analysis - Number of Average Annual Day Operations by Runway, Type of Operation (Arrival/Departure), Aircraft Category, and Scenario

Runway	Arrival/ Departure	Aircraft Category	2009	Alt. 1	Alt. 2	Alt. 3	Alt. 4
06L	A	NJT	0.45	0.60	0.60	0.63	0.61
06L	A	SJT	0.82	1.78	1.71	1.72	1.69
06L	A	SNB	2.26	4.16	4.22	3.69	4.09

Source: Ricondo & Associates, 2012.

The commentor also inquires about "passenger growth-inducing impact of increasing the peak hour IFR." As discussed above, based on the fact that the SPAS alternatives did not provide for an increase in IFR capacity and the fact that the 2025 Design Day Flight Schedule (DDFS) was developed independently from the LAX airfield capacity, the SPAS Draft EIR did not analyze a potential increase in passenger volumes due to an increase in peak hour IFR operations.

All of the aforementioned appendices associated with the SPAS Draft EIR and the Preliminary LAX SPAS Report were available on the LAWA SPAS website (laxspas.org), with links that were tested and validated by numerous parties on the day the SPAS Draft EIR was released for public review (July 27, 2012), and were also on the CDs that were hand-delivered on or about that day to the commentor and to the Cities of Inglewood and Culver City, which the commentor represents, and were within the complete hard-copy sets of documents also hand-delivered to those Cities.

SPAS-AL00008-31

Comment:

3.5 The Master Plan forecasts are outdated and inaccurate and need to be redone

The Master Plan forecasts developed by LAWA in 1995 have not stood the test of time. These forecasts projected 98 MAP and 3.6 MAT (Million Annual Tons) of cargo at LAX for 2015. Recent levels, despite 4-5% increases in 2011 and 2012, are 61 MAP and 1.7 MAT. In 2000, levels were 67 MAP and 2.0 MAT. Thus, not only have the high forecasts not been achieved, levels have decreased 10% to 20%. As stated above, the Draft EIR itself uses a forecast of approximately 74 MAP in 2025. Thus, while it is obvious that the Draft EIR is using forecasts that are vastly different from the ones used in the original Master Plan EIR, there is no discussion or revelation regarding these new forecasts. Recent forecasts by SCAG, FAA and the airline industry also indicate a rate of increase much less than envisioned in the 1995 Master Plan. Much has occurred in the world since 1995 including not only 9/11 and the Great Recession, but also a vast difference in how business is conducted and how income is distributed. The introduction of the Internet and computer interconnectedness (as documented in Thomas Friedman's book, "The World is Flat.") have reshaped the global economy. The U.S. economy is in a state of flux with no clear direction, and North American airlines are operating on very thin margins (0.5%) with uncertain forecasts for future revenues.

Accommodating LAWA's 1995 forecasts formed the Purpose and Need of the original Master Plan and its constituent projects. The FAA ROD that certified the EIS also cites accommodating these forecasts as the Purpose and Need for the Master Plan. The Settlement Agreement is based on these outdated and discredited forecasts, as are the follow-on Specific Plan Amendment and its Draft EIR.

- Considering that the 1995 passenger demand forecasts comprise the fundamental basis for development of the proposed project alternatives, it is important that the current Draft EIR, disclose the new forecasts and their underlying assumptions.

Response:

The passenger forecast used for the SPAS planning and Draft EIR analyses is not based on 1995 forecast, but was developed anew based on baseline (2009) conditions. Please refer to Section 1 in Appendix F-1 of the Preliminary LAX SPAS Report regarding the passenger forecast developed for the SPAS Draft EIR. Section 4.2 in Appendix F-1 discusses projections of cargo, general aviation, non-scheduled passenger and military operations developed for the SPAS Draft EIR; these projections were not based on 1995 projections, but rather a review of recent trends. Thus, the forecasts and projections used for SPAS planning account for changes since 1995 noted by the comment, such as more recent economic conditions and business trends.

SPAS-AL00008-32

Comment:

4.0 THE SPAS PROCESS DOES NOT FULFILL TRAFFIC COMMITMENTS CONTAINED IN SETTLEMENT §IV.G. AND FAILS TO COMPLY WITH CEQA

4.1 SPAS Alternatives would significantly impact nine County intersections yet mitigation (partial) is provided for only one of these intersections.

The County Department of Public Works does not agree that the Draft EIR adequately analyzes and discloses the impacts and appropriate mitigations for County intersections. The County requests that LAWA consult and work with its Public Work's engineering staff before finalizing the EIR. The study area for the traffic analysis includes over 100 intersections. Table 6 lists the 40 intersections that are all or partially in the County, and notes the impact analysis findings for each. Mitigation is proposed in those cases where LAWA considers the improvements to be feasible, also shown in Table 6.

NA = Not Applicable; e/o-east of; n/o=north of; s/o=south of				

Table 7 lists nine intersections located wholly or partially in the County that would experience significant adverse impacts from the project. At only one of these 9 intersections is LAWA proposing to reduce the impacts to less than significant levels; mitigation for the remaining 8 significantly impacted intersections has been found infeasible by LAWA. Table 7 outlines forecast service levels and LAWA's proposed mitigation for these nine significantly impacted intersections:

Table 7. COUNTY INTERSECTIONS SIGNIFICANTLY IMPACTED BY THE SPAS ALTERNATIVES

LOCATION	LEVEL OF SERVICE	MITIGATION
36. La Cienega Blvd & Century Blvd	F	No Feasible Mitigation
63. Hawthorne Blvd & Lennox Blvd	D	No Feasible Mitigation
76. Inglewood Ave & Lennox Blvd	D	No Feasible Mitigation
86. La Brea Ave/Overhill Dr & Stocker St.	F	No Feasible Mitigation
87. La Brea Ave & Slauson Ave	F	Partial
93. La Cienega Blvd & Stocker St	F	No Feasible Mitigation
95. La Cienega Blvd & W. 120th St	D	No Feasible Mitigation
119. Ocean Ave/Via Marina & Washington Blvd	F	No Feasible Mitigation
173. Western Ave & Imperial Hwy	E	No Feasible Mitigation

With few exceptions, the impact findings apply to all five alternatives (1, 2, 4, 8 and 9). Some of the impacted locations show Level of Service (LOS) D operating conditions, but are identified as being impacted by the project based on LA County criteria for a significant contribution to the volume/capacity ratio when the with-project LOS is D (which is generally considered an adequate LOS, however the impact is caused by the high project contribution).

Of primary concern are the locations at LOS E or F without identified mitigation, which six of the County intersections fall into this category. The traffic study identifies potential mitigation measures for each location, but deems them infeasible due to "policy" considerations such as needing additional right-of-way, sidewalk - adjustments, or impacting other modes of travel.

- Based on review of the SPAS Draft EIR, it appears that the feasibility findings represent LAWA's interpretation of each jurisdiction's assessment. The County requests that LAWA modify/clarify the following:
- Did LAWA extend to Los Angeles County the offer to fund or provide fair-share mitigation for the significantly impacted County intersections?
- What evidence can be provided that the County rejected potential mitigation measures as infeasible?
- When did LAWA provide the County with an opportunity to select intersections for the Draft EIR analysis, and which intersections did the County submit to LAWA for this purpose?
- Given the potential magnitude of the deficiencies noted in Table 7, it is important that the affected jurisdictions either verify the finding of infeasibility or be given an opportunity to consider implementation of the identified improvements (or other appropriate improvements) with necessary funding or fair-share contributions by LAWA. This is critical because the Settlement Agreement requires LAWA to "contribute its fair share for each mitigation measure to the implementing agency."

Response:

The comment states that "THE SPAS PROCESS DOES NOT FULFILL TRAFFIC COMMITMENTS CONTAINED IN SETTLEMENT §IV.G AND FAILS TO COMPLY WITH CEQA"

Stipulated Settlement Section IV.G does not address traffic, but discusses the fact that the West Satellite Concourse will not be considered a Yellow Light project. Section V.G of the Stipulated Settlement provides that "For any new significant traffic impact that is identified as a result of the traffic study, LAWA will propose *feasible* mitigation measures, *if any*, to mitigate the potentially significant impact." (Emphasis added.) As discussed in Response to Comment SPAS-AL00008-10, this does not require discussion of infeasible mitigation measures.

The comment lists the 40 study intersections that are wholly or partially within the jurisdiction of Los Angeles County, and correctly notes that the SPAS Draft EIR identified significant impacts at nine of those intersections. The comment correctly notes that with the addition of project traffic, six of those nine significantly impacted intersections are projected to operate at LOS E or LOS F, while three are projected to operate at LOS D. The comment states that locations where LOS E or LOS F operation is projected are of primary concern. The commentor asks if LAWA consulted with Los Angeles County on the selection of study intersections, if LAWA consulted with Los Angeles County prior to rejecting certain mitigation measures as infeasible, and if LAWA offered to fully or partly fund mitigation at the impacted intersections under the County's jurisdiction.

Input from Los Angeles County Department of Public Works on the geographic scope of the traffic impact analysis was solicited during the preparation of the SPAS Draft EIR via letters dated April 6, 2006 and April 8, 2008, which also contained a list of intersections that LAWA planned to analyze. As discussed under State CEQA Guidelines Section 15082(b), one of the purposes of commenting upon the Notice of Preparation is to "provide the lead agency with specific detail about the scope and content of the environmental information…" Los Angeles County's June 30, 2008 NOP comment letter explicitly commented upon the "scope and focus" of the transportation analysis. (SPAS Draft EIR, Appendix A, Part 1 of 2, page 162.) In addition, on October 16, 2012 and December 10, 2012, LAWA and its consultant met with staff of the Los Angeles County Department of Public Works to discuss the extent of the County's existing signal coordination system (intelligent transportation systems, or ITS) and whether contributions to improving or expanding that system could be considered as mitigation measures. County staff indicated that the existing system is not as extensive or as sophisticated as it could be. At study intersections where significant impacts were identified but where no physical improvements are feasible at this intersection, a partial mitigation measure (subject to FAA approval) is that LAWA will make a monetary contribution to upgrading the County's ITS system to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

The comment also suggests that LAWA found mitigation measures infeasible based purely on "policy" considerations. Contrary to the assertion, Section 4.12.2.7.1 of the SPAS Draft EIR provides numerous grounds for infeasibility of some of the traffic improvements, as do the Response to Comments in the Final EIR, including economic infeasibility, environmental infeasibility (including impacts to alternative modes of transportation), legal infeasibility, social infeasibility, and policy infeasibility. Please see Responses to Comments SPAS-AL00001-1, SPAS-AL00008-34, SPAS-AL00008-35, SPAS-AL00008-36, SPAS-AL00008-37, SPAS-AL00008-38, SPAS-AL00008-39, SPAS-AL00008-40, and SPAS-AL00008-41, SPAS-AL00008-42, addressing comments submitted by Los Angeles County, which discuss the feasibility of specific mitigation measures.

SPAS-AL00008-33

Comment:

4.2 The Draft EIR does not address overall system deficiencies associated with significant adverse effects

The foregoing discussion points to significant, unmitigated, direct adverse impacts to eight County intersections, and partial mitigation at one County intersection. LAWA does not propose full mitigation for any of the 9 significantly impacted County intersections. The fact that demand is forecasted to exceed capacity at these critical County intersections clearly indicates that some amount of traffic will divert to other routes. These traffic diversions will cause indirect impacts and overall system deficiencies throughout the region.

- It is incumbent upon the Draft EIR to identify and analyze system-wide deficiencies caused by traffic diverted from significantly impacted intersections, and undertake additional efforts as needed to evaluate the mitigation measures for feasibility in coordination with the affected jurisdictions.

Response:

The comment states that secondary (i.e., indirect) impacts should be assessed due to the diversion of traffic from congested intersections to other routes. As described in Section 4.12.2.2.2 of the SPAS Draft EIR, the traffic analysis in the SPAS Draft EIR employed a focused travel demand forecasting model to assist in estimating the routes that airport-generated traffic would use, as well as the routes of other traffic in the vicinity. Development of the model for use in this study included both static and dynamic validation tests. Because it was determined to operate within accepted standards for accuracy, it was found to be appropriate for this use. Figure 4.12.2-2 of the SPAS Draft EIR shows the model process, which includes iterative traffic assignment until traffic is optimally distributed over the street network. This dynamic assignment process accounts for traffic diversion from congested routes to other available routes. By using the resulting forecast traffic volumes, the SPAS Draft EIR traffic analysis did, in fact, include secondary traffic impacts that could be caused by diversion from congested routes.

SPAS-AL00008-34

Comment:

4.3 The Draft EIR must consider additional measures to reduce traffic impacts

Within the larger context, there are certain locations where potential mitigation measures are available and should be evaluated within the Draft EIR.

- Provided below is a list of intersections and recommended potential mitigation measures and/or analyses that merit thorough evaluation in the Draft EIR:

- 27. La Tijera Boulevard & Centinela Avenue: The DEIR makes a finding that the addition of a second southbound left-turn lane (which would mitigate the project impact) is physically feasible, but has policy constraints (narrowing sidewalks and impacts to alternative transportation modes). The County has not evaluated this finding in coordination with the City of Los Angeles recognizing that the projected LOS D may be considered acceptable by the City.

Response:

The comment states that the County has not evaluated the finding that no mitigation is feasible at La Tijera Boulevard and Centinela Avenue (study intersection 27), but notes that the City of Los Angeles may consider projected future operation at LOS D acceptable.

Contrary to the assertion in the comment, potential mitigation was evaluated at Intersection 27, but was determined to be infeasible. (See SPAS Draft EIR, Section 4.12.2.7.1 ["Identification and Evaluation of Mitigation Measures."], page 4-1293.) The mitigation measure considered at this location was the addition of a second southbound left-turn lane, which would align with the dual northbound left-turn lanes. Implementation of this measure would require narrowing the sidewalk on the northbound departure of the intersection, where a bus stop and shelter are located. Because the sidewalk there is only approximately ten feet wide and includes existing transit infrastructure, it was determined that the sidewalk there could not feasibly be narrowed while maintaining the current level of pedestrian safety and if implemented would result in secondary impacts to alternative modes of transportation (pedestrian access and transit stop access).

In addition, as stated on page 4-1293 of the SPAS DEIR "It is noted that a recent study conducted for SCAG developed grade separation concept designs for the adjacent intersection of La Cienega Boulevard at Centinela Avenue, La Tijera Boulevard, and Fairview Boulevard. If this grade separation concept becomes feasible, LAWA can provide fair share contribution, subject to FAA approval," LAWA is not relying upon the grade-separation project in the SCAG study to reduce impacts to less than

significant since the implementation of this measure is under the jurisdiction of another agency and cannot be guaranteed at this time. Nevertheless, this mitigation measure for the subject intersection has been included in the SPAS Final EIR as Mitigation Measure MM-ST (SPAS)-38. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that, at this time, no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-35

Comment:

- 36. La Cienega Boulevard & Century Boulevard: This intersection is a critical location as far as airport accessibility is concerned. Right-of-way is constrained by large office buildings on the northeast and southwest corners, which are not constrained by buildings and where consideration should be given to opportunities presented by right-of-way acquisition from these parts of the intersection. The Cities of Inglewood and Los Angeles share this intersection.

Response:

Potential mitigation was evaluated at Intersection 36 but was determined to be infeasible. (See SPAS Draft EIR, Section 4.12.2.7.1 ["Identification and Evaluation of Mitigation Measures."].) The comment states that the County considers La Cienega Boulevard and Century Boulevard (study intersection 36) to be a "critical intersection" but correctly notes that large office buildings constrain the ability to widen the eastbound and westbound approaches on Century Boulevard.

The wording in the remainder of the comment is unclear. To the extent the commentor is suggesting right-of-way acquisition, the commentor's suggestion is considered infeasible for the reasons discussed on page 4-1294 of the SPAS Draft EIR. As discussed therein, removal of existing businesses, including two high-rise commercial buildings with multiple tenants and two gas stations, is considered economically infeasible, socially infeasible, infeasible based upon policy considerations, and infeasible due to inconsistency with the project objectives (i.e., inconsistent with the objective of advancing "economic growth and vitality of the Los Angeles region.") The physical improvement would also create secondary environmental impacts associated with demolition and construction, such as noise and air quality, and therefore is considered infeasible.

In addition, page 4-1294 of the SPAS Draft EIR notes that the "impact at this location could be reduced through increased service levels of the airport employee TDM/Vanpool program." This mitigation program has been suggested in MM-ST (SPAS)-1 on page 4-1307 in Section 4.12.2.7.2 of the SPAS Draft EIR and has already been incorporated into the project to the extent feasible.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-36

Comment:

- 63. Hawthorne Boulevard & Lennox Boulevard: This intersection has some physical constraints, but could potentially be improved with the removal of the north-south median, restriping with minor sidewalk adjustments, and lane width reductions. The potential for such improvements should be the subject of a more detailed evaluation, recognizing that the projected LOS D could be considered acceptable by the City.

Response:

Potential mitigation was evaluated at Intersection 63 but was determined to be infeasible. (See SPAS Draft EIR, Section 4.12.2.7.1 ["Identification and Evaluation of Mitigation Measures."]) As noted therein, there are existing right-of-way constraints, and the mitigation measure would require the removal of existing one-story commercial businesses on Hawthorne Boulevard, including a car wash, a restaurant and a retail store.

The comment recommends that mitigation at the intersection of Hawthorne Boulevard and Lennox Boulevard (study intersection 63) be further evaluated, but notes that the City of Los Angeles may consider projected future operation at LOS D acceptable. The comment specifically suggests the potential to remove the raised center median on Hawthorne Boulevard, restripe Hawthorne Boulevard with narrowed lanes and narrowing of the sidewalk.

The intersection modifications cited in the comment were considered when mitigation options at this location were being evaluated. The existing curb lanes are currently just wide enough to allow drivers in the northbound and southbound curb lanes to pass buses at the far-side bus stops that are present in both directions. If the curb lanes were narrowed, the resulting lane widths would no longer allow drivers to readily pass by stopped buses and result in operational problems thereby increasing traffic impacts and creating safety problems, making the suggestion infeasible. Also, based on consultation between LAWA and Los Angeles County staff during the meetings that took place on December 10, 2012 and on December 18, 2012 the addition of a southbound travel lane would require the prohibition of on-street parking, which is considered by the County to be infeasible at this location due to the partial reliance of businesses in this commercial district upon street parking. Removal of the median would also create secondary environmental impacted associated with demolition and construction, such as noise, air quality, etc., and is therefore considered infeasible. Further, median landscaping and beautification improvements were made in 2012 on the segment of Hawthorne Boulevard from 104th Street to 111th Street, which includes the intersection with Lennox Avenue, and removal of the median would reduce the value of the recent investment in that corridor.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2

of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-37

Comment:

- 76. Inglewood Avenue & Lennox Boulevard: Improvements as noted in the SPAS are physically feasible at this location, but would result in the loss of on-street parking. Since the projected performance is LOS D, these improvements are recommended if the high project contribution to this location is of concern (as determined through communications between the City and the County).

Response:

The comment states that the mitigation measure discussed in the SPAS Draft EIR for the intersection of Inglewood Avenue and Lennox Boulevard (study intersection 76) is physically feasible but would result in the loss of on-street parking on Inglewood Avenue. The comment appears to conditionally recommend the improvements, which were determined to be infeasible in the SPAS Draft EIR (see page 4-1297 of the SPAS Draft EIR), "if the high project contribution to this location is of concern (as determined through communications between the City and the County.)" The intended meaning of this conditional recommendation is not clear.

The loss of parking and potential narrowing of sidewalks on Inglewood Avenue at this location were considered when mitigation options were developed for this location but were rejected as infeasible because the sidewalk there could not feasibly be narrowed while maintaining the current level of pedestrian safety and convenience and this location is densely developed with residential and commercial uses that rely, in part, on on-street parking, thereby resulting in economic infeasibility, social infeasibility, policy infeasibility, and infeasibility based upon inconsistency with the project objectives (i.e., such a suggestion would not "Advance[ing] the Economic Growth and Vitality of the Los Angeles Region"; Section 1.2.1 of the SPAS Draft EIR).

This finding was discussed further with Los Angeles County staff during meetings that took place on December 10, 2012 and on December 18, 2012, prior to the completion of the SPAS Final EIR and concurrence was reached that a lack of right-of-way and the presence of on-street parking preclude the ability to physically mitigate the significant impact at this intersection. As discussed on page 4-1288 of the SPAS Draft EIR, the physical improvements suggested by the commenter are considered infeasible because they would result in impacts to alternative modes of transportation (narrowing of existing sidewalk on Inglewood Avenue). It should be noted that the reference to Imperial Highway in the discussion of Intersection 76 on pages 4-1288 and 4-1297 of the SPAS Draft EIR is a typographical error. The correct reference in each case is to Inglewood Avenue, not Imperial Highway. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-38

Comment:

- 86. La Brea Avenue/Overhill Drive & Stocker Street: This five-legged intersection is projected to operate at LOS F. An identified mitigation measure is to add a southbound through lane, which would require sidewalk modifications and potentially some right-of-way. Since this intersection is adjacent to open space, the feasibility of such an improvement should be evaluated to determine the extent of constraints to obtaining additional right-of-way.

Response:

The comment references a potential mitigation for intersection 86 which was determined to be infeasible on page 4-1298 of the SPAS Draft EIR. The comment appears to be referring to the second infeasible mitigation measure discussed in the fourth sentence of page 4-1298 under Intersection 86. (See Section 4.12.2.7.1, Identification and Evaluation of Mitigation Measures, of the SPAS Draft EIR.) The comment recommends that the potential mitigation measure described for the intersection of La Brea Avenue/Overhill Avenue and Stocker Street (study intersection 86) be further evaluated to determine whether the acquisition of adjacent parkland is feasible. As discussed on page 4-1298 of the SPAS Draft EIR, to fully mitigate the impact at this location would require the provision of a southbound through lane, which is not feasible within the existing right-of-way and would require narrowing sidewalks on La Brea Avenue south of Stocker Street. Because the sidewalk there is only approximately seven feet wide, it was determined that the sidewalk there could not feasibly be narrowed while maintaining the current level of pedestrian safety and if implemented would result in secondary impacts to alternative modes of transportation (pedestrian access). Acquisition of additional right-of-way would require removal of existing one-story commercial and motel businesses on the west side of La Brea Avenue, which is considered economically infeasible, socially infeasible, infeasible based upon policy considerations, and infeasible due to inconsistency with the project objectives (i.e., inconsistent with the objective of advancing "economic growth and vitality of the Los Angeles region.") The physical improvement would also create secondary environmental impacted associated with demolition and construction, such as noise, air quality, etc., and therefore is considered infeasible.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection, but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measure and Table 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the SPAS Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-39

Comment:

- 93. La Cienega Boulevard & Stocker Street: The DEIR declared improvements at this location as infeasible due to right-of-way constraints, even though there are no buildings in the vicinity. A recent SCAG study is referenced, indicating potential project participation in future improvements if and when something is identified; this should be pursued with a projected LOS F, with possibly some initial improvements identified.

Response:

The comment restates the discussion of a potential mitigation measure at La Cienega Boulevard and Stocker Street (study intersection 93) on page 4-1299 of the SPAS Draft EIR, a fair-share contribution to a grade separation should it be found feasible and should the FAA approve of a contribution by LAWA, and suggests that unspecified lesser improvements in the near term may be possible. This finding was discussed further with Los Angeles County staff during meetings that took place on December 10, 2012 and on December 18, 2012, prior to the completion of the SPAS Final EIR and concurrence was reached that no short-term physical mitigation measures are feasible at this location and the proposed fair-share contribution to the grade-separation, subject to FAA approval, as stated on page 4-1299 of the SPAS Draft EIR, remains feasible to fully mitigate the project impact at this location.

As discussed in Response to Comment SPAS-AL00008-32, consultation between LACDPW and LAWA confirmed that no physical improvements are feasible at this intersection in the near term but a potential partial mitigation measure was identified for this location. If permitted by the FAA, LAWA will make a monetary contribution to upgrading the County's ITS system at this intersection to partially mitigate the alternative's contribution to the cumulative impacts (i.e., the Future (2025) With Alternative versus without alternative).

However, as the contribution to Los Angeles County is conditional pending approval by FAA and the County does not have a method to quantify the benefits of this improvement, no quantitative V/C reduction has been taken for this location. Similarly, as the grade separation concept design for La Cienega Boulevard at Stocker Street is not reasonably foreseeable at this time, no quantitative V/C reduction has been taken for this location. Therefore, in response to this comment, Section 4.12.2.7.2 of the SPAS Draft EIR has been revised to incorporate the proposed mitigation measures and Tables 4.12.2-27 through 4.12.2-38 (on page 4-1315 through 4-1326) of the Draft EIR have been revised to add a footnote stating that no V/C credit was taken at this intersection. Please see Chapter 5, Corrections and Additions Related to the SPAS Draft EIR. Therefore, the impact at this location would remain significant and unavoidable.

SPAS-AL00008-40

Comment:

- 95. La Cienega Boulevard & W. 120th Street: While a potentially feasible mitigation measure is identified for this location (may require some right-of-way or sidewalk adjustment), the LOS D that is forecast may be considered acceptable.

Response:

The comment states that the County considers the mitigation measure discussed for the impact at the intersection of La Cienega Boulevard and 120th Street (study intersection 95), the addition of a second southbound left-turn lane, to be potentially feasible. The comment notes, however, that the projected future operation LOS D may be considered acceptable. This intersection is within the jurisdiction of the County of Los Angeles, in the community of Del Aire.

The SPAS Draft EIR concluded that the right-of-way acquisition that would be required rendered it infeasible due to economic and policy considerations. Please see pages 4-1299 and 4-1230 in Section 4.12.2.7.1 of the SPAS Draft EIR, to fully mitigate the impact at this location would require the provision of a southbound left-turn lane, which is not feasible within the existing right-of-way. This would require removal of existing one-story office and commercial buildings with multiple tenants on the east side of La Cienega Boulevard, and is considered economically infeasible, socially infeasible, infeasible based upon policy considerations, and infeasible due to inconsistency with the project objectives (i.e., inconsistent with the objective of advancing "economic growth and vitality of the Los Angeles region.") The physical improvement would also create secondary environmental impacts associated with demolition and construction, such as noise, air quality, etc., and therefore is considered infeasible.
